Law.—The courts in India administer English, Hindu, and Muhammadan law. In 1726, when the East India Company established Mayor's Courts in Calcutta, Bombay, and Madras, the common and statute law in force in England at that date were supposed to be transplanted to India. A Supreme Court was set up at Fort William, in Bengal, in 1774, and an Act of 1781 defining its powers provided that the Hindu and Muhammadan law regarding succession and inheritance to lands, rank, and goods, and all matters of contract and dealing between party and party, should be applicable when Hindus and Muhammadans were parties. Supreme courts were afterwards established in Bombay and Madras with the same powers. Side by side with these courts were provincial courts which had nothing to do with English law and procedure. The duplication of systems was abolished in 1861, after the Crown took over the government of India. Other sources of Indian law in addition to English law as it stood in 1726 and the Hindu and Muhammadan laws are Brit. Acts relating to India, and the Acts of the Ind. Legislative Council. Eng. lawyers who do not agree that the benefits of an English code would outweigh the disadvantages, admit that the case is different in India, where distances are so great and the assistance of highly trained advocates and large law libraries are not always at hand. The law of India has been compressed into four codes—penal, penal procedure, civil, civil procedure. Codification in India does not prevent a supplementary development of the law by judicial decisions. Case-law is unknown to many continental countries where codes exist, the judge merely applying the principles of the code as best he can without reference to previous decisions. In India the courts, as in

England, follow a previous decision as authoritative. The courts enforce the customs as well as the laws of the Hindus and Muhammadans. Indian codification has been in progress since 1833, and may be attributed to Macaulay, who in a speech in Parliament after debates on the defects of Indian law said that no country ever stood in such need of a code. He was a member of the first commission app. to draft a code, and Sir Henry Maine and Sir Fitzjames Stephen are among the famous jurists who have taken part in the work. Indian codes are regarded as the best yet produced. A novelty in them is that each principle laid down is accompanied by an illustrative set of facts. Both the Civil and Penal Codes were drafted and enacted in sections. The Indian Succession Act of 1865 is the first instalment of the Civil Code. It is based on the Eng. law, and does not apply to Hindus and Muhammadans, whose complex and peculiar laws are enforced by the court. In this part of the code there are two interesting deviations from Eng. law, both making for simplicity. One is the abolition of the distinction between real and personal property in the rules governing the succession to a dead person's estate—a reform long overdue in England. The other is the abolition of the rights acquired by marriage over the property of the wife or husband. In India the assignment of a debt need not be absolute and may be by word of mouth, though the notice of assignment made to the debtor must be in writing. Rights under a contract can be transferred, as by Hindu law and English equity. An important step is the compulsory registration of all dealings in land of the value of over 100 rupees. Other sections of the Civil Code deal with Trusts, Transfer of Property, Contracts, Easements, and Specific Relief (specific performance of contracts).

A special feature of the Penal Code is the retention of the punishment of transportation—which is regarded with a peculiar terror in India. Severe punishments are prescribed for acts offending religious susceptibilities.

Salt, coal, and small quantities of gold are worked in the N.W. mountains; the ruby mines of Burma have an output valued at £100,000 yearly; 80 % of the entire coal comes from Bengal; petroleum is obtained in Burma and Assam, salt in Rajputana and the Punjab, saltpetre and mica from Bengal. The gold obtained from Mysore is valued at £2,000,000 yearly. I. is in the main an agricultural country. Of the 545,000,000 acres which are Brit. territory, 135,000,000 are not available for cultivation, 106,400,000 are waste lands that might be cultivated, 57,100,000 lie fallow, 65,800,000 are under forest, and 180,200,000 under crop; 23,700,000 acres produce two or more crops yearly; 37,500,000 require irrigation, while 13,000,000 have regular supply from 12,000 miles of main canals and 31,000 miles of distributaries. The crops in order of extent of cultivation are rice, millet, and maize, food-grains and pulse, wheat, oil-seeds, cotton, chick-peas, barley, fodder, and similar crops, sugar, jute, and other fibres, indigo, tobacco, tea and coffee, poppies, and cinchona. Weaving of cashmere shawls, carpets, etc., wood-carving, and metal work is still important, through giving way before Brit. and native manufactures. There are nearly 200 cotton mills, 146 of which are in Bombay presidency. Madras produces 76 % of the finer goods. Jute is mainly spun round Calcutta. There are two woollen mills (at Cawnpore and Dhariwal in the Punjab), paper, timber, and other mills carried on after W. methods. The exports amounted to 217,000,000 rupees in 1911. There are 435 million miles of railway; the great rivers of the N. are useful for locomotion, and there is good canal system in S. The towns with over 200,000 inhabitants are the former capital, Calcutta (1,222,313 with the suburbs), Bombay, Madras, Hyderábád, Rangoon, Lucknow, Delhi (made the capital in 1911), Lahore, Ahmedábád, and Benares. The entire population of the Brit. provinces is (1911) 244,267,542, that of the Native States, 70,864,995.

Language.—The languages spoken in India are divisible into four families: I. INDO-ARYAN (*q.v.*); II. TIBETO-BURMAN (*q.v.*); III. KOLARIAN, spoken by aboriginal hill-tribes, *e.g.* Santals in Central Provinces; IV. DRAVIDIAN, spoken by *c.* 60 millions in whole S. India and northern half of Ceylon, of uncertain origin and having no relation to linguistic groups outside India. Four best-known Dravidian languages are Tamil (*q.v.*), Telegu, Malayālam, Kanarese. Tamil is parent of other three and has oldest lit. Telegu lit., modelled on Sanskrit, begins XI. cent. A.D. General characteristics: (1) literary language often widely different from spoken; (2) tendency to pronounce short vowel after every final consonant; (3) harmonic sequence, *i.e.* tendency to approach vowel-sounds in syllables consecutive to each other.

Elliot, *History of I. as told by its own Historians* (1867); Smith, *Early History of I.* (1908); Lane-Poole, *Mediæval I.* (1903, 'Story of the Nations'), *The Mogul Emperors* (1892), *The Mohammedan Dynasties* (1894); Festing, *When Kings rode to Delhi* (1912).

INDIA, FRENCH.—The Fr. possessions in India comprise Pondicherry, Chandernagore, Karikal, Mahé, and Yanaon; administered by the governor of Pondicherry.

INDIA-RUBBER, see RUBBER.

INDIAN CORN, see MAIZE.

INDIAN CRESS, NASTURTIUM (*q.v.*).

INDIAN FIG, BANYAN (*q.v.*).

INDIAN INK, see INK.

INDIAN MUTINY, rebellion of native army of Bengal, 1857. The immediate cause of outbreak is supposed to have been the introduction into the army of cartridges greased with cows' and pigs' fat, the handling of which was abhorrent both to Hindus and Muhammadans; but discontent with British rule had long been gaining ground. After several slight outbreaks early in the year the mutiny began in earnest with the revolt of the native regiments at Meerut in May 1857, when the Sepoys murdered the Eng. officers and massacred European residents; the mutineers then marched towards Delhi, which they captured and retained for four months.

In July occurred the terrible massacre of English at Cawnpore by the Nana, whom Havelock defeated on the following day; on Sep. 14 Delhi was at last stormed and taken by English; and Lucknow, which at first was defended by Sir Henry Lawrence, was partially relieved by Havelock in Sep. 1857, and in Nov. by Sir Colin Campbell (afterwards Lord Clyde), who finally captured it in July 1858.

Others who distinguished themselves during the mutiny were Lord Canning, Gov.-Gen., who conducted affairs in Calcutta; Sir John Lawrence, who enlisted support of Sikhs and contributed greatly to Brit. success by sending large contingent to Delhi; General Outram, who served under Havelock; General Nicholson, killed in storming of Delhi; and Sir Hugh Rose, who conducted campaign in Central India, and by his capture of Jhansi and other positions practically ended the war. On re-establishment of Brit. authority, a royal proclamation announced that the governing power of the East India Company was abolished, and that henceforth the sovereign of England would be supreme ruler of India.

Forrest, *Indian Mutiny* (1904).

INDIAN OCEAN (*c.* 4° N., 75° E.), bounded W. by Africa, N. by Asia, E. by Australia and Malay Archipelago; divided in N. by Ind. Peninsula into Bay of Bengal (E.) and Arabian Sea (W.); mean depth, *c.* 2300 fathoms; area, *c.* 17,320,300 sq. miles; receives many important rivers from Asiatic continent; chief islands are Madagascar, Mauritius, Réunion, and Comoro Islands.

INDIAN ORDERS, see under KNIGHTHOOD.

INDIAN TERRITORY, see OKLAHOMA.

INDIANA (40° N., 86° W.), N. central state of U.S.A., lying between Lake Michigan and the Ohio River—which constitutes S. boundary line—and bounded N. by Lake and State of Michigan, E. by

Ohio, S. and S.E. by Kentucky, and W. by Illinois. Area, *c.* 36,350 sq. miles, of which *c.* 440 sq. miles are water surface. The capital is Indianapolis. The surface is mostly undulating prairie, with a gentle S. slope, and having a range of sand-hills in the N.; S. of this, the country is flat and marshy with shallow lakes; and along the Ohio River, in S., a chain of hills (called 'Knobs') rises steeply.

The more important rivers are the Wabash, a tributary of the Ohio, and measuring over 500 miles, of which *c.* 350 are navigable; it is the boundary between I. and Illinois; tributaries are the Salamonie, Mississinewa, Wild Cat, Tippecanoe, and White River—the latter being the most important; other rivers are the Kankakee—tributary of the Illinois—and the St. Joseph and Elkhart into Lake Michigan, the Maumee into Lake Erie, and White Water into the Ohio. English Lake—part of the Kankakee—is the only large lake.

The climate is even; the soil—excepting sandy region, S. of Lake Michigan—is exceedingly fertile, especially the Wabash valley. The state coal-fields have an area of *c.* 6500 sq. miles; petroleum, natural gas, sandstone, limestone, and cement are worked. The land is largely agricultural—the chief crops being maize, wheat, oats, hay, and potatoes; tobacco is also grown, as well as fruits and vegetables of all varieties. Manufactures and industries are important, and include clay-working, flour and grist milling, slaughtering and meat packing, iron and steel foundries, as well as woollen works and manufacturing of agricultural implements. Indianapolis is an important centre for live stock. Natural facilities for transport are provided by the Ohio and Wabash Rivers and Lake Michigan; there are extensive railroads. Admitted to Union as State in 1816. Pop. (1910) 2,700,876.

J. F. Dunn, *Indiana*; J. H. Levering, *Historic Indiana* (1909).

INDIANAPOLIS (39° 46′ N., 86° 6′ W.), capital of Indiana, U.S.A., in Marion County, on White River. Well-laid-out and handsome city, built on flat plain, with wide imposing streets and avenues and spacious parks. Most important buildings are State Capitol, city hall, Propylæum, and county court house. Contains many educational institutions, including I. Coll. of Law and Indiana Medical Coll. Important railway centre; meat-packing chief industry; large trade in agricultural produce; manufactures include furniture and carriages. Pop. (1910) 233,650.

INDIANOLA (41° 23′ N., 93° 35′ W.), city, Iowa, U.S.A.; seat of Simpson Coll. (Methodist).

INDIANS, RED, called I. by Brit. as inhabitants of what the early discoverers of America believed to be the W. Indies, but known to most nations as Red-Skins (*e.g.* Fr. *Peaux-rouges*). They are confined to the Amer. continent, and now generally believed to be a Mongolian people separated from Asia by the comparatively recent subsidence of the 'Pacific continent.' In the convenient approximation to racial division of the classification Black, Brown (or Red), Yellow, and White, they constitute the Brown group (see RACES OF MANKIND). The Palæolithic remains show early habitation. The numerous tribes may be divided into these main stocks: 1. (N. America) Algonquin, Athabascan, Eskimo, Iroquoin, Muskhogean, Pawnee, Pueblo, Salish, Shoshone, Siouan; 2. (Central America) Cuna, Leucan, Maya-Quiché, Mixtec, Nahuan, Opata-Pima; 3. (S. America) Antisuyu, Araucan, Arawak, Aymara, Bororo, Botocudo, Carib, Chibcha, Chiquito, Choco, Chuncho, Fuegian, Jivaro, Mataco, Pano, Payagua, Puelche, Quichua, Tehuelche, Ticuna, Toba, Tupi-Guarani, Warrau, Zaparo. The largest remaining tribes are the Sioux, Cherokees, Choctaws, and Creeks. Over sixty different languages, all polysynthetic, have been recorded in N. America; the processes by which these have been differentiated, and, indeed, the existence in some cases of any relationship to each other, are interesting philological problems.

I. territories steadily decrease, but the race, which seemed in the stages of extermination fifty years ago, is now slowly increasing, at all events in the U.S.A. There are about 6 million I. in N. America, about 4½ million in S. America, in both cases including half-breeds, of which there are about 1½ million in S. America, where, however, the estimation of the Indian population is only a rough one, owing to the amount of almost unexplored forest region. The half-breeds of N. America belong chiefly to the 'Five Civilised Tribes,' of whom *c.* 60,000 (*i.e.* two-thirds) are pure I. Excluding Alaska, there are about 300,000 pure I. in the U.S.A., where there are now only 77,446 sq. miles of Indian reservations (tracts of land set apart for their habitation), the chief being in Arizona, S. Dakota, Montana, and Oklahoma. Alaska has *c.* 30,000 I. The very few I. who have abandoned their tribes in the U.S.A. pay taxes but have no political rights. The I. of Arizona and New Mexico, who are U.S. citizens by treaty, exercise no political rights, but have so far shown no political interest. The total I. of Canada are *c.* 111,000. The various estimations of the numbers of I. vary, but seldom fall below the figures given above. The various stocks are characterised by copper-coloured skin, lank black hair, high cheek bones, long, deep-set eyes, and powerful, often aquiline, noses. They vary in stature and development, the finest specimens being found among the Patagonians of S. America and the Iroquois, Pawnees, and Sioux of the U.S. and Canada.

Before they were ousted by Europeans they were skilled hunters, trained observers, of extraordinarily acute senses, capable of enduring without a murmur great hardships and torture which they freely employed on others, and they have never shown any liking for European comforts or any sympathy with European ideals. Both Fr. and Spaniards showed adaptability to I. ways (this being one of the reasons for their respective successes in colonising S. America and Canada), but the I. have always receded before the Eng. Most of them were still in the Stone Age when Columbus landed. Iron seems never to have been known to the makers of the old civilisations of Peru and Mexico (*q.v.*). An interesting attempt at rudimentary political unity was made in the XVI. cent. by Hiawatha, chief of the Onondagas; he established a federation for offence and defence of the Onondagas, Cayugas, Mohawks, Oneidas, and Senecas. The I., however, are the least political of races, and some of the tribes come near to forming an exception from the universal rule that primitive man is never found without some form of government. The I. are of the utmost importance for the study of primitive institutions and religions, and this importance has been recognised in late years by a growing number of students. The matriarchate was common if not universal, and at the close of the XVIII. cent. European commissioners still found that the tribe was to be treated with through its head women; polygamy is rare, monogamy the rule; the chieftainship was very rarely hereditary, the strongest man of the tribe being chosen by varying systems of election. The 'medicine-men,' *i.e.* magicians, have great power. Their tales of the Creation are interesting as giving prominence to the Deluge.

The accounts of the Pawnees and Arikaras agree as to the creation of a race of powerful and disrespectful giants whom the Creator Atiuch (Atius) destroyed in a flood. The Pawnees have the legend of a second creation, which succeeded, but the Arikaras told of a second destroyal and third creation, and a long story of early wanderings and final settlement by the Missouri River. Their well-known belief in a future Happy Hunting-Ground seems widely spread, but is not universal. Grinnell tells of tribes who believe that 'the ghost country is a land of unrealities, where the unhappy shadows endure an existence which is an unsubstantial mockery of this life. Here they hunt shadow buffaloes with arrows, which, on being lifted from the ground, are found to be only blades of grass;

their camps or their buffalo traps when approached vanish from sight; or their canoes, though real to the ghosts, are to mortal eyes rotten, moss-covered, and full of holes; their salmon and trout are only dead branches and leaves, floating on the river's current, and even the people themselves, though to all appearance human, turn to skeletons if a word is spoken above a whisper.' The ghosts of the dead take animal forms or appear as skeletons or unsubstantial bodies, and may inflict harm on the living. Many tribes believe in reincarnation as human beings. In their creed is a strong element of animism, but over all deities and spirits is 'Atiuoh' or the 'Father' or 'Manito,' to whom alone direct prayer is offered. He is sometimes conceived as the sun. Corn is worshipped, credited with miraculous powers, and named the 'Mother.'

Reverence for certain animals, the white eagle, beaver, buffalo, etc., is seen in the curious picturesque names of chieftains and braves—White Bear, Many Horses, Buffalo Ribs—and in names of women, such as White Antelope. Dreams are supposed to be communications from animals. A young man is bidden to blow (in the ritual which precedes enjoyment of the pipe) 'four smokes to the east, to the night; for in the night something may come to you which will tell you a thing which will happen' (Grinnell, *Story of the I.*, 1896). The Pawnees preserve sacred bundles of legendary antiquity which contain a grain of corn, scalps (a favourite object with the I. collector), pipes, etc. Like the Greeks the I. have a stock of poetical legends about the heavenly bodies. They make sacrifices of animals, etc., and fast as a religious act; they also fast when they wish to receive visions. The Navajo have numerous incantations, magical dances, and religious ceremonies; the custom of initiation by which a boy becomes a brave of the tribe is an ordeal calculated to break him for ever of the relics of childhood, and was perhaps originally devised for this reason; he is then taught the tribal secrets and has a voice in tribal concerns.

One of the few I. revolts, the Sioux rising of 1890, was of a crusade against the whites through the medium of the famous 'Ghost Dance.' The first white men to come in contact with the brown were the Danes, who settled in Greenland in the X. cent., and were gradually exterminated by the Eskimos. The Spaniards took with them an army of priests, who had considerable success. In the XVII. and XVIII. cent's the Brit. and Fr. were continual rivals for the favour of the I's, and the dispatches of Eng. colonial governors to the home government often express admiration of Fr. methods of dealing with the natives. These dispatches generally have large sections set aside for the consideration of I. affairs and describe the governor's occasional journey into I. territory to an appointed meeting-place, his interview with the chief, and the terms by which he occasionally obtains a large cession of I. lands. This important material is not yet published, but is to be found in the colonial papers at the Public Record Office. There were 'friendly' or Brit. Indians and Fr. Indians. The early colonists lived in constant dread of the 'I. peril,' and the State of New York was particularly exposed until Fr. alliance with the Algonquins led to the Iroquois becoming firm friends of the British. These two peoples played an important part in the history of N. America. The Algonquin tribes were the principal power from Labrador on the north to the Carolinas and nearly as far west as the Rocky Mountains. Their lands surrounded those of the Iroquois. Among their tribes are the Blackfoots, Cheyennes, Crows, Delawares, Illinois, Massachusetts, Ojibwas, and Sacs or Foxes. The 'Princess' Pocahontas, dau. of the chief, Powhatan (*c.* 1550–1618), m. a Virginian, John Rolfe, and was ancestress of prominent Virginians.

The Iroquois inhabited the district round St. Lawrence River and the Great Lakes, part of New York state, and lands in Virginia, the Carolinas, and Georgia. Their tribes included the federation formed by Hiawatha, important in Brit. colonial history as the Five Nations which became Six Nations by the accession of the Tuscaroras. The Cherokees of this stock were the chief tribe with which the Carolinas and Virginia had to deal in the XVIII. cent. They were transferred bodily to the other side of the Mississippi in 1838. The Iroquois, however, by their bitter enmity to the French in Canada, did much towards the establishment of Brit. N. America. The Athabascan tribes were of great importance in the W. North America; the Apaches and Navajos are said to be able to run down the deer while hunting, and the grim, mysterious, and skilled Apache has given his name to the Parisian thug, while Navajo blankets are widely known. The Siouan tribes formerly spread over the N. and centre of the present U.S.A. To this stock belonged the now extinct tribe of Catawbas, prominent in the history of S. Carolina, and it includes the Assiniboines and famous Dakotas, or confederate Sioux, who were allies of the British in the XVIII. cent.

The Sioux, roused by a religious prophet, gave much trouble in the late XIX. cent. Gen. Custer was slain by a force under Sitting Bull while invading Sioux territory in 1876, but they were put down by Sheridan, and in 1889 sold 11,000,000 acres, parcel of the Dakota reservation to the U.S. A rising in Badlands, S. Dakota, followed immediately after (1890), other tribes joined, and the I's laid waste surrounding territory. Col. Cody ('Buffalo Bill') was sent against them, and before the close of the year Gen. Miles' forces captured and slew Sitting Bull, his s. Crow Foot, etc. A small, heroic band under Big Foot sought to revenge Sitting Bull's death, but were exterminated at *Wounded Knee Creek* (1890); further forces surrendered to Brook and Miles (1891). Risings of the Chippewa (1892) and Navajo (1893) followed. Unrest seems to have ceased with the union of I. Territory and Oklahoma in the state of Oklahoma (1906).

Grinnell, *Pawnee Hero Stories* (1893), *Blackfoot Lodge Tales* (1893), *Story of the I.* (1896); Washington Matthews, *Navaho Legends* (1897); Brinton, *Religions of Primitive Peoples* (1900).

INDICATOR, in engineering, a mechanical device for registering pressure in steam boilers, cylinders; number of revolutions, speed, etc. I's generally work by some contrivance using resistance against a spring as motive and show their readings by means of movable pointer on a graduated face. In other cases the pointer may be operated by a pair of governors depending on centrifugal force, as in speedometers.

Indicator, in chemistry, term used to apply to certain reagents or chemicals which are used to indicate the presence of very small quantities of other substances in certain chemicals or minerals.

INDICATORIDÆ, HONEY-GUIDES (*q.v.*).

INDICTIONAL PERIOD, see CHRONOLOGY.

INDICTMENT, the charges preferred in writing for offences in law punishable upon summary conviction, or after trial by jury, constitute an i., and the counts of an i. are its several parts, charging distinct offences. Indictable offences must be tried before a jury and the accusation must be set down in writing.

INDIES, see EAST INDIA, WEST INDIES.

INDIES, LAWS OF THE, name applied either to Span. colonial law code in general, or to the special codes of certain colonies.

INDIGESTION, see DYSPEPSIA.

INDIGO is a dye-stuff which exists in the leaf of plants of genus *Indigofera*, natural order *Leguminosæ*, as a glucoside *indican*, $C_{14}H_{17}O_6N_3H_2O$. An enzyme in the leaf acting on a water extract of the colourless glucoside in presence of atmospheric oxygen gives indigotine, the colouring matter of indigo. About ½ % indigo is obtained from leaves and after evaporation sold as 3-in. cubes. A 20 % paste made by melting the carboxylic acid of phenylglycocoll with

caustic alkalies has supplanted the natural Indian product.

INDIUM is a white malleable metal. When ignited the hydrate yields oxide, In_2O_3, brown when hot, yellow when cold. Three chlorides exist—InCl, $InCl_2$, and $InCl_3$.

INDIVIDUALISM, view that governmental interference with conduct of individual citizens should be jealously restrained; opposed to collectivism and socialism (*q.v.*). See POLITICAL PHILOSOPHY.

INDO-ARYAN LANGUAGES, important group of seven languages—Hindi, Marâthi, Bengâli, Panjâbi, Gujrâti, Sindhi, Uriya—belonging to Indo-European family. All descended from Sanskrit (*q.v.*), to which they bear same relation as European Romance languages to Latin, and from which principal portion of vocabulary and whole inflectional system are derived. Usual theory is that they arose from Prâkrits, or local dialectical forms of Aryan speech (Sanskritic and non-Sanskritic), which received great stimulus from adoption as medium of Buddhist teaching.

Three classes of materials entered into formation of Indo-Aryan languages: (1) TATSAMA, words unaltered from pure classical Sanskrit; (2) TADBHAVA, words Sanskrit and Prâkrit, much changed in process of derivation; (3) DÊSAJA, words obtained by contact with aboriginal and other races conquered by Indian Aryans.

In first few cent's A.D., change took place from synthetic to analytical. Alphabets employed are all varieties of Devanâgari (Sanskrit). Most important of seven languages is Hindi, which, written in pure Devanâgari, spoken by *c.* 100 millions, understood throughout N. India, bids fair to become national language. There are two varieties of Hindi, western and eastern, Hindustani (*q.v.*) being dialect of former.

Distribution: HINDI, United Prov., Central Prov., C. India, Panjab, etc.; BENGÂLI, 50 millions, Bengal; PANJÂBI, 17 millions, Panjab; MARÂTHI, 19 millions, Bombay, Haidarabad, C. Prov.; GUJRÂTI, 10 millions, Bombay, Baroda; URIYA, 10 millions, Orissa; SINDHI, 3 millions, Sind.

INDO-CHINA, FRENCH (8° 30′ to 23° 20′ N., 100° 10′ to 109° 30′ E.), Fr. territory, S. Asia, consisting of dependencies of Tonkin, Annam, Laos territory, Cambodia, Cochin-China. The French have had continous relations with country since 1787, when they first acquired dominions here; Fr. force, sent to avenge persecution of Fr. subjects and murder of Bp. Diaz, seized Tourane, 1858, routed Annamese army, 1861; cession of Lower Cochin-China to France followed in 1862, while Cambodia became Fr. protectorate in 1863; in 1867 remainder of Cochin-China was incorporated in Fr. possessions, and in 1873 war between France and Tonkin occurred, with result that Annam and Tonkin were included in Fr. protectorate by treaties of 1883, 1884, and 1885.

Region is bounded N. by China, E. by Gulf of Tonkin and China Sea, S.W. by Gulf of Siam, W. by Siam, Burma; area estimated at 85,000 sq. miles. Surface of Tonkin consists of Red River delta in S.E., plateaux in N., forests in W.; Annam is mountainous except along coast; Laos territory flat along Mekong River, mountainous elsewhere; Cambodia has mountain ranges in N. and W., forests in N.E., and elsewhere great alluvial plains; Cochin-China is low and flat except in N. and E. Whole region is administered by gov.-gen., while the protectorates and colonies are respectively under local control of resident-superiors and lieut.-governors. Native religion is Buddhism. Army numbers 25,476 in all. Produces rice, cotton, sugar-cane, tobacco, gutta-percha, spices, pepper, maize, coffee, vanilla. There are teak and other valuable trees in Laos, and minerals include coal, gold, silver, tin, salt. Exports rice, fish, pepper, tin, coal, cotton, hides. Imports textiles, wheat, iron goods, etc. Railway mileage, *c.* 2000. Pop. (1911) 16,990,229.

INDO-EUROPEAN LANGUAGES are a group of languages with certain characteristics in common, and otherwise called Aryan, or Indo-Germanic. The following are the Indo-European languages: A., the so-called *Centum* group—(1) Greek, (2) Italic, (3) Celtic, (4) Germanic or Teutonic (including Swedish, Danish, Norwegian, Icelandic, English Frisian, Dutch, Flemish, German); B., the so-called *Satem* group—(1) Aryan (including Sanskrit, Zend, and Old Persian), (2) Armenian, (3) Balto-Slavonic group (including Old Bulgarian, Russian, Servian, Polish), (4) Albanian.

The resemblances between these languages of Europe and Asia force on our attention the problem of their hist. connection, their relation to the original language, and the original land of the parent race. Round these problems there have been long and divers controversies. Some claim the East as the original home of the languages; others claim the West; the claims for the East being older. The obviously great antiquity of the language of the Hindus was the basis on which the theories of an Eastern origin were built. Linguistic evidence seemed to point to Central Asia as the original home of the parent race. But claims began to be put forward for Europe, and various tracts were suggested as the original home, *e.g.* South Russia, West Germany, the region of the Baltic, and Scandinavia.

The inhabitants of Europe may be divided into two distinct classes—the dolichocephalic and the brachycephalic, and the pivot of the problem is ultimately which of these two classes is the Aryan. Modern opinion seems to favour the dolichocephalic race; or, to be more exact, European civilisation and culture are regarded as derived from the Aryan race, the tall, fair, dolichocephalic peoples most purely represented to-day by the English, Germans, and Scandinavians. This theory is technically called Aryanism.

INDONESIAN, Indo-inhabitants to be found in Malaysia, etc.

INDORE (22° 42′ N., 75° 54′ E.), native state, Central India; consists of various isolated tracts; capital, Indore; commercial centre. Pop. *c.* 850,000.

INDORSEMENT, ENDORSEMENT, writing on back (Lat. *dorsum*) of document as description, or, in case of money, as quit claim, the possessor becoming owner.

INDO-SCYTHIANS, Asiatic races of N. India.

INDRA, Hindu deity represented as covered with eyes and riding on an elephant.

INDRE (46° 50′ N., 1° 30′ E.), department, Central France, formed principally from ancient province Berry; surface flat; watered by the Indre; produces cereals, fruit, wine; capital, Châteauroux. Pop. (1911) 287,673.

INDRE-ET-LOIRE (47° 16′ N., 0° 45′ E.), department, Central France, formed principally from ancient province Touraine; produces grain, fruits, wine; capital, Tours. Pop. (1911) 341,205.

INDUCTION, in logic, the process of reasoning from particular instances to a general law; the opposite of DEDUCTION (*q.v.*).

INDUCTION, ELECTRICAL.—If two circles of wire, equal in diameter, be placed parallel to each other and a short distance apart, the starting or stopping of an electric current in one circle produces a momentarily induced current in the other. When the current in the first (or *primary*) is started, the induced current in the other (or *secondary*) is opposite in direction to the primary current. When the primary current stops, the secondary current is in the same direction as the primary. The electromotive force of these induced currents is high, and is greater in proportion to the suddenness with which the primary current is 'made' or 'broken.' These effects are intensified in the **Induction Coil** by (1) arranging the primary circuit in the form of a number of turns of wire placed cylindrically, thick wire being used for this purpose; (2) laying over these a large number of turns of the secondary circuit, for which thin wire is used; (3) increasing the inductive effect by placing a core of iron wires along the axis of the cylinder; (4) providing an automatic and sudden 'make' and 'break' arrange-

ment, which can act many times per second; and (5) connecting the primary circuit to a condenser which acts so as to suppress the secondary current induced at 'make' of the primary, and to intensify the current induced at 'break.'

The terminals of the secondary circuit are led to insulated brass rods whose ends can be adjusted to varying distances from each other, and when the coil begins to work by turning on the primary current, a rapid succession of sparks passes between these terminals. The sparks may be of any length up to about 2 feet, and are increased in violence when the terminals are connected to the inner and outer coats of a Leyden jar. The induction coil is used in researches on the conduction of electricity in gases, for the production of cathode rays and Röntgen rays, in electrotherapeutics, for the transmission of signals in wireless telegraphy, and for other purposes, such as firing mines, where the passage of an electric spark is required.

INDULGENCE, in R.C. theology 'the remission of the temporal punishment which often remains due to sin after its guilt has been forgiven.' Pope Urban II. granted a plenary i. for the first crusade, 1095; and since then i's, plenary or partial, have been frequent. The abuse of i's was one of the signs of decay of the mediæval Church. According to the official R.C. view the Saints have done more than was necessary in expiation of their own sins, and the benefit of this can be transferred to others.

INDULINES are amidated azonium salts which dye blue, bluish-red, and black. Rosindulines and Napthindulines are basic. The salts give red fluorescent solutions.

INDULT (from Lat. *indulgere*, to permit), papal licence for non-performance of religious duty.

INDUNA, Kaffir magnate.

INDUS (24° N., 67° 30′ E.), river, India; rises in S.W. Tibet near sources of Sutlej; general course N.W. through Ladak, Kashmir, etc.; turns S.W. in N.W. Frontier Province, flows through Punjab and Sind, and enters Arabian Sea by numerous mouths; chief tributaries, Zanskar, Shayok, Kabul, and Punjnud (five united rivers); delta begins at Hyderabad (chief town); total length, 1800 miles; navigation begins near Attock; drainage basin, 375,000 sq. miles; fish and crocodiles abound; subject to great floods.

INDUSTRIA (*c.* 45° 10′ N., 8° E.), ancient town, Liguria, Italy.

INDUSTRIAL SCHOOL, voluntary school for giving manual and commercial training to the poor; regulated by Children Act, 1908.

INDY, VINCENT D' (1851–), Fr. musical composer, dramatic and orchestral; strongly original.

INE, king of West Saxons from 688 to 726; issued important code of laws.

INEBOLI (41° 57′ N., 33° 47′ E.), seaport, Asia Minor, on Black Sea; wool and mohair. Pop. 9000.

INEZ DE CASTRO, see CASTRO, INEZ DE.

INFALLIBILITY, a theological term used of Pope, Church, or Bible, though for the last *Inspiration* (q.v.) is more commonly found. The doctrine of Papal I. is of gradual growth; defined by the Vatican Council of 1870. By this the Pope is infallible when he speaks on faith or morals *ex cathedra*, that is formally and finally as teacher of all Christians. Those who strongly defended this view were called *Ultramontane*: the rejection of it by a small minority led to the formation of the *Old Catholics*. The I. of the Church is held by some High Churchmen.

INFAMY, technical term among Romans for publicity given to disgraceful conduct; in England legal state of a person once convicted of crime.

INFANT (law term), see AGE.

INFANT SCHOOLS, see EDUCATION.

INFANTE, title of younger sons of kings of Spain and Portugal, eldest s. being called prince.

INFANTICIDE, a common crime in ancient Greece and Rome, and until comparatively recent times (in the matter of female infants) in China and India. It is a capital offence in the United Kingdom, and when the exposure or abandonment of a newborn child has resulted in death, and a verdict of wilful murder has been returned, the capital sentence is pronounced. But public opinion has long refused to sanction the hanging of a mother who in despair and distraction of mind has abandoned her illegitimate child, and the death sentence is always revised and imprisonment substituted.

INFANTRY.—As long as there has been fighting in the world there has been i. of a sort, but it was only by degrees that it came to be developed as an *arm*, one worthy to be put by the side of cavalry; for all who could tended to get horses, and the foot were sometimes the inferior or unfortunate men left over. The phalanx, which fought in a wedge-shaped formation, was first practically utilised by Epaminondas of Thebes, and developed and improved by Philip of Macedon and Alexander the Great. The Romans had well-drilled and disciplined i., for discipline is absolutely essential in an i. army. The Rom. legion, as reorganised by Gaius Marius, consisted of 4000–6000 infantry, armed with javelin (*pilum*) and short sword. It fought in line and was flanked by cavalry and lightly armed troops, *e.g.* slingers and archers. It was the main centre of Rom. strength in Republican times, but under the Empire hardly more than a unit in a large and miscellaneous host. With the fall of the Western Empire i. ceased to be of importance, for the legions were cut down ruthlessly by the Barbarians, notably before Adrianople, 378 A.D. During the Middle Ages, the age of feudalism, i. was quite subordinate, and only became of first importance in battles now and again. In the XIV. cent., however, it revived.

The growth of towns produced a militia, and the increase of archery led to important results. The battle of Crécy, 1346, showed what could be done by the sturdy Eng. yeomen. This was partly the result of the Eng. social system, for the close relation between yeomen and knight would have been impossible in the more thoroughly feudalised France. Thus, by the close of the Hundred Years War, i. was not merely something inferior to cavalry, but existed alongside of, and worked with, it. In Germany the burghers firmly defended themselves against feudal interference, and the townsmen were more often than not successful in repelling the knights who tried to attack them. At the end of the XV. cent. feudal hosts were being superseded by hired armies, and the mercenary troops who fought in the first part of the XVI. cent. in the Ital. wars have been called the 'nursery of modern i.' They were mainly Swiss, Spanish, and French. By the middle of the XVI. cent., however, i. had taken their place as a regular 'arm.' The keenest conflict took place in the Netherlands between the trained Span. troops and the equally efficient Dutch militia. The XVI. cent. was the time of the professional soldier, for only a well-trained man was able to use the musket of the day. The pistol was used by cavalry who still wore armour. I. showed they were equal to any troops in discipline and organisation.

A fresh period of military history begins with the Thirty Years War, in which both sides harked back to ancient models; the Swedes imitated the Rom. legionaries, while the Austrians imitated the Gk. phalanx. Meanwhile firearms were improved by being made lighter. At this time the discipline and *morale* of an army was seen to be of fundamental importance. The Swedes were more amenable to a rigid disciplinary system than either the English or the French, and only when they were trained was it seen what could be done with soldiers lacking in initiative, but thoroughly drilled. In the Civil War in England i. played comparatively little part. In the XVIII. cent. the 'linear' formation was evolved. The soldiers were formed in two long lines. Battalions were drawn up in long lines so as to have as great a range of fire as possible. At the time of the Seven

Years War the Prussians were the best-drilled troops. At the battle of Leuthen, 1757, the Prussians conquered a much larger force than their own by greater skill in manœuvring; an attack was made on the enemy's flank, which was nearly annihilated. The Prussian army now had the *prestige* enjoyed by the Swedish in the preceding cent. The latter part of the XVIII. cent. was occupied with many disputes as to modes of attack, and the question of skirmishing was discussed.

Another era was opened by the Revolutionary and Napoleonic wars. *Close order columns* and *loose order skirmishers* were often used in combination.

The most fundamental part of the i. then was the attacking column. Only a small part was generally drawn up in line formation, and there were only a few skirmishers. That Napoleon had different methods from Frederick the Great was largely due to his having a much greater number of troops at his disposal, but insufficiently trained, and in this respect his army was like modern continental armies. The Brit. army, however, maintained the earlier method of attack, but the column formation of Napoleon was followed after his day by most continental armies. In the middle of the XIX. cent. the best i. in Europe was the Prussian; the Prussian military superiority was shown beyond question in the Austro-Prussian War of 1866 and still more in the Franco-Prussian of 1870–71; the Prussians had not only better guns and fired better at close range, but were better trained and disciplined.

Skirmishers are most important in modern battles, but scouts now do what was formerly done by them. Of the greatest importance in the last generation has been the improvement in rifles and the great increase in firing range. The importance of drill is now recognised and a reaction is setting in against the reliance on individual initiative, which was customary in the South African War. It is recognised that soldiers must be so trained as to act instinctively when their ordinary reasoning faculties are overpowered by the strain of battle.

MOUNTED INFANTRY is a force which fights as i., but employs horses or bicycles for other military services. When possible, m. i. do entire duty of reconnoitring in modern campaigns, to save fatigue of ordinary foot-soldier. In Brit. army special training as m. i. follows ordinary i. training for selected members of i. corps. See TACTICS.

Oman, *Art of War*; *Middle Ages*; Fortescue, *History of the British Army*; *Field Service Regulations*, and various official publications.

INFECTION, see BACTERIOLOGY, PARASITIC DISEASES.

INFERNAL MACHINE, BOMB (*q.v.*).

INFINITE, that which is without end. It is impossible to conceive a point in past time without something before, or in future time without something after; so also in space; hence idea of infinity. But infinity cannot be imagined. Some assert space and time are finite.

INFINITESIMAL CALCULUS, DIFFERENTIATION.—(I.) If u is a given function of an independent variable x, and the value of x changes by an amount δx, the value of u will change by some corresponding amount δu. If δx and δu are finite quantities, the ratio $\frac{\delta u}{\delta x}$ has in general a finite value. Assuming this ratio has a definite limiting value when δx becomes indefinitely small, we denote this value by $\frac{du}{dx}$, which is called the *first differential coefficient of u with respect to x*. In the differential calculus the values of such limiting ratios are investigated for different forms of functions. If $u=f(x)$, then $\delta u=f(x+\delta x)-f(x)$, and $\frac{\delta u}{\delta x}=\frac{f(x+\delta x)-f(x)}{\delta x}$

Hence
$$\frac{du}{dx}=\mathrm{L}_{\delta x\to 0}\frac{f(x+\delta x)-f(x)}{\delta x} \quad . \quad (1)$$

Giving different forms to the function $f(x)$, we can deduce $\frac{du}{dx}$ from (1).

(II.) If $f(x)$ and x define a point P on the graph of $f(x)$, then $f(x+\delta x)$, $x+\delta x$ define a neighbouring point Q on the graph, and $\delta u/\delta x$ gives the slope of the line PQ with respect to the axis of x. Proceeding to the limit, when Q approaches indefinitely near to P, we see that du/dx gives the tangent of the angle of slope (θ) of the tangent to the curve at the point $f(x)$, x, i.e. $du/dx=\tan\theta$. So the differential coefficient measures the rate of increase of $f(x)$ with regard to x, e.g. if u is the distance of a given point from a given origin at time x after starting, du/dx gives the velocity at any time.

(III.) If $y=u\times v$, where u and v are given functions of x, then
$$\frac{dy}{dx}=u.\frac{dv}{dx}+v\frac{du}{dx} \quad . \quad . \quad . \quad . \quad (2)$$

If $y=u/v$,
$$\frac{dy}{dx}=\frac{v\frac{du}{dx}-u\frac{dv}{dx}}{v^2} \quad . \quad . \quad . \quad . \quad (3)$$

If $y=f(z)$, where $z=\phi(x)$, then
$$\frac{dy}{dx}=\frac{dy}{dz}.\frac{dz}{dx} \quad . \quad . \quad . \quad (4)$$

Formulæ (2) and (4) may be extended to any number of variables.

(IV.) Taking $u=x^2$, formula (1) gives
$$\frac{du}{dx}=\mathrm{L}_{\delta x\to 0}\frac{x^2+2x.\delta x+(\delta x)^2-x^2}{\delta x}=\mathrm{L}_{\delta x\to 0}(2x+\delta x)=2x$$

Similarly, if $u=x^n$ we may show that $\frac{du}{dx}=nx^{n-1}$.

Other functions, as $\sin x$, $\log x$, l^x, etc., may be differentiated using formula (1), and from these other more complicated expressions may be dealt with by means of formulæ (2), (3), and (4).

(V.) If $f'(x)$ denote $\frac{d}{dx}f(x)$, and we obtain $\frac{d}{dx}f'(x)$, we get the second differential coefficient of $f(x)$, written $f''(x)$. In the same way we get the successive derived functions $f'''(x)$, $f^{\mathrm{iv}}(x)$ . . . $f^n(x)$.

Taylor's Theorem.—Assuming the function $f(x+y)$ can be expanded in powers of y, and that it is continuous, Taylor (1715) showed that, when $f(x)$, $f'(x)$, etc. are finite and continuous,
$$f(x+y)=f(x)+\frac{y}{1}.f'(x)+\frac{y^2}{1.2}f''(x)+\ldots+\frac{y^n}{n!}f^n(x)+\ldots(5)$$
This expansion is known as Taylor's Theorem.

Rigorous treatment shows the series to be convergent. The Binomial Theorem, Exponential and Logarithmic Series, may be deduced from this as particular cases. Putting $x=0$ in (5) we get
$$f(y)=f(0)+\frac{y}{1}.f'(0)+\frac{y^2}{1.2}f''(0)+\ldots+\frac{y^n}{n!}f^n(0)+\ldots(6)$$
where $f(0)$, $f'(0)$, etc. are the values of $f(x)$, $f'(x)$, etc. when $x=0$. This expansion is **Maclaurin's Theorem.**

(VI.) Problems concerning maxima and minima values of a function $f(x)$ are dealt with by solving the equation $f'(x)=0$, which gives abscissæ of points where max. or min. values occur; for since $f'(x)=\tan\theta$, and $\theta=0$ where there is a max. or min., $f'(x)$ must be zero at such points. But $f'(x)=0$ gives other singularities, and so further tests are required for discrimination.

INTEGRATION.—(I.) Integration may be regarded as the inverse of differentiation, for the fundamental problem is to find the sum of a certain infinite series of indefinitely small terms, and for this we must be able to find the function of which a given function is the differential coefficient. If $\psi(x)$ is any function of x, and $\phi(x)$ its differential coefficient, supposed finite and continuous for all values of x between a and b, and if $nh=b-a$, n being a positive integer, then the limit when n is indefinitely increased of
$$h\{\phi(a)+\phi(a+h)+\phi(a+2h)+\ldots+\phi(b-h)\}$$
is $\psi(b)-\psi(a)$. The limit of the above expression is denoted by $\int_a^b\phi(x)dx=\psi(b)-\psi(a)$.

$\int_a^b \phi(x)dx$ is called a *definite integral*. When we are not concerned with the limits of integration, and write $\int\phi(x)dx=\psi(x)$, we are merely making the same statement as $\frac{d\psi(x)}{dx}=\phi(x)$ in a different way. $\int\phi(x)dx$ is called an *indefinite integral*.

(II.) Many integrals may be written down by inspection, the given function being recognised as the differential of some known function. Thus we have—

$$\int x^n dx=\frac{x^{n+1}}{n+1};\ \int\cos\ x\ dx=\sin\ x;\ \int\frac{1}{x^2+a^2}\,dx=\frac{1}{a}\tan^{-1}\frac{x}{a};\ \text{etc.}$$

Other integrals may be transformed to known types by some simple substitution; *e.g.* $\int\frac{dx}{\sqrt{2ax-x^2}}$ is made to depend on the standard form $\int\frac{dz}{\sqrt{a^2-z^2}}$ by the substitution $x=a-z$. Knowledge of the proper substitution must be gained by experience.

Integration by Parts.—From the formula $\frac{d}{dx}(uv)=u\frac{dv}{dx}+v\frac{du}{dx}$ we have by integration and rearrangement

$$\int\left(u\frac{dv}{dx}\right)dx=u.v-\int\left(v\frac{du}{dx}\right)dx.$$

Use of this formula is known as *integration by parts*; e.g. $\int\theta\sin\ \theta\ d\theta$ may be written $-\int\theta\frac{d\cos\ \theta}{d\theta}.d\theta$; and we get

$$\int\theta\sin\ \theta\,d\theta=-\theta\cos\ \theta+\int\cos\ \theta\,d\theta=-\theta\cos\theta+\sin\theta.$$

Rational Fractions are of constant occurrence; they are dealt with by decomposition into partial fractions. Special forms require special methods which can only be learned by practice.

(III.) **Applications.**—(*a*) If (x,y) is a point P on the curve $y=f(x)$, and s is the length of the arc AP measured from a fixed point A, we have $\frac{ds}{dx}=\sqrt{1+\left(\frac{dy}{dx}\right)^2}$. Hence $s=\int\sqrt{1+\left(\frac{dy}{dx}\right)}\,dx$, and from this we can find s.

(*b*) If P and Q are two points (x_1y_1), (x_2y_2) on the curve $y=f(x)$, M and N the feet of the perpendiculars from P and Q on the axis of x, then it can easily be shown that, A being the area of the figure PQNM,

$$\mathrm{A}=\int_{x_1}^{x_2}f(x)dx=\psi(x_2)-\psi(x_1)$$

where $\psi(x)$ is the integral of $f(x)$. Thus plane areas may be found. If the polar equation of the curve is given, the corresponding formula is $\mathrm{A}=\frac{1}{2}\int_{\theta_1}^{\theta_2}\{f(\theta)\}^2d\theta$.

(*c*) To find volumes of solids we use the formula $\mathrm{V}=\iint z\,dx\,dy$, using appropriate limits. $\iint z\,dx\ dy$ is a *double integral* and denotes $\int[\int z\,dy]dx$.

(*d*) *Centres of gravity* in mechanics, and *centres of pressure* in hydrostatics may in many cases be found quickly by simple integration. *Moments of inertia* also may be very simply obtained; *e.g.* the M.I. of a disc of radius a and surface density $=\int_0^a 2\pi\rho r^3.\,dr=\frac{\pi\rho a^4}{2}$, the axis being perpendicular to the disc and through its centre. For higher work, elliptic integrals, Gamma, and other functions, etc., special treatises should be consulted.

INFIRMARY, see HOSPITAL.

INFLUENCE, power exercised by the stars. See ASTROLOGY.

INFLUENZA, acute infectious disease caused by a specific bacillus, *Bacillus influenzæ*, characterised by fever and by symptoms affecting the respiratory, digestive, or nervous systems. It occurs in epidemics, appearing most frequently in the winter months, and has spread, at one time or another, to practically all parts of the world, adults between the ages of twenty and forty being attacked most often, children and aged persons less frequently. Infection is from the secretions of the mucous membrane of the nasal passages and the trachea and bronchial tubes. The incubation period of the disease is from two to six days. The onset is sudden, with pains in the back and loins, and headache, often accompanied by giddiness and nausea or vomiting. The temperature rises quickly to about 100° to 104°, and a feeling of weakness and discomfort is marked. After a few days the disease may assume one of four varieties, *respiratory*, with bronchitis or broncho-pneumonia developing; *gastro-intestinal*, with pain in the abdomen, vomiting and diarrhœa; *nervous*, with great depression, insomnia, severe headache and other pain, irregular heart and perhaps delirium; *febrile*, with pronounced prostration and high temperature, especially in children. The death-rate in proporton to the number of cases is not high, in the London hospitals in the well-known epidemic of 1890 it was 1·6 per 1000, but the prolonged weakness and nervous exhaustion following an attack of i. leads frequently to complications.

The treatment is simply rest in bed, warmth, and nourishing foods, complications being treated as they arise. For the pains at the commencement of an attack, salicylate of soda, aspirin, and quinine are valuable, phenacetin if headache is pronounced, while quinine in small doses (2 grs. every morning) is also an effective preventive of the disease in epidemics and at other times.

INFORMATION (law), suit filed by the Attorney-General in the court of King's Bench against person guilty of offence for which ordinary legal process is not suitable.

INFORMER, legal term for person who brings a suit against another as a law-breaker; a *common i.* is one who shares the profits of convictions. The system was brought to an art in the later Rom. Empire, and was common in Ireland during the XVIII. and XIX. cent's.

INFUSORIA, the highest class of Protozoa, with many members which are among the most familiar of the group. Their name is due to the fact that, where any infusion of vegetable matter is exposed to the air, Infusoria abound therein in a short time. As the other classes of Protozoa are distinguished by the presence or absence of characteristic locomotor organs, so the Infusorians are known by the coating of fine, short, vibratile hairs or cilia, which, present often in hundreds or even thousands, enable them to swim through the water or glide over solid substances. The free-swimming forms are generally round or oval in shape, while the gliding forms are flattened, with a permanent creeping surface; but the essential structures are the same—a protoplasmic body formed of external ectoplasm and internal endoplasm, containing usually two nuclei (*macronucleus* and *micronucleus*), food vacuoles and numerous contractile vacuoles, and furnished frequently with a mouth and œsophagus which guides the food to the endoplasm.

As is often the case in Protozoa, the bodies of many Infusoria are preserved from desiccation in continuous dry weather by the formation of a protective covering—*encystment*—but this process is also related to reproduction and to lack of food. When encystment precedes reproduction the contents of the cyst break up into very many minute individuals, but a more usual mode of reproduction is that of simple division, where an individual splits into two, crosswise if free, lengthwise if fixed.

Most Infusoria live in the sea or in fresh water, where they swim independently or are attached to rocks, seaweeds, zoophytes, etc., by means of a long contractile stalk or by adhesive organs, or simply by modified cilia. They live on small organisms, such as Bacteria, Diatoms, and minute Protozoa, which are wafted towards the mouth (where it is present) by the continuous action of the neighbouring cilia. Some Infusoria are parasitic, and live in the bodies of other animals, upon the juices of which they feed. The parasitic forms, however, do little apparent harm, with the exception of one form (*Ichthyophtheirus*), which occasionally causes fatal epidemics amongst fresh-water fishes.

The class **Infusoria** falls into two distinct groups:—Sub-Class I., CILIATA, in which cilia occur throughout life; some without mouths (*Astomata*), such as *Opalina*, parasitic in the food canal of frogs; or the group of GYMNOSTOMATA, with simple pore-like mouths; or the large permanently open-mouthed HYMENOSTOMATA, of which the common Slipper Animalcule or *Paramœcium* of infusions is a member. Or there are forms distinguished by a spiral band of well-developed cilia which leads to the mouth (*Spirigera*), including the sedentary *Stentor*, which has a body covered with an even, fine coating of cilia, and which builds a gelatinous tube within which it can withdraw for refuge; the closely related sluggish *Balantidium*, parasitic in the human food canal; or the stalked forms, such as *Epistylis*, with a stiff, rigid stalk, or *Vorticella*, with long stalk which contracts spirally under excitation.

Sub-Class II., SUCTORIA, with cilia only during the early stages, the functions of these being taken up, in the adults, by peculiar suctorial tentacles. Such are flattened forms with branched arms, as *Dendrocometes*, or stalked species with knobbed tentacles, as *Acineta*.

INGEBORG (*c.* 1176 to *c.* 1238), queen of France, whose repudiation by Philip Augustus led to his excommunication (1196) and the placing of France under an interdict.

INGELHEIM, NIEDERE, and **INGELHEIM, OBER** (*c.* 49° 58′ N., 8° 6′ E.), two small contiguous towns, Hesse, Germany, on Selz; wine. Pops. (1910) 3853 and 3500.

INGELOW, JEAN (1820–97), Eng. poet and novelist, who became known by publication of poems in 1863; her best-known novels—*Off the Skelligs* and *Fated to be Free*.

INGEMANN, BERNHARD SEVERIN (1789–1862), most popular Dan. poet and novelist of his day; his writings are somewhat mawkish, but graceful and finished.

INGERSOLL (43° 3′ N., 80° 58′ W.), town, Ontario, Canada, on Thames; agricultural implements; furniture. Pop. 5000.

INGERSOLL, ROBERT GREEN (1833–99), Amer. barrister and free-thinker; noted for lectures attacking the Bible.

INGHAM, CHARLES CROMWELL (1796–1863), prominent Amer. portrait painter.

INGHIRAMA, FRANCESCO (1772–1846), Ital. antiquary; made valuable Etruscan researches. His bro., GIOVANNI I. (1779–1851), wrote astronomical books.

INGHIRAMI, TOMMASO (1470–1516), distinguished Ital. humanist.

INGLEBY, CLEMENT MANSFIELD (1832–86), Eng. scholar; author of books on Shakespeare.

INGLEFIELD, SIR EDWARD AUGUSTUS, KT. (1820–94), distinguished Eng. Arctic navigator; made admiral, 1879.

INGLIS, SIR JOHN EARDLEY WILMOT (1814–62), Brit. general. During the Indian Mutiny he commanded the Residency at Lucknow from death of Lawrence to relief by Havelock, 1857.

INGLIS, SIR WILLIAM (1764–1835), Scot. officer distinguished in Peninsular War; bade his regiment 'Die hard!' with result that nearly all were slain; this regiment (57th foot) has retained the name of Die-hards.

INGOLDSBY, see BARHAM.

INGOLSTADT (48° 47′ N., 11° 25′ E.), fortified town, Bavaria, Germany, on Danube; seat of a univ., founded 1472, transferred in 1800 to Landshut, and in 1826 to Munich; manufactures cannon and gunpowder. Pop. (1910) 23,760.

INGRAM, JAMES (1774–1850), Eng. scholar, edit. *Saxon Chronicle* (1832).

INGRAM, JOHN KELLS (1823–1907), Irish literary man, political philosopher, and philologist.

INGRES, JEAN AUGUSTE DOMINIQUE (1780–1867), Fr. painter; belonged to the classical school, withstood the Romantic inrush and lived to enjoy short classical revival of the Second Empire; born at Montauban; became pupil of David (1796) and speedily his rival; executed portraits of Napoleon and other pictures, including famous *Girl after Bathing*, of which the marked individuality led to the charge of affectation; numerous historical subjects followed, including the *Chapelle Sistine*, one of the few pictures in which I. shows any Romantic feeling; elected to the Institute, 1825, and for a while most prominent painter of France, but his *Martyrdom of St. Symphorien* (1834) was coldly received by a Romantic age; I.'s work suffered from this adverse criticism, never again attaining the artistic conviction of his earlier products. Among best works are *Ambassadors of Agamemnon*, *Stratonice*, and *La Source*.

INHAMBANE (23° 50′ S., 35° 20′ E.), seaport (and district), Portug. E. Africa; exports rubber, wax, oil-nuts. Pop. 3500; district, *c.* 300,000.

INHERITANCE.—According to Eng. law, if a person dies intestate his *real* property passes according to certain rules. The person who last held it is the *purchaser*, unless he can be proved to have inherited. It descends first to lineal descendants, male coming before female, and the issue of a dead heir before the next living bro. or sister. If there are no descendants then it passes to ancestors. Relatives of the half-blood inherit much as relatives of the whole, with certain differences. The present law depends on the —(1) *Inheritance Act* of 1833, and the (2) *Law of Property Amendment Act*, 1859. See also HEREDITY.

Heritable and Movable, in Scots law, a division of things. Heritable subjects (*e.g.* land, annuities, leases) descend to an heir; movable subjects (*e.g.* furniture, stocks and shares) descend to next of kin.

Heritable Securities, in Scots law, are equivalent to mortgages (*q.v.*) on land in Eng. law.

INHIBITION (from Lat. *inhibere*, to prevent), legal expression for qualified superior's forbidding an offending clergyman perform his office.

INISFAIL (Gaelic for island of the *fail*, or stone), Ireland; the country which possessed the *fail*, or stone, on which Jacob slept. This stone was afterwards taken to Scone in Scotland, and thence to Westminster Abbey, where it forms part of Coronation Chair.

INITIALS, see ILLUMINATION, ART OF.

INJUNCTION.—A legal remedy for the enforcement of covenants, particularly negative covenants. Thus, where a tenant covenants not to carry on a particular trade the court will grant an i. to restrain him from doing so, or an i. may be obtained from the courts to restrain the publication and sale of books and newspapers pending the trial for breach of contract, or to prevent a public singer from singing in certain places when the contract has been made to sing elsewhere.

INK contains dissolved or suspended colouring matter; it should not mould nor form a thick deposit; it should be non-erasable, non-poisonous, and non-corrosive. Since the XI. cent. ink has been made from an *iron* salt and *tannin*. TANNIN INKS are made by fermenting *galls* with *yeast* and mixing the *tannic acid* so obtained with *ferrous sulphate*. *Gum arabic* is added to suspend the precipitate. Oxidation by air develops the intensity of the colour. Coloured inks

are obtained by adding different pigments. PRINTING INK contains lamp-black, linseed oil, and some yellow soap. CHINA or INDIAN INK is soot from wood or lamp-black mixed with glue from ox-skin, and made into cakes. COPYING INKS are made from *logwood, ammonium alum,* and *metallic salt.* They are corrosive. The colour develops by oxidation. ANILIN INKS are non-corrosive, and have no sediment, but are fugitive. MARKING INK, indelible ink for marking linen, etc., is a solution of silver nitrate, or other salts. SYMPATHETIC INKS are *chlorides* of *nickel, cobalt,* etc., which become visible only on the application of heat or a chemical agent.

Mitchell, *The Manufacture of Ink.*

INKERMANN, village in the Crimea, 33 miles from Sebastopol; noted for defeat of the Russians by the English and French on Nov. 5, 1854.

INK-SAC of cuttles, see under CEPHALOPODA.

INLAND REVENUE, see EXCISE, FINANCE.

INLAYING, method of decoration by inserting one material into another, differing in nature or colour; different kinds are bidri, damascene, buhl work, marquetry, pietra dura, mosaic.

INMAN, HENRY (1801–46), Amer. artist, who executed many portraits of celebrities.

INN (48° 34′ N., 13° 28′ E.), river, Central Europe; ancient *Œnus*; rises in Swiss canton of Grisons; joins Danube at Passau; length, 320 miles; navigable to Hall.

INN.—An 'inn' has been defined as 'a house, the owner of which holds out that he will receive all travellers and sojourners who are willing to pay a price adequate to the sort of accommodation provided.' Generally a hotel is an inn. The ale-house, or tavern, is merely a refreshment-house, and a fully licensed public-house is not necessarily an inn. Neither is a boarding-house, for the proprietor of the latter makes what arrangements he, or she, pleases with the boarders. But the innkeeper is bound by law to receive and afford proper entertainment to every one who offers himself as a guest, if there be sufficient room and no good reason for refusal. In the event of neglect or non-fulfilment of duty on the part of the innkeeper proceedings should be taken against the person who is, in fact, the innkeeper.

INNER HOUSE, higher divisions of Scot. Court of Session.

INNER TEMPLE, see INNS OF COURT.

INNERLEITHEN (55° 37′ N., 3° 5′ W.), town, health-resort, Peeblesshire, Scotland, seat of woollen industry; saline springs (Scott's *St. Ronan's Well*).

INNESS, GEORGE (1825–94), Amer. landscape painter, remarkable for poetry of conception and colouring.

INNOCENT, INNOCENTIUS.—The name of numerous popes, of whom the most important are:—

INNOCENT I., reigned 402–17; confirmed actions of Synod of Carthage, 416; commemorated in Rom. Church, July 28.—INNOCENT II., reigned 1130–43; supported St. Bernard against Abelard and Arnold of Brescia.

INNOCENT III., reigned 1198–1216; one of the greatest of the popes; exercised enormous power; as pope and as an Ital. prince he opposed imperial power; enforced his decisions on marriage question on Philip of France and Peter of Aragon; more significant still were his relations with King John and his putting England under interdict; promoted Fourth Crusade, 1204, and crushed the Albigenses; d. soon after presiding at the Lateran Council of 1216. I. was a statesman rather than a theologian, and under him the papacy reached the height of its power.

INNOCENT IV., reigned 1243–54; engaged in long conflict with Emperor Frederick II., carrying on the lofty ideal of power of Innocent III.; had more personal ambition and less loftiness of aim than his predecessor; promoted study of canon law.—INNOCENT VI., reigned 1352–62, at Avignon; a firm ruler, he carried through various reforms, but has sometimes been charged with nepotism.—INNOCENT VII., reigned 1404–06; tried to summon general council in 1404, which never assembled.—INNOCENT VIII., reigned 1484–92; unsuccessfully preached a crusade; without real ability, and guilty of nepotism; influenced by Cardinal della Rovere (Julius II.).—INNOCENT X., reigned 1644–55; condemned the Jansenists, 1653; largely swayed by his sister-in-law, Donna Olimpia Maidalchini.

INNOCENT XI., reigned 1676–89; carried out reforms in papal court, and tried to secure greater simplicity and spirituality in Church life; came into conflict with the Jesuits; took some part in politics, opposing Louis XIV. over *Declaration of Gallican Liberties,* which I. resisted; an unsuccessful attempt was made to canonise him.

INNOCENT XII., reigned 1691–1700; a reforming pope, tried to abolish nepotism by declaring popes should not give offices to relatives.—INNOCENT XIII., reigned 1721–24; supported Old Pretender and opposed the Jesuits.

INNOCENTS' DAY, CHILDERMAS, Church holiday to commemorate massacre of innocents by Herod; Dec. 28 in Rom. Church; considered unlucky.

INNS OF COURT.—Corporate bodies of which all barristers and students of law must be members. (The phrase is also applied to the buildings belonging to these societies.) Four of these courts exist in London: The *Inner Temple,* the *Middle Temple, Lincoln's Inn,* and *Gray's Inn*—all the smaller inns have long been abolished. Each of these societies is governed by a body of benchers. The privileges of the inn are to admit men to become students of law, and to confer the right, by calling them to the Bar, to practise in the Law Courts. The Inns have the power of refusing to admit a person as a student without stating a reason, and of disbarring a member whose conduct is considered unworthy of the profession. Each student before admission must pass an entrance examination or produce a certificate from a university, and before being called to the Bar must keep twelve terms (three years) and pass other examinations. In Ireland, King's Inn, Dublin, is the only Inn of Court. In Scotland there are no Inns of Court, and an advocate, corresponding to the Eng. barrister, is trained in the Faculty of Advocates.

Loftie, *Inns of Court and Chancery*; Home and Headlam, *Inns of Court.*

INNSBRUCK (47° 17′ N., 11° 24′ E.), town, Austria, capital of Tyrol; beautifully situated at head of Brenner Pass; seat univ., founded 1677. Among principal edifices are Franciscan Church (with magnificent monument to Maximilian I.), imperial castle, and Ferdinandeum museum; textile and glass-painting industries. Pop. (1910) 53,194.

INNUENDO (from Lat. *innuere,* to nod towards), method of defamation by insinuation which may constitute libel (*q.v.*).

INOCULATION, see BACTERIOLOGY (ARTIFICIAL IMMUNITY).

INOUYE, KAORU, MARQUESS (1835–), Jap. Meiji statesman, who won some success for European innovations.

INOWRAZLAW, HOHENSALZA (52° 47′ N., 18° 15′ E.), town, Posen, Germany; iron-works; salt-works in vicinity. Pop. (1910) 25,695.

INQUEST (Lat. *inquisitio,* search), legal inquiry made by Coroner (*q.v.*) and jury in England; held in cases of death from unusual causes; formerly held at death of every tenant-in-chief, or at his coming of age, which he had to 'prove' before the Crown surrendered his lands, and to ascertain extent of Crown lands, etc.

INQUISITION, THE.—In the IV. cent. the Christian Church, which till then had been persecuted, became itself persecuting. Laws were passed in the Christianised Empire against heretics. In the Dark Ages there was not much persecution, but about the X. cent. rigorous measures were adopted, and in various countries heretics were burnt. It came to be established that heretics, after being condemned by the

Church courts, should be handed over to the 'secular arm' for punishment. The Emperors Frederick I. and Frederick II. and Pope Innocent III. urged increased severity. Gregory IX. really created the mediæval inquisition which he entrusted to the Dominicans. The judicial procedure of the I. was quite different from that to which we are accustomed. The accused was assumed to be guilty; he did not know who had accused him, and all proceedings were in secret. Hardly a case is known of complete acquittal, but if the prisoner confessed, he had to suffer various pains and penalties, such as scourging, penance, imprisonment. Torture was frequently used to extort confession, and every effort made to induce the heretic to accuse others also. Those who were obdurate were liable to be burnt. The heretic's goods were confiscated, the spoils going sometimes to the secular monarch, sometimes to the Church, and occasionally confiscation was so great as to involve impoverishment in a district where the I. had been acted. The I. extended its activities to the suppression of heretical lit. and to magic.

The I. never had a real existence in England, although from the XV. cent. onwards heretics were burned at the stake, particularly in the Marian persecution. In France the Albigenses were suppressed in the XIII. cent. with great cruelty, and the Waldenses in the XIV. In Italy persecution was often for political reasons, and in Germany heretical mystics suffered most.

It is the SPANISH I., however, of which the influence was greatest. Owing to the independent policy of Span. kings the I. never did much in the Middle Ages. It was reorganised by Ferdinand and Isabella in 1480. Despite its independence of the Holy See it was recognised by the popes. (It is noteworthy that while no country in Europe was more orthodox than Spain, none was so jealous of papal interference.) No class in Spain was exempt from its vigilance, but some came off worse than others—*e.g.* the descendants of converted Moors or Jews were always regarded with suspicion. The Span. I., after having been twice temporarily abolished, finally disappeared in 1834. Its work had been more thorough and far-reaching in Spain in modern, than elsewhere in mediæval times. It is very difficult to summarise justly the work of the I. as a whole, partly owing to the theological passions engendered when its very name is mentioned, partly to the fact that in many cases records have been destroyed. It must be remembered that competent authorities estimate the actual number of persons burnt alive by the mediæval I's at much less than is generally supposed, and that in Spain victims were generally strangled before they were burnt, and that it was sometimes directed against moral and political offenders; still, a very serious indictment remains.

Lea, *History of the Inquisition in the Middle Ages: History of the Inquisition of Spain.*

INSANITY is a term applied to certain abnormal mental conditions due to disorder, disease, or imperfect development of the brain, but i. is such an indefinite term, and takes so many forms, that no short definition is satisfactory, the important point, however, being that it is not a mere disorder of the understanding, but is the result of an actual pathological condition of the brain. It has been calculated that among civilised peoples the ratio of insane to sane is about 1 to 300, but the proportion varies in different countries. The most important predisposing cause of i. is a hereditary tendency towards mental disease, about 60 or 70 % of the insane having a hereditary taint, the predisposition developing into an actual manifestation of disease on an exciting cause arising. It is said that marriage of near relations is a source of mental disease, but this does not apply to healthy persons whose family history is good. Epilepsy, hysteria, nervous diseases of different kinds, intemperance, tuberculosis, over-work, advanced age of one of the parents, are all apt to produce i. in offspring. Such periods as puberty, pregnancy, the climacteric, which have a considerable effect upon the nervous system, alcoholism, drugging, and other intemperances, injury to the brain, various diseases, such as gout, rheumatism, influenza, diabetes, and other morbid conditions due to organic or inorganic toxins in the body, and personal afflictions, religious excitement, financial worry, etc., are all important factors in the causation of i.

GENERAL SYMPTOMS of i. may be considered under the heads of physical and mental symptoms, the physical generally appearing before the mental. Sleeplessness is frequently a symptom in the early stages of i., and derangement of speech may be noticeable, unusual rapidity or slowness, changes in articulation, incoherence. The natural expression of the features is often changed, control over the expression of the emotions may be lost and an apathetic look present, or the emotions may be unusually vividly indicated by the expression; the eyes may show changes in the pupils, they may be extremely dull and lifeless, or feverishly brilliant. The nutrition of the body is very generally affected, the digestion is much deranged, and weight is rapidly lost. The liver, kidneys, heart, and other organs may be considerably affected, and the skin, perspiration, hair, and nails suffer from the disorder of nutrition. The chief mental symptom is loss of self-control, undue emotional depression or emotional exaltation. The power of judgment and reasoning also fails, the power of attention is lost or weakened, and delusions are common, for which theories, which seem quite logical, are often worked out by the patient. There may be hallucinations of hearing, seeing, taste, and smell, natural affection for near relatives and close friends is frequently lost, and suspicion or dislike takes its place. There is a tendency to suicide, particularly in those persons who are in a depressed state, and sometimes great pains are taken to carry out this design; while some persons are affected by irresistible impulses in other directions, smashing furniture or windows, or attempting to kill their children or other people in their vicinity.

CLASSIFICATION OF INSANITY.—Cases of i. differ from one another so much that the only thing any two may have in common is that in both the mind is affected. Nor can any classification be considered as dividing up the cases into separate, definite classes, as many cases are on the borderland of two or more different types of i., merging more or less into several of them. The classification of the different main varieties of mental disease has continually been undergoing modification since it was first laid down according to mental symptoms by Philippe Pinel (1745–1826), the classification given here being both convenient and generally accepted.

Congenital I. is due to imperfect development of the brain, to injuries to the brain before or at birth or in early infancy, or hereditary predisposition, or to the occurrence of such conditions as hydrocephalus. *Idiocy* is the term applied to the lower conditions of mental development, which may be weakness of mind or entire lack of intelligence, while *imbecility* is applied to the more advanced states of mental development. *Cretinism* (q.v.) is a condition of undeveloped intellect due to absence or atrophy of the thyroid gland.

Melancholia includes all states of morbid mental depression, among the secondary symptoms being delusions and hallucinations, nervous and digestive derangements, while a tendency to suicide is a very marked symptom in the majority of cases. Under suitable treatment a large percentage of cases recover completely.

Mania embraces all states of morbid mental excitement or exaltation, the symptoms being great restlessness and mental excitement, an unnatural expression of the face, bright eyes, muscular excitement and sleeplessness, the body loses weight rapidly, and death may even ensue from an attack. Of acute cases, the majority recover, and in regard to recurrent cases usually the intervals between attacks gradually become

longer, and the attacks less violent until they cease. *Folie Circulaire* includes regularly alternating mental states of melancholia and mania, and in the early stages of the condition moral changes, recklessness, obscenity, drunkenness, are often seen. A tendency to recurrence and relapse is common, but the majority of cases recover even after several years, although a recurrence is always possible.

Delusional I., or *Monomania*, is a somewhat loose term including those forms of i. in which the chief mental symptoms are insane delusions, *e.g.* of grandeur or pride, unseen agencies (imaginary annoyance by poisonous gases, electricity, etc.), or persecution (by unknown or known persons or classes of people). The state may resemble melancholia or mania at different stages. Recovery in the early stages is common, in the later rare. *Dementia* denotes the mental state in which the will power is lost, reasoning power, attention, and mental sensation weakened, and resembles congenital imbecility. It usually occurs as a sequel to melancholia or mania, being practically the incurable stage of those conditions. *Impulsive I.* is a state of the mind in which self-control is lacking, and is often due to hereditary influence, actions being done on impulse without reasoning, or it may be that the individual knows that he is doing wrong and has not sufficient control over his actions to prevent himself. The condition is often curable. *Stupor* includes those mental states in which the mind is shut off from the world around, the senses recording no impressions, the person being able to walk about, eat, and so on, but having no mental sensations, and taking no notice of anything. It may be due to some severe shock, and is usually curable. *General Paralysis of the Insane* is a disease characterised by degeneration of the central nervous system, motor power, and the senses as well as the intelligence being gradually destroyed. The onset of the disease is slow, the moral sense and self-control are affected, extravagant delusions are often present, writing, speaking, etc., become more difficult, and paralysis of all the muscles gradually appears. The disease is usually fatal in from eighteen months to three years. *Epileptic Insanity* is a term which has been applied to i. accompanying epilepsy (*q.v.*), often characterised by violence, but is now believed to have no connection with epilepsy, a mind affected by the one mental condition being more or less liable to be affected by the other. *Alcoholic I.* may be very slight or very acute, and may last for a very short or for a long time; it may take the form of *delirium tremens* (which may also be due to injury or other cause), in which there is mental excitement, hallucinations, sleeplessness, or it may take the form of *dipsomania*, in which there is an extreme craving for drink, with loss of self-control, with hallucinations, etc., usually occurring in recurring attacks. Women are subject to attacks of i. at special periods, such as *insanity of pregnancy, puerperal insanity, lactational insanity*, all of which are usually easily curable. Various forms of i. are associated with puberty, adolescence, and the climacteric, and with derangements of the reproductive organs and functions.

Senile I. may come on in extreme old age, with failing mental power, accompanied by hallucinations, with melancholia or mania, or by sleeplessness, neurasthenia, and apathy. Attacks may be recurrent, and recovery from them may often take place, but treatment is rather hopeless. I. may be the result of injury to the head, *Traumatic I.*, or a sequel of such diseases as diabetes, Bright's disease, many fevers, especially scarlatina, lead-poisoning, anæmia. The terms *Katatonia*, for a form of usually adolescent i. mainly characterised by stupor and muscular spasm, and *Hebephrenia*, for a form of adolescent i. distinguished by failure of the power of concentration and attention along with arrested physical development, have been introduced by certain authorities, but are not generally recognised as distinct diseases.

Treatment.—Although it appears that the ancient Egyptians and Greeks treated the insane as suffering from disease, this was succeeded by the mediæval idea that they were possessed of devils, and the treatment applied was scourging, torture, plunging afflicted persons into pools of water until they were nearly drowned, chaining them up in dungeons. In somewhat later times the harmless insane wandered about the country or were taken care of at holy shrines, and those considered dangerous were put in chains in prisons along with criminals. Asylums where the insane were detained were built (or in some cases former monasteries, etc., were used) in the XVII. and XVIII. cent's, but the treatment was much as before. More humane treatment was first advocated by Pinel and Esquirol in France at the end of the XVIII. cent. It was not, however, until near the middle of the XIX. cent. that physical restraint began to be abolished from asylums, and a scientific treatment with light work and exercise in the open air began to be introduced.

Short attacks of delirious mania and alcoholism and such comparatively transient states as acute puerperal insanity may be treated quite well at home under a good nurse and the supervision of a physician, but a good modern ASYLUM has the advantages of a healthy situation, spacious grounds, a healthy and systematised régime and dietary under skilled nursing and medical supervision, and proper accommodation for violent and invalid cases. In fact, instead of the old asylums of detention with strait waistcoats and other appliances, they are nowadays mental hospitals conducted on scientific principles. Indeed, certain mild forms of i. can well be treated in special wards of general hospitals.

The treatment consists of plenty of nourishing food, over-feeding rather than under-feeding. Cod-liver oil, malt extract, and the like are valuable in cases where nutrition is poor, and in many such cases wines and malt liquors are of distinct benefit. Quinine, iron, and dilute mineral acids are valuable tonics, but nerve stimulants, *e.g.* strychnine, require more care in administration, as they may lead to mental excitement. Moderate exercise in fresh air is most important, simple open-air, such as gardening, and social amusements, dancing, etc., in moderation, help to divert patients' minds from morbid thoughts into more healthy channels. Massage, which has been recommended, is suitable in very few cases. Many cases of i. suffer from sleeplessness or from morbid brain excitement, which are treated with benefit by hypnotic, sedative, and motor depressant drugs, paraldehyde being the best of the first class, a combination of cannabis indica and the bromides of the second, and hyoscine, or sulphonal and trional, which have also hypnotic and sedative qualities, of the third; but these drugs must all be carefully employed, their dangers being considerable. *Hypnotism* is employed with marked benefit in the treatment of many types of insanity, particularly in cases of mental depression or delusions, or to relieve troublesome symptoms.

LUNACY LAWS.—The first laws in England dealing with the insane were passed in Edward III.'s reign, since when numerous statutes have been enacted concerning the subject. The most important was that carried through by the exertions of the philanthropic Lord Shaftesbury in 1845, by which asylums were established throughout the Eng. counties, Commissioners app. to control them, and other provisions made for the well-being of the insane. The present asylum administration is regulated by the Acts of 1890 and 1891, visiting committees of the local authority, Commissioners in Lunacy, and Chancery Visitors being appointed. A person not being a pauper, or a lunatic so found by an inquisition ordered by the judge in lunacy before one of the masters in lunacy, cannot be received into an asylum without a 'reception order' by a magistrate, which is given after a private hearing of evidence supported by two medical certificates, except under an 'urgency order' made by a near relative, and supported by one medical certificate, on which the person may be detained for seven days. There are also asylums for the detention and treatment

of criminal lunatics, the criminal responsibility of an insane person being founded in Eng. law upon the Rules in the case of Macnaughton, tried in 1843 for the murder of Mr. Drummond, the private sec. of Sir Robert Peel. In Scotland the laws for the detention of an insane person are somewhat simpler than in England; while in Ireland, America, the Brit. Colonies, France, Germany, and other European countries, the main features of legislation affecting the insane are the same as in England.

Clouston, *Hygiene of the Mind* and *Mental Diseases*; Mercier, *Text-Book of Insanity*.

INSCRIPTIONS, ANCIENT, archaic writings on a durable material, writings on papyrus, vellum, or paper belonging to the branch of palæography (*q.v.*). There is this difference between i. and palæography: the former is never cursive except in the *graffiti* (wall-scribblings) found in buried towns and generally considered, despite their material, as palæographical rather than inscriptional. I. were the models from which all cursive scripts were formed, and in any case it would be natural, from the difference in material, to expect earlier examples of the former than the latter.

The CUNEIFORM (*q.v.*) i. begin about 4500 B.C.; this form was employed by Assyrians, Babylonians, and Persians, and there is an enormous quantity of cuneiform literature of which the secret of decipherment was not disclosed until the XIX. cent. The cuneiform alphabet had been everywhere superseded by the Phœnician by the beginning of the Christian era. The Phœnician alphabet, which began to spread in the Mediterranean early in the 1st millennium B.C., was probably derived from Egypt (*q.v.*), where i. in hieroglyphics are still extant of the 4th millennium B.C. Phœnician i., probably of the IX. B.C., have been found on bronze bowls in Cyprus; at Marseilles was found a sacrificial tablet which has thrown great light on the nature of Punic civilisation. Jews and Greeks probably received their alphabets from Phœnician merchants.

HEBREW i. date back to the IX. cent. B.C. and, although few in number, have great importance from their relation to the *Old Testament* narrative, which, in its turn, has aided in their interpretation. This has been the case with the Moabite Stone (discovered in 1868) and the i. in the tunnel from the spring to the pool of Siloam. Many Semitic i. of all dates are discovered in the great archæological storehouse, Egypt.

GREEK i. exist in great numbers and, being to many scholars of greater intrinsic interest than the i. of other nations, are the subject of the labours of a large and distinguished band of modern scholars. The i. on marble filled in a Gk. city the place of public notices in a modern town and the function of the *London Gazette*; and, moreover, monuments in honour of distinguished citizens, funeral steles, etc., abounded. The city archives, collections of i., were in the temples. One of the earliest Gk. i. is that inscribed by Gk. travellers on the leg of a statue at Abu-Simbel in Egypt in the VII. or early VI. cent. B.C., but some of the i. lately excavated in the Ægean district may be earlier. The Gks. of the V. cent. B.C., who were the first to form an ideal of scientific history, were the first to commence the study of i., of which collections began to be made in the III. cent. B.C. This ideal of history almost entirely vanished in the Middle Ages, but the reverence for things Gk. of the Renaissance led to a new period of collection and copying of Gk. i. The first publication of the results of this toil was Boeckh's great *Corpus Inscriptionum Græcarum* (1828, 1833), continued by Franz and Kirchhoff under the auspices of the Berlin Academy, and in 1840 Franz wrote his valuable *Elementa Epigraphicis Græcæ*. Amer., Austrian, Brit., Fr., and Ger. societies, with their headquarters at Athens, are now engaged in the excavation of classical sites and deciphering of i.

LATIN i., which are to be found in every country ruled by the Romans, and are often a guide to the site of a Rom. station, were collected like those of Greece by Renaissance scholars of the XV. and XVI. cent's. Among these scholars was Poggio, whose devotion to antiquity makes one of the characteristic stories of the movement. Several other antiquarians made collections before the days of the printing-press, and Spreti's collection of the interesting i. of Ravenna (one of the last strongholds of antique civilisation in Italy) was one of the *Incunabula*, appearing in 1489. Smetius, Pighius, Justus Lipsius, etc., made inscriptional studies in the XVI. cent., the famous Scaliger and others in the XVII. cent. Marini published his important *Atti dei fratelli arvali* in 1795. Borghesi, who in 1818–20 published *Frammenti dei Fasti Consolari Capitolini*, won the support of the Berlin Academy for the great work of making a *Corpus Inscriptionum Latinarum*, largely carried out by Mommsen (*q.v.*), who did an enormous work in this field.

Niebuhr, who collected *Inscriptiones Nubienses*, gave a great stimulus to antiquarian zeal by his new hypotheses on Rom. history. Besides the great *Corpus* there are various local treatises, and much information about the Rom. antiquities of the U.K. is to be found in Bruce's *Lapidarium septentrionale* (1875), the *Archæologia, Archæologia Æliana, Archæol. Journ.*, etc. A special Fr. journal of i., *L'Année épigraphique*, is published. Mediæval Lat. i. did not fall within the scope of the *Corpus*, but have been collected by Rossi and others. The bold and simple Rom. lettering, often painted with *minium*, a bright red pigment from Spain, has never been surpassed for monumental purposes. Funerary i. (*tituli*) are among the earliest Lat. i., dating back to the VI. cent. B.C.; the well-known i. of the Scipios are of the III. and II. cent's B.C. These i. were on stones very like the Gk. stele, but instead of the acanthus scroll, anthemian, and figure offering libations in low relief of the Gk. stele, a head in high or low relief surrounded by a garland was a more usual ornament of the Rom. grave-stone. The *titulus honorarius*, or eulogy bestowed by the state in the form of an i., was adopted from Gk. practices. As in Greece laws and public and private muniments were inscriptional, as also were ecclesiastical records; Rome had not the excellent marbles of Greece, and, moreover, made a considerable use of metal for i., with the result that less material has been preserved than in Greece. Fire, which in charring the papyri of Herculaneum and Pompeii preserved them from the invariable fate of papyri in all but the driest climates, has been fatal to a large number of the i. of Italy. The *runes* (q.v.) of the Scandinavian peoples are also believed to be derived from Phœnician sources.

CHINESE i's, which date back to at least the XVIII. cent. B.C., are to be found on bronze pots, bones, rocks, and ordinary stone tablets. The letters are evolved almost certainly from original picture-writing. In *India*, although clay, metals, and even crystal are used for i., the principal material is stone. As Indian chroniclers have been few and particularly unreliable, the wealth of i. is of great historical importance. All over India are temples and monuments inscribed with the record of hist. events, and there are valuable and numerous coins and seals.

Berger, *Histoire de l'écriture* (1892); *Corpus Inscript. Semit.* (1881, etc.); Chabert, *Epigraphie grecque* (1906); Egbert, Lat. I's (1896); Hopkins, *Development of Chinese Writing* (1910); *Corpus Inscriptionum Indicarum* (1877, incomplete); Mommsen, *Res Gestæ divi Augusti* (1883). See PALÆOGRAPHY.

INSECTA, or HEXAPODA, are a class of arthropods characterised by the following features: (*a*) the body is segmented, and in the adult is divisible into three regions—the head, bearing a pair of sensory antennæ and a number of highly specialised mouth-parts, the thorax, to which are attached three pairs of legs (hence *Hexapoda*), and, generally, two pairs of wings, and the abdomen. (*b*) The mode of respiration is tracheal, the tracheæ communicating with the exterior by means of special apertures termed stigmata. (*c*) The young invariably differ from the adult in a greater

or less degree, and during development undergo slight, incomplete, or complete metamorphosis. In common with the remaining Arthropoda the body secretes an exoskeleton of chitin and the appendages are jointed. Insects constitute by far the largest number of terrestrial animals known, both generically and individually, the rapidity with which many multiply being little short of marvellous. Typically they are either aerial or creeping in the adult condition, although some (e.g. *Dytiscus*) are aquatic, but many pass a part, or the whole, of their larval life in the water.

External Characters.—The head, which contains the so-called 'brain,' and also bears the more important sense-organs (eyes, ocelli, etc.), is usually rounded in character and is divisible into two main portions, the *clypeus*, situated between the two antennæ and bearing the labrum or upper lip, and the *epicranium*. The mouth-parts consist primarily of three pairs of paired appendages, the mandibles, and first and second maxillæ respectively, the last pair being fused to form the labium, but in many forms they are highly modified in connection with the suctorial habit. The thorax consists of three segments, namely, the pro-, meso,- and meta-thorax, each of which bears one pair of legs, whilst the meso- and meta-thorax bear the wings where these are present. In the Coleoptera the anterior pair are modified as wing cases (*elytra*), whilst in the Diptera (*q.v.*), where only one pair occur, they are mesothoracic, and in some groups (springtails, lice, and fleas) they may be entirely wanting. The wings are outgrowths of the skin and are traversed and supported by nervures, the disposition of which is of considerable systematic importance. The abdomen consists of a variable number of segments—twelve, according to Heymons, being the maximum. They are typically without appendages, but the hinder end often bears stings, ovipositors, claspers, or other specialised structures.

Internal Anatomy. — The alimentary canal consists of three main portions: (*a*) the *stomodæum*, formed by the mouth, into which the products of the salivary glands pass, the œsophagus, crop, and gizzard; (*b*) the *mesenteron* or true gut, lined by endoderm and possessing a number of blindly ending cæcal glands; (*c*) the *intestine*, into the anterior portion of which the excretory organs, termed the Malpighian tubules, discharge. The blood is normally colourless, being mainly nutritive in character. It fills the body cavity and is circulated by the action of a pulsatile heart, surrounded by a pericardial cavity containing fat cells, and continued anteriorly into an aorta, whence it passes into the cœlom. The tracheal respiratory system is essentially a system of much branched tubes, ramifying throughout the body and oxygenating the various parts directly. They are lined internally by chitin and are supported internally by a closely coiled spiral thread. Each system is connected with its neighbours, and communicates with the exterior by means of a, usually protected, stigmatic aperture. The nervous system is typically invertebrate, consisting of a dorsal, ganglionic mass, united by a circum-œsophageal loop, to the ventral nerve chain, which bears a pair of ganglia in each segment. In many forms, however, notably in the Diptera, this arrangement is considerably modified by ganglionic fusions. The eyes may be either simple ocelli or elaborate compound structures similar to those of the Crustacea (*q.v.*). In addition there occur auditory and other organs, the significance of which is very imperfectly understood. In insects the sexes are distinct, but Aphides and certain 'Stick Insects' are parthenogenetic, whilst drone bees are also produced from unfertilised ova. The male sexual organs consist of paired testes opening into vasa deferentia, which are often coiled. These swell posteriorly to form seminal vesicles in which the ripe sperms aggregate and are eventually discharged by way of the ejaculatory duct during copulation. The ovaries are also paired, and consist of ovarian tubules from which the ova are discharged into paired oviducts, these usually uniting posteriorly to form a muscular vagina.

In the majority the life-history is very complex, but three main types are distinguishable as follows: (*a*) those in which the differences between young and adult are comparatively slight and in which the young, after a series of moults, assume the mature form (e.g. *Aptera, Orthoptera, Hemiptera*); (*b*) those, such as the dragon-fly (*q.v.*), in which the larva differs considerably both in structure and habits from the adult, and is often aquatic; this larva never pupates, but after a period of quiescence sheds its skin for the last time and emerges a perfect insect; (*c*) in the third type the larva also differs markedly from the adult (*e.g.* maggot, caterpillar), but undergoes a definite, resting, pupal, or chrysalid stage during which the larval organs disintegrate and are replaced by those of the adult (e.g. *Hymenoptera, Coleoptera, Lepidoptera*, and many *Neuroptera*). Such are said to undergo *complete metamorphosis* as distinguished from the incomplete metamorphosis of the second type. The principal features utilised in the classification of insects are, the absence, or occurrence, and character of the wings, the structure of the mouth-parts, and the nature of the change from larva to adult, and upon this basis Sharp separates the nine following orders: (1) *Aptera*, springtails and bristletails; (2) *Orthoptera*, cockroaches, grasshoppers, earwigs, locusts, and crickets; (3) *Neuroptera*, dragon-flies, May-flies, caddis-flies, and termites; (4) *Hymenoptera*, bees, wasps, ants, and saw-flies; (5) *Coleoptera*, beetles; (6) *Lepidoptera*, butterflies and moths; (7) *Thysanoptera*, thrips; (8) *Diptera*, flies proper; (9) *Hemiptera*, bugs, aphides.

Economic.—Either the adult forms or larvæ of many insects are injurious to cereal crops, fruit trees, and numerous other cultivated plants. Where large crops are to be dealt with the only remedy seems to lie in the thorough breaking up of the soil in autumn, the burning of refuse, and the encouragement in reason of natural enemies (*e.g.* moles and birds). In the case of trees and garden crops the treatment will vary with the type of insect, thus in the case of biting insects the food supply is poisoned, whilst suctorial insects are dealt with by contact spraying. There are three chief periods when spraying is useful, namely, winter, late spring, and summer. The object of the winter spraying is to cleanse the plant and to clear out all places where the eggs or young might be hidden. As the plants are dormant a strong solution may be used, the following being a standard one: sulphate of iron ½ lb., lime ½ lb., caustic soda 2 lb., paraffin 5 pints, water to 10 gallons. April and summer sprayings must be much weaker, their object being to exterminate any larvæ which have escaped the previous sprayings. For contact spraying against mealy bugs and the like a solution of soft soap and quassia, or an emulsion of soft soap and paraffin is generally used. For biting insects spray the foliage with the following: arsenate of soda 8 oz., lead acetate 1 lb., water 24 gallons. (For details as to separate life-histories consult the Leaflets of the Board of Agriculture and Fisheries.)

See Coleoptera, Diptera, etc., and also Sharp, *Insecta* (Cambridge Nat. History); Packard, *Text-Book of Entomology*; Lubbock, *Origin and Metamorphoses of Insects*.

INSECTIVORA (Insect Eaters), are Mammalia of the class Rodentia, usually small in size and nocturnal in habit. They may possess a smooth velvety fur, as in the mole (*Talpa*), or have a covering of spiny erectible quills, as in the hedgehog (*Erinaceus*). They run partly or wholly upon the sole of the foot, and the first digits of both feet (corresponding to the human thumb and great toe respectively) are not apposable. In addition to moles and hedgehogs, the order also includes shrews, tree-shrews, potamogale (an elongate animal and a powerful swimmer, inhabiting the river banks of the W. African tropics), and galopitheous (a bat-like creature inhabiting S.W. Asia, which possesses

a membranous skin-fold, the *patagium*, by means of which it is able to glide parachute-fashion from tree to tree). In nearly all, the snout is peculiarly delicate and sensitive and projects beyond the apex of the upper jaw. The teeth are characteristic, the mandible bearing more than two incisors, whilst the molars possess tuberculate roots. The milk dentition is extremely transitory, and is absorbed in the majority of cases before birth. The brain is small, the cerebrum leaving the cerebellum exposed, and being, with the exception of a lateral groove, quite smooth. The characters of the molars, and the small, smooth brain, are strongly indicative of the primitive character of the group, and this is confirmed by the absence of scrotal sac and the abdominal position of the testes. With the exception of the West African elephant-shrews, the urinogenital and anal apertures are partially or wholly enclosed in a common skin-fold suggesting a cloaca.

The order, which is not represented in Australasia, first makes its appearance in the Lower Eocene. The fossil forms are more or less synthetic in type, and suggest nearer affinities with the marsupials, the wholly extinct creodonts, and the lemurs than do their modern representatives. The I. are grouped in twelve families, of which the *Soricidæ* (shrews), *Talpidæ* (moles), and *Erinaceidæ* (hedgehogs) have Brit. representatives. The wide and often extremely limited geographical distribution of many of the families lends further support to the primitive character of the order.

INSECTIVOROUS PLANTS, besides feeding in usual way, capture and devour insects. Varieties: (1) with leaves provided with pit-like traps filled with a viscid fluid, *e.g. Drosophyllum lusitanicum* of Portugal and Morocco; (2) with no pits on leaves, but secreting a viscid fluid, *e.g.* Sundew; (3) with viscid fluid, along with a movement to capture insect, *e.g.* Venus' Fly-Trap. See PITCHER-PLANTS.

INSOLVENCY, see BANKRUPTCY.

INSOMNIA, inability to sleep, which is usually accompanied by emaciation, dryness of the skin, and nervous disturbances; may be due to anæmia or hyperæmia of the brain secondary to diseases of the heart, lungs, and other organs; while the abnormal state of the blood in gout, rheumatism, etc., or through excessive use of tobacco or alcohol will also produce i. It may be due, also, to over-work, or nervous derangements, neurasthenia, etc., from various causes. The treatment depends on the cause, which, if possible, is removed by suitable remedies, and various drugs, potassium bromide, chloral hydrate, belladonna, opium, when administered under the direction of a doctor, are valuable.

INSPIRATION (Lat. 'inbreathing').—The idea that a human being can be an organ or vehicle for the manifestation of the divine, or can receive divine communications, appears in all religions. Often the inspired person is in a state of great emotional excitement. The Old Testament prophet was at first a seer, then moral, spiritual, and to some extent predictive. I. is most frequently used in connection with sacred writings; all great religions have their sacred books; in Muhammadanism the conception of i. of the Koran is more rigid than that of the Bible has ever been among Christians. In the Christian Church the literal and verbal inerrancy of Scripture has been largely believed in, but it is now generally abandoned. Another view is that the Bible is infallible in matters of faith and morals, though not always necessarily in others. Most Christian theologians would now accept the Bible as spiritually more inspired than any other book, and as containing all things necessary to salvation, but would admit moral and spiritual progress.

Sanday, *Inspiration*.

INSTERBURG (54° 37′ N., 21° 50′ E.), town, E. Prussia, Germany; iron foundries, tanneries. Pop. (1910) 31,627.

INSTINCT, a word used in a vague and popular and also in a more exact scientific sense, in which it is defined as meaning those mental faculties which are for a specific end, but which do not necessarily imply conscious knowledge on the part of the creature who exercises them. Some would try to separate the biological and psychological aspects of i. among animals, but it is in the connection of the two that the problem really consists. The i's of animals popularly so-called are only partly i's proper, and partly what they have acquired. Many instinctive actions, again, are due to imitation. The problem of i. is closely connected with heredity. There is undoubtedly such a thing as racial preparation, and the capacity for certain actions is inherited.

Lord Avebury, *On the Instincts of Animals*.

INSTITUTE (Lat. *instituere*, to establish, appoint), name given to laws and commentaries thereon (see JUSTINIAN); to places in which training is given, or to associations for scientific purposes. The *Institut de France* (established 1795) comprises the five Academies (*q.v.*).

INSTITUTE OF FRANCE, see ACADEMY.

INSTITUTIONAL CHURCH, one which makes social activities besides worship important in Church life (some think to the exclusion of religion).

INSTRUMENT OF GOVERNMENT, a paper constitution drawn up in Dec. 1653 by officers of the army, making Cromwell Protector under control of Council of State and a reformed Lower House; Cromwell ruled under it till 1657, when it was superseded by the *Humble Petition and Advice*.

INSTRUMENTATION is virtually synonymous with ORCHESTRATION, and signifies the distribution of parts of a musical composition among the various instruments of an orchestra. The history and development of i. run parallel, as it were, to the history and development of the orchestra (*q.v.*). Up to the XVIII. cent. the orchestra served almost exclusively as an accompaniment to vocal music (opera, choral, etc.). Within these limitations, however, marked progress was made in the art of i. by Scarlatti, Bach, and Händel. With Gluck the orchestra and orchestration attained more importance in opera, while Haydn laid foundation of symphonic music. In Mozart's day the orchestra was still small (about forty instruments), and brass and percussion parts were insignificant, almost artificial. Beethoven gave a greater share to brasses and drums, and improved the rôle of almost every instrument. XIX.-cent. inventions led to an enormous advance in tone, compass, and flexibility of winds in particular. New instruments were introduced and the orchestra was considerably enlarged. The art and science of i. naturally became more complex as the orchestra's capabilities increased. Wagner first fully realised the dramatic power of orchestral music, and by applying new laws and original ideas to the improved instruments of his day, attained effects never previously attempted or possible. Tchaikovsky and the Russ. school gave even greater prominence to brass and percussion instruments, and imparted new colouring to orchestral music. The modern masters, Strauss and Debussy, strive after emotional effects which add still further to the difficulties and complexities of i. See ORCHESTRA.

Prout, *Primer of Instrumentation*; Berlioz, *Instrumentation*.

INSUBRES, Celtic people who crossed the Alps and founded Milán, 396 B.C.; crushed by Romans, 222 B.C.; last rising defeated, 194 B.C.

INSURANCE may be defined as 'a contract by which a person (called the insurer or assurer), in consideration of a lump sum of money, or of a periodical payment, undertakes to pay to another (called the insured or assured) a larger sum on the happening of a particular event.' In other words, it is the making of financial provision against loss of income, through accident or through death. The instrument in which the contract of i. is contained is called the *policy*

of insurance, the term policy being derived from an Ital. word signifying a promise. Nearly every risk that threatens the average man may be insured against. Unusual and extraordinary risks are not as a rule undertaken by the ordinary i. offices, but by members of Lloyd's and similar companies. A man may be insured against loss through bad debts, or through the failure to meet bills of exchange of which he is the holder or payee. Football and cricket clubs frequently insure against loss in the receipts from the season's play. Merchants and business men insure themselves against loss when they anticipate an increase in the duties or taxes levied on the goods in which they traffic. These latter, of course, do not as a rule go direct to the *underwriters* (*i.e.* the persons who jointly undertake the business of i.); they employ a *broker*, whose business is to know the underwriters or insurers likely to undertake this kind of i., and through the broker the i. is effected with the underwriter. The oldest and commonest forms of i. are Marine, Fire, and Life. Only in quite recent times have i. against accidents and burglary been added, and national and compulsory i. against unemployment and ill-health is a still later development. In U.S.A. all i. is state controlled.

Marine Insurance was in existence as far back as the XIII. and XIV. cent's, when Lombard, Florentine, and Venetian shipowners insured against the loss of cargo or vessel. In the XVI. cent. Eng. shipping-masters followed their example. The contract of marine i. is one 'of indemnity in which the insurer, in consideration of the payment of a premium, agrees to make good to the insurer all losses not exceeding a certain amount, that may happen to thing insured, from the risks enumerated in the policy during a certain voyage or period of time.' The person effecting the i. must have an insurable interest (*i.e.* a personal pecuniary interest, or be liable or accountable for any loss arising) in the thing insured; and this interest must be a continuing one—that is, the insured person must have an interest in the subject-matter of the i., not only at the time of effecting the policy, but also at the time when the loss occurred. Any concealment or misrepresentation of a material fact renders the policy void. Everything likely to influence the insurer in estimating the risk which he is asked to undertake must be made known to him. In effecting a policy of marine i. with the underwriters (so called because they subscribe their names to the policy) it is usual to employ a broker. It sometimes happens that an underwriter after subscribing his name to a policy finds the risk greater than he anticipated, and he tries to secure himself by reinsuring with another underwriter, who, of course, charges a high premium. The common form of marine policy is Lloyd's, and all other policies are based upon it. Application without policy may effect i. in U.S.A., and unless otherwise provided constructive total loss is taken to be damage of over 50 % of vessel's value when repaired.

Fire Insurance in England dates from 1680. In that year a private office, near the Royal Exchange, was set up. In 1864 a Friendly Society against fire was established in London. Here again the contract is one of indemnity, by which the insurer, in return for the payment of a sum of money, agrees to compensate the insured for any loss or damage (not exceeding a specified amount) to his property, caused by fire during a given period. The maximum amount of compensation which can be claimed is stated in the policy, but, of course, the insured person will not necessarily receive this amount; he will receive only such compensation as will cover the amount of damage done by the fire. Hence there is no advantage in over-insuring property, or in insuring property at its full value in different offices. For should the property be totally destroyed by fire the different offices between them will make up the amount. The insured will not be allowed to make a profit out of a fire—if the fire offices can prevent it. Fire i. is dearer in U.S.A. owing to state interference, taxing companies, and forbidding them to combine to arrange rates, and (*Valued Policy laws*) taking the amount of the policy to be the amount of the loss.

Life Insurance, or ASSURANCE, as it is usually called professionally, commenced in England in 1762 when the Equitable Society began business. It is not a contract of indemnity, but one 'by which the insurer, in return for a lump sum, or a periodical payment, undertakes to pay to the person for whose benefit the i. is effected, or to his executors, or administrators, a certain sum of money or an annuity on the happening of a given event, or on the death of the person whose life is insured.' Every life i. company established since 1870 in the U.K. must deposit £20,000 in the High Court, and no certificate of incorporation can be issued until the deposit has been made. The form of i. adopted by working people, who in return for the payment of a few pence per week receive a sum on the death of the person insured, is a very costly business for the insured. For the expenses of management, due to the enormous number of canvassers and collectors employed, amount to nearly half of the total incomes from premiums. In the ordinary life assurance the expenses of management in well-conducted offices vary roughly from one-sixth to one-eighth of the annual income from premiums. In 1864 the Post Office established a system of life assurance for any sum from £5 to £100.

In U.S.A. first life insurance society was founded in Philadelphia, 1759, and the Mutual Co., N.Y. Life and the Equitable are largest institutions in world. The standard mortality rate from 35 to 75 is lower than British, but above and below higher. Including assessment i. total life i. is nearly 30,000,000,000$, about five times that of Great Britain.

Accident and Burglary Insurance.—By the contract of accident i. the insurer undertakes to provide against loss if the insured sustains injury or disablement, partial or temporary, or to pay to the personal representatives of the insured if he meets with death in a particular way. There is no limit to the amount for which a life may be insured against accident. Burglary i. is subject to the same laws as fire i. There can be no over-insurance of property against theft.

National Insurance.—The principle of compulsory i. for workmen was adopted in Germany in 1879, largely as the result of Socialist agitation for State interference. The theory that the working man who has become incapacitated through age or in consequence of his work should not be a burden upon the public was accepted by the Government, and legislation was enacted in 1883 ordering compulsory i. against sickness. In 1884 i. was extended to accidents, and in 1889 to invalidity and old age. Austria, France, Norway, and Holland subsequently adopted workmen's compulsory i., and in 1911 the Brit. Parliament passed a National Insurance Act for the compulsory i. of all workmen and other employees, the State, the employer, and the employee all contributing. It applies to all whose incomes are less than £160. Opposition to the Act is raised on these grounds: i. 'cards' are badges of poverty and servitude, and the unemployed, having cards not stamped up-to-date, are rejected by prospective employers; doctors on the 'panel' are too few, and adequate attention to patients is impossible.

F. W. Lewis, *State Insurance*; W. A. Robertson, *Insurance as a Means of Investment*; William Gow, *Marine Insurance*; Comyns Carr and others, *National Insurance*, 1912.

INTAGLIO, representation of an object made by cutting away the object from the ground, not, as in relief, cutting away the ground from the object.

INTEGRAL CALCULUS, see INFINITESIMAL CALCULUS.

INTELLIGENCE IN ANIMALS.—I. has been defined as the 'conscious adaptation of means to ends.' It is closely connected as regards animals

with instinct (*q.v.*). Romanes asserted and Mivart denied that animals possess i. and reason. But a distinction is drawn by psychologists between perceptual and conceptual thought, the former involving the perception of some relation between two things, the other abstract analysis. Much human and, at any rate, most animal thought is 'perceptual,' but it is still an open question whether animals are capable of 'conceptual' thought as human beings undoubtedly are. The question can only be settled by psychological experiments properly conducted; mere stories of 'intelligent' animals are not enough. Probably animals are not capable of reasoned thought.

INTEMPERANCE, see TEMPERANCE.

INTENDANTS, officials of Fr. kings, before Revolution. *Intendants des finances* were under controller-general of finances. *Intendants des provinces* from about 1570 had considerable authority in provinces; they came into collision with provincial gov's and with parliaments over administration; very powerful in XVIII. cent.

INTENT, element of purpose which, with attempt at offence, constitutes legal crime; the i. is an important question in criminal, but is not considered in civil matters. Many legal documents have saving clause, by which the verbal expression is to be interpreted 'according to the true i. and meaning of these presents.'

INTERCALARY DAYS, days inserted in the calendar (*q.v.*) to restore correspondence of solar and civil year; this is secured by leap-year system.

INTERCOLUMNIATION, spacing of columns in classical architecture, differing in different orders.

INTERDICT, forbidding of divine worship and administration of sacraments by ecclesiastical authority as punishment for sin; pronounced by Pope against persons or countries; (Scots law) an injunction (*q.v.*).

INTERDICTION (Scots law), action of restraint which may be placed under certain conditions on a person's disposal of his real property.

INTERESSE TERMINI (Lat. interest for a term), title to entry of lessee into land leased.

INTEREST, sum paid in return for loan of money; since repeal of Usury Laws in 1854 borrowers have been liable for payment of such interest as they have agreed to pay. See USURY.

INTERFERENCE OF LIGHT, see LIGHT.

INTERIM (Lat. meanwhile), name given to temporary settlements of controversial points during the Reformation, by order of the emperor, to remain in force until a general council should meet; noted i's are those of Ratisbon (or Regensburg), 1541, Augsburg and Leipzig, 1548.

INTERLAKEN (46° 42′ N., 7° 52′ E.), town, Swiss canton of Berne, on Aar, between lakes Thun and Brienz; tourist centre. Pop. 3000.

INTERMITTENT FEVER, see AGUE, MALARIA.

INTERNATIONAL LAW (also called *jus inter gentes*, or erroneously, *jus gentium*), the usages observed in relations between civilised states. I. L. may be divided into the Natural and Conventional elements. The former, generally known as the *Law of Nature*, is based on those principles which are supposed to be universally accepted as rules of conduct for both states and individuals in their dealings with each other; it is thus a moral rather than a legal obligation. The Conventional element is the result of obligations imposed upon states by treaties and agreements between themselves, and of precedents and cases whereby the customary practice has been established. In many European states the writings of lawyers on the subject are also regarded as law. The chief question which has to be decided is that of the lawfulness or unlawfulness of war; and to prevent war the states may refer their disputes to international arbitration (see ARBITRATION). This is becoming increasingly common, and has on various occasions been made compulsory.

The state as the unit of I. L. has certain rights which other states must recognise; these include: (1) The right to do whatever is necessary for its own conservation; (2) the right to acquire new dominions; (3) to buy or sell property; (4) to choose its own form of government or to change it; (5) to increase its army and navy and develop its commerce. And among the obligations morally binding on states are: (1) To allow no plots against sovereign of a foreign state to be organised within its bounds; (2) to put down sedition; (3) to protect its subjects in foreign countries; (4) to see that justice is impartially administered. In I. L. the sea beyond the three-mile limit is regarded as free to all, every nation having rights of navigation and fishing on the high seas. Only ships of war and merchant vessels are recognised in I. L.; the former are armed vessels used in public service; they are considered to be part of the national territory of the state to which they belong, and when entering the ports of foreign states are not subject to the local jurisdiction of those states. Merchant vessels, on the other hand, are subject to the laws of any foreign state whose ports they may enter. Pirate vessels are not recognised and may be seized; and by most states ships engaged in slave trade are treated as pirates. In 1899 the International Peace Conference met at The Hague, and arranged for the constitution of an arbitration court, to which disputes between states might be referred. This tribunal has already amicably settled two disputes—the one between the U.S. and Mexico, the other certain questions concerning the Venezuelan difficulty.

F. E. Smith, *International Law.*

International Private Law.—Rules whereby persons living in one country are affected by the laws of another; among the cases where these rules apply are those concerning marriage, property, succession, legal proceedings, commission of crime, the status of any person and his capacity to enter into contracts. A person's national character may be decided either by his native country or place of origin, or by his domicile; in England and America the law of domicile governs the person's status and capacity, but in France, Italy, and other European countries these are ruled by the law of origin. In 1881 Signor Mancini, the Italian foreign minister, with a view to obviating the conflict of private I. L., entered into correspondence with other powers on the subject of establishing certain fixed rules concerning aliens which should obtain in all states; and since that time international conferences have been held on various occasions at The Hague, with the object of establishing fixed rules on such subjects as marriage, wills, and wardship. Great Britain has had no share in these proceedings; and, accordingly, while among the European states generally a marriage between persons of different nationality is valid everywhere if valid according to the law of the place at which it was contracted, yet the validity of a marriage between an English person and a foreigner depends on whether it was celebrated in accordance with the law of the husband's domicile; if not so celebrated the husband may subsequently repudiate the contract.

Westlake, *International Private Law* (1905).

INTERNATIONAL, THE, an international association of working men, founded 1864 in London; came to an end at Philadelphia in 1876; most important members were Karl Marx and Bakunin, leaders respectively of moderate and extreme factions.

INTERPELLATION, term in legislative procedure for interruption, with the consent of the Assembly, of ministerial business, by question attacking ministerial policy; sometimes weapon of obstruction.

INTERPLEADER, term in Eng. law for process by which defendant is relieved of suit brought against him by parties claiming against each other.

INTERPOLATION (in math's), term denoting primarily the insertion of missing terms in a series whose law of formation is known; but used in a wider

sense to denote the calculation, assuming some law of continuity, of any term of a series from the values of those given. In the case of almost all tabulated functions the successive orders of differences rapidly diminish. Assuming the nth order of differences constant, the function u_x in question may be expressed as a rational integral function of x; thus

$$u_x = a + bx + cx^2 + \ldots + kx^n.$$

If n values of u_x are given, we can obviously by substitution obtain n equations, giving $a, b, c \ldots k$, and thus intermediate values of u_x may be calculated. But shorter methods are available. (i.) Given n equidistant values $u_0, u_1 \ldots u_{n-1}$ of a function u_x, the properties of finite differences lead to the result

$$u_x = u_0 + x\Delta u_0 + \frac{x(x-1)}{2\,!}\Delta^2 u_0 + \ldots + \frac{x(x-1)\ldots(x-n+2)}{(n-1)\,!}\Delta^{n-1}u_0;$$

where $\Delta^p u_0$ is the pth difference.

e.g. given $\log 2{\cdot}10 = {\cdot}3222193$, $\log 2{\cdot}11 = {\cdot}3242825$, $\log 2{\cdot}12 = {\cdot}3263359$, $\log 2{\cdot}13 = {\cdot}3283796$; required $\log 2{\cdot}115$. We have, omitting the decimal point

	u_0	u_1	u_2	u_3
	3222193	3242825	3263359	3283796
Δ	20632	20534	20437	
Δ^2	−98	−97		
Δ^3	1			

Hence $$u_x = 3222193 + 1{\cdot}5 \times 20632 - \frac{1{\cdot}5(1{\cdot}5-1)}{1\cdot 2}\cdot 98 + \frac{1{\cdot}5(1{\cdot}5-1)(1{\cdot}5-2)}{1\cdot 2\cdot 3}\cdot 1 = 3253104$$

which is correct to the last figure. The ordinary method of *proportional parts* would have given 3253092.

(ii.) When the values given and that sought constitute a series of equidistant terms, we proceed thus: Taking the series as $u_0, u_1, u_2 \ldots u_n$, we have $\Delta^n u_0 = 0$.

$$\therefore u_n - nu_{n-1} + \frac{n(n-1)}{2\,!}u_{n-2} \ldots + (-1)^n u_0 = 0$$

an equation from which any one of the quantities u_0, u_1, etc., may be found. Thus for a term midway between two others we get $u_0 - 2u_1 + u_2 = 0$. $\therefore u_1 = \frac{u_0 + u_2}{2}$ and is the ordinary arithmetic mean. For five terms the middle one is $u_2 = \frac{4(u_1+u_3) - (u_0+u_4)}{6}$.

(iii.) When the given values are not equidistant, Lagrange's interpolation formula is used.

H. L. Rice, *Theory and Practice of Interpolation*: G. Boole, *Finite Differences*; *Text-Book of Institute of Actuaries*.

INTERPRETATION OF STATUTES ACT (1889), a guide to authority and meaning of statutes.

INTERREGNUM, period between death of king and election of successor; in Middle Ages this often meant lapse of government.

INTERREX (Lat. *inter.*, between; *rex*, king), official app. by Rom. senate on death of a king to govern until appointment of new king (period called an *interregnum*), sometimes ten *interreges* were elected with duty of choosing a king. Under the republic an inter-consular 'i.' was sometimes appointed.

INTERSTATE COMMERCE, see UNITED STATES.

INTERVALE, term used geographically in America for low-lying land between hills.

INTESTACY.—In the case of persons dying without making a will (*i.e.* intestate), if the whole estate does not exceed £100, the widow or any of the children may apply to the Registrar of the nearest County Court, and the Registrar will send the necessary papers to the Court of Probate, and in due course supply Letters of Administration. In other cases of intestacy these Letters of Administration are to be obtained from the Probate Registry at Somerset House by the next of kin.

INTESTINE, the lower part of the alimentary canal, divided in man into small and large intestines, communicating by the ileo-cæcal valve. See DIGESTION.

Intestinal Obstruction may be *acute*, caused by strangulation by bands or adhesions, by volvulus or rotation of the intestine on its own axis so as to produce strangulation, by acute intussusception or the telescoping of one portion of the intestine into the part below, by the termination of chronic obstruction, by kinking or through peritonitis; or the obstruction may be *chronic*, due to impaction of fæces or foreign bodies, to stricture, tumours, and other affections of the intestinal wall, or to compression of the intestine from tumours or adhesions without. The symptoms of the former are sudden severe pain, later becoming continuous, in the region of the umbilicus, shock and collapse. There is persistent vomiting, which soon becomes very offensive, the bowels do not move, the abdomen becomes distended, and peritonitis comes on if the obstruction is not relieved by immediate operation. Massage of the abdomen is harmful. In regard to chronic obstruction, there are colicky pains, with constipation alternating with diarrhœa, and finally acute obstruction takes place. The treatment before the case becomes acute is a fluid diet, enemata, and small doses of cascara or calomel. Operative treatment is generally carried out at an early stage.

INTOXICATION, poisoning by drugs or other poisonous substances; used chiefly as denoting the condition produced by excessive consumption of alcohol. See TEMPERANCE.

INTRA (45° 57′ N., 8° 34′ E.), town, Piedmont, Italy, on Lake Maggiore; cotton and silk industries. Pop. 7100.

INTRADOS (Lat. *intra*, within; Fr. *dos*, back), the concave side or soffit of an arch.

INTRANSIGEANTS (irreconcilables), political party uncompromisingly hostile to an existing government, the term being used chiefly in Spain (1873), France, and Italy.

INTUITION, a philosophical term for that which is directly perceived or apprehended, whether in logic or ethics, as opposed to that arrived at by a reasoning process.

INVENTORY, BENEFIT OF (Lat. *beneficium inventarii*), term in Rom. and Common law for right of heir to enter into estate without being liable for encumbrances beyond its value as inventoried.

INVERARAY (54° 14′ N., 5° 4′ W.), seaport, county town, Argyllshire, Scotland, on Loch Fyne; herring fishery. I. Castle (built 1744–61) is seat of Duke of Argyll.

INVERCARGILL (46° 26′ S., 168° 23′ E.), town, Otago, South Island, New Zealand, on New River estuary; breweries, foundries; exports, preserved meat, wool, and timber. Pop. 12,000.

INVERELL (29° 45′ S., 151° 8′ E.), town, New South Wales, Australia, on Macintyre; centre of agricultural district; tin and diamond mines in vicinity. Pop. 3350.

INVERKEITHING (56° 2′ N., 3° 23′ W.), town, Fifeshire, Scotland, on Firth of Forth. Pop. (1911) 3291.

INVERNESS (57° 28′ N., 4° 13′ W.), royal burgh, seaport, and county town, Inverness-shire, Scotland, on Ness; tweed centre; 'Capital of Highlands'; near end of Caledonian Canal; has coasting trade; woollen industries; breweries, distilleries. I. was ancient Pictish capital; has remains of castle built by Cromwell and destroyed by Jacobites in 1746; scene of 'Northern Meeting'; has Episcopal cathedral; famed for purity of Eng. accent. Pop. (1911) 22,216.

INVERNESS-SHIRE (57° N., 4° 40′ W.), Highland county, Scotland, extending from Moray Firth on E. to Atlantic and Outer Hebrides on W.; area, c. 4200 sq. miles; county town, Inverness. Surface is mostly wooded country, rough hill-grazing, heath, peat, and stony waste little cultivated; deer-forests and grouse-moors; excellent fishing; many wild glens. I. is

largest and most mountainous county in Scotland; flat strip near Inverness gradually rises into mountain-land, culminating in Ben Nevis (4406 ft.) in S.W., highest point in Brit. Isles. There are many rivers, the largest being Spey, Ness, Beauly, and Lochy. Among the numerous lochs are Ness, Morar (deepest in Brit. Isles), Shiel, Archaig, Lochy, Ericht, and Laggan. Caledonian Canal traverses I. A geological 'fault' runs across Scotland through I.; slight earthquake shocks frequent; interesting signs of glaciation. Pop. (1911) 87,270.

INVERURIE (57° 17′ N., 2° 23′ W.), royal burgh, Aberdeenshire, Scotland, at confluence of Don and Ury; important centre of cattle trade; manufactures paper. Pop. (1911) 3960.

INVESTITURE.—In feudal times some token of i. was commonly given when a man was installed in lands or office. Many of the bp's and abbots held land under the Crown from the days of Charlemagne and were invested with ring and crozier on appointment to their sees. This soon was plainly objectionable, for simony and other abuses became common. The Lateran Synod of 1059 forbade clerical i. by a layman, and papal prohibitions followed in 1078, 1080, 1087, 1089. The final prohibition came from the Lateran Council of 1123. In England the struggle over i. was between Abp. Anselm and Henry I.

INVOLUTION, in math's, the raising of a quantity to a given power, *e.g.* $4^2=16$. **Evolution**, the extracting of roots (*e.g.* $\sqrt{16}=+4$) is included with i. under *Theory of indices*. See ALGEBRA.

IO.—(1) legendary dau. of Inachus, king of Argos; beloved by Zeus, who, to save her from Hera, changed her into white heifer; Hera sent Argus to guard her, but Hermes slew him; eventually was restored to human form. (2) (Astron.) an asteroid, and also a satellite of Jupiter.

IODINE (I., At. Wt. 126·8), non-metallic element with bluish-black metallic lustre; S.G. 4·95, M.P. 115° C., B.P. 200° C. Formerly it was manufactured from *kelp*, a species of seaweed, but it is now worked up from the salts of which large natural deposits exist. In presence of potassium iodide, i. dissolves in water, forming a brown solution. It forms a brown solution in alcohol and in ether, and a violet solution in carbon disulphide and in chloroform. With starch i. gives an intense blue coloration. I. is present in the thyroid gland, and from the earliest times bodies containing i. have been much prized medicinally. There are two series of salts, *Iodides* and *Iodates*, and two acids, *Hydriodic Acid* (HI) and *Iodic Acid* (HIO_3). Of the *Halogens*, i. has the least affinity for other elements.

IODOFORM, CHI_3, yellow crystalline substance with strong smell; antiseptic and disinfectant; much used in surgery.

IOLA (37° 55′ N., 95° 20′ W.), city, on Neosho, Kansas, U.S.A.; zinc-works: machine-shops; natural gas region. Pop. (1910) 9032.

ION, OF CHIOS (d. 421 B.C.), Gk. poet and historian; won prize for tragedy at Athens.

IONA, ICOLMKILL (56° 19′ N., 6° 29′ W.), island at S.W. corner of Mull, Inner Hebrides, Scotland; about 3½ miles long and 1½ miles wide; area, *c.* 2000 acres; scarcely half cultivated; coast rocky and surface mostly rough. I.'s chief interest lies in association with St. Columba (*q.v.*) and introduction of Christianity into Scotland; great centre of learning and religion, VI. cent. onwards; frequently ravaged by Norsemen; abounds in hist. antiquities; ruins of ancient nunnery, monastery, and chapels; also restored ruins of cathedral, with choir, sacristy, transepts, and a 70-ft. tower, as well as Columba's tomb and numerous crosses and carved stones. Pop. 200.

Trenholme, *The Story of Iona* (1909).

IONIA (42° 59′ N., 85° 7′ W.), city, Michigan, U.S.A., on Grand River; iron foundries, furniture factories. Pop. (1910) 5030.

IONIAN ISLANDS (38° 30′ N., 20° 30′ E.), group of islands on W. coast of Greece, consisting of 7 islands—Corfu, Cephalonia, Paxos, Santa Maura (Leuks), Ithaca, Cerigo (Kythēra), Zrante (Zakynthos); surface mountainous; highest peak, Monte Nero, 5310 ft., in Cephalonia; subject to frequent earthquakes; rich in marble, sulphur, salt, coal, wine, olives, currants, fruit. Formed into a province called Thema of Cephelenia, IX. cent.; gradually taken by Venetians from XIII. cent. onwards; passed to France, 1797; made an independent state, 1800; retaken by French, 1807; came under the protection of Britain, 1815; ceded to Greece, 1863. Area, *c.* 1100 sq. miles. Pop. *c.* 265,000.

IONIAN SCHOOL OF PHILOSOPHY, name given to group of philosophers about 600–400 B.C., who interpreted the universe scientifically rather than, like others, metaphysically. They may fairly be said to have started European philosophy. Thales declared water to be the underlying principle of all things. Anaximenes thought it was air, and Hippo moisture. Anaxagoras thought the Universe the work of mind, conceived as thin substance.

IONIANS, inhabitants of Attica (held by some to have been the cradle of the race), Eubœa, west coast of Asia Minor, Cycladic Islands, and of colonies in Thrace, Propontis, Pontus, and Egypt. Origin of name is unknown, but Homer and Herodotus use it. A mythical ancestry is attributed to Ion.

IONS, see ELECTRICITY (*Electrolysis*).

IOPHON (fl. early V. cent. B.C.), prominent Gk. poet of age of Pericles.

IOVILÆ, name given locally to Osco-Umbrian monuments (of V. and preceding cent's B.C.) in Italy.

IOWA (42° N., 93° 30′ W.), N. central state of U.S.A.; bounded N. by Minnesota; E. by Mississippi River, which separates it from Wisconsin and Illinois; S. by Missouri; W. by Missouri and Big Sioux Rivers (separating it from Nebraska and S. Dakota); area, *c.* 56,030 sq. miles, of which *c.* 550 are water. Surface is mostly rolling tableland or prairie (average elevation being scarcely 1000 ft. above sea-level) broken by vertical cliffs at river banks in N.E.; and bluffs near rivers in S.W. I. is divided into two drainage systems—the larger, on the E., drained by tributaries of the Mississippi—Des Moines, Skunk, and Iowa; and on the W. by tributaries of the Missouri. There are several small lakes in the N. The climate is healthy. Valuable deposits of coal, which is of good quality and extends over vast areas, are found; other minerals are lead, gypsum, limestone, clay, etc. The land is almost entirely devoted to farming—about half to the growing of cereals, chiefly maize, wheat, barley, oats, rye, potatoes, hay, etc.; naturally, industries are mainly agricultural and live stock rearing; other industries are meat-packing and preparing food-stuffs; dairy-farming and poultry-keeping are also of importance. There are no important manufactures. Chief towns are Des Moines (capital), Dubuque, Sioux, Davenport, Council Bluffs, and Cedar Rapids. I. was organised as territory, 1838, and admitted as State of U.S.A., 1846. I. has a Gov., a Senate and House of Representatives, and sends 2 Senators and 11 Representatives to Congress. Pop. (1910) 2,224,771.

Shaw, *Iowa.*

IOWA CITY (41° 40′ N., 91° 33′ W.), city, Iowa, U.S.A.; seat of Iowa State Univ. and of Iowa City Academy; various mills. Pop. (1910) 10,091.

IPECACUANHA, a creeping plant (*Uragoga ipecacuanha*), with drooping flowers, growing in clumps in Brazil and other parts of tropical S. America. The root is used as a drug in med., being a powerful emetic, acting both upon the stomach and the vomiting centre in the medulla of the brain; especially valuable for children in bronchitis, diphtheria, and laryngitis for emptying the air-passages by the act of vomiting; used as a specific in dysentery, and also as an expectorant in bronchitis, etc. The chief active principle is analkaloid, *emetine* ($C_{30}H_{42}N_2O_4$), which is a white, bitter, uncrystallisable substance.

IPEK (42° 34′ N., 20° 27′ E.), town, Albania, Euro-

pean Turkey; until 1690 seat of the Servian patriarchs. Pop. *c.* 15,000.

IPHICRATES (d. *c.* 353 B.C.), Athenian general distinguished in Corinthian War (395–87), Egypt (378–74), and against Sparta (372–71); inventor of new armour.

IPHIGENIA (classical myth.), Gk. legendary character, fixed to some extent by Euripides and other poets; dau. of Agamemnon and Clytæmnestra; sacrificed to Artemis (Euripides' *I. in Aulis*); according to one of the floating stories she was miraculously caught away by Artemis; with her bro. Orestes became chief character of another play of Euripides', *I. in Tauris*.

IPSAMBUL, see ABU SIMBEL.

IPSUS, see ANTIGONUS CYCLOPS.

IPSWICH.—(1) (52° 4′ N., 1° 10′ E.) seaport, Suffolk, England, on Orwell estuary. Noteworthy public buildings are the town hall, corn exchange, museum, and church of St. Mary le Tower. I. has a grammar school refounded by Queen Elizabeth in 1565; manufactures agricultural implements; artificial manures; and has breweries and tanneries; sacked by the Danes in 991 and 1000. Pop. (1911) 73,939. (2) (42° 41′ N., 70° 37′ W.) town, Massachusetts, U.S.A., on Ipswich; cotton and woollen industries. Pop. (1910) 5777. (3) (27° 38′ S., 152° 48′ E.) town, on Bremer, Queensland, Australia; coal mines. Pop. 10,000.

IQUIQUE (20° 10′ S., 70° 7′ W.), seaport, Chile, S. America; exports nitrate of soda and iodine. Pop. (1910) 40,171.

IQUITOS (3° 40′ S., 72° 57′ W.), town, river port, Peru, S. America, on Upper Amazon; centre of trade; exports rubber. Pop. *c.* 20,000.

IQUITOS, tribe of uncivilised S. Amer. Indians.

IRAK (34° 30′ S., 50° E.), fertile province, Persia; carpet-weaving industry; capital, Sultanabad.

IRAK-AJEMI (34° N., 52° E.), province, Central Persia; produces grain and fruits; contains Teheran, the capital, and Ispahan. Area, 138,190 sq. miles. Pop. *c.* 3,000,000.

IRAK-ARABI (32° N., 46° E.), name since Arab conquest for district lying between Tigris and Euphrates, and corresponding to Ancient Babylonia. Consists of flat plain made up of steppes and swamps; in swamps vegetation is luxuriant, and wild animals abound; some districts infested by lawless tribes over whom Turk. government has no authority. Some efforts made at irrigation; chief products are dates, fruits, grains, millet-seed, and rice; considerable caravan commerce; navigation on rivers difficult, and in certain parts impossible. Chief towns, Bagdad, Basra, Kufea, and Wasit. Once prosperous, well-watered, and cultivated country, now fallen into decay; everywhere may be seen traces of ancient canals, cities, and villages. Pop. *c.* 2,000,000.

IRAN (30° N., 60° E.), the great plateau including Persia, Afghanistan, and Beluchistan; now official name of Persia (*q.v.*).

IRAWADI, see IRRAWADDY.

IRBIT (57° 29′ N., 63° 4′ E.), town, Perm, Russia; famous annual fair. Pop. 20,000.

IRELAND, the western island of the U.K., lies between 51½° and 55½° N., and between 5½° and 10½° W., and is bounded N., S., and W. by the Atlantic Ocean, N.E. by the North Channel (separating it from Scotland, Mull of Kintyre, 14 miles), E. by the Irish Sea and St. George's Channel (separating it from England and Wales, 44 to 86 miles). The area is 32,600 sq. miles, exclusive of 938 sq. miles of inland water; the coast is about 2200 miles long, with so many inlets that no place is more than 50 miles from the sea. The island has a basin-shaped central plain, 250 to 300 ft. in height, surrounded by the mountainous coasts (2000 to over 3000 ft. in height). As there is a great deal of rain from W. and S.W. this configuration naturally results in a large area of bogland. Rivers are (N.) Foyle, Bann; (E.) Laggan, Boyne, Liffey; (S.) Barrow, Suir, Blackwater, Lee; (centre and W.) Erne, Moy, Galway, and Shannon. Good-sized lakes are Neagh, Erne, Allen, Ree, Derg, Conn, Mask, Corrib, Killarney.

The rim of mountains in the direct path of the warm, damp W. and S.W. winds (the wind is in the west for about three-fourths of the year) off the Atlantic gives wet, warm climate of W. Ireland. The rainfall in the hilly districts varies from 70 to 75 in., and in the centre and along some parts of the E. coast from 25 to 30; the summer temperature ranges from 58° Fahr. in the N. to 62·5° in the S., and in winter 39° surrounds an oval in the centre and N.E., and the rest of the country ranges from that up to 43° on the S. and S.W. coasts. It is believed that Archæan rocks show in County Tyrone; there is no Cambrian stratum, with the possible exception of tracts in the E. and central plain, where the Silurian rocks appear; there are Devonian strata in Kerry, Cork, and round the Silurian tracts of the wide Carboniferous Limestone district of the central plain. There are Upper Carboniferous strata in Clare, Limerick, Trim, Kilkenny, and Tipperary; Lower Carboniferous sandstone and slate in S.W. Cork, Donegal, Tyrone, and Antrim. The coal (79,802 tons in 1910) is obtained chiefly in Kilkenny and Tipperary. The excellent slate, marble, and stone are little worked, but there is some report of limestone and iron ore (Antrim). There are 4,839,000 acres of arable land, 9,822,000 acres of permanent grass, and 301,000 acres of woods and plantations; about 4,200,000 acres are mountain-land, peat bog, or marsh. The crops in order of extent are oats, sown grass, potatoes, turnips, and flax. The cattle number about 4,700,000: sheep, 4,400,000; pigs, 1,200,000; horses, 560,000. Efforts are being made to extend the cultivation of flax, which has declined in last fifty years, and to introduce grass- and straw-plait as domestic industries. Horse-breeding is important all over the country, and there is a valuable trade in bacon, ham, and pork, the chief centres being at Belfast, Limerick, Cork, and Waterford. Efforts are being made to extend co-operation in dairy-farming, as in Denmark. The co-operative trade in butter has already reached a yearly value of £700,000, and there are signs that Irish dairy produce may recover its old repute. The valuable E. coast fisheries (mackerel, cod, ling, and herring) are largely exploited by Eng. and Scot. fishers, and those of the W. are too far from the markets; there are salmon fisheries on coast and river.

I., whose dyed and woven linens and serges were known as far as Italy in the Middle Ages, ceased to be a great manufacturing country in the XVI. cent., and in modern times has been handicapped by lack of coal. A considerable linen industry, however, has developed round Belfast, where 835,000 spindles are employed, and nearly 31,500 looms; in connection there is extensive shirt-making industry in Londonderry. Dublin manufactures poplin. Domestic and convent industries in hand-made lace and embroidery, spinning of wool and hand-loom weaving of woollens, carpets, rugs, etc., are noted and being fostered by technical instruction. There are small leather and boot and shoe industries in various parts. Brewing of porter and ale and distilling are also important, the chief centres being Dublin, Cork, Dundalk, Kilkenny, Limerick, and Belfast. Belfast and Londonderry have shipbuilding yards. 0·3 % of Brit. exports are from I.

I. is divided into the four provinces of Ulster (in which are Counties Antrim, Armagh, Cavan, Donegal, Down, Fermanagh, Monaghan, Tyrone), Leinster (Counties Carlow, Dublin, Kildare, Kilkenny, King's Co., Longford, Louth, Meath, Queen's Co., Westmeath, Wexford, Wicklow), Munster (Counties Clare, Cork, Kerry, Limerick, Tipperary, Waterford), and Connaught (Counties Galway, Leitrim, Mayo, Roscommon, and Sligo).

There is an excellent canal system of nearly 600 miles in length. From Dublin the Royal Canal passes W.

and N. to the upper Shannon; thence other canals lead N. and W. to the Erne, which is navigable thence; the Ulster Canal goes to Loch Bann and continues to the sea at Coleraine, Belfast, and Newry. The Grand Canal goes W. to the middle Shannon, from which there is communication by lough and river to the N. line near Longford, and down the river to the sea. There are a number of short branches, including that of the Grand, which connects County Kildare with Waterford and the Suir. There are 3401 miles of railway; the chief lines are the Gt. Northern (Dublin to Belfast and Londonderry), the Belfast and N. Co's, the Dublin, Wicklow, and Wexford, the Midland Gt. W. (from Dublin), and the Gt. S. and W. from Dublin to Cork, Valentia, Waterford, Tuam, and Athlone; the turnpike road is almost confined to the neighbourhood of towns; Atlantic liners by the N. passage call at Moville, those by the S. at Queenstown.

Church of I.—When Christianity was first preached in Ireland is unknown, but the real conversion of Ireland was undoubtedly due to Saint Patrick in the V. cent. Till the XI. cent. the Celtic Church flourished, producing saints and scholars and maintaining customs different from those of Rome. At length it succumbed, and Christianity followed the Rom. model. The Irish Supremacy Act was passed in 1537, and the Church was reformed like the English, but the bulk of the people remained faithful to Rome. The Irish Church, which has always been more definitely Prot. than the English, was disestablished and disendowed in 1869. It has 2 abp's, 11 bp's, and 1400 churches, and about 1 in 10 of the general population are served by it.

The R.C. Church has 4 abp's (of Armagh, Cashel, Dublin, and Tuam), 23 bp's, and a bp. auxiliary. The great majority (3,238,656 in 1911) of the population is R.C. There are 575,489 Protestant Episcopalians, 439,876 Presbyterians, 61,806 Methodists, and small bodies of Independents, Baptists, and Jews. Dublin University was founded in 1591, the National Univ. of I. (Dublin), 1909, Queen's Univ. (Belfast), 1909.

History.—There are remains in I. of the Neolithic and Bronze Ages. It is believed that a good deal of pre-Celtic blood runs in the inhabitants of western I., but no human remains of that time have been found to throw light on early history. The Goidels possibly colonised I. in the great age of Celtic civilisation, the VI. cent. B.C. Unfortunately for I. it escaped the Rom. domination, and so had no tradition of central government to modify the tribal system, which did not die out until the XVI. cent., when neighbouring countries had become strong modern states. Some parts of I. seem, however, to have learned Christianity from the Romans; Palladius is said to have been sent here by the Pope in 431 to missionise, and in the following year St. Patrick commenced the systematic conversion of I. By Irish missionaries the north of England was converted, and, like I., came to differ from the Rom. Church as to the date of observance of Easter, the tonsure, etc. According to Bede it was merely a chance, the childish logic of Oswi, which made Northumbria decide for Rom. against Celtic usages at the Synod of Whitby (664). The great monastic schools of the north of Eng. owed their foundation and their characteristics to I. The Danes invaded I., but never settled there.

I. was a rich country at this time, and the Norman rulers of England turned their thoughts towards its conquest; but the first step towards Eng. rule was taken under Henry II. It was afterwards stated that the Eng. Pope Adrian IV. bestowed I. on Henry II.; it is probable that he blessed Henry's Irish enterprise, but the fact is a matter of controversy, as has been also the alleged papal title to dispose of all islands. The occasion of Henry's interference was the appeal of Dermot of Leinster to the barons of Wales for aid in a tribal dispute. They assisted him in 1167, and then settled in Ireland, intermarrying with the native chiefs. In 1171 Henry II. landed in I., received the homage of both Eng. and Irish chieftains, and made his s. John lord. Eng. authority was, however, nominal. The Norman lords settled round Dublin in the district known as the Pale. In this district Eng. law was supposed to be administered, but Irish customs crept in, and Normans (for instance, the Butlers and Fitzgeralds) became the heads of clans and regarded England in much the same way as the 'mere' Irish did.

While England was in the throes of the Wars of the Roses I. became practically a foreign country. Henry VII. made an attempt to reduce the country. English policy in allowing the Fitzgerald earl of Kildare to be Deputy (then the title of the Eng. Governor) was merely a recognition of the *de facto* ruler, and would, no doubt, have been continued but for the support given by Kildare to the Yorkists. Henry replaced him by the Eng. Deputy, Poynings. Poynings made the celebrated law (1494) by which the independence of the Irish parliament was taken away, but he found his position untenable without a large army, and Henry VII. practically abandoned the task by replacing Kildare. Henry VIII. sent generals to make demonstrations in I., but followed his father's policy in the main until Thomas Cromwell persuaded him to enrich his coffers by forcing the Reformation on I. Besides suppressing the monasteries, Henry persuaded the chieftains to accept Eng. titles and acknowledge his supremacy, and in 1542 took the title king. Edward VI. continued the reforming of I., and Mary, although she restored Catholicism, carried out the new policy of colonisation, King's County and Queen's County being planted and named after herself and Philip. With the whole of Catholic Europe against her the tenure of I. was a life-and-death matter to Elizabeth. She was the first to subjugate the entire country, and methods less fair than war, massacre, or devastation were employed in the final subjugation of the chieftains and breaking up of the tribes. After baffling England for years, Shane O'Neill was entrapped and slain in 1567.

After the Desmond revolt Munster, devastated so as to be almost uninhabitable, was planted by Eng. colonists (1583); the second Desmond revolt, which brought about the disgrace of Elizabeth's favourite, Essex, the last rising of an Irish chieftain, was put down in 1601. The O'Neill renounced his tribal leadership in 1603, James I. introduced the shire system into I. and the Eng. system of land tenure, while in 1610 Ulster was planted with settlers whose descendants have ever since upheld Eng. ideas and the Protestant religion. I. enjoyed some prosperity under Earl of Strafford, who not only ruled despotically as Deputy of Charles I., but exploited I. in order to furnish money for Charles, offering the Irish army to the king for his struggle against the parliament. Strafford went to England with the king's promise of protection, but was attainted and executed (1641). Strife between the Catholics and Protestants in I. was now complicated by the question of Eng. king versus the ardently puritanical Eng. parliament, until Oliver Cromwell landed in Ireland in 1649, captured Drogheda and Wexford, and carried out massacres which have left his name as hated there as that of Elizabeth. Emigration was freely allowed: Cromwell, like Elizabeth, 'made a solitude and called it peace.' By the Act of Settlement in 1661 a large proportion of the lands confiscated by Cromwell was confirmed to Eng. tenants, and the Rom. Catholics gained nothing at first by the religious change, since Puritanism merely gave way to restored Episcopacy. James II. cr. the Catholic Talbot Earl of Tyrconnel, and in 1687 made him Deputy as an encouragement to Romanism. The result of the Revolution of 1688, therefore, was that I. became a stronghold of the Jacobean cause, Tyrconnel leading an anti-Protestant revolt. James II. landed in I. in 1689, and the Irish parliament repealed the Act of Settlement. This led to the final conquest. In Ulster the Prot. towns of Londonderry and Enniskillen held out for the Orange cause until aid came. William III. landed, won the *Battle of the Boyne*, and drove the Irish army before him into *Limerick*, which repelled every attack. James fled after the Irish defeat at *Aghrim* (1691), William again laid siege to *Limerick*, and the city capitulated after a famous resistance (1691). The terms of the Treaty of Limerick were disputed and their intent disregarded by the English. Further Irish lands were confiscated and the penal laws against Catholics introduced. These laws merely strengthened the hold of Rom. Catholicism on the Irish, but fines reduced the propertied Irish classes, and deliberate discouragement of Irish trade prevented the growth of a Catholic middle class. Opposition gradually grew during the XVIII. cent., potato famines commenced their ravages, secret societies committed outrages, and the hatred, still strong, between Ulster and the rest of I. sprang up. A new danger to England was the growing Prot. discontent. The revolt of the Amer. colonies was received with acclamation in I., where hopes of emulation arose. The agitation of Flood and Henry led to commercial concessions in 1779, but Britain found herself obliged to grant political rights. The Irish parliament made a declaration of independence (1782), and Rockingham's ministry was forced to assent to the repeal of Poynings' Act. Under the influence of Grattan the newly emancipated parliament passed measures of Catholic relief, and in 1793 the Catholics received the franchise. The Society of United Irishmen was formed in 1791 to unite all creeds in political opposition to England, but Irish Protestants, alarmed by Grattan's measures, began to arm against the Catholics. The rebellion of the United Irishmen, put down at *Vinegar Hill* in 1798, led, therefore, to nothing but Brit. conviction of the necessity for legislative union. The separate Irish parliament was abolished by Pitt's ministry in 1800, and owing to the pious obstinacy of George III. the condition of Catholic emancipation was not granted.

Catholic emancipation was the next subject of struggle. Daniel O'Connell founded in 1823 the Catholic Association which in 1829 wrested emancipation from the government, Peel supporting the cause, and Wellington finding himself obliged to give way. O'Connell, however, continued his agitation for repeal of the Union until his death in 1847. The Whig ministries of Grey and Melbourne passed the Irish Church Act (1833) and the Tithes Commutation Act (1838), which settled the tithe disputes; but the agitation of O'Connell proved a serious danger, and he was tried and imprisoned for sedition in 1844. The Young I. party, however, took his place. The terrible potato famine of 1846–47 led to the Fenian outrages. The Fenian movement was not suppressed until 1867. The first act of Gladstone's first ministry was the disestablishment of the Irish Episcopal Church (1869), and the first Land Act followed, making eviction illegal except for non-payment of rent (1870).

The Home Rule party now commenced its agitations, and the Land League was established in 1879, with Parnell as president. It worked for separation from England and boycotted those who rented tenements from which the previous holder had been evicted; this severe ostracism was named from a

landlord's agent, Capt. Boycott, whose crops would have rotted on the ground but for the intervention of the Ulster organisation of Orangemen, fierce opponents of the Home Rule party through fear of Catholic supremacy. The indictment of Parnell for conspiracy failed, it was believed, through terrorisation of the jury. Parnell and thirty-five other Irish members were suspended for their obstruction of the Coercion Bill in the House of Commons, Parnell introducing that Irish method which has often made Home Rule seem desirable to its opponents. Gladstone's second administration passed the second Irish Land Act (1881), granting free sale, fair rents, and fixity of tenure (the 'three F's'). Parnell's denunciation of the Act and incendiary speeches led to his speedy imprisonment. The Phœnix Park murders, among other outrages, followed, and in 1882 the National League took the place of the suppressed Land League. To aid the tenants the Arrears Act was passed in 1882, Labourers Acts in 1883, and the Ashbourne Act in 1885. Gladstone now became an upholder of Home Rule, and as premier for the third time in 1886 wrecked his government by Home Rule and Irish Land Purchase Bills, his proposals causing wild riots in Ulster. The split in the Liberal party on this theme created the branch of Liberal Unionists.

Balfour's secretaryship under the Salisbury ministry (1886–92) was marked by repressive Acts, the taming of Parnell (who died in 1891), and new agrarian Acts for relief of tenants. In 1892 Lord Houghton became Lord-Lieut., and John Morley Sec. in Gladstone's last administration; Balfour's repressive measures were undone, and a new Home Rule Bill passed the Commons in 1893. Lord Salisbury in 1896 passed a Land Act which displeased the landlords. Further agrarian Acts are Wyndham's Land Purchase Acts of 1903–4 and Birrell's Evicted Tenants Act (1907). In 1912 Mr. Asquith introduced a new Home Rule Bill (Irish Government Bill), passed by Commons, 1912, rejected by Lords, 1913, and demonstrations against it in Ulster were conducted by Sir Edward Carson and Mr. F. E. Smith. Mr. John Redmond, leader of the Nationalists, Mr. John Dillon, Mr. William O'Brien, and Mr. T. M. Healy are now leading Irish politicians.

I. is administered by a Lord-Lieutenant appointed by the Eng. party in power; 28 Irish peers and 103 Commons' representatives sit in the Brit. parliament. At the head of the legal department is the Lord Chancellor.

The population in 1911 was 4,381,951. The capital is Dublin (pop. 309,272), but the largest town is Belfast (pop. 385,492); next come Cork (76,632), Londonderry (40,799), Limerick (38,403), Waterford (27,430).

Gilbert, *Viceroys of I.* (1865); Bagwell, *I. under the Tudors* (1885–90); Froude, *English in I.* (1872–74); Alice S. Green, *Making of I. and its Undoing* (1908); J. W. Russell, *I. and the Empire, 1800–1900* (1901); Plunkett, *I. in the New Century* (1905).

IRELAND, JOHN (1761–1842), dean of Westminster; founder of Ireland scholarships at Oxford.

IRELAND, JOHN (1838–), Amer. R.C., apb. of St. Paul, Minn.; noted for nationalism.

IRELAND, WILLIAM HENRY (1777–1835), forger of Shakespearean documents (pub. 1795–96); the fraud and its disclosure caused even greater excitement than the Payne Collier forgeries later.

IRENÆUS, ST. (*c.* 120–200), pupil of Polycarp (disciple of St. John), brought up in Asia Minor; then bp. of Lyons; wrote *Adversus omnes hæreses* ('Against all heretics') in Greek; Latin version and fragments of original survive; in it I. assails Gnosticism and defends Catholic doctrine and tradition; one of most important authorities for history of Christian Church in II. cent.; shows four gospels clearly established as canonical.

IRENE (752–803), Byzantine empress; murdered her s. Constantine, and reigned 797–802, when exiled; beatified by Gk. Church for restoring image worship.

IRENE (fl. 1100), Byzantine empress; intrigued against her s.

IRETON, HENRY (1610–51), Eng. soldier; general in Parliamentary army during Civil War; m. a dau. of Cromwell, and took leading part in trial of Charles I.; assisted in reduction of Ireland during Commonwealth.

IRIARTE Y OROPESA, TOMÁS DE, YRIARTE (1750–91), Span. poet; author of amusing *Fábulas literarias.*

IRIDACEÆ, IRIDEÆ, order of cotyledonous plants with creeping, bulbous, or tuberous roots and root-leaves, *e.g.* Crocus, Iris, Gladioli.

IRIDIUM (Ir=193·1), metal of platinum group; S.G. 22·4; M.P. very high; used for tips of fountain pens; forms hard alloy with platinum employed for standard length bars; salts derived from Ir_2O_3 and IrO_2.

IRIGA (*c.* 13° 20′ N., 123° 30′ E.), town, S. Camarines, Luzon, Philippine Islands. Pop. c. 20,000.

IRIS, the personification of the rainbow; in Gk. myth. dau. of Thaumas and Electra and messenger of the gods to mortals; (anat.) see EYE.

IRIS is a genus of perennial herbs of natural order *Iridaceæ*; the root is a horizontal rhizome; leaves are long, narrow, and green; flowers, yellow or purple, are epigynous and regular. There are three petals, sepals, stamens, and stigmas. The sepals and stigmas function as petals. The ovary is tri-locular and inferior. The floral envelope is united at the base and carries broad bands of hairs. The *fleur-de-lis* is an iris.

IRISH LITERATURE, see under CELTS.

IRITIS, inflammation of iris. See EYE.

IRKUTSK (55° N., 104° E.), government, E. Siberia, separated from China by the Sayan Mts.; traversed by the navigable Angara and Lena; has gold, iron, and salt mines; agriculture and cattle breeding industries. Climate is severe. Inhabitants are chiefly Russians, Buriats, and Tunguses. Pop. 674,900. The capital, IRKUTSK (52° 30′ N., 104° 10′ E.), is an important commercial centre and abp's see. Pop. (1910) 85,860.

IRMIN (Teutonic myth.), deity possibly invented to explain the *Irminsäulen* (Irmin pillars) of the Herminones. There are considerable remains of an Irminsal in Westphalia; it is possibly a relic of pillar-worship.

IRNERIUS (*c.* 1050–*c.* 1130), famous jurist of Bologna, little of whose work remains.

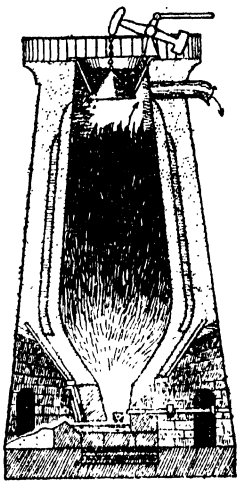
IRON (Fe; At. Wt. 56) is only found in its native state in meteorites and in certain platinum ores, and as such is very rare, but it exists abundantly as an oxide in the iron ores. Its S.G. varies from 7·84 to 8·14 in different varieties. It fuses at a very high temperature, but before doing so it becomes soft, in which condition it is easily welded. It is unaffected by dry air, but when moist, or in a moist atmosphere, especially in the presence of carbon dioxide, it easily rusts, the rust being a hydrated oxide of iron. At a red heat it decomposes water, liberating hydrogen and combining with the oxygen to form the black magnetic oxide of iron.

COMPOUNDS.—It combines with oxygen in various proportions to form three oxides—(1) *ferrous oxide* (FeO), also called *protoxide* and *iron monoxide*; (2) *ferric oxide* (Fe_2O_3), *sesquioxide*, or *red oxide*, used as a pigment (rouge) and polishing powder; (3) *ferroso-ferric oxide* (Fe_3O_4), *black oxide*, or *magnetic oxide*. This form is considered a combination of the first two, viz. $Fe_2O_3 . FeO$. The first two oxides form the bases of the *ferrous* and *ferric salts* of iron respectively, whilst the third yields both ferrous and ferric salts. Some of the ferrous salts, such as the carbonate and phosphate of iron, are largely used for medicinal purposes.

The physical properties of iron cannot be definitely stated, because they are diametrically opposite in different varieties of the metal; thus, iron is both extremely hard and very soft, brittle in one form and

ductile in another, easily susceptible to magnetism in one state and non-magnetic in another; one variety readily welds whilst another does not; and so for a number of other physical properties. The chief factors which profoundly affect its properties are (*a*) the treatment it has received in process of manufacture, (*b*) the quantity of carbon it contains, and (*c*) the presence of impurities, however small in amount. Microscopic study has shown that foreign substances such as sulphur and phosphorus form a weak kind of mortar between the crystals of the metal and greatly reduce its strength. The presence, however, of small quantities of carbon results in the production of a carbide which has a much finer structure than that of pure iron and adds to its strength.

The amount of the carbon content so greatly modifies the metal that, broadly speaking, iron may be divided into two classes, *wrought iron* and *steel*, containing less than 2·2 % of carbon and *cast iron*, with a greater percentage of carbon. The thermal treatment of iron produces remarkable changes—steel becomes very hard and brittle if cooled quickly by plunging it while hot into a bath of water or oil, but if cooled slowly it is malleable; iron at a red heat is malleable and easily forged into any required shape, but not so when cold; steel rails after prolonged use gradually become brittle and consequently dangerous, but if heated for some time at a temperature of about 900° C. they can be made tough and elastic again.



The use of iron by man dates back for thousands of years, although, historically, it comes later than gold, silver, or copper, these metals being more easily obtained from their ores than iron. There is abundant evidence that the Romans manufactured iron in great quantities during their occupation of Britain. Their process was, however, very crude and wasteful. It was the inventions of the last two cent's that resulted in the cheap production of iron in large quantities and its use for purposes hitherto undreamed of. About 1735 coke supplanted charcoal as a fuel; the processes of puddling and rolling were invented by Henry Cort in 1784; the hot blast was introduced by Neilson in 1830, and in 1856 Bessemer patented his process of manufacturing steel.

Commercially, iron is extracted from its ores, the chief varieties of which are: *magnetite* (Fe_3O_4) or *magnetic iron ore*, which contains about 73 % of iron; *red hæmatite* (Fe_2O_3) or *red oxide* (specular iron ore), yielding about 70 % of iron; *brown hæmatite* ($2Fe_2O_3.3H_2O$) or *limonite*, which is really the red hæmatite containing water, and yields about 60 % of iron; *spathic iron ore* ($FeCO_3$) or *siderite*. This is found either as *clay band* (spathose iron mixed with clay) or as *black band* (clay band containing from 20 to 25 % of bituminous coal); *iron pyrites* (FeS_2), an ore not used for extracting iron, but for manufacturing sulphuric acid.

All these ores are impure, being associated with mineral substances such as quartz, limestone, etc. About two-thirds of the ore mined in Great Britain is siderite. The chief sources of supply extend from Northampton to Glasgow, and about half of this supply comes from the Cleveland district of North Yorkshire.

In the manufacture of iron from clay or black band three steps are necessary: (1) water, carbon dioxide, and any sulphides present are expelled from the ore by calcination or roasting. The ore is broken into small pieces, spread in open heaps, mixed with small coal, and set to burn slowly for a long time. The roasting is also carried out in kilns. (2) The ore is deoxidised, that is, the iron is separated from the oxygen with which it is in chemical combination, and (3) separated from the mineral matter with which it is associated. These last two processes are performed in the blast furnace, in which the calcined ore, mixed with limestone and coke, is smelted. The coke acts as fuel, and the limestone as a reagent, which combines with the siliceous substances in the ore and forms a fusible 'slag.'

The BLAST FURNACE is shown in section. Externally its form is that of a truncated cone with a broad base, internally it is barrel shaped; in height it varies from 70 to 100 ft. The furnace is kept going for years without cessation. The mixture of coke, ore, and lime is put in at regular intervals at the top, the furnace being there closed by a cup and cone arrangement, which prevents the escape of heat. A machine forces through the furnace a powerful blast of air, which burns the fuel. The air before being admitted is first passed through pipes in an oven, heated by the hot waste gases from the furnace; this raises the blast to a temperature of from 300° to 600° C., and results in an enormous saving of fuel. The introduction of the hot blast has played a very important part in the development of ore-smelting. The chemical reactions which take place in the furnace are of too technical a nature to be dealt with here. The fused iron, on account of its weight, sinks to the bottom of the furnace with the slag floating on its surface; the latter as it accumulates is permitted to overflow through the 'slag hole.' The molten iron, carburised by the fuel, is drawn off at regular intervals and allowed to run on to a sanded floor, the sand being arranged to form moulds. In many works a casting machine now takes the place of the sanded floor. The product of the blast furnace is termed *pig iron* or *cast iron*, and of this two kinds are produced—grey and white—depending on the proportions in which the coke, limestone, and ore are mixed. The white pig iron contains its carbon in a chemically combined form, and is used for making wrought iron and steel, while the grey iron, which has its carbon physically mixed throughout, is utilised for castings.

SECTION OF BLAST FURNACE.

Pig iron is converted into *wrought iron* in a reverberatory furnace by a puddling process, which expels most of the carbon and other impurities from the metal. The furnace, the bed of which has a lining of ferric oxide, is so arranged that the iron does not come into contact with the fuel. The carbon combines with the oxygen of the furnace bed lining and passes off as a gas; the iron becomes soft and pasty, and while in this condition it is worked up into lumps (*blooms*), removed, and each bloom either hammered by a steam-hammer or squeezed in a squeezer. The hammer or squeezer squeezes out any slag which may have become mixed with the iron, and welds the metal into a solid mass. The bloom is then rolled into a bar and cut. Frequently the bars are reheated and rolled again. Wrought iron contains only a trifling quantity of carbon—from ·06 to ·15 %.

Steel only differs from iron in the quantity of carbon it contains, a quantity which is less than that in cast iron and greater than that in wrought iron. Hence it can be manufactured either from an iron containing a quantity of carbon by the removal of some of that element, or from a pure iron by the addition of carbon or by a combination of these two processes. This last is the means adopted in the *Bessemer Process*, by which steel is at present mostly produced. In this process liquid cast iron is run into a large pear-shaped vessel, called a *converter*, mounted on trunnions so that it can be swung either into a horizontal position in which it receives and empties its charge, or into a vertical position in which the 'blowing' is effected. A strong blast of air is blown through the liquid iron, and the impurities are thus burnt away in a very short time

(5 to 10 minutes). As soon as all the carbon has been removed—the operator can judge this accurately by the appearance of the flame issuing from the top of the converter—the exact quantity of carbon required (depending on the kind of steel to be produced) is added —generally in the form of *spiegeleisen* (a pig iron rich in manganese and carbon). The molten steel is then turned out into casts.

Steel alloys are coming largely into use for special purposes. An enormous number of these, possessing special qualities, can be made by alloying with the steel various percentages of certain metals with varying percentages of carbon. The chief steel alloys at present in use are *chrome* steel, *chrome-tungsten* steel, *nickel* steel, and *manganese* steel.

The numerous other methods in vogue, besides the Bessemer Process of manufacturing steel and the processes to which iron and steel are subjected in iron founding, castings, forging, drawing, rolling, etc., cannot be dealt with here. For these the reader is referred to books specially dealing with the subject.

Phillips and Bauerman, *Elements of Metallurgy*; T. Turner, *The Metallurgy of Iron*; F. W. Harbord, *The Metallurgy of Steel.*

IRON AGE, see AGE, ARCHÆOLOGY.

IRON CROSS, order of knighthood for bravery in battle; founded by William III. of Prussia, 1813; revived, 1870.

IRON DUKE, see WELLINGTON.

IRON GATES, narrow gorge and rapids (now navigable) between Carpathians and Balkans.

IRON HAND, see BERLICHINGEN.

IRON MASK, name applied to a prisoner in the Bastille in Louis XIV.'s reign. The mask was in reality of black velvet, and its wearer's identity still remains matter for speculation. It is known that he was brought from Pignerol to Sainte-Marguérite, and transferred to Bastille in 1698; that his face was always masked and his name never divulged; and that he died in 1703 and was buried at St. Paul, his name being then given as Marchiali, his age as forty-five. Early theories concerning his identity were numerous; among other conjectures, he is said to have been an illegitimate son of Louis XIV., an illegitimate son of Anne of Austria, a twin bro. of Louis XIV.; but all these and many other theories are now known to be incompatible with facts of history.

A later theory, which for some time gained credence, was that the Mask was Count Mattioli, Duke of Mantua's minister, who was imprisoned for treachery to Louis XIV.; but against this it is argued that Mattioli did not reach Pignerol until several years after the masked prisoner's arrival there, and that he remained behind when the latter was transferred, with the gov., Saint-Mars, to Exiles. He has also been identified with an Ital. adventurer, M. de Marchiel, imprisoned on suspicion of plotting to assassinate Louis XIV., but other writers say that Marchiel was put to death in 1669. And, finally, he is thought by many critics to have been one Eustache Dauger, who, when in Bastille, acted as valet to Foucquet and whose previous history remains obscure.

Andrew Lang, *The Valet's Tragedy* (1903); Jung, *La Vérité sur le Masque de Fer* (1873).

IRON MOUNTAIN (45° 48′ N., 88° 5′ W.), city, Michigan, U.S.A.; iron mines. Pop. (1910) 9216.

IRON, RALPH, see SCHREINER, OLIVE.

IRONSIDE, surname of Eng. king, Edmund (1016–17); applied by Prince Rupert to Cromwell after *Marston Moor* (1644), and afterwards to his soldiers.

IRONTON (38° 30′ N., 82° 30′ W.), city, Ohio, U.S.A., on Ohio; iron and coal industries. Pop. (1910) 13,147.

IRONWOOD (46° 27′ N., 90° 10′ W.), city, Michigan, U.S.A., on Montreal River; iron mines. Pop. (1910) 12,821.

IRON-WORK, important branch of hist. ornament; Germany had famous mediæval and Renaissance workers in this style.

IRONY, mode of speech conveying a meaning directly opposite to natural meaning of the words used; cf. Plato's dialogues, or Swift's arguments.

IROQUOIS, N. Amer. Indians, who formed the famous six nations (Cayugas, Mohawks, Oneidas, Onondagas, and Senecas); took Brit. side against French and Americans. Morgan, *League of the Iroquois*. See INDIANS, RED.

IRRAWADDY, IRAWADI (16° 30′ N., 95° 5′ E.), principal river of Burma, India; total length, c. 12,300 miles; navigable for small craft; spreads into wide delta with some dozen mouths in W. of Martaban Bay; affords chief means of communication in Burma. On its banks stand Rangoon, Mandalay, Bassein, Prome, and Ava. Largest tributary is the Chindwin.

IRREDENTISTS, political party in Italy, which in 1876 was placed at head of government; aimed at recovery of *Italia Irredenta* ('Unredeemed Italy'), *i.e.* those territories which at one time formed part of Italy, and were held by Austria and other powers.

IRRIGATION is the artificial distribution of water for purposes of vegetation. In the form of *baling* water on to the fields it was used in the earliest times, and is still used in remote districts of India. The *reservoir* system, consisting of tanks in which rain-water is collected, is very old, but is bad because the system is dependent on the amount of rainfall, and the tanks are apt to become filled with mud or silt. *River-fed canals* vary according to the river and the situation. The water may be almost pure, filled with barren mud, or charged with fertilising material. This system succeeds best when the river maintains a fairly uniform supply of water throughout the season, whereas, if it is almost dry at one season and excessively flooded at another, *sluices*, *dams*, and waste outlets are necessary as controls, and they are very costly. Where the rivers are large, the canals are easily managed, because the rivers are not so liable to sudden change. Thus the Nile, with its African lake supply, and the Ind. rivers fed from the glaciers, are never entirely diminished, and are very favourably situated for this river-fed canal system. In most parts only seasonal i. is wanted. Where water has to be distributed throughout the year it is satisfactory if one-third of the crop-bearing area can be supplied. If the land is irrigated it must be drained or the soil will deteriorate, for the water, if allowed to evaporate, will, in time, leave behind on the surface soil excess of salts which it has carried in solution. In Egypt and most other countries the canals are taken along crests and the drains are led along the hollows.

WATER MEADOWS are fields which are flooded with water during the winter and on which certain crops are grown. The soil filters out and retains certain materials which the ensuing crop makes use of. Clear water is used for grass meadows. River water with sewage is suitable for arable land. Water from peat moors, as it contains acid, is not suitable for any kind of i. If water is once used for i. it loses a great deal of its value, as plant food is filtered out of it.

BEDWORK IRRIGATION is the most suitable for level ground. It is the most efficient and most costly. The ground is thrown into beds or ridges. A *conductor* carrying the water supply should start at the highest end of the meadow and should terminate in a feeder, or, where there are no feeders, the main drain should be at the lowest part of the field. The ground is formed into beds at right angles to the line of the conductor. The length and width of the beds is regulated by the amount of water which can be supplied and by the steepness of the slope from the conductor to the drain. *Feeders*, channels with a wide lower end, are led between the beds. A too rapid flow of water along the feeders is prevented by placing stones or turf, *stops*, in them. The main conductor should be controlled by *sluices* of stone and mortar.

CATCHWORK IRRIGATION is suitable for the slopes of valleys. The conductors, except the main, are used both as drains and distributors. In UPWARD IRRIGATION the water which should be carried away by drains is

carried by means of pipes upwards through the soil and there evaporated. WARPING raises the level of the ground, and manures and irrigates the soil. It is carried out on the land near estuaries or tidal rivers. Main conduits are led from stone sluices with strong iron doors. Mud and water are carried to the fields; the mud remains, while the water returns to the river with the falling tide. The mud so deposited is very rich and suitable for any crop.

The object of i. is not only to supply moisture to plants, because comparatively few plants require so much moisture as has to be supplied if i. is to be successful. The water always brings with it a certain amount of nourishment. I. aids in the solution and distribution of the food already present, and helps in the oxidation of any excess of organic matter in the soil. Water meadow i. keeps the frost from acting so severely on the roots in winter, and encourages the growth of the roots of grasses. It has been observed that after repeated i's of this kind several persistent weeds become extinct.

IRULAS, tribe of the Nilgiris, India, numbering *c.* 80,000.

IRUN (43° 21′ N., 1° 47′ W.), town, Guipúzcoa, Spain, on Bidassoa; iron-works. Pop. 10,000.

IRVINE (55° 36′ N., 4° 39′ W.), royal burgh and seaport, on river Irvine, Ayrshire, Scotland; chemical works; foundries. Pop. (1911) 10,180.

IRVING, EDWARD (1792–1834), Scot. preacher; ed. at Edinburgh Univ.; teacher at Haddington and Kirkcaldy; obtained a preaching licence, 1815; went to Edinburgh, 1818, and to the Caledonian Church, London, 1821; became a popular preacher, his passionate utterance and remarkable personality drawing large crowds to listen to him; after a time popularity dwindled; owing to the revival, as he thought, of prophecy and healing, founded the *Catholic Apostolic* or *Irvingite Church* in 1832; d. exhausted with his labours. *Life*, by Mrs. Oliphant.

IRVING, SIR HENRY (1838–1905), Eng. actor; changed his name from JOHN BRODRIBB; early went on stage; his tenure of the Lyceum as actor-manager was epoch-making in history of Eng. drama. I.'s success depended on wonderful poetic imagination; his school has been displaced by strong modern current in favour of realism. His sons, HENRY B. (1870–) and LAURENCE (1872–), are actors with much of I.'s quality.

IRVING, WASHINGTON (1783–1859), Amer. author; called to the Bar, but never practised; first literary success, amusing sketches, *Salmagundi*, written in collaboration with his bro. William and Paulding. In 1809 appeared satirical *History of New York*, by 'Diedrich Knickerbocker.' He went to England (1810) and wrote sketches of Eng. life, visited Spain and wrote biography of Columbus, etc. His various biographies are still read for the sake of their style and judgment, though contributing little new in fact. I. was a master of mockery. *Life* by Warner (Amer. Men of Letters Series).

IRVINGITES, CATHOLIC APOSTOLIC CHURCH (*q.v.*).

IRVINGTON (40° 43′ N., 74° 13′ W.), town, New Jersey, U.S.A.; residential suburb 3 miles S.W. of Newark. Pop. (1910) 11,877.

ISAAC, Bible character; only child of Abraham and Sarah, and f. by Rebecca of Esau and Jacob. Abraham's faith was tried by being bidden to slay him. Christ was his antitype, and he was held up as a model by St. Paul (*Hebrews* 11).

ISAAC I., COMNENUS (d. 1061), East Rom. emperor (1057–59), and founder of dynasty of the Comneni; made important reforms.

ISAAC II., ANGELUS (d. 1204), East Rom. emperor; defeated Normans in Sicily; obstructed Third Crusade; deposed and blinded by his bro.; illustration of Byzantine decadence and vice.

ISAAC OF ANTIOCH (fl. V. cent.), writer to whom are ascribed nearly 200 eloquent didactic sermons in metre in the Syrian tongue.

ISABELLA (1451–1504), in own right Queen of Castile; m. Ferdinand V. (*q.v.*), king of Aragon, 1469; a wise ruler, but fanatical; patron of Columbus.

ISABELLA II. (1830–1904), queen of Spain; succ., 1833; her uncle, Don Carlos, disputed her right, and her reign was marked by plots and intrigues; abdicated, 1870.

ISABELLA, or ELIZABETH, OF BAVARIA (1370–1435), queen of France; wife of Charles the Mad (1385); misruled the kingdom, which she granted to England at Troyes (1420); of evil fame and hated in France.

ISABELLA OF HAINAULT (1170–90), queen of France, who brought Artois to the Crown.

ISABEY, JEAN BAPTISTE (1767–1855), Fr. miniature painter of First Empire; one of greatest masters of this art.

ISÆUS (fl. 365 B.C.), Attic forensic orator; pupil of Lysias and teacher of Demosthenes; first speech written about 389 B.C.; continued in his profession for about thirty-six years; specially noted for skill in inheritance cases. Twelve of his speeches are still in existence, eleven concerning inheritance suits; less graceful in style than Lysias, but more logical in reasoning, though inferior to Demosthenes.

Jebb, *Attic Orators*.

ISAIAH, the greatest of the Old Testament prophets; received the call *c.* 740 B.C., and d. some time after 701. His book has given rise to a great theological and critical lit. It is not one continuous work, but a collection of prophesies of varying date. Large portions of chaps. 1–39 are the work of I. himself. But it is now universally held that chaps. 40–66 date from after the return from exile, and were written therefore *c.* 540 B.C.; chaps. 60–66 may be later still,—V. cent. B.C.,—while Kenneth would date considerable portions of the whole book in the II. cent. Its hist., spiritual, and theological importance is as great as that of any Old Testament book.

Cheyne, *Isaiah, Chronologically Arranged*; Driver, *Introduction to Old Testament Lit.*, and *Isaiah: Life and Times*; Commentaries in *Cambridge Bible* (Skinner), *Century Bible* (Whitehouse), *Churchman's Bible* (Barnes), *Expositor's Bible* (Smith); Kenneth, *Composition of Isaiah* and *Servant of the Lord*.

ISAIAH, ASCENSION OF, apocryphal work dating in present form from probably about A.D. 200. R. H. Charles, who has thoroughly examined it, believes it made up of (1) *Martyrdom of Isaiah*, (2) *Testament of Hezekiah*, (3) *Vision of Isaiah*. Written in Gk.; (2) possibly in Semitic; these three probably written end of I. cent.

ISANDHLWANA, ISANDULA (28° 24′ S., 30° 38′ E.), hill, Zululand, S. Africa; scene of memorable Brit. disaster in Zulu War (1879). See NATAL.

ISAR (48° 36′ N., 12° 19′ E.), river, Bavaria, Germany; ancient ISARUS; rises in Tyrol; joins Danube near Deggendorf; length, *c.* 200 miles.

ISAURIA (37° 20′ N., 32° 10′ E.), ancient district, Asia Minor, on N. slope of Taurus; seat for cent's of a race of robbers who, defeated successively by Servillus and Pompey, remained still barbarous and unsubdued.

ISCHIA (40° 44′ N., 13° 55′ E.), island of Italy, W. of the Bay of Naples; of volcanic origin; very fertile; wine, fruit, oil, and corn produced; has warm mineral baths; chief towns, ISCHIA and Casamiccola; visited by earthquakes in 1881 and 1883. Pop. 28,000.

ISCHL, BAD ISCHL (47° 44′ N., 13° 37′ E.), watering-place, Austria, at junction of Traun and Ischl; brine and other baths; important centre of salt industry. Pop. (1910) 10,188.

ISEGHEM (50° 55′ N., 3° 12′ E.), town, W. Flanders, Belgium; linen, lace, tobacco. Pop. 12,172.

ISEO (45° 45′ N., 10° 3′ E.), lake, Lombardy, Italy, traversed by the Oglio; length, *c.* 15 miles; ancient *Lacus Sebinus*.

ISÈRE (45° 25′ N., 5° 25′ E.), department, S.E

France, formed from part of ancient Dauphiné; surface mountainous; chief rivers, Rhône and Isère; produces wheat, wine, fruit; coal and iron worked; manufactures gloves, paper, iron and steel goods; chief town, Grenoble. Pop. (1911) 555,911.

ISÈRE (45° 2′ N., 5° 10′ E.), river, S.E. France; traverses Savoy and Dauphiné; joins Rhône 6 miles N. of Valence; course, c. 180 miles.

ISERLOHN (51° 23′ N., 7° 42′ E.), town, Westphalia, Germany, on Baar; iron- and steel-works. Pop. (1910) 31,294.

ISFAHAN, see ISPAHAN.

ISHIM (56° 6′ N., 69° 25′ E.), town, Tobolsk, W. Siberia, on Ishim; large annual fair. Pop. c. 7000.

ISHMAEL (Book of *Genesis*), son of Abraham and Hagar; an 'ethnic' name.—ISHMAELITES, tribe to whom Israelites were akin.

ISHPEMING (46° 30′ N., 87° 42′ W.), city, Michigan, U.S.A.; in centre of iron district. Pop. (1910) 12,448.

ISHTAR, ISTAR, Babylonian and Assyrian goddess, worshipped in Phœnicia as Astarte (*q.v.*).

ISIDORE OF ALEXANDRIA (fl. 500 A.D.), a Neo-Platonic philosopher; and mystical thinker.

ISIDORE OF SEVILLE, ISIDORUS HISPALENSIS (c. 560–636), learned ecclesiastic of Western Church; collected numerous propositions covering entire plan of salvation.

ISIDORIAN DECRETALS, see DECRETALS.

ISINGLASS, the cleaned, dried swimming-bladder of fish, that from sturgeon being most valuable; uses are to clarify beer and wine by mechanical precipitation of particles, and to give lustre to silk.

ISIS, Egyptian goddess; wife of Osiris; often represented with her s. Horus in way suggestive of Virgin and child; her worship spread to Greece and Rome and was powerful rival of Christianity; her sacred animal was the cow. See EGYPT.

ISIS, old name for upper Thames (*q.v.*).

ISKANDERUN, see ALEXANDRETTA.

ISKELIB (40° 45′ N., 34° 10′ E.), town, Angora, Asia Minor. Pop. c. 15,000.

ISLA, JOSÉ FRANCISCO DE (1703–81), Span. Jesuit; author of witty burlesque, *Fray Gerundio de Campazas*, etc.

ISLAM (Arab. 'obedience,' 'pious'), name applied to the Muhammadan religion from its salient trait, resignation to will of Allah. See MUHAMMADANISM.

ISLAMABAD (33° 43′ N., 75° 17′ E.), town, Kashmir, India, on Jhelum; cotton and woollen goods. Pop. 9500.

ISLAND, a piece of land wholly surrounded by water, originating either by submersion of connecting portion of mainland, or volcanic upheaval of parts of the ocean bed.

ISLAY (55° 45′ N., 6° 15′ W.), island, Inner Hebrides, Argyllshire, Scotland; ancient seat of Lord of the Isles; industries—stock-raising, dairy-farming, and whisky-distilling. Pop. (1911) 6387.

ISLE OF FRANCE, former name of MAURITIUS.

ISLES OF THE BLEST, or FORTUNATE ISLANDS (classical myth.), islands inhabited after death by those who received immortality; sought for in Atlantic between Portugal and the New World by navigators of the Renaissance.

ISLINGTON, parliamentary borough of London, 2 miles N. of St. Paul's. Pop. (1911) 327,423.

ISLIP (40° 45′ N., 73° 25′ W.), town, summer resort, New York, U.S.A. Pop. (1910) 18,346.

ISLY (c. 34° 30′ N., 2° W.), small river, E. Morocco; scene of defeat of Moroccans by Fr., 1844.

ISMAIL, see IZMAIL.

ISMAIL HADJI MAULVI-MUHAMMAD (1781–1831), founder of new Muhammadan sect.

ISMAIL PASHA (1830–95), khedive of Egypt; grandson of Mehemet Ali; made Egypt virtually independent of Sultan of Turkey, who acknowledged him as khedive, 1873; engaged in internal reforms and great public works, chief of which was construction of Suez Canal; became so involved in debt that he sold his shares in Canal to Brit. Government; compelled to abdicate by France and Britain, 1879.

ISMAILIA (30° 40′ N., 32° 20′ E.), town, Lower Egypt, on Lake Timsah, Suez Canal; founded 1863. See also GONDOKORO, IZMAIL. Pop. 10,000.

ISMAY, THOMAS HENRY (1837–99), Brit. shipowner; founded White Star Co. (I., Imrie, & Co.).

ISMID (40° 45′ N., 29° 57′ E.), town, on Gulf of I., Asia Minor; seat of Gk. and Armenian abp's; ancient *Nicomedia*. Pop. c. 20,000.

ISNARD, MAXIMIN (1758–1825), Fr. revolutionary regicide and leader of Girondists, later became Imperialist and Royalist.

ISOBARS, lines joining places which have same barometric pressure. See METEOROLOGY.

ISOBUTYL ALCOHOL, see BUTYL ALCOHOLS.

ISOCHRONISM (Gk. *isos*, equal, and *chronos*, time), property possessed by pendulum when its oscillations, large and small, are performed in equal times; this occurs only when it moves in a cycloid arc. See CYCLOID.

ISOCLINIC, see MAGNETISM (TERRESTRIAL).

ISOCRATES (436–338 B.C.), Gk. orator; friend of Plato, who highly esteemed his talent for rhetoric and philosophy; b. at Athens; ed. by Socrates and several of best-known Sophists. Most of his speeches were published as pamphlets, as weakness of voice prevented his appearance in public as an orator; he gave lessons in oratory at Chios, and later at Athens, many well-known writers and orators being among his pupils (*e.g.* Isæus, Lycurgus, Timotheus, Æschines). For a few years he adopted the profession of speech-writing, but in this he was less successful than as a teacher. In politics he aimed at uniting all Greece against Persia, and late in life he appealed to Philip of Macedon to lead the Greeks against Persia; subsequently, hearing of Philip's victory over the Athenians at *Chæronea*, he starved himself to death. His writings include the *Panegyricus* (written c. 380 B.C.), exhorting Athens and Sparta to take the lead against Persia, and the *Philippus*, the aforementioned appeal to Philip of Macedon, the *Areopagiticus*, and other political works. He also wrote some educational pamphlets, some letters containing moral exhortations, the *Panathenaicus*, an historical work, and the *Encomium on Helen*. His style shows great polish and perfection; but his matter is marked by paucity of ideas. Jebb, *Attic Orators*.

ISODICTYA, see under SPONGES.

ISOGONIC, see MAGNETISM (TERRESTRIAL).

ISOLA DEL LIRI (41° 40′ N., 13° 34′ E.), small town, on Liri, Caserta, Italy. Pop. 8700.

ISOMERISM (chem.) is the phenomenon seen when compounds occur having the same molecular formula but different constitutions. Such compounds are called *Isomers* or *Isomerides*, and they differ in the arrangement of their atoms. For every possible arrangement of atoms with a given *valency*, there is a *Graphic Formula* representing an isomer. Thus supposing carbon to be tetravalent, the hydrocarbon butane with the molecular formula C_4H_{10} can be represented by two graphic formulæ. There should be and there are two isomers. The number of possible isomers increases with the number of carbon atoms in the molecule.—OPTICAL, PHYSICAL, or STEREO-ISOMERISM: these isomers have the same graphic formula, but they differ in their action on polarised light and in certain physical properties. Such isomerism occurs only in substances which have a carbon atom combined directly with four different groups (asymmetric carbon atom).

ISOMORPHISM, see under CRYSTAL.

ISOPLEURA, a sub-class of GASTEROPODA.

ISOPODS, see under MALACOSTRACA.

ISOPTERA, see TERMITES.

ISOTHERM, see METEOROLOGY.

ISPAHAN, ISFAHAN (32° 41′ N., 51° 52′ E.), province and town, Persia. Province bounded N. by

Kashan, Natany, and Irak, E. by Yeyd, S. by Fars, W. by Bakhtiari district and Arabistan; mostly fertile country, producing quantities of rice, wheat, barley, cotton, opium, and tobacco. Town, once capital of Persia, situated on the Zāyendeh River, surrounded by beautiful orchards, avenues, and fields; formerly magnificent city of great importance, now practically in ruins, with deserted streets and dilapidated houses. Of many splendid buildings little remains but ruins; most interesting features are square, called Maidan Shah, numerous mosques (particularly Mesjid Shah), minarets, ruined palaces, castle of Tabarrak, ruinous mud walls, some fine bridges, and line of covered bazaars; some buildings lately rebuilt. Suburb of Julfa, once extensive Armenian town, now almost uninhabited. I. is still of considerable commercial importance; manufactures include firearms, glass, earthenware, brocade and velvet fabrics. Pop. 75,000.

ISRAEL, name given to Jacob after his wrestle with the angel (*Genesis* 32[28]); 'Children of I.' shows mixed patriarchal and theocratic elements in early chief of a tribe. See also JEWS.

ISRAELI, ISAAC BEN SOLOMON (*c.* IX. and X. cent's), Jewish physician and philosopher; flourished in N. Africa; author of medical and philosophical works in Arabic, later trans. into Latin.

ISRAËLS, JOSEF (1824–1911), great Dutch-Jewish painter; his characteristics are tragic sense, delicacy and richness of treatment, and choice of poverty and misery for subject.

ISSACHAR, tribe of Israel named from Jacob's ninth son.

ISSEDONES, extinct Asiatic tribe of cannibals mentioned by Herodotus.

ISSERLEIN, ISRAEL (d. 1460), Ger. writer on Hebrew antiquities.

ISSERLES, MOSES BEN ISRAEL (*c.* 1520–72), Polish Jew; author of theological works.

ISSOIRE (45° 32′ N., 3° 15′ E.), town, Puy-de-Dôme, France; ancient *Issiodorum*; nearly destroyed during the religious wars, 1574–77. Pop. 5650.

ISSOUDUN (46° 57′ N., 2° E.), town, Indre, France; textiles, agricultural implements. Pop. 14,200.

ISSUS, ancient city, Cilicia, Asia Minor; scene of victory of Alexander the Great (*q.v.*).

ISSYK-KUL (42° 30′ N., 77° 30′ E.), lake, Central Asia; area, *c.* 2200 sq. miles.

ISTAHBANÁT (29° N., 54° E.), town and district, Fars, Persia; fertile, fruit and grain. Pop. *c.* 11,000.

ISTAMBOUL, see CONSTANTINOPLE.

ISTER, ancient name for Danube (*q.v.*).

ISTHMUS, a narrow neck of land connecting two larger portions of land, *e.g.* i. of Corinth, i. of Panama.

ISTRIA (45° 20′ N., 13° 55′ E.), margraviate, Austria, forming a peninsula in N.E. of Adriatic; generally mountainous; produces fruit and wine. Pop. (1910) 403,566.

ISYLLUS, Gk. poet of Epidaurus (fl. IV. or III. cent. B.C.); name and inscription alone commemorate his existence.

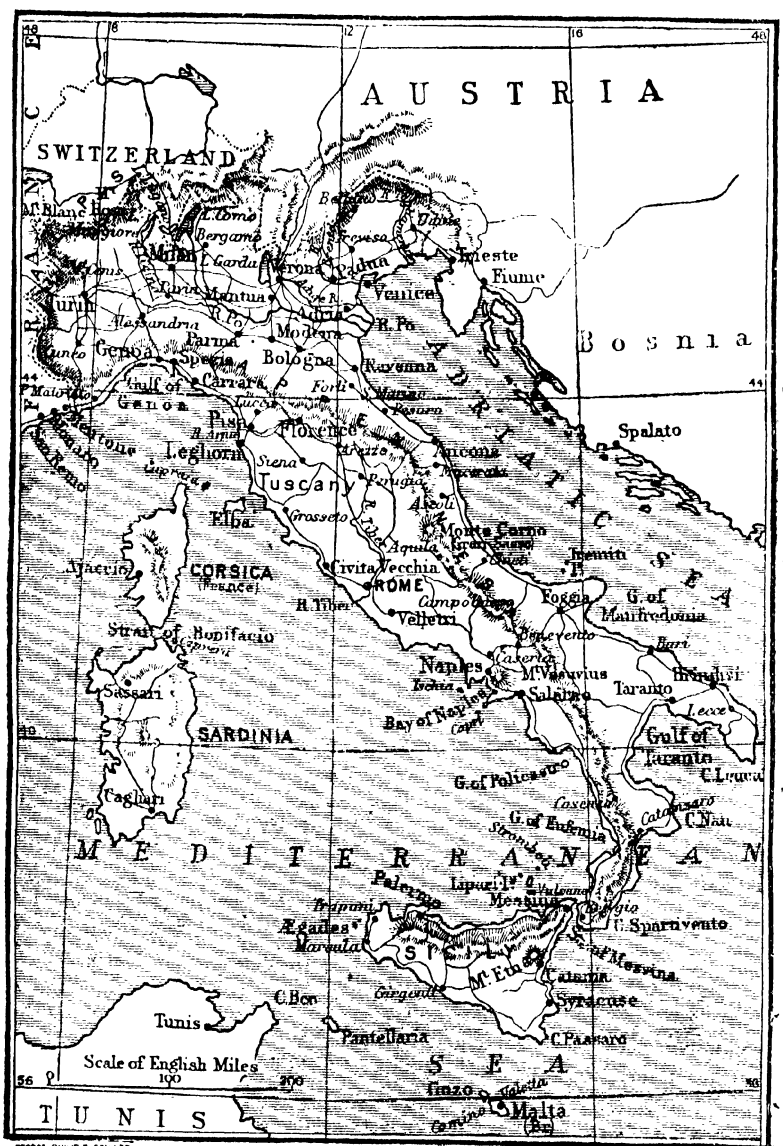
ITAGAKI, TAISUKE, COUNT (1837–), Jap. politician; helped to suppress Shogunate rebellion, 1868; has held various offices of state; Home Minister, 1898; advocated constitutional government.

ITALIA IRREDENTA, 'Unredeemed Italy,' embraces those districts out of Italy where Ital. speech prevails, such as S. Tyrol, Trieste, Istria, Dalmatia. See IRREDENTISTS.

ITALIC, term applied to Composite order of architecture; also to a Lat. edit. of the *Bible*; Italian as distinguished from 'Roman'; kind of type, e.g. *Italic*.

ITALY, a kingdom in S. Europe, is about 700 miles long, and the peninsula of which it mainly consists varies in breadth from 100 to 150 miles. It is bounded on the N. by the long chain of the Alps, and is therefore a natural besides a political entity; only on the N.E. is the boundary artificial. The N. is largely filled with the basin of the Po, which takes into itself the waters of many tributaries. Just N. of the mouth of the Po is that of the Adige, on one of the lagoons of which stands Venice. The long chain of the Apennines, almost an offshoot from the Alps, runs right down the peninsula, starting at the N.E. corner, where they fringe the beautiful coast strip known as the Riviera. The Apennines spread out into a number of ranges in Central Italy, and have thus broken up the country and facilitated political disunion. The climate of this central part varies considerably, for the higher land is bleak while the valleys are warm and comparatively luxuriant. The two rivers of Central Italy are the Arno and the Tiber; on the former stands Florence, on the latter Rome, and the country they flank is volcanic. The Po is the only Ital. river that surpasses the Arno in size. S. of Rome is the Campagne, an open plain. S. Italy is mostly broken up, particularly Calabria, but here there are no rivers of importance. The only important lakes in Italy are those in the N. The Lake of Garda is the biggest, that of Maggiore is the longest (37 miles). Como has a depth of over 1300 ft.

The Ital. *climate* varies greatly in different places and in different times of the year. Summer heat in the N. is as great as in the S. of Italy, but in winter it is as cold as N. Europe. Oranges and lemons grow on the coast of Calabria, but a few miles inland the climate more resembles that of England. The great scourge of the S. is malaria, and parts formerly inhabited are now dreary wastes. Malaria is, however, being reduced; pellagra is prevalent. Earthquakes at intervals convulse the S. (especially Calabria and Sicily); Vesuvius and Etna are active volcanoes.



HISTORY.

Ancient Times.—Until the XIX. cent. Italy was never a political unity, but either a number of states and peoples or a member of a larger whole—the Roman Empire. The name Italy was applied by the Greeks to a district in the S., only later to the whole peninsula. Her early history is dark, but ethnology and archæology afford us some glimpse of her condition, and fairly reliable maps have been constructed showing her as she was—say, 500 B.C. The greater part of the peninsula was occupied then by the 'Italic' branch of the Aryan (or at any rate Aryan-speaking peoples). These, however, can be subdivided into the *Latin* on the one hand and the *Oscan*, *Volscian*, and *Umbrian* on the other. These last three are really *Sabine* (or, as some modern scholars prefer, Safine). This is a linguistic classification, but also ethnological.

Rome was a Latin community, though not the earliest town founded, according to tradition, which is probably correct. The early history of Rome is much obscured by myth, but it is probable that an originally pure population (the patricians) won the supremacy over a mingled 'plebeian' population. There was probably a Sabine element in early Rome. In the N.E. of Italy dwelt the *Veneti*; they and the *Iapygians* in the S.E. were probably of Illyrian stock—speaking an Aryan but hardly an Italic language. In Sicily there were *Siculi* and *Sicani*, one probably, the other possibly, Italian; Phœnician traders had settled on the towns on the coast and there were the remnants of a strange people called the *Elymi*. Greek settlers, too, were a most important factor in primitive Italy from about the VIII. cent. B.C. onwards, and part of the S. was called *Magna Græcia*. A great part of N. Italy and one or two isolated districts farther N. were held by the *Etruscans*, one of the most interesting peoples of the ancient world, over whose linguistic and ethnological affinities there has been much dispute. It seems certain, however, that they were not Aryan. The remains of their language have never been properly deciphered. Their power reached its greatest *c.* 500 B.C. and then declined. N. of the Etruscans and all over the valley of the Po were the *Gauls*, who swooped down to sack Rome, 390 B.C. E. of them, around what is now the Gulf of Genoa, dwelt the

Ligurians, again of people of disputed race—certainly different from the Etruscans.

Thus Ancient Italy was made up of a number of diverse peoples who were ultimately welded together under the sway of Rome. The stages of this process really belong to Rom. history (see ROME). The influx of barbarian tribes on the collapse of the Empire brought a further infusion of diverse peoples, and this lack of homogeneity of race, together with geographical and political circumstances, was largely responsible for the subsequent divisions.

Under the Empire, *Cisalpine Gaul* (N. Italy S. of the Alps) was a province, hence Italy meant something smaller than it does for us. The reorganisation of the country was taken in hand by the Emperor Augustus.

Middle Ages.—It is impossible to draw a sharp dividing-line at any one point between mediæval and modern times, for the change took place at different times in different places. But we can fairly take 476 A.D. as the starting-point of mediæval history. Then the separate W. Roman Empire came to an end, and though the Empire continued in the E. for nearly a thousand years, and even in the W. recovered some of its territory in the next cent. under Justinian, in 476 Italy fell under the rule of a barbarian and alien, and by foreigners she was ruled for many cent's to come. Odoacer became king, but his reign did not last long, for in 488 Theodoric, king of the E. Goths, was ordered by the Emperor Zeno to subdue Italy. This he succeeded in doing by 493. He was in many ways a fine man, but an Arian, and this proved a hindrance to his power. Under Justinian Italy was invaded, and after a struggle of some years the Gothic kings came to an end in 553. Another Germanic invasion soon followed, for in 568 the *Lombards* came down into the valley of the Po; the Lombard king Albion made Pavia his capital. The pope, alarmed at this new power, called in the aid of the *Frank*. This is the first instance of a continued policy of disaster—the tendency of Ital. rulers to apply for foreign help against other powers in the peninsula. The immediate result of this was a firm alliance between the Franks and the Papacy, and the 'Donation of Pippin,' the founding of the temporal possessions of the Papacy in 756. Meanwhile much of S. Italy continued to belong to the Byzantine Empire, and the Lombard Duchy of Benevento still survived.

A new epoch begins in Ital. as in general European history with the Frank kings and the assumption by them of the Imperial title. Displacing the feeble Merovingian dynasty in the VIII. cent., they started on a career of conquest which culminated in the coronation of Charles the Great as Emperor of the Romans by Pope Leo III. in 800. But the exact powers of Pope and Emperor were not stated—a fact which led to future difficulties, for at the time each wanted the help of the other. The new Empire, however, soon fell to pieces, and it finally came to an end with the inglorious reign of Charles the Fat in 888. Meanwhile Sicily was a prey to Arab conquerors, and the Byzantine Empire again got a firmer hold in Italy. The political and social disruption of the decaying Karling had its parallel in the terrible degradation of the Papacy in the X. cent. A brighter period began again with the Saxon emperors when Otto the Great assumed the Imperial title at Rome in 962. There was still nominally an Italian king, Berengar, the successor of the

Karling kings, but he was conquered by Otto, and afterwards there was no real kingship till the XIX. cent.

Henceforth the control of the Holy Rom. emperors over Italy was but slight, and the states which were to play a prominent part till, only in our own day, Italy became united, now took shape. City life, which was to be such a prominent feature of Ital. life, began to develop, and the lead was here taken by Milan. Meanwhile a new ecclesiastical movement comes into prominence under the monk Hildebrand, who became pope under the title of Gregory VII. in 1073. He set himself a twofold task—(1) a moral reformation, particularly enforcing the celibacy of the clergy; (2) taking away from secular princes any control over the Church, particularly in the appointment to benefices. The result was the so-called Investiture Controversy, which ended in a nominal compromise, though the Church really came off victor. Hildebrand also strengthened the influence of the cardinalate in papal elections.

The XI. cent. saw also the advent of the *Norman* power in S. Italy and Sicily, where Greek, Lombard, and Saracen still contended for power. The Normans first landed in Apulia, 1017; William of Hauteville became Count, 1029; the years 1060–90 were spent in the conquest of Sicily; the title King of Sicily was taken in 1130.

From this time the communes in the N. became more and more important. Some memory of ancient liberties still lingered in Rome, where Arnold of Brescia tried to establish a republic, but without the permanent success of republican institutions in the N. The N. cities provoked the opposition of the Emperor Frederick I. (Barbarossa), but in the long-run they maintained their position. Frederick II.'s dominions were torn by the struggle between Empire and Papacy, and each Ital. city was rent by Guelph and Ghibelline factions, though the terms lost their original significance. Frederick II. was a 'brilliant failure,' and had he been able to rule in Italy alone it might have been well.

The XIV. cent. was the culmination of the Middle Ages, and 1300 was the date of Dante's vision. Afterwards all is on the decline, and the 'Babylonish Captivity' of the Papacy at Avignon marked a lowering of papal prestige. The popes were largely, though not entirely, under the influence of the Fr. kings. By the XV. cent. the great Ital. states, which were to last to the middle of the XIX. cent., were fairly marked out. Milan was under the family of the Visconti, who were succeeded by the Sforza. In Florence the Albizzi came into power in a reaction against commercial domination; they were succeeded by the Medici. Venice had lived her life apart from the rest of Italy, more in touch with the East than with the West. The Venetian constitution is one of the most remarkable in history (see VENICE); the power gradually passed from the hands of the doge to the oligarchy, particularly the 'Council of Ten.' After the fall of Constantinople in 1453, Venice had to throw in her lot with the Western powers.

The Papacy, after the return from Avignon, became Ital., princes putting secular power and the 'New Learning' of the Renaissance before spiritual affairs.

The kingdom of the Two Sicilies was fought for by houses of Aragon and Anjou.

The Italy of the XV. cent. is displayed in the work of Machiavelli, with its cleverness, brilliance, and political intrigue; there was a revival of learning and artistic splendour, but the general tone alike of private morals and of politics was bad.

But the Italy of the Middle Ages had produced one of the sweetest characters known to history in St. Francis, and the glories of Italian art had never been surpassed. But the moral collapse of the Renaissance would not have been so bad had Italians possessed something of the sturdier conception of national unity.

Modern History.—At the end of the XV. cent., therefore, Italy was divided against itself and at the mercy of rival foreign conquerors. The Papacy had shared in the splendour and worldliness of the classical Renaissance, and then its prestige in Europe was undermined by the Prot. revolt. Turkish aggression since the fall of Constantinople (1453) loomed in the background. The detailed history during the XVI. cent. is very intricate, but certain facts stand out. France ceased to meddle so much in the internal affairs of Italy, and the influence of Spain became predominant. The N. was a cluster of small states. Pope Paul III. (Alessandro Farnese) planted a dynasty in Parma. The Medici still ruled in Florence. Venice and Genoa were the only important republics. *Savoy*, under its duke, Emmanuel Philibert (1553–80), was in the ascendant. His family dated from the XI. cent., and in his time Italy really became an Ital. power. Its capital was moved from Chambéry to Turin. Venice fell from her great position in the XVII. cent.; mainly because of the opening up of new trade routes, and then for the time Italy became involved in the three great wars of the Spanish Succession, Polish Succession, and Austrian Succession. After the first, which was brought to an end by the *Treaty of Utrecht*, 1713, Victor Amadeus of Savoy became king of Sicily, which country was afterwards exchanged for Sardinia. The second, finished 1738, settled the succession in Parma and Tuscany. After the third had been brought to a close in 1748 by the *Treaty of Aix-la-Chapelle*, Milan and Tuscany became Austrian property. Genoa handed Corsica over to France in 1755. The latter part of the XVIII. cent. saw Italy slumbering under several benign despotisms—in some provinces under despotisms not benign, particularly in Naples.

A new era in Ital. history opened in 1796, when the country was drawn into the vortex of Napoleonic activity. At that time considerable parts of the country were held by Spain and Austria—by the former the Two Sicilies (a name frequently given to Naples and Sicily together) and Parma; by the latter, Tuscany, Mantua, and Milan. In 1796 a *Cispadane Republic* was founded at Modena and supported by Bonaparte, and next year a *Cisalpine* or *Transpadane Republic* at Milan. In 1798 the Venetian Republic, whose best days had been long since over, was finally crushed and her territory divided between Austria and France. Fr. troops took Rome (1798) and next year a *Parthenopean Republic* was founded at Venice. Then followed the invasion of Italy by the allied Austrian and Russian armies. In 1801, by the *Treaty of Lunéville*, Austria recognised the Ligurian and Cisalpine Republics so long as they were not under France. Meanwhile Napoleon had practical control over most of Italy and was determined to maintain it. In 1803 he was elected Pres. of the Cisalpine Republic, and next year his bro., Joseph Bonaparte, took the title of king of Italy. In 1805 he annexed the Ligurian Republic, whereupon Britain, Austria, and Russia combined against France; but after Napoleon's victory of Austerlitz, Austria gave up to France her share of Venetia and some of the Austrian lands along the Adriatic. Still many reforms were carried out by the Fr. rulers of Italy, particularly in the judicial sphere. Joseph Bonaparte exchanged his Ital. kingdom for Spain in 1808, and Murat was created king of Naples. Meanwhile, Napoleon quarrelled with the Pope and annexed the Papal States and took the Pope away, annexing Rome in 1810.

The *Papal States* were now under the direct government of Napoleon, and many salutary reforms were introduced, but trade was practically limited to France, and the number of men required for the Napoleonic armies was rather a strain. Napoleon's power in Italy declined after the disaster of the Russ. campaign, Austrian forces captured Milan in 1814, and by the *Treaty of Paris*, 1814, the *status quo* before the Revolution was restored. Sardinia got back Savoy and Nice and annexed Genoa; Austria got back her N. Ital. and Danubian lands. The restoration of the old régime was received with bitter feeling, particularly in Naples, where the Bourbon government, with its cruelty, bigotry, and incompetence was deservedly detested.

The period from 1815 to 1870 is often called the *Risorgimento*, that is, 'Reawakening.' Austrian

influence was predominant, repression provoked inevitable reaction of feeling, and revolutionary societies grew apace.

There was a revolution, for a time successful and then checked, in Naples in 1820, and another outburst in several parts of Italy in 1830. The famous Ital. patriot, Mazzini, wrote in 1831 to Charles Albert of Sardinia, asking him to renovate Society, and there were various schemes, some moderate, some extreme, afoot. 1846 saw the death of Pope Gregory XVI. and the election of Pius IX., a well-meaning man of some liberal sympathies, but neither a clear thinker nor a good statesman. He carried through some reforms, but things soon got beyond his control. 1848 was a time of revolutionary agitation all over Europe. In March there were disturbances in Lombardy, and there was an Ital. alliance against Austria—a war which the Pope, much to his distress, was obliged to sanction. In August there was a truce between Austria and Piedmont, in which the former relinquished Lombardy and Venetia.

There were commotions in Rome. The Pope's authority was defied and a republic was proclaimed. Ferdinand II., the King of Naples, was deposed, but restored. War broke out again between Piedmont and Austria, and the former was defeated at Novara. Garibaldi took Rome, but was then obliged to flee from the country. Austria won back Venice and again things became as they were before. For ten years Austria carried out a policy of vigorous repression in Lombardy and Venetia. The great reforming statesman in Piedmont was now Cavour, but he had to bide his time. At last Austria took to milder measures, but in Rome the government remained quite reactionary. A 'Societale Nazionale' was formed which looked to Victor Emmanuel of Piedmont to become the leader of a free and united Italy, though to unite N. Italy was the first step. Victor Emmanuel won the support of the Emperor Napoleon III., and war was declared by France and Piedmont against Austria in 1859.

But after a time Napoleon backed out and made an agreement with Austria by which Lombardy should be given to Piedmont and Venetia retained by Austria. Tuscany was annexed by Piedmont and the Grand Duke fled. In 1861 Cavour died, and Piedmont was deprived of her greatest statesman at a most critical time. But the new **kingdom of Italy** was really founded. In 1864 an agreement was arrived at between Italy and France, by which Fr. troops were to be taken away from Rome, and Italy not to move against it within six months. In 1865 the capital was removed to Florence. An alliance was made between Italy and Prussia against Austria in 1866, which was followed by war. Austria was defeated and Venetia annexed by Italy. The year 1870 was marked by the meeting of the Vatican Council in Rome, when the doctrine of Papal Infallibility was formulated. In July Italy went to war with the Papal States, and in September Rome was entered. On October 2, Rome was united to Italy by popular vote. A law was passed defining the position of the Vatican under the new régime (see above). The relations of Vatican and Quirinal have gradually become friendlier despite a certain amount of official friction. Meanwhile, the country was in a state of financial exhaustion, and all the energies of the State were required to get the kingdom in a happier condition. On Jan. 9, Victor Emmanuel died, to the great grief of his people, and was succeeded by his son, Humbert, and on the 28th, Pope Pius IX., who had sent his benediction to the dying king, likewise passed away. In 1882 Garibaldi, to whom the union of Italy owed so much, died. In 1887 Crispi came into power, but fell in 1891; when, after a short coalition government, Giolitti came in with a liberal programme, but in defence of monarchical principles. A scandal, however, occurred when it was discovered that several members of the government had had suspicious dealings with the Banca Romana. Crispi returned to power, but in 1896 came the terrible defeat of Adowa in Abyssinia, and a wave of popular fury drove the government from office.

In 1898 there were riots and social disturbances more or less all over Italy, particularly in Milan, followed by military trials and far too rigorous repression. At length there was an amnesty, but many were exempted from it. In 1900 King Humbert was murdered, and his son, Victor Emmanuel III., came to the throne. There were several strikes, partly caused by the more sympathetic attitude of the government to the Labour movement. In 1903 Leo XIII., who had done much to raise the prestige of the Papacy in the world, died, and Giuseppe Sarto, the Patriarch of Venice, was elected under the title of Pius X. In 1904 there was a general strike, and the feeling of the middle classes was roused against the proletariat. The taking over of the railways by the government in 1905 caused a general upset of the traffic. The XX. cent. has seen some new forces emerge in Ital. life. Large numbers of the Catholic laity take a moderately Conservative line, while, on the other hand, Socialism is a strong and rising force. The pressure of taxation, particularly local, is very great, hence, on economic lines, Ital. statesmen will have to go carefully.

Italy's foreign policy has largely been concerned with Africa. From 1884 the government had relations with Abyssinia; in 1895 war broke out and the Ital. army suffered the overwhelming disaster of Adowa in 1896.

Meanwhile, trouble had for some time been brewing in the Balkans, and in September 1911 war, for which Italy was really responsible, broke out between her and Turkey, as a result of a dispute over Tripoli. On Oct. 18, 1912, the *Peace of Lausanne* ended the war in favour of Italy, which secured Tripoli and Cyrenaica. In 1913 the Triple Alliance with Germany and Austria was renewed.

Unity* (1899); Stillmann, *The Union of Italy* (1898); Hodgkin, *Italy and Her Invaders* (1896–99); Corner, *History of Italy*; Hunt, *History of Italy*; Orsi, *Modern Italy* ('Story of the Nations' Series).

ITALIAN LANGUAGE.

Italian is one of the **Romance Languages** (*q.v.*), and is the one which most closely resembles their common source, Latin. Barbarian invasions of Italy were of a less permanent character than in France or Spain, and Roman culture had a firmer grip of the population. There is hardly a leading language to-day with so many dialects as Italian; this is due partly to the lack of political unity of the country until lately, partly to the fact that certain districts were more open to foreign influences than others. The differences, however, are seldom of a deep nature, and are more a matter of pronunciation. Caix gives the distribution of the leading dialects as follows: (1) Venetian, the most unorthodox of all, spoken in South Tyrol and on the Austrian Adriatic coast. It is coloured with German, Romansch, and Dalmatian. (2) Gallic Italian, influenced mainly by French. It in its turn comprises several local dialects, viz. Bolognese, Lombard, Piedmontese. (3) Pure Italian, spoken where Roman influence was strongest, in the old Papal States, in Tuscany, Umbria, Campania, Apulia, and Abruzzi. (4) Ibero Italian, including a group of dialects strongly influenced by Spanish or the now dead Sardinian, *e.g.* Corsican, Ligurian, Genoese, Calabrian, and Sicilian.

The political unity of Italy and the standardisation of elementary education are having their inevitable effect in levelling down these local differences, and the probability is that the next 50 years will see the disappearance of many of these dialects as languages spoken by any but the very poor, and the formation of a uniform Italian language-standard, probably holding the balance between pure and Gallic Italian.

See D'Ascoli's *Archivio Glottologico.*

ITALIAN LITERATURE.

The chief characteristic of early Ital. lit. is its contempt

for the vernacular and its leaning towards Lat., and not until XIII. cent. is there a serviceable vernacular.

Poetry.—In XI. cent. Troubadours invaded Italy, and in XIII. cent. the Sicilian-Provençal school, headed by Emperor Frederick II. of Hohenstaufen, produced lyrics imitating the, by that time, decadent Provençal lyrics. The Umbrian school of St. Francis of Assisi and Jacopone da Todi wrote religious lyrics; and the Tuscan poets, Cavalcanti, Pistoia, and Dante, wrote lyrics in almost pure Italian. The poetry of the Troubadours by its beauty and perfect versification encouraged men to make the vernacular a beautiful literary language, but the Provençal subject-matter gave to Italy a stilted, conceited, conventional style. What the vulgar lit. wanted was ideas. Dante saw the possibilities of Italian, and his *De Vulgari Eloquentia* is a vindication of the vernacular; he eschewed the empty rhetoric of Provençal lyrics, and wrote lyrics full of thought and passion. With his *Divine Comedy* he reached the highest Ital. poetry of all time. Petrarch, his contemporary, brought the sonnet to excellence. Both poets had imitators, mostly of inferior type.

In XV. cent. the cultured classes contemned the vernacular, but the Medici rulers of Florence, Cosimo, and Lorenzo de' Medici, encouraged a return to the vulgar tongue. The Romantic epic introduced by Pulci was elaborated by Boiardo and perfected by Ariosto (*q.v.*), and Lorenzo de' Medici, Pulci, and Sannazaro wrote pastoral poetry. All are Renaissance poets, but Ariosto is the greatest of all. In XVI. cent. Trissino adopted the classical manner in hist. epic, but his imitators returned to the Romantic epic with its pseudo-classicism. Berni headed a group of humorous satirical poets which included Grazzini. Italy, torn by invaders in XVI. cent., brought forth a decadent lit.—the lit. of the *Secentismo Period*. Tasso alone stands out as a great poet with his *Jerusalem Delivered*. Marini's epic *Adone* (1623) shows the bombastic, artificial style of the period. In 1690 the 'Academy of Arcadia' strove to combat 'Marinism' by seeking simplicity. About 1760 the Ital. Romantic movement began, with Manzoni as leader, and in Leopardi, the greatest Ital. lyric poet since Dante, found its highest expression.

The revolt against romanticism was led by Carducci (1836–1907) and his pupil Pascoli. D'Annunzio (b. 1864) is a writer of lyrics of great originality of form; he combines classicism and romanticism and adds XX. cent. realism.

Drama.—The first sign of drama is found in the *lauda*, a religious song with dialogue used by Todi. The first secular drama is Sannazaro's pastoral poem *Arcadia*. In XVI. cent. Ariosto and Machiavelli wrote comedies in the classical manner of Plautus and Terence. Tasso, in *Aminta*, brought pastoral drama to perfection, and he was rivalled by Guarini in *Pastor Fido*. Aretino (1492–1536) shows in his comedies the corruption of an age that produced Machiavelli, and in his tragedy *Orazia* the Renaissance sense of beauty. Trissino in his tragedy *Sofonisba* (1515) and Giraldi imitated Senecan drama. At the end of XVI. cent. the pastoral drama developed into opera (cf. Rinuccini's *Dafne*), and in XVII. cent. the melodrama of Metastasio is set to music. In early XVIII. cent. Fr. drama and that of Shakespeare was imitated by Martelli and Conti. Goldoni (1707–93) raised comedy above the level of the *commedia dell' arte* with its conventional clowns. The great tragedian, Alfieri (1749–1803), wrote twenty-two tragedies, the greatest of Ital. lit. The romanticist Manzoni in tragedy followed Shakespeare, and Giambattista Niccolini also wrote romantic drama. In XIX. cent. realism came into drama, cf. Rovetta and Giacosa, Testo, Martini, D'Annunzio.

Prose.—Ital. prose began about mid. XIII. cent. with Guittone d'Arezzo's epistles, and at the same time short stories, sermons, and chronicles were written in the vernacular. No prose of importance appeared before Boccaccio's *Decamerone*, a collection of tales. This great work inspired men like Guardini to write prose tales. After the Renaissance there is no great prose till Machiavelli wrote *Il Principe*, and Guicciardini his famous histories. Blandello and Grazzini in their tales show the blending of classicism and vernacularism. In XVI. and XVII. cent's, when 'Marinism' is obsessing poetry, prose becomes tainted, and writers of history like Rosa and Menzini continually criticise the evils.

Literary criticism flourished under men like Zeno and Mazzuchelli, and Manzoni wrote hist. novels which influenced Grossi and D'Azeglio. In XIX. cent. Verga is the first realist in prose fiction; Foggazaro is realistic and romantic, while D'Annunzio is acknowledged as a master of the novel.

Garnett, *Short History of Ital. Lit.* (1898); Symonds, *Ital. Lit.*

Constitution.—The Government of Italy is a constitutional monarchy, the legislation being shared by monarch with the two houses. The Chamber of Deputies contains 508 members, elected for five years; electors must be over 21, and those eligible for election over 30. The Senate contains 390 members, nominated for life by the king; it includes a prince of the Blood Royal, and the rest are chosen for eminence in politics or other walks of life.

The official relations with the Vatican are of considerable importance. When the temporal monarchy of the Papacy was abolished in 1870 the Vatican and Lateran Palaces, St. Peter's and the Papal Villa at Gandolfo, were left in the absolute possession of the Pope, and outside Ital. territory. The Pope is given sovereign honours, and the diplomatic corps of the Vatican enjoys the same privileges as that of the Quirinal. A certain sum is granted every year to the Pope. The only other state within a state in Italy is the Republic of San Marino.

Finance.—The financial condition of Italy can hardly be called satisfactory, as no country in Europe is oppressed with such a burden of taxation, many of the common necessaries of life being subject to taxation. There are duties on almost all imports, and monopolies on tobacco and salt.

Thus the revenue is in excess of the expenditure, but the adjustment and lightening of the burden of taxation is one of the great needs of Italy to-day. In 1910–11 the former was £94,635,641, the latter £93,231,540; the National Debt was £539,764,404. Of the total imports, £131,081,666, rather less than one-sixth (£19,052,000), and of the exports of £85,123,750, £8,416,000 were from and to the United Kingdom.

Defence.—Army.—The Ital. army is recruited by conscription, but many are dismissed as physically unfit; some, whose families are dependent on them, are exempted, while others again are chosen by lot to serve for a shorter time. The full training begins at 19 and lasts 19 years, and comprises 2 years with the colours, 6 in the permanent army, 4 with the mobile militia, and 7 with the territorial militia; for those exempted by lot 2 to 6 months of military instruction at a time over several years. Those exempt for family reasons undergo 30 days' training a year for 17 years. In war time they can be called on as a last reserve. For those of better education, who undergo an examination and pay a sum, 1 year with the colours suffices. Various reforms have been carried out since 1907, and it is estimated that the active army should reach 1,000,000 in 1915.

Navy.—The Ital. navy has very much increased in the last forty years, for while the expenditure on it was then under one million it now exceeds five. In 1912 Italy had 290 ships.

Oversea Possessions.—Politically the Italian Kingdom includes Sicily and Sardinia (Corsica belongs to France), the colony of Eritrea, with a population of about 300,000, and also part of Somaliland and the town of Tientsin in China. In Sept. 1911 Italy invaded Tripoli, and by *Peace of Lausanne*, Oct. 1912, secured Tripoli and Cyrenaica from Turkey.

Resources and Industries.—The State owns about

three-fourths of the 11,000 miles of railway, the post-office, and telephones.

Minerals are plentiful, sulphur ore working employs more labourers than any other mineral; lead and zinc are important; coal, iron, mercury, antimony, gold, silver, manganese, and copper are found. Carrara and Massa produce marble.

Chief crops of N. Italy are maize and rice; of S. Italy, olives, oranges, lemons, chestnuts, almonds; flax and hemp are grown, and tobacco is under State control. Cheese of Gorgonzola is famous. Manufactures are silk and cotton in N., woollens, furniture, glass (at Venice), porcelain, beetroot sugar, olive oil, paper.

Coral- and tunny-fishing employ over 26,000 fishermen.

The exports in order of value are raw silk, cotton, manufactured silk, olive oil, wines, cheese, dried fruits, hemp, hides, eggs, acid fruits, sulphur, flour, wheat pulp, etc.

EDUCATION.—Education is under State control, and the cost is borne partly by local authorities, partly by the State itself. The proportion of the population which remains illiterate is steadily decreasing. In 1871 it was 73 %, now it is only 51 %. Illiteracy is greatest in the S. provinces.

LIBRARIES.—Italy is very rich in libraries, particularly those containing rarities. The Vatican Library is one of the most valuable in the world, and is particularly strong in Biblical and other MSS. The archives of the Vatican were thrown open for research by Leo XIII.

RELIGION.—The religion of Italy is Rom. Catholic, less than 3 % of the total population of the country belonging to other religions; there are altogether about 65,000 Protestants. There are a few members of the Greek rite of the Roman Church, and some of the Greek Orthodox Church, and about 40,000 Jews.

POPULATION.—The population of Italy at the census of 1911 numbered 34,686,683. The chief cities are Naples, with 723,208; Milan, 599,266; Rome, 538,634; Turin, 427,733; Palermo, 341,456; Genoa, 272,077; Florence, 232,860; Catania, 211,699; Bologna, 172,639; Venice, 160,727. Of recent years there has been a considerable increase in emigration. In 1910, 402,779 persons emigrated beyond the seas (mostly to America, North and South), and 248,896 to neighbouring lands.

ITASCA LAKE, see MISSISSIPPI.

ITCH, see SCABIES.

ITHACA.—(1) (38° 25′ N., 20° 40′ E.) small island, Ionian Isles; celebrated as the traditional home of Ulysses; area, *c.* 43 sq. miles; surface mountainous; principal town, Vathy; produces currants, sponges, olive oil, wine. Pop. *c.* 13,000. (2) (42° 46′ N., 73° 34′ W.) town, on Cayuga Lake, New York, U.S.A.; seat of Cornell Univ. Pop. (1910) 14,802.

ITO, HIROBUMI, PRINCE (1841–1909), Jap. statesman; studied educational and military systems, as well as constitutional forms of government, in Europe and America; on returning to Japan took leading part in political revolution; drew up constitution, and negotiated alliance with Britain; assassinated in Korea.

ITRI (41° 16′ N., 13° 33′ E.), town, Italy. Pop. 5800.

ITURBIDE, AUGUSTINE DE (1783–1824), Mexican emperor for less than one year; originally adhered to Spain, later adopted national cause; emperor, 1822; forced to abdicate, 1823; outlawed; on returning, executed.

ITZEHOE (53° 55′ N., 9° 31′ E.), town, Schleswig-Holstein, Prussia; trading centre. Pop. (1910) 16,548.

IUKA (34° 50′ N., 88° 12′ W.), town, Mississippi, U.S.A.; site of indecisive battle in Civil War, 1862.

IVAN, or JOHN, name of several Russian rulers: IVAN I., Grand-Duke of Vladimir (succ., 1328); acquired Tver and other dominions; took title Grand-Duke of Moscow. IVAN III., THE GREAT (1440–1505), Grand-Duke of Muscovy, began to reign, 1462; abolished Tatar rule and brought provinces and principalities of Muscovy under central government; patron of art and learning. IVAN IV. (1530–84), *Ivan the Terrible*, was first to assume title of Tsar; he succ. in 1533, and did a great deal in developing art and commerce in the country, besides extending his dominions and introducing many reforms. He annexed Kazan and Astrakhan, and later Siberia, but failed in his attempts to acquire Livonia. In his later years the cruelty of his rule made his name a byword; at Novgorod in 1570 he is said to have put to death about 60,000 people for alleged treason in six weeks. In 1580 he killed his s. Ivan in a fit of rage, and passed the rest of his life in sorrow for the deed. IVAN V., Tsar of Russia (1666–96), was of weak mind, and the conduct of affairs devolved upon his bro. Peter. IVAN VI. (1740–64) succ. his great-aunt, the Empress Anne, in 1740; deposed, 1742; imprisoned twelve years, and then put to death.

IVANGOROD (51° 37′ N., 21° 59′ E.), fortified town, Russian Poland.

IVANOVO-VOZNESENSK (57° 2′ N., 41° 1′ E.), town, Vladimir, Russia; great cotton manufactures. Pop. 68,540.

IVIZA, IVIÇA, IBIZA (39° N., 1° 25′ E.), one of Balearic Isles, Mediterranean; area, *c.* 229 sq. miles; salt, lead, fruit, cereals. Pop. (1900) *c.* 23,500. Chief town, IVIZA (38° 54′ N., 1° 26′ E.), is episcopal see; fortified. Pop. 6500.

IVORY, material found especially in form of tusks in elephants, boars, etc.; developed from vascular pulp in concentric layers forming a compact mass, the pores of which are filled with a gelatinous substance. It is a variety of dentine.

I. has been used from earliest times as an article of commerce. The chief source is from male African elephants, while boars, hippopotami, and walruses (*qq.v.*) produce a smaller quantity.

Elephant i. is easily workable and takes a high polish; it is therefore in demand both for useful and ornamental articles, such as knife handles, piano keys, billiard balls, and carved work. London, Antwerp, and Hamburg are the chief markets.

Mammoth ivory has been found in Siberia and N. Europe, but only about half is sufficiently well preserved to be used.

Substitutes for i. include colluloid and corozo nuts ('vegetable ivory').

IVORY COAST, CÔTE D'IVOIRE (5° N., 5° E.), Fr. colony, N. coast of Gulf of Guinea, between Liberia and Gold Coast; part of Fr. West Africa. Area is *c.* 130,000 sq. miles. Surface rises from low coastal region to mountainous Kong territory in N.E.; much of interior densely forested. Among largest towns are Grand Bassam, Bingerville (capital), Abijean, Assinie. Maize, coffee, rubber, fruit, gold, mahogany are among products. Fr. trading ports were founded here in XVIII. and XIX. cent's; French acquired concessions on coast in 1843, and have actively occupied district since 1883. Pop. (1910) 1,132,812.

IVORY, SIR JAMES (1765–1842), Scot. mathematician; b. Dundee; contributed many papers to *Philosophical Transactions*, one of which contained his theorem relating to attraction of a homogeneous ellipsoid.

IVREA (45° 28′ N., 7° 52′ E.), town, Italy; seat of bishopric; X.-cent. cathedral. Pop. 12,000.

IVRY-SUR-SEINE (48° 49′ N., 2° 20′ E.), town, Seine, France; glass, steel, chemicals. Pop. (1911) 38,307.

IVY (*Hedera helix*), an evergreen, climbing, by means of an extensively developed system of adventitious rootlets, upon trees, walls, and similar places. The leaves are dimorphic; being five lobed on the climbing shoots and lanceolate on the free, flowering shoots. The flowers are inconspicuous, but appear in the autumn, and hence are eagerly visited by insects. The fruit is a berry. When regularly pruned i. forms

an excellent protection of walls against rain, and is commonly grown for this reason as well as for its ornamental qualities. I. was held sacred to Osiris by the Egyptians, and to Bacchus by the Greeks.

IXION (classical myth.), king of the Lapithæ, Thessaly; chained by Zeus to burning wheel for attempting to violate Hera.

IXÓDES, see under MITES.

IXTACCIHUATL, IZTACCIHUATL (*c.* 19° N., 98° 32′ W.), extinct volcano, Mexico.

IZBARTA, SPARTA (37° 44′ N., 30° 22′ E.), town, Asia Minor. Pop. *c.* 20,000.

IZHEVSK (56° 52′ N., 53° E.), town, Vyatka, Russia. Pop. 23,000.

IZMAIL, ISMAIL (45° 22′ N., 28° 50′ E.), town, Bessarabia, S.W. Russia; acquired by Russia, 1878. Pop. 44,290.

IZU-NO-SHICHI-TŌ (*c.* 34° N., 139° 30′ E.), seven islands of Izu, Japan, extending S. from Tokyo Bay.

J, a modified *I*; dates from XIV. cent.; consonantal sound when initial letter of word, often vocalic sound in middle or end.

JABALPUR, see JUBBULPORE.

JABLONSKI, DANIEL ERNST (1660–1741), Ger. Moravian pastor; tried with Leibnitz to unite all Prot. churches.

JABORANDI, name applied to species of the genus *Pilocarpus*, natives of tropical America and the W. Indies. The foliage of *P. pennatifolius* yields the *tinct. Jaborandi* of pharmacy. The genus is included in the *Rutaceæ*, to which the orange also belongs.

JACA (42° 32′ N., 0° 29′ W.), fortified town, Spain: seat of bishopric; Gothic cathedral. Pop. (1900) 5000.

JACINI, STEFANO (1827–91), Ital. author and politician.

JACINTH, see HYACINTH.

JACK, corrupt form of John, the commonest name in European countries, and hence used as a general name with a contemptuous signification, *e.g.* j.-of-all-trades, j.-ass, j.-an-apes; and of common implements, etc.—boot-j., j. (knave in cards), and j.-a-lantern.

JACK FRUIT, see BREAD FRUIT.

JACKAL, member of Dog Family (*q.v.*). Common j. (*Canis aureus*) of S. Asia and N. Africa, *c.* 3 ft. long, has bushy tail and is brownish; nocturnal, it hunts in packs; feeds on offal, and is general scavenger; howls hideously. S. African varieties are black-backed j. (*C. mesomelas*) and striped j. (*C. adustus*).

JACKDAW, see CROW FAMILY.

JACK-O'-LANTERN, see WILL-O'-THE-WISP.

JACKSON.—(1) (42° 16′ N., 84° 26′ W.) city, Michigan, U.S.A.; iron-founding. Pop. (1910) 31,433. (2) (32° 17′ N., 90° 9′ W.) capital, Mississippi, U.S.A.; large cotton trade. Pop. (1910) 21,262. (3) (35° 33′ N., 88° 42′ W.) city, Tennessee, U.S.A.; seat of Baptist Univ.; cotton trade. Pop. (1910) 15,779.

JACKSON, ANDREW (1767–1845), 7th pres. of U.S.A.; b. at Waxhaw, N. Carolina; helped to draw up constitution of Tennessee; entered Congress, 1796; Senator, 1797; justice of Supreme Court of Tennessee, 1798; in war with Britain, 1812, he commanded Tennessee militia and defeated Indians at Tohopeka, 1813; later obtained a command in U.S. army, occupied Pensacola, and defeated British at New Orleans in 1814; app. governor of Florida, 1821, holding office only for a few months. He was elected Democratic Pres. of U.S., 1828; re-elected in 1832. During his administration the national debt was paid up in 1835; and the U.S. bank was destroyed by J.'s exercising his right of veto when the question of renewing its charter came up, and his removal of government deposits to other banks.—Colgar, *Life and Times*.

JACKSON, FREDERICK GEORGE (1860–), has explored in Siberia, Franz Josef Land, Australia.

JACKSON, HELEN MARIA (1831–85), Amer. novelist, poet and commissioner to investigate state of Cal. Indians; m. first Lieut. Hunt, whence pseudonym 'H.H.'; author of *Ramona*.

JACKSON, THOMAS JONATHAN, 'STONEWALL JACKSON' (1824–63), Amer. soldier; served in Mexican War; taught military subjects at Lexington, 1851–61; commanded Virginian army in Civil War; defeated Federals at Cedar Mountain, Bull Run, Harper's Ferry (1862); commanded right wing at Fredericksburg (1862); accidentally shot dead by his own men at Chancellorsville. J. resembled Cromwell in religious fervour and military genius. *Life*, by Henderson (1902). Mary Johnston's novel, *The Long Roll*, gives an excellent picture of him.

JACKSON, WILLIAM (1730–1803), Eng. composer; organist, Exeter Cathedral; wrote operas, songs, and church music.

JACKSONVILLE.—(1) (30° 19′ N., 81° 51′ W.) city, Florida, U.S.A.; railway centre; trades in lumber, fruit, cotton. Pop. (1910) 57,699. (2) (39° 41′ N., 90° 6′ W.) city, Illinois, U.S.A.; has many educational and charitable institutions. Pop. (1910) 15,326.

JACOB, or ISRAEL, the patriarch of the Israelites; s. of Isaac; there are accounts of J. in *Genesis*.

JACOB, BIBLIOPHILE, see LACROIX, PAUL.

JACOB OF EDESSA (b. *c.* 645 A.D.), Syriac bp.; was bp. of Edessa; at the monastery of Teleda he revised the Peshitta version of the Old Testament by comparing it with Gk. texts—his great work.

JACOBA, JACQUELINE (1401–36), Countess of Holland; Bavarian claims disputed by uncle, John of Bavaria; defeated by Philip of Burgundy.

JACOBABAD (28° 15′ N., 68° 30′ E.), town, Bombay, India. Pop. 11,000.

JACOBI, FRIEDRICH HENRICH (1743–1819), Ger. philosopher; pres., Academy of Sciences, Munich.

JACOBINS, members of a Fr. political club formed at the outbreak of the Fr. Revolution, 1789; so called from Jacobin Convent in Paris, where they held meetings; club had branches all over France, and became the principal power in the country, being supreme during the 'Reign of Terror.' Its members included Mirabeau, Marat, and other Revolutionary leaders; later on, Robespierre became pres., and under his influence the policy of the club became more extreme; his fall in 1794 led to its dissolution the same year, and the meeting-place was closed.

JACOBITE CHURCH, name given to Syrian Monophysites who refused to accept the Chalcedonian definitions; many have seceded to Rome and are called Syrian Uniats.

JACOBITES, Brit. supporters of fallen royal house of Stewart; with the death of Cardinal York in 1807 the male line ended. The present representative is Marie, wife of Prince Louis of Bavaria; she is now considered lawful queen (Mary III. and IV.) by Brit. 'legitimists.'

JACOBS CAVERN (36° 36′ N., 94° 23′ W.), cave, Missouri, U.S.A., where human and animal remains and flint and bone implements were discovered by Mr. Jacobs, 1903.

JACOTOT, JEAN JOSEPH (1770–1840), Fr. educationist; prof. successively of Humanity, Math's, French; invented 'Universal method,' which recognised mental equality of all men.

JACQUERIE, see FRANCE (HISTORY).

JADE, greenish, hard stone, a native silicate of calcium and magnesium; generally found in veins in schists and gneisses. Owing to the veins having multitudinous fissures, large pieces are rare. Varieties are jadite and nephrite. J. is found in Persia, Turkey, Corsica, China, Siberia, and South Sea Islands, while in New Zealand it is known as 'greenstone,' in China as 'yu-stone,' where it is elaborately carved for ornamental purposes. J. ornaments have been found in lake dwellings in Switzerland.

JADE, JAHDE (*c.* 53° 27′ N., 8° 12′ E.), bay, Oldenburg, Germany.

JAEN.—(1) (37° 51′ N., 3° 30′ W.) S. province, Spain; area, 5203 sq. miles; drained by Guadalquivir; cereals, wine, oil, lead. Pop. (1910) 532,368. (2) (37° 47′ N., 3° 50′ W.) cathedral town, capital of above; seat of bishopric. Pop. (1910) 29,164.

JAFARABAD (20° 52′ N., 72° 20′ E), town and state, Bombay, India. Pop. 13,000; of town, 6500.

JAFFA, see JOPPA.

JAFFNA (9° 42′ N., 80° E.), town, on island J., Ceylon; tobacco, palmyras. Pop. *c.* 35,000.

JÄGERNDORF (50° 6′ N., 17° 44′ E.), town, Austria. Pop. (1910) 16,681.

JAGERSFONTEIN (29° 45′ S., 25° 27′ E.), town, Orange Free State, S. Africa; diamonds. Pop. (1911) 9018.

JAGUAR, see under CAT FAMILY.

JAHANABAD (28° 37′ N., 79° 44′ E.), town, Patna division, Bihar and Orissa, India. Pop. 8000.

JAHANGIRPUR, see JANGIPUR.

JAHN, FRIEDRICH LUDWIG (1778–1852), Ger. patriot; invented a system of raising the moral and physical standard of his country by means of gymnastics. He founded the first *Turnplatz* and originated the corps of Lützow.

JAHRUM (28° 3′ N., 53° 37′ E.), town, Persia; district produces dates. Pop. *c.* 15,000.

JAINA ARCHITECTURE, see ARCHITECTURE, INDIAN.

JAINS, an Ind. sect, numbering over a million, an offshoot from Hinduism. They began about 500 B.C. in direct opposition to Buddhism, which dates from the same time. They believe that many earlier prophets, Jinas (whence their name), taught their system. The Jains are animists, *i.e.* they believe that everything has a soul, and the most rigid asceticism is a sign of piety. They are divided into two schools, called *Digambaras* and *Svetambaras*. The Digambaras generally go naked. There is an extensive lit., much of it still unpub., dating from about 400 A.D., the earlier works being in Prākrit, and from 1000 A.D. in Sanskrit.

Bühler, *Sect of the Jainas*.

JAIPUR, JEYPORE.—(1) (27° N., 76° E.) native state, Rajputana, India; area, 15,579 sq. miles; hilly in N.W. and E.; level in interior; produces salt. Pop. (1911) 2,636,647. (2) (26° 56′ N., 75° 52′ E.) town, capital of above; royal palace; jewellery. Pop. (1911) 137,098.

JAISALMER, JEYSULMERE.—(1) (*c.* 27° N., 71° E.) native state, Rajputana, India; area, 15,579 sq. miles. Pop. (1911) 2,636,647. (2) (26° 55′ N., 70° 55′ E.) fortified town, capital of above. Pop. 8000.

JAJCE (44° 16′ N., 17° 10′ E.), ancient fortified town, Bosnia; scene of hostilities between Turks and Hungarians, XV.–XVI. cent's. Pop. *c.* 4500.

JAJPUR, JAJPORE (20° 53′ N., 86° 24′ E.), town, Bihar and Orissa, India. Pop. *c.* 13,000.

JAKOVA (43° 9′ N., 27° 9′ E.), town, Turkey-in-Europe. Pop. c. 12,000.

JALALABAD, JELLALABAD (34° 27′ N., 70° 28′ E.), fortified town, Afghanistan; held by Sir Robert Sale during five months' siege (1841–42). Pop. *c.* 3500.

JALALPUR (32° 38′ N., 74° 10′ E.), town, Punjab, India; shawls. Pop. *c.* 12,000.

JALANDHAR, see JULLUNDUR.

JALAP, drug consisting of the dried tuberous roots of a plant, *Ipomœa purga*, of natural order *Convolvulaceæ*, growing in Mexico; has a slight smoky odour, and a sweetish, nauseous taste, the chief constituent being the *jalap resin*; the extract, the powder, and the tincture are the pharmaceutical preparations; used medicinally as a purgative, especially in Bright's disease and dropsy, as it gets rid of much fluid.

JALAPA, XALAPA, HALAPA (19° 30′ N., 96° 54′ W.), cathedral town, Mexico. Pop. (1910) 24,816.

JALAUN.—(1) (*c.* 26° 4′ N., 79° 25′ E.) district, United Provinces, India; area, 1479 sq. miles. Pop. 410,000. (2) (26° 9′ N., 79° 22′ E.) town, capital of above. Pop. 9000.

JALISCO, XALISCO, GUADALAJARA (20° 30′ N., 104° W.), state, Mexico; crossed by Rio Grande de Santiago; volcanic district; cereals, rubber, cotton, gold. Pop. (1910) 1,202,802.

JALNA, JAULNA (19° 48′ N., 75° 54′ E.), town, India. Pop. 22,000.

JALPAIGURI, JULPIGOREE.—(1) (*c.* 26° 42′ N., 89° E.) district, Bengal, Brit. India. Pop. *c.* 793,000. (2) (26° 33′ N., 88° 46′ E.) town, capital of above. Pop. 10,000.

JAMAICA (*c.* 18° 10′ N., 77° 20′ W.), largest and most important of Brit. W. Indian islands; discovered by Columbus, 1494; annexed by Spain, 1509; in 1655 Eng. force commanded by Venables and Penn banished Spaniards and took possession of island, which subsequently became great centre of slave trade. In 1831–32 negro rising occurred, and in 1834 slavery was abolished; consequent lack of labour caused ruin of many sugar-plantations. Negro insurrections later were suppressed by Governor Eyre. In 1907 island suffered from severe earthquake. J. has area of 4207 sq. miles; surface is mountainous, being crossed by Blue Mts., rising to 7423 ft., from E. to W. J. is drained by Black River and other streams. Best harbour is Port Royal; largest towns, Kingston (capital), Spanish Town. Climate generally is pleasant and healthy. J. is administered by governor, aided by Privy and Legislative Councils. No established Church since 1870. Education is free, but not obligatory. Inhabitants include whites, negroes, Indians, Chinese, half-breeds. J. produces valuable timber, fruits, vegetables, sugar, coffee, ginger, pimento, cocoa, cinchona; cattle and horses raised. Railway mileage is *c.* 200. Pop. (1911) 831,383.

Ford and Cundall, *Handbook of J.* (annual).

JAMAICA (40° 45′ N., 73° 50′ W.), village, Queens, New York City, U.S.A.; formerly post-village, now absorbed.

JAMAICA PEPPER, see PIMENTO.

JAMES, name in New Testament of (1) J., son of Zebedee, bro. of Apostle St. John, and called with him. According to Acts 12², Herod Agrippa slew him with the sword. (2) J. 'the less,' s. of Alphæus, and one of the Apostles. (3) J., 'brother of the Lord,' traditionally author of Epistle of J., and first bp. of Jerusalem, certainly one of 'pillars' of Church.

JAMES, THE OLD PRETENDER (1688–1766), Prince of Wales, s. of James II.; led unsuccessful expedition from France to Scotland, 1708; in rising of 1715 he landed at Peterhead, after the surrender of his supporters at Preston; seeing his cause was hopeless, he returned to France; m. Clementina Sobieski; lived at Rome.

JAMES I., THE CONQUEROR (1207–76), king of Aragon; succ., 1213; conquered Balearic Isles, 1232; took Valencia, 1238, and subdued surrounding district; established suzerainty over Catalonia, 1258; warred against Moors.

JAMES I. (1394–1437), king of Scotland; s. of Robert III.; captured by English when on his way to France, 1406; succ. while captive in England, 1406; released, 1423; crowned, 1424; made Parliament efficient representative body; curbed power of nobles; warred against England, 1436; murdered at Perth, 1437, reputed author of *King's Quair*, and *Good Counsel*.

JAMES II. (1430–60), king of Scotland; s. of James I.; succ., 1437; killed Douglas, 1452; killed at siege of Roxburgh Castle, 1460.

JAMES III. (1451–88), king of Scotland; s. of James II.; succ., 1460; defeated by rebels at Sauchieburn; treacherously murdered during flight.

JAMES IV. (1473–1513), king of Scotland; s. of James III.; succ., 1488; m. Margaret, d. of Henry VII. of England; as ally of France he led an army against England, and was defeated and slain at Flodden.

JAMES V. (1512–42), king of Scotland; s. of James IV.; succ., 1513; reduced the Borders to order; m. Mary of Guise; was defeated by English at Solway Moss, 1542; d. at Falkland.

JAMES I. (1566–1625), king of Great Britain and Ireland; s. of Mary, Queen of Scots, and Darnley; proclaimed **James VI.** of Scotland, 1567; under regents till 1581; captured in raid of Ruthven (*q.v.*), 1582; m. Anne of Denmark; curbed power of nobles in Scotland. James succeeded Elizabeth on Eng. throne, 1603;

two years later occurred Gunpowder Plot (*q.v.*). J. had an obstinate belief in divine right of kings, and in duty of passive obedience on part of subjects; his reign was marked by constant struggle with Parliament, which in the following reign led to Great Rebellion. He had great learning, and was much influenced by favourites. See ENGLAND, SCOTLAND: *History.*

Henderson, *James I. and VI.*

JAMES II. (1633–1701), king of Great Britain and Ireland; second s. of Charles I.; distinguished himself in Fr. and Span. service, and in Dutch Wars; professed Rom. Catholicism, 1672; succeeded bro.; Charles II., 1685; put down insurrections of Monmouth and Argyll, 1685; persecuted Covenanters in Scotland; issued Declaration of Indulgence, 1687; escaped to France on landing of William of Orange; defeated at the Boyne, 1690; subsequently lived in France.

Fea, *James II. and his Wives.*

JAMES, EPISTLE OF, a short book of New Testament traditionally assigned to James, first bp. of Jerusalem, and brother of the Lord. Though the argument is not very connected, there is distinct style and language throughout, which seem to indicate one author, though some think there has been a redactor. If work of J., it was probably written about 50 A.D. Despite its Jewish colouring, it has little of what would be expected of a Christian writing of so early a date, and is more akin to the writings of the early II. cent., at which period many critics put it. It is probably based on teaching of Jesus, Jewish wisdom, and Gk. philosophy; not mentioned by name before Origen.

Mayor, *Epistle of St. James.*

JAMES, GEORGE PAYNE RAINSFORD (1799–1860), Brit. novelist; known chiefly by his hist. romances. Thackeray made a notable parody of his two horsemen in his 'Barbazure.'

JAMES, HENRY (1843–), Amer. novelist; novels usually depict Americans in Europe; excellent psychologist; literary critic too.

JAMES, JOHN ANGELL (1785–1859), Eng. Congregationalist theologian and popular preacher.

JAMES OF HEREFORD, HENRY JAMES, 1ST BARON (1828–1911), Eng. lawyer; solicitor-gen., 1873; attorney-gen., 1873, and again, 1880–85; carried Corrupt Practices Bill, 1883; disagreed with Gladstone's Home Rule policy, and, in 1886, became Liberal Unionist M.P. for Bury; Chancellor of Duchy of Lancaster in Unionist government, 1895–1902.

JAMES, WILLIAM (1842–1910), Amer. philosopher and psychologist; prof. at Harvard; known specially as exponent of 'Pragmatism'; author of *Varieties of Religious Experience,* etc.

JAMESON, ANNA BROWNELL (1794–1860), Brit. authoress and art critic; b. Dublin; wrote *Memoirs of Female Sovereigns* (1831), and well-known *Characteristics of Shakespeare's Women* (1832). Five volumes represent her work as an art-critic.

JAMESON, SIR LEANDER STARR (1853–), S. African statesman; b. Edinburgh; entered medical profession; went to South Africa, 1878; Rhodesian Administrator, 1891; led *Jameson Raid,* and imprisoned, 1896; Premier of Cape Colony, 1904–7; took active part in arranging Union of S. Africa, and led Opposition in first Union Parliament, 1910–12; cr. Bart., 1911.

JAMESTOWN.—(1) (42° 7′ N., 79° 17′ W.) city, New York, U.S.A. Pop. (1910) 31,297. (2) (46° 50′ N., 98° 38′ W.) town, N. Dakota, U.S.A. Pop. (1910) 4358. (3) (*c.* 37° 10′ N., 76° 35′ W.) site of former village, James City County, Virginia, where English established first permanent colony, 1607; afterwards declined; fortified during Civil War.

JAMI, see PERSIA (*Language and Lit.*).

JAMKHANDI (16° 30′ N., 75° 24′ E.), town and native state, Bombay, India. Pop. *c.* 14,000; of state, *c.* 107,000.

JAMMU, JUMMOO.—(1) (32° 40′ N., 75° 20′ E.) native state, upper Chenab valley, India. Pop. *c.* 3,000,000. (2) (32° 44′ N., 74° 53′ E.) town, capital of Jammu and Kashmir. Pop. (1901) *c.* 37,000.

JAMNIA (31° 52′ N., 34° 47′ E.), Gk. name for Gebna, Palestine; where Sanhedrin met in I. and II. cent's.

JAMRUD (33° 59′ N., 71° 18′ E.), frontier fort, Punjab, India.

JAMSETJEE JEEJEEBHOY, SIR, see JEEJEEBHOY.

JAMUNA, see JUMNA.

JAN MAYEN (*c.* 70° 58′ N., 7° 30′ E.), uninhabited volcanic island, Greenland Sea.

JANAUSCHEK, FANNY (1830–1904), Bohemian-Amer. tragic actress.

JANESVILLE (42° 40′ N., 89° W.), town, Wisconsin, U.S.A.; tobacco, textiles. Pop. (1910) 13,894.

JANET, PAUL (1823–99), Fr. philosopher; follower of Hegel and idealist.

JANGIPUR, JAHANGIRPUR (24° 25′ N., 88° 8′ E.), town, Bengal, India. Pop. 12,000.

JANIN, JULES GABRIEL (1804–74), Fr. critic and novelist.

JANINA, YANINA (39° 48′ N., 20° 54′ E.), town, capital of vilayet of same name, European Turkey, on Lake J.; seat of Gk. abp.; manufactures gold and silver embroidered goods; under Turkish rule since 1431; fl. in the time of Ali Pasha, 1788–1822; besieged by Greeks, 1912–13; captured, March 1913. Pop. 25,000.

JANISSARIES, body of Turk. infantry formed about 1330 as the sultan's bodyguard, originally composed chiefly of Christian captives, who were compelled to profess Muhammadanism. The numbers were kept up by recruiting from Christian families in Turkey. Their rules included obedience, religious conformity, and abstinence; but they soon became lawless and violent, rebelled and plotted against the sultans, and in 1807 even deposed Selim III. The corps was dissolved in 1826, after a revolt said to have been purposely provoked by Mahmoud II.

JANIUAY (11° N., 122° 20′ E.), town, Panay, Philippines. Pop. (1910) 20,738.

JANJIRA.—(1) (18° 8′ N., 73° 6′ E.) native state, Bombay, India. Pop. *c.* 89,000. (2) (18° 16′ N., 73° 4′ E.) town, capital of above.

JANSEN, CORNELIUS (1585–1638), Dutch Catholic theologian; opponent of Jesuits and founder of *Jansenism*; bp. of Ypres, 1636; also student of St. Augustine and opponent of Protestantism.

Jansenism was a religious movement in opposition to the logic of Scholasticism, the ethical rationalism of moralists, and to popular forms of devotion. Jansen wrote a work entitled *Augustinus,* and was particularly antagonistic to the Jesuits. His follower Arnauld published *Frequent Communions,* which roused violent opposition, and several of his propositions were condemned by the pope, 1653. Jansenists had to fight for their existence in France, where they were persecuted; they found a refuge in Holland, where they joined the Old Catholics.

JANSSEN, JOHANNES (1829–91), Catholic historian; wrote *History of the Ger. People from the Close of the Middle Ages.*

JANSSENS VAN NUYSSEN, ABRAHAM (d. 1832), Flemish painter.

JANSSENS, VICTOR HONORIUS (1664–1739), Flemish painter.

JANUARIUS, ST. (III. cent.), Neapolitan saint; traditionally martyred.

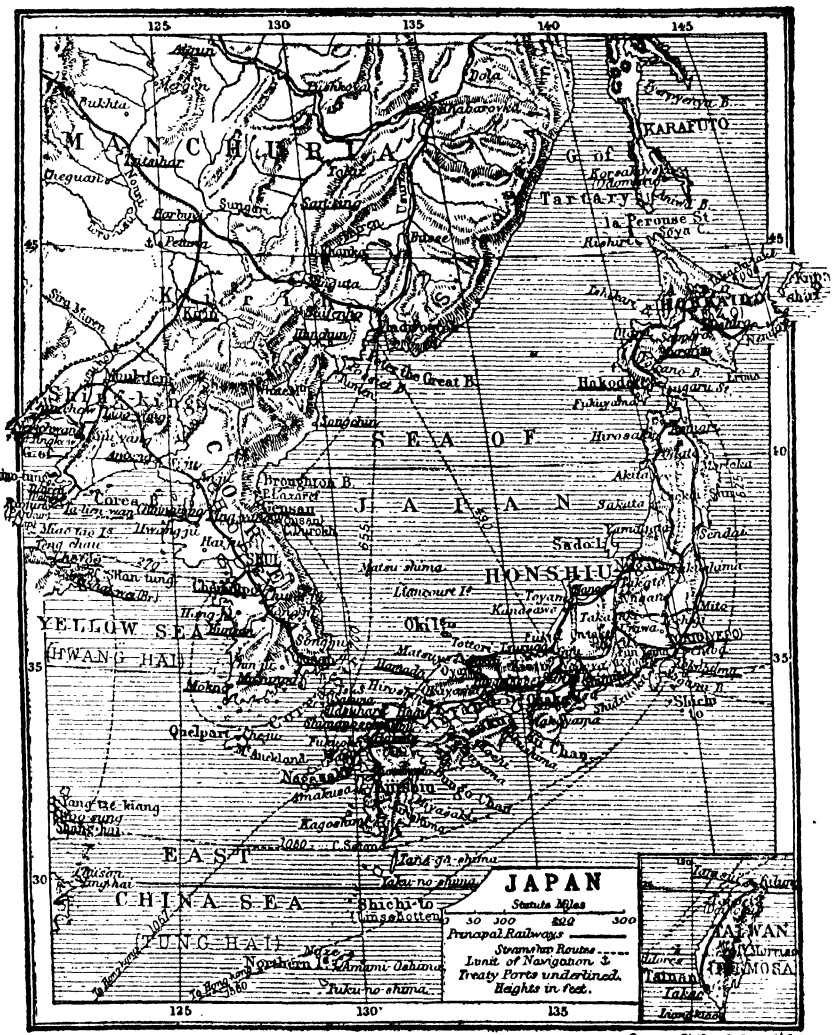
JANUARY, 1st month of year; named after Janus.

JANUS (Lat. *janua,* a gate), ancient Rom. deity; had double head and looked both ways. For 'Janus,' the *nom de guerre,* see HUBER, J. N.

JAORA (23° 40′ N., 75° 12′ E.), town and native state, Central India; opium. Pop. of town, 24,000; state, *c.* 87,000.

JAPAN (22° to 51° N., 130° to 156° E.), empire of Eastern Asia, consisting of irregular chain of islands extending from S. end of Kamchatka down towards N. end of Philippines and the peninsula of Korea (*q.v.*); bounded N.W. by Sea of Okhotsk, Sea of Japan, and Eastern Sea, and S.E. by Pacific Ocean. In the N. are

Kurile Islands; in the centre, S.W. of Saghalien, from which they are separated by La Perouse Strait, are the main islands of the empire—Yezo (or Hokkaido), Hondo (or Nippon), Shikoku, and Kiushiu—S. of which the Liu-Kiu or Loo-Choo Islands carry the line on to Formosa and the Pescadores, which were transferred from China to Japan in 1895; total area, 259,759 sq. miles. Largest of Kuriles are Paramushir in N., and Urup and Iterup in S. Yezo has area *c.* 30,000 sq. miles, Hondo *c.* 99,000 sq. miles, Shikoku *c.* 7000 sq. miles, Kiushiu *c.*14,000 sq. miles.



Surface generally is very mountainous, with large number of active or dormant volcanoes, and the country is subject to frequent earthquake shocks, except along the N.; several of the peaks are between 10,000 and 12,000 ft. above sea-level, among highest being the beautifully shaped cone of Fuji-san (12,400 ft.), in Hondo, 60 miles S.W. of Tokio; Ontake, Tatyama, and Yari-ga-take in the Hida-Echu mountains reach height of *c.* 10,000 ft.; Asamayama in Shinshu is an active volcano of 8200 ft., and Mt. Morrison in Formosa is highest peak in empire, reaching 14,300 ft.

The outline of all the islands is much broken; Yezo has coast-line of over 1400 miles, Hondo of over 4700 miles, Shikoku *c.* 1100 miles, Kiushiu over 2100 miles; total coast-line of empire *c.* 18,000 miles. Rivers are short and rapid, and in summer torrential, from the heavy rains and melting of snow; are useful for irrigation but not for navigation; most important are Kitakamgawa, Tonegawa, Shinanogawa, and Kisogawa, in Hondo, and the Ishikarigawa, in Yezo; largest lake is Biwa, in Omi province, Hondo.

Geology.—Jap. islands are most notable seismic line in the eastern hemisphere; the mountain cores are composed of ancient rocks; Tertiary and Quaternary deposits cover about half the area, including the coastal plain, and Triassic, Jurassic, and Cretaceous formations about one-twelfth; about one-eighth is covered with older igneous rocks, of which granite is most important, and more recent igneous rocks, such as andesite, basalt, and liparite, form about one-fifth.

Climate naturally varies greatly; taking main islands, the temperature ranges from about 5° Fahr. (winter) to 80° (summer) in the N., and from 42° to 98° in the S.; rainfall increases from 40 inches in the N. to over 80 in the S., and in some places may rise as high as 150. Hottest period is during July, Aug., and first half of Sept. Branch of N. Pacific Current known as the Kuroshiwa or Black Stream, which passes northward along whole S.E. coast, makes this much warmer than the N.W. Typhoons occur in summer and are most destructive in autumn. Snowfall very heavy in N.W.

Fauna shows that at an early geological period the islands must have been connected with the Amer. and Asian continents; wild animals include bears, foxes, wild boars, deer, and monkeys, while there are many rats and other rodents. Principal domestic animals are dogs, horses, cattle, and pigs. Birds include crows, larks, pheasants, owls, nightingales, cranes, cormorants, and storks. There are numerous varieties of fish—salmon, bream, and carp, and many snakes are found. Insects include some beautiful moths and many kinds of beetles, while fleas and mosquitoes are common pests.

HISTORY.

There are no authentic records of Jap. history until beginning of V. cent. A.D., when under the Emperor

Richu an attempt was made to construct a history of the country from old traditions and legends. The islands are said to have been formed by the gods, from whom Jimmu, the legendary founder of the present dynasty in 660 B.C., is descended. One of most important legends refers to the conquest of Korea by the Empress Jingo *c.* 201 A.D., to which date the beginnings of Korean civilisation in J. are ascribed.

The introduction of Buddhism took place in mid. VI. cent.; soon afterwards the Emperor Susun was murdered, and under his successor, the Empress Suiko, the Buddhist religion was firmly established; friendly relations with China were fostered, and Chin. civilisation was soon acquired. Empress Suiko belonged to the Soga family, which thus attained supremacy in J., but lost power in reign of Empress Kokyoku (642–45); Kokyoku was succeeded by the Emperor Kotoku, whose accession was secured by the statesman Kamatari, founder of the powerful family of Fujiwara. The name Fujiwara was given to Kamatari in recognition of his gallant deeds, and the family he founded obtained the chief power in the State and retained it for five cent's, although they never assumed the imperial title, contenting themselves with that of regent, an office which became hereditary in the family; under their administration the power and civilisation of J. greatly increased.

During the VIII. cent. a code of laws was drawn up; the power of the emperor was gradually reduced and that of the Fujiwara increased; a law was passed which enacted that the regent must control every official action of the emperor; and the army and the church greatly increased in power. The country continued to enjoy great prosperity until the XII. cent., when a quarrel broke out between two clans called the Minamoti and the Taira, both of which were akin to the Fujiwara; this originated in a dispute as to succession to imperial throne at Kyoto, and resulted in civil war which lasted for five cent's. The Fujiwara had been accustomed to allow only those whom they could dominate to wear imperial crown; in 1159 there were two rival candidates for the empire, and these were supported by the Taira and Minamoto respectively. The former were successful, and secured the accession of the Emperor Nijo; Yoshitomo, the Minamoto leader, was executed, but his son Yoritomo was allowed to escape. In later years Yoritomo raised an army against the Taira, and with the aid of his bro. Yoshitsune succeeded in defeating them and in seizing the Shogunate and becoming virtual ruler of J. The Mikado remained as nominal ruler, to whom the Shogun paid homage, but all real power was in hands of the latter. Yoritomo made Kamakura his centre of government, and established a system of military organisation; he d. in 1198, after which his father-in-law, Hojo Tokimasa, became the real head of affairs and established his family as Shikken or directors of the Shoguns.

The Hojos became so powerful that the emperor at Kyoto sent a force against them in 1221; this, however, was routed, and the emperor sent into exile; and the Hojo remained in power for another 100 years, still retaining their title of Shikken, and securing the succession of children to the imperial throne and the Shogunate, both of which were at this time merely nominal dignities. During their administration occurred the great Mongol invasion of J.; the first invading force was defeated at Inazu in 1274, and compelled to return to China; Kublai Khan then dispatched embassies to J. for tribute, and as the only notice taken of this request was the execution of the ambassadors, he prepared a mighty fleet which appeared in Jap. waters, 1281; in spite, however, of the invaders' superior forces, they were unable to effect a landing; and after many desperate conflicts in which great deeds of valour were performed by the Japanese, the Chinese fleet was destroyed by a storm, the boats foundering by scores. A few survivors found a temporary refuge on Taka Island, where they were soon afterwards attacked and almost all killed by Japanese.

In first part of XIV. cent. the Mikado Go-Daigo, who was older than most of the Hojo-controlled emperors, ventured to oppose the Shikken, and was banished; his cause, however, was supported by the great generals Nitta Yoshisada, Ashikaga Takauji, and others, who gained great victories over the Hojo, drove them from power, and re-established Go-Daigo on the throne in 1334. He was not long allowed to hold any real power, however, the Shogunate being revived by Ashikaga Takauji in 1335; Go-Daigo, not consenting to this, was deposed. Another Mikado was appointed by Takauji, and for over 50 years there were two rival dynasties, one in the N. and one in the S. of J. These were eventually reunited under the Mikado Go-Komatsu during the administration of the Shogun Yoshimitsu, a member of the Ashikaga family, which held the Shogunate till 1573. That office during the XV. cent. lost a great deal of power, and during this time also the country was torn almost to pieces by civil war among the nobles and chiefs.

This condition of anarchy was ended by three great generals, Hideyoshi, Iyeyasu, and Nabunaga, the last-named being the most distinguished figure in the Jap. history of his time; he obtained control of Echizen and five other provinces, made Ashikaga Yoshiaka Shogun, and himself conducted affairs in Mikado's name; he was assassinated in 1582, after which Hideyoshi, who was one of his generals, continued his work of restoring order in the country, and obtained supreme authority under the emperor; he fortified Kyoto and Osaka, carried out various reforms, opposed the Jesuits, who had been introduced into J. by the Portuguese, and organised an invasion of Korea. After his death in 1598 his general and bro.-in-law, Tokugawa Iyeyasu, assumed the chief power; he also opposed the Jesuits, and won a great victory over the nobles who supported his nephew Hideyori, the young son of Hideyoshi, at Sekigahara in 1600; he was app. Shogun in 1603, reduced all J. to submission, and established a united empire; his defeat of the Jesuits at Osaka in 1615 was last important battle on Jap. ground. Iyeyasu established a feudal system of government which was brought to greater perfection by his grandson Iyemitsu; and the Tokugawa dynasty, which he founded, retained the Shogunate till 1868.

During this period the country enjoyed peace and great prosperity, and increased in wealth and civilisation. Foreigners were excluded until 1853, after which commercial treaties with America, Britain, and Russia were made, and a number of ports were declared open to foreign trade. The power of the Shogunate, meantime, had greatly declined; and the coming of foreigners hastened the break-up of the feudal system. The last Shogun resigned in 1867, after which civil war broke out between his followers and the imperial party, the latter ultimately triumphing in 1868. The Mikado then established his seat of government at Tokio; and for the first time since the Fujiwara regents arrogated supreme power to themselves and relegated the emperors to a position of only nominal authority, the titular sovereign was also the real ruler of the country. Feudalism was abolished and Buddhism superseded by Shintoism; army and navy were reorganised, railway and postal services inaugurated, and many reforms introduced. In 1872 Tokio was destroyed by fire, and a modern town was constructed upon the site, stone buildings superseding the former wooden houses; in the same year the slave trade was abolished in Japan.

In 1874 the desire of one section of the nation for war with Korea led to a rising which, however, was soon put down; and in the same year an expedition was directed against Formosa, where some Jap. sailors had been killed by savages; China, to whom Formosa belonged, protested, and eventually the matter was settled by China's paying an indemnity of 700,000 dollars to Japan to defray the cost of the expedition, which had established order in the hitherto uncivilised

Island. In 1877 there was an insurrection in Satsuma, which was suppressed; Saigo and many of the other leaders were killed either in action or by their own or their friends' hands.

The year 1878 was marked by great progress and by a great development of the postal service. Loo Choo was annexed in spite of the threatening attitude of China in 1879. In 1881 the Mikado pub. a decree promising to establish a constitution in 1890, and in the following year education was made obligatory. In 1889 the constitution was established, and religious freedom was granted; and new treaties were concluded with America, Russia, and other countries. Extra-territoriality for foreigners was abolished in 1899.

War with China broke out in 1894, and originated in the interests of both powers in Korea. An agreement was made whereby China promised not to dispatch armed troops to the peninsula without informing the Mikado; but as she ignored this promise and continued to send forces to the country in question, the Jap. Government informed her that war would be declared if this policy were persisted in. China taking no notice of this warning, war began in July 1894; first engagement, in which Chinese were utterly defeated, was fought at A-San, July 29; shortly afterwards an alliance between J. and Korea was concluded. Further victories were gained by Jap. arms at Chiu-lien-Cheng, Newchang, and elsewhere, and on Nov. 21 Port Arthur was taken by Oyama; the Chinese also suffered defeat at Hai-tcheng, Kai-phing, and Yung-tcheng, and in Jan. 1895 they were compelled to surrender Wei-hai-Wei. The result of the war, in which from first to last the Japanese were uniformly successful, and suffered a loss of only 1000 men out of 340,000, was now a foregone conclusion; peace was negotiated in April 1895, the terms being: J. to retain the places she had conquered, including Formosa, the Pescadores, part of Liao-tung peninsula, and Liao; Korea to remain independent; China to pay a heavy indemnity, and several ports in China to be opened to foreign trade. France, Russia, and Germany, however, objected to the incorporation of Liao-tung and Port Arthur in Jap. Empire; and J. accordingly relinquished her claim to the peninsula. While the war was still in progress, new treaties with Britain and America had been concluded, and in 1902 Britain and J. formed an offensive and defensive alliance, which is still in force (1913).

Russo-Japanese War.—Meantime the occupation of Manchuria by the Russians, who, disregarding a former agreement, failed to withdraw from that province in 1903, led to strained relations between Russia and J.; J., having designs on Korea, regarded Russ. proximity as national danger. War broke out, Feb. 1904. J. had great advantage in vicinity to disputed territory and took Russia by surprise. Russia communicated by Eastern Siberian Railway, not yet completed, and Lake Baikal, now frozen, had to be navigated; thus nothing could be done till after spring thaw. Russia had fleet and garrisons at Port Arthur, at Vladivostók, 900 miles from Port Arthur, and in two or three minor forts; these J. determined to attack before European reinforcements could come.

Admiral Togo sailed for Port Arthur without raising any suspicion of object, Feb. 8; engaged Russ. fleet in harbour, defeated it, and attempted blockade of port. Land army, under Kuroki, sent to force Korean Government to promise neutrality and seize Korean ports, successfully repulsed Russ. outposts and crossed Yalu. Admiral Makaroff arrived from Russia in March, but sank in battleship *Petropávlovsk*, blown up by Jap. mine; Russ. General Kuropatkin arrived, March 27, and decided to make Liaoyang his base, as routes from Korea and S. and W. Manchuria met here, and it would be probable Jap. line of attack; disadvantage of policy was that it meant abandoning minor positions. Kuropatkin superseded the viceroy, Admiral Alexéyeff, as commander-in-chief in the Far East, and had to face his opposition and lack of support; Alexéyeff's great idea was to save Port Arthur and keep sea free.

Kuropatkin retained chief force at Liaoyang, sent reinforcements to Lieut.-Gen. Stoessel at Port Arthur and to Lieut.-Gen. Linevich at Vladivostók, and dispatched 19,000 men under Lieut.-Gen. Zasulich to Korean frontier and S. coast of Manchuria, where Kuroki was established; Japanese made surprise attack, May 1, and by victory of the *Yalu* established Jap. pre-eminence in Korea. J., which had been training for years, now attained self-confidence, and the victory facilitated loans; Russians showed hardiness and heroism, but antiquated methods and lack of brilliance. Togo drew nearer in, and Jap. armies, under Oku, cut off Port Arthur by land, while General Kawamura disembarked with small force at Takushan, to serve as link between Port Arthur and Korea.

To protect Port Arthur, Russians had run strong fortifications across Kwantung peninsula, at Nanshan, which were carried by Oku, May 26; Russia sent reinforcements and ordered relief of Port Arthur; Marshal Oyama came as Jap. commander-in-chief in July; Nogi attacked Port Arthur by land, July; the Russ. fleet attempted to escape to Vladivostók and was annihilated by Togo, Aug.; Kuroki advanced, won many days' battle of *Liaoyang*, and drove Kuropatkin back behind Sha-ho, Aug.–Sept.; desperate attack on Port Arthur ended in Stoessel's capitulation, Jan. 1, 1905; combined Jap. armies won battle of *Mukden* in Feb. and drove Kuropatkin from Sha-ho; Kuropatkin resigned and was succ. by Linevich. Russ. Baltic fleet under Admiral Rozhdestvensky was annihilated by Togo in *Straits of Tsushima*, May 27–28. By the *Treaty of Portsmouth*, 1905, Russia agreed to evacuate Manchuria, to recognise J.'s pre-eminence in Korea, and to cede Liao-tung peninsula. These terms caused great displeasure among the people of J., who considered that too great concessions had been made by the Jap. ministers, and riots occurred in various towns. At Tokio these were so serious that about 800 rioters were arrested, and martial law was proclaimed; but before long order was restored.

In Sept. 1905 a new treaty with Britain was concluded, the terms of which were very popular; this treaty aimed at maintaining peace in the East and preserving the commercial interests of all Powers in China. In 1907 *ententes* concerning China were arranged with Russia and France. Recent events include severe earthquakes in Formosa and floods in J. in 1906, the signing of a commercial agreement with U.S.A. in 1908, and the agreement with China concerning boundary of Korea in 1909. Korea was annexed 1910. Yoshihito succ. his f. Mutsuhito as Mikado, July 1912.

LITERATURE.

The language is polysyllabic and is akin in structure to the Altaic group; the written language differs widely from the spoken, and there are two forms of speech and two modes of writing Japanese; it may be written in Chin. characters, which were introduced and adapted to the Jap. language in the VI. cent., or in the simpler signs of the native alphabet known as the Kana. The verb comes at the end of the sentence and the preposition after the noun it governs.

Jap. lit. is of considerably less interest to foreigners than Jap. art. The VIII. cent. A.D. is said by Mr. Aston to have been the golden age of poetry, while the prose literature of that period is of little importance; but Jap. poetry is of little interest even at its best, and most of it is included in two compilations dating from the IX. and X. cent's. The earliest prose works are the *Kojiki*, or Book of Ancient Traditions, and the *Nihongi*, or Chronicle; these were both written about the same time in the VIII. cent., and profess to narrate the early history of J., but are of no value as authentic records.

The Heian era (IX.–XII. cent's) is regarded as the great age of Jap. prose; during this time there was a great development of literary culture, and histories, essays,

romances, and other compositions were written in great numbers, some of them in Chinese and others in the vernacular. Romances of this period were generally written by women, in the vernacular; the best of these are *Makura-no-Zoshi*, by Sei Shonagon, and *Genji Monogatari*, by Murasaki no Shikibu. From end of XII. until beginning of XVII. cent. J. was under military control, and so constantly engaged in civil war that there was little opportunity for lit. to flourish; yet one or two hist. works were produced, of which most important were the *Heike* and the *Jinkoseitoki*; and during the time of the Ashikaga Shogunate the 'No,' or drama, originated.

The Tokugawa period was marked by a great literary renascence, when numbers of hist. and philosophical works and romances were written. Bakin is generally considered by the Japanese to be the greatest novelist of this epoch. The introduction of Western ideas in J. has had considerable effect upon lit., although so far no works of outstanding genius have appeared; among the modern writers of the greatest repute are Koyo and Rohan, both of whom owe much to European culture. The influence of lit. and the drama on the national character can hardly be overestimated, novelists and playwrights alike aim at leaving a deep impression, generally of a moral nature, on the minds of their public; they are timid of realism in fiction. There are many daily newspapers in Japan, including a number of 'Yellow' papers, which have a greater sale than the larger and more politically important journals.

Art.—The keynote of Jap. art is impressionism. The painter sets himself to express the massed grandeur of mountains, the rush of torrents, the flight of birds, the pliancy of trees and plants, the strength and grace of animals, etc. The fundamental difference in the outlook of the painters of East and West is that to the latter mankind is the centre of the universe; while to the former the universe itself is his subject. With us landscape art is the invention of recent times, but in the East it has afforded the artist one of his chief means of expression for a thousand years. Therefore the slightest sketch of a master, be it a figure or bird, or a few leaves, never fails to suggest its part in the visible universe.

In the beginning the art was borrowed from China, and dates from the introduction of Buddhism; but in Kanaoka (928–87) there arose a native artist who broke from the trammels of the Chin. school, and became, in fact, the founder of Jap. art. Since that time various influences have been at work. Thus in the XVII. cent. Matabei (1578–1650) started the Ukioye, or popular school, taking his subjects from the daily life of the people. The XX. cent. is a period of transition. Famous artists are dealt with under their names.

Morrison's *The Painters of Japan*, 2 vols.

The arch. of J. is also derived from that of China; before the introduction of Chin. civilisation in the VI. cent. all buildings were of the most primitive kind; but after the establishment of the Buddhist religion many fine temples were built, although private houses remained very simple in construction. Wood is generally used for the walls, and the heavy roofs are tiled; but interest attaches more to the decoration of the buildings than to the general architecture.

The town of Nikko is famed for its temples and shrines, which are visited annually by many thousand pilgrims; the principal temples are the old Buddhist temple (716), and those of Iyeyasu and Iyemitsu, which are ornamented with wonderful painted carvings and contain many beautiful bronze figures and some fine lacquer frescoes.

Sculpture in stone is not of great importance, but numerous statues cast in bronze or carved in wood show great artistic merit. The finest image of Buddha stands in a grove near the temple of Hachiman at Kamakura; it is in bronze, is nearly 50 ft. high, and was cast in 1251. A still larger and much older image of the god stands in the park at Nara, but is not generally considered so artistic a masterpiece.

The decorative arts have flourished in J. for many cent's; these include very beautiful china, cloisonné enamel, lacquer work, and wonderful embroideries. The manufacture of china dates from the XIII. cent., and shows the influence of both China and Korea; and although J. does not on the whole reach the standard of China in this particular, she has yet produced many varieties of great artistic excellence. The most celebrated is Satsuma ware, an enamelled crackled china of which very few genuine old specimens are to be found outside J. Other well-known varieties are Banko, Hizen, Kutani, and Owari. Towards the close of the XIX. cent. a great deal of very inferior china was manufactured for export to the Western world; but now some very fine work is being produced.

Cloisonné enamel as a Jap. manufacture dates only from the XIX. cent., but many specimens of unusual excellence have been produced. Lacquer-work (*q.v.*) has been an important industry since very early times, and during the XVII. cent. reached a perfection which has in no other country been attained. Embroidery has also reached a very high standard; and many of the most beautiful examples are so perfectly finished, and executed with such regard for perspective, as to resemble paintings. Jap. inlaid metal work is very highly thought of by connoisseurs.

Government is a constitutional monarchy, the present constitution having been drawn up by the Marquis Ito in 1889. The executive is in the hands of the Mikado, who is assisted by a Cabinet of 10 Ministers nominated by himself; legislative authority is also exercised by him, subject to the consent of the Imperial Diet. Cabinet consists of the Premier and Ministers for Foreign Affairs, Interior, Finance, War, Marine, Justice, Education, Agriculture and Commerce, Communications; and there is a Privy Council. Diet comprises a House of Peers, the members of which hold their seats by hereditary right, by appointment, or by election, and a House of Representatives, the 379 members of which are elected by popular vote.

Most of the country is subdivided into prefectures for local administrative purposes; but Chosen (Korea), Hokkaido, Karafuto (Sakhalin), and Taiwan (Formosa) are differently organised, Hokkaido being under a governor and the other three under military gov's-gen. The prefectures are again subdivided into counties and municipalities, and these counties into towns and villages; prefectures are administered by governors, assemblies, and councils, while counties and towns are respectively governed by sheriffs and mayors, in each case assisted by an assembly and council. The members of all these assemblies are elected by the people.

There is a modern system of justice; law-courts are of four kinds—courts of cassation, presided over by 7 judges; courts of appeal, by 5; district courts, with 3 judges; and subdistrict courts, with 1. Judges are nominated by the Mikado, and hold their appointments for life unless they are dismissed as a punishment. Laws are based on Western principles, and the Code Napoleon is the foundation of the criminal laws.

The finance department of the administration is of great importance; estimates of revenue and expenditure are given in the Budget of each year, which must be approved by the Imperial Diet, and without the consent of the Diet no new tax may be levied. Principal sources of revenue are the liquor tax, land tax, monopolies, customs duties, posts and telegraphs, and income tax; and the chief items of expenditure are those connected with the finance department, army, navy, communications, home affairs, and justice; revenue for year 1911–12 estimated at £56,890,391. The unit of account is the gold yen = 100 sen = 2s. 0½d.

Defence.—Before 1871 the army had for several cent's been a feudal organisation, consisting of the retainers of the Daimios, or feudal lords. In early

XVII. cent. a number of provinces were granted by Iyegasu to military nobles, who were vassals of the Shogun, but had absolute control over their own dominions; and the people were ranked in four classes, of which the Samurai, who rendered military service for the lands bestowed upon them by the nobles or overlords, were the first. The Samurai were noted for their unstained honour, their loyalty and courage; and they trained themselves in the stoical endurance of pain to so great a degree that they were able to commit suicide by the terrible method of hara-kiri (*q.v.*) without hesitation when honour demanded such a sacrifice.

The modern army system dates from *c.* 1871, when a conscriptive system was first introduced. The supreme command is held by the Mikado, who nominates the War Minister, Chief of General Staff, and Director of Military Instruction, as well as the Military Council. Service is obligatory, all men between 17 and 40 being liable to service in either army or navy. The Geneki, or active army, comprises 27 cavalry and 80 infantry regiments, 28 garrison artillery and 19 engineer battalions, 150 field and 9 hill batteries. The Kobi, or second line, consists of 228 battalions, 57 squadrons, 114 field batteries, 12 garrison artillery and 19 engineer battalions. There is also a territorial force known as the Kokumin. Army expenditure for 1911–12 was estimated at over £7,600,000. There are numerous military schools and training colleges.

The navy became a separate department of the administration in 1872. The coast is divided into five naval districts, of which the headquarters respectively are Yokohama, Kuré, Sasebo, Maizuru, and Chinkai. Fleet includes (1913) 3 Dreadnoughts, 16 pre-Dreadnoughts, 13 armoured cruisers, 17 protected cruisers, 6 torpedo gunboats, 61 destroyers, 50 torpedo boats, and 12 submarines. Naval expenditure for 1911–12 was estimated at over £4,070,000.

Inhabitants.—The Japanese are of Mongoloid stock, but they are not a pure race, and a striking difference exists between the upper and lower classes. The former are white or light yellow in colour, with oval face, obliquely set eyes, and small mouth; the latter are darker in complexion and stronger in build, and have coarser features and straight eyes. The early inhabitants were the ancestors of the Ainus, a hyperborean race of cave-dwellers, who migrated from N.E. Asia to the Jap. islands in early times, and were subsequently conquered by the race from whom the upper classes are descended. The Japanese attain their full height at an earlier age than the Caucasian races do; the average height of the men is an inch or two above 5 feet, that of the women about 4 ft. 8 in. They are of weak physique, and it is said that 40 % of the students die before completing their univ. course. The head is large and the lower limbs are short in comparison with the size of the body.

Native dress for men consists of a silk or cotton shirt, and a *kimono*, with a silk belt round the waist; in cold weather several kimonos may be worn at once; and over all are the *hakama*, or divided skirt, and the *hasri*, or cloak, both of which are generally removed in the house. The native women's dress consists of a short underskirt with a *kimono* above, and an *obi* or belt, 1½ ft. wide, which is wound round the body above the *kimono*; the hair is kept in place by means of large pins and a considerable amount of oil; it is taken down only about once a week, and to prevent its becoming untidy a wooden block curved to fit the neck is used instead of a pillow.

In character the Japanese are light-hearted and philosophical; they have great powers of endurance and are extremely economical. There is an elaborate code of politeness; it is considered good manners to apologise for all one's possessions, and as the wife is regarded as the property of the husband, the latter, on welcoming a stranger to his house, may beg him to 'excuse his disgraceful and abominable old woman.'

Large families are an exception, five being above rather than below the average number. Jap. houses are low, never above two storeys; they are bare of furniture, having neither chairs nor tables; the people sit on the floor and have their meals placed on trays beside them, the staple article of diet being rice, while green tea is the usual beverage. Like the ancient Egyptians, the Japanese are extremely punctilious in regard to personal cleanliness; there are boiling hot open-air baths where every one bathes in public. This custom may be responsible for the spread of the various skin diseases so prevalent. Other complaints are heart disease, which is common among the coolie class, and is ascribed to the introduction of *jinrikshaws* (light two-wheeled vehicles drawn by coolies); dyspepsia; leprosy, or elephantiasis, which is considered a terrible disgrace.

Sports and pastimes include wrestling, juggling, jumping, etc.; wrestling is said to be the oldest sport known in Japan (see Ju-Jitsu), and traditionally dates from 25 B.C. Kite-flying is indulged in by adults as well as children. The principal indoor amusement is dancing.

Education is obligatory for children between 6 and 14; elementary schools in 1909 numbered 26,386; technical schools, 5253; kindergartens, 406; and middle schools, 297. Subjects taught in primary schools are morals, Jap. language, arithmetic, history, geography, gymnastics, etc.; and in secondary schools, besides the foregoing subjects, Chinese, English, French, German, mathematics, physics, and political economy are included in the curriculum. There are over 100 high schools for girls; a girl's coll. at Tokio, called the Higher Normal School for Women, provides training for women teachers, and there is another coll., called the Women's Univ., also in Tokio. Tokio, Kyoto, Tohoku, and Kiushiu are seats of State-supported univ's; Tokio Univ. is the largest, and had, in 1910, 344 prof's and lecturers, and 5503 students. The Education Department of the administration was founded in 1871, and the present educational system established in 1873.

Religion.—J. has no State religion, and all creeds are tolerated; principal religions are Shintoism and Buddhism, each of which has twelve sects. Many Christian missions have been established, and the R.C. Church has had an episcopate here since 1891. Shintoism was the original religion of the country, whereas Buddhism was imported from China about mid. VI. cent. A.D. Shintoism is a form of nature-worship, and has elements of ancestor-worship as well; thus the chief goddess, Amaterasu (sun-goddess), is said to be the ancestress of the Mikados. There are numerous minor deities who are associated with mountains, streams, and other physical features. Religious festivals are a characteristic of Jap. life, many of them being observed as national holidays, and most of them relating to ancestor-worship; among the most important are the 'Genshi-Sai' on Jan. 3, the 'Komei Tenno-Sai' on Jan. 30, the 'Kigen-Setsu' on Feb. 11, the 'Kan-Name-Matsuri' on Oct. 7, and the 'Shin-Sho-Sai' on Nov. 23. There are numerous Shinto temples, most of which are simple buildings. Buddhist temples, which numbered 71,927 in 1908, are more elaborate structures, and in the same way the Buddhist ritual is more resplendent than that of Shinto. Confucianism is professed by many people of the upper classes.

Towns.—The largest are: Tokio, Osaka, Kyoto, Yokohama, Nagoya, Kobé, Nagasaki, Hiroshima, Kanazawa, and Kuré. The most important ports are Yokohama, Kobé, Osaka, Moji, and Nagasaki.

Railways.—Japan had 6042 miles of railway in 1909–10, and of this 5536 miles were controlled by State, which took them over, 1906; the gross income of the State railways in that year was over £8,200,000, and the expenditure over £4,200,000; and the gross income of private railway companies was over £400,000, and the expenditure over £200,000. The first railway in the country was that between Yokohama and

Shimbashi, which was opened by the Mikado in 1872. Later in the same year the line between Osaka and Kyoto was begun, and since then railway construction has increased every year; 40 years ago there were only 18 miles of railway in the country. The Diet has passed a plan for further construction and improvement, which will extend over several years and for which about £17,450,000 has been voted. J. is well provided with postal and telegraphic communications.

Industries.—The principal are those connected with agriculture, sericulture, forestry, and fisheries. Agriculture has been the most important industry of J since the earliest times, and about 60 % of the inhabitants are engaged in farming. The country has, however, a large amount of sterile ground among the hills, and the cultivation of the productive part is greatly hampered by the difficulties of communication, which render prohibitive the cost of transport for many agricultural products. Of the whole area (exclusive of Formosa) over 23,437 sq. miles are under cultivation, and of this nearly 60 % is under rice, after which come rye, barley, and wheat. Owing to the use of spade husbandry and the plentiful application of manure, the produce is much greater than might be expected, and the soil maintains, in consequence, a much larger population. The thoroughness of the cultivation renders it possible to raise two or three crops on the same field every year. Millet, beans and peas, buckwheat, colza, potatoes, cotton, hemp, tobacco, indigo, and tea are all grown, as well as mulberries for silkworms, which are placed in vacant spaces between other crops. Cotton crop has greatly decreased in recent years, and the import of raw cotton from other countries has correspondingly increased. Tobacco is a Government monopoly. Sericulture is of great importance, as silk is the principal item in Jap. foreign trade; the industry dates traditionally from the VI. cent. B.C.; in 1910 silk-manufactured goods to the value of over £2,927,500 were exported.

Cattle, horses, pigs, and goats are reared in considerable numbers. Over 18,000,000 acres are under forest—bamboos, bananas, sago, and other palms, lacquer trees, camphor trees, vegetable wax, paper trees, mulberry, etc., being mingled with cypress, oak, pine, beech, and almost all the ordinary trees of the temperate latitudes of Europe and America.

Minerals are important, but are not yet sufficiently developed; coal-production, especially from Kiushiu and Yezo, is increasing, and silver, copper (noted for its purity), antimony, gold, sulphur, iron, graphite, and china-clay are all worked, as well as petroleum (central Hondo and Yezo), but the iron output is hampered by the difficulty of getting the ore to coal. Labour is abundant and cheap, and manufactures prosper rapidly. Among those of importance are cotton, yarn and piece goods, silk piece goods, lacquer-ware, bronzes, mats and matting, carpets and rugs, porcelain, pottery, straw-plait, bamboo and cane work, matches, glass, flannel, umbrellas, fans, iron and steel goods. There are large shipbuilding yards at Nagasaki and important iron and steel works at Wakamatsu. Fishing gives employment to about 5 % of the population, and fish and marine raw and manufactured products have an annual value of about £11,700,000.

Shipping has greatly increased in the last 35 years, and there is a large mercantile marine, including 338 steamers of over 1000 tons and 1325 sailing vessels of over 100 tons. The tonnage of Jap. steam and sailing vessels entered in 1910 was 9,348,659, and cleared, 9,463,875; foreign ships entered in 1910 had tonnage of 10,825,128, cleared, 10,734,043. In 1910 the imports amounted to the value of over £46,400,000; exports, over £45,800,000. A considerable part of the trade is carried on by foreign merchants. Of the imports about 23 % are raw cotton, 13 sugar, 7½ iron and other metals; and others of importance are machinery, woollens, cottons, oil-cake, dyes, leather, fibres, chemicals, drugs. Of the exports about 40 % are silk and silk goods, 13½ cotton goods, 6½ coal; and others of importance are copper, tea, matches, rice, camphor, straw-plait, earthenware, cuttle-fish, fish-oil, etc. About 45 % of the imports come from the Brit. Empire, about 11 % from U.S.A., and about 14 % from China. Of the exports, about 18 % go to the Brit. Empire, about 31 % to U.S.A., and about 20 % to China. Principal exports to Brit. Empire are silk, copper, straw-plaits, rice; principal imports from Brit. Empire are raw cotton (from India), iron and steel, machinery, textiles. There are Brit. consuls at Kobé, Nagasaki, Shimonoseki, Tainan, Tamsui, and Yokohama. Pop. (1912) (Japan) 52,200,685; including possessions, 69,647,025.

J. Year Book; D'Aautremer, *The J. Empire and its Economic Conditions* (1910); Browne, *J., the Place and the People* (1905); Gubbins, *Progress of J.* (1911); Longford, *J. and the Japanese* (1912); Okakura-Kakuzo, *The Awakening of J.* (1905); Saito, *A History of J.* (1912); Wenckstern, *Bibliography of the Jap. Empire* (1895, 1907); Stead, *J. by the Japanese* (1904); Aston, *History of Jap. Literature* (1899); Hearn, *J.* (1904); Knox, *Imperial J.* (1905); Scherer, *Young J.* (1905).

JAPANNING, art of coating metal, wood, papier-maché, etc., with varnish, so as to resist heat.

JAPETH, according to *Genesis* 9^{27}, son of Noah; believed to be ancestor of peoples of W. Asia.

JARKENT (*c.* 44° N., 80° E.), town, Semiryechensk, W. Turkestan. Pop. 17,000.

JARNAC (45° 41′ N., 0° 10′ W.), town, France. Pop. 5000.

JARO (10° 51′ N., 122° 41′ E.), town, Panay, Philippines. Pop. 11,000.

JARRAH WOOD, hard timber of Australian eucalypt used for paving blocks, railway sleepers, etc.

JARROW (54° 59′ N., 1° 28′ W.), town, Durham, England; industrial centre; monastic remains, associated with Venerable Bede. Pop. (1911) 33,732.

JASHAR, BOOK OF, a lost book, the nature of which is uncertain; referred to in *Joshua* 10^{13} and *2 Samuel* 1^{18}; possibly a book of songs.

JASHPUR (*c.* 22° 50′ N., 84° E.), feudatory state, Central Provinces, India. Pop. *c.* 134,000.

JASMIN, JACQUES (1798–1864), Provençal poet of lowly birth; wrote in Provençal simple, popular songs, and was at last made *Maistre ès Jeux* by Academy of Toulouse; not connected with Félibrige movement, for which he prepared way.

JASMINE, or JESSAMINE (*Jasminum*), a genus included in the *Oleaceæ*, and comprising a number of erect or twining shrubs with opposite or alternate leaves; often cultivated for their fragrantly scented flowers, and for ornamental purposes (e.g. *J. grandiflorum*). From the blossoms is extracted an essential oil used in perfumery.

JASON, see ARGONAUTS, GOLDEN FLEECE.

JASSY, YASSY (47° 10′ N., 27° 37′ E.), town, Rumania; R.C. archiepiscopal see; seat of Gk. Orthodox metropolitan; univ.; fine churches; trades in cereals, wine, petroleum; Turko-Russ. Treaty arranged here, 1792. Pop. *c.* 80,000.

JASZBERENY (47° 29′ N., 19° 57′ E.), town, Jasz, Hungary; wine, cloth manufacture; agricultural centre. Pop. *c.* 26,000.

JÂTAKA, name of the many stories of incarnation of Buddha, and of a particular collection of j's known to have been made not later than the III. cent. B.C. This collection is an important source for the history of folklore and fable, 'Æsop' (*q.v.*) deriving much from it. See BUDDHISM.

JATH.—(1) (17° N., 75° 12′ E.) native state, Bombay, India. Pop. *c.* 70,000. (2) (17° 4′ N., 75° 11′ E.) town, capital of above. Pop. 6000.

JÁTIVA, SAN FELIPE DE JATIVA (39° 24′ N., 0° 53′ W.), town, Spain; wine, fruit. Pop. 13,000.

JAUER (51° 3′ N., 16° 11′ E.), town, Silesia, Prussia. Pop. (1910) 13,556.

JAUNDICE, term applied to a condition in which

the skin and other parts of the body are yellow in colour, accompanied by other symptoms, due to the circulation of bile in the blood, and to its absence from the intestines preventing the proper digestion of food. It may be due to obstruction of the bile duct by (1) foreign bodies, *e.g.* gall-stones or hydatids; (2) stricture of the duct; (3) catarrhal inflammation, with exudation of the duct or of the duodenum; (4) tumours within or at the opening of the duct; (5) pressure from tumours in the liver or other organ; or it may be due to other causes, such as (1) the toxins of certain fevers, or of pyæmia, poisoning by snake poison, phosphorus and certain other mineral poisons, chloroform; (2) nervous derangements, *e.g.* concussion or fright; (3) absorption of bile into the blood through habitual constipation; (4) undue secretion through congestion of the liver.

The symptoms include the following in addition to the tinting of the skin, conjunctivæ, and other parts; gastric disturbances are present; constipation, which frequently alternates with diarrhœa, in which the fæces are pasty and fatty, the fats in the food not having been digested by bile as occurs normally; the pulse is slow; there is itchiness of the skin; cerebral symptoms are often present, depression and irritation; bile acids and bile pigments are present in the urine. The treatment of jaundice implies, since jaundice is merely a symptom, the removal of the cause, and naturally the number of treatments is as great as the number of possible causes, catarrh of the duodenum or gall-stones being the most common causes in mild cases. Usually the treatment should be commenced by a dose of two or three grains of calomel followed by a saline purge (*e.g.* Epsom salts) to clear away the old bile.

JAUNPUR (25° 40′ N., 82° 30′ E.), district, United Provinces, India; area, *c.* 1552 sq. miles. Pop. *c.* 1,220,000. Chief town, JAUNPUR (25° 44′ N., 82° 43′ E.), has fine mosques, ruined fort; formerly capital of Muslim kingdom; manufactures perfumes. Pop. *c.* 43,000.

JAUNTING-CAR, one-horse vehicle in which passengers sit at right angles to horse; used in Ireland; drivers known as 'jarvies.'

JAURÈS, JEAN LÉON (1859–), Fr. politician and journalist; founded socialist organ, *L'Humanité*, 1904; became head of new party of 'unified socialists,' 1905.

JAVA (5° 52′ to 8° 50′ S., 105° 13′ to 114° 39′ E.), island belonging to Holland, East Indies; lies to S.E. of Sumatra, and is bounded N. by Java Sea and Borneo, E. by Bali Strait, S. by Indian Ocean, W. by Strait of Sunda. Area, *c.* 48,500 sq. miles, or, with Madura, 50,554 sq. miles. S. coast is inaccessible owing to the surf, and from it the surface rises steeply to line of volcanic mountains, which run from end to end of island. There are many active volcanoes, some of the peaks reaching heights of 10,000 to 12,000 ft.; among highest peaks are Smeru, Gedeh, Sumbing. Along the N. are fertile alluvial plains. Rivers, short and commercially unimportant, include Tji Manuk and Tji Tarun.

Long before its existence was known to Europe, J. had attained considerable degree of civilisation under Hindus, who founded here several independent states. Under them Buddhism and Sivaism became in turn the prevailing religion, traces of both being seen in the numerous Hindu temples which still exist. In XV. cent. the island gradually became Muhammadan; visited from about 1520 by Portuguese traders, who were overcome by Dutch in *c.* 1596. Dutch carried on long warfare with natives, and gradually obtained possession of most of the island, acquiring Preanger regions in 1705 and Bantam in 1808. During Napoleonic wars J., with rest of Dutch possessions, was incorporated in French empire. It was taken by Britain in 1811 and occupied by them until 1817, when it was restored to Holland. In 1825 rebellion against Dutch rule was led by Depa Negara, who was ultimately defeated and exiled in 1830. Since then various unsuccessful risings have taken place, but Dutch control is now practically complete, although the native states of Jukjakarta and Surakarta have still a nominal independence.

Java's chief source of wealth lies in rich vegetation. The mountains are covered with trees to heights of 10,000 ft. Forests occupy probably one-fifth of whole surface, and produce valuable teak, cocoanuts, palms, bamboos, spice trees. Cultivated products include rice, maize, sugar, coffee, indigo, tea, cinchona, tobacco, rubber. Minerals include petroleum, coal, salt, sulphur. Exports, chiefly to Netherlands, are sugar, coffee, tobacco, cinchona, quinine, tea, copra, indigo, kapok, hides, teak, tin. Imports include cottons, cutlery, hardware, ground-nut cake, bean cake. Trade is mainly carried on by Arabs and Chinese, the native inhabitants being engaged chiefly in agriculture. There are few industries, the most important being manufacture of coarse cloth, mats, and soap. Railway mileage is *c.* 1400.

Principal towns are Batavia (capital), Semarang, Surabaya, Surakarta. Climate, unhealthy in low-lying districts, is hot and damp, but heat is tempered by regular sea breezes. Average temperature in lower parts is 78° Fahr.; rainfall about 75 in. J., with Madura, is divided for administrative purposes into seventeen residencies, each of which is controlled by a Resident, who is assisted by various minor officials. Supreme executive authority is vested in Gov.-Gen. of Dutch India, who is app. by the Crown; legislative power also rests with him, assisted by a Council of five members. There is complete religious liberty; prevailing belief, Muhammadanism.

There is a distinct Javanese language, of which various dialects are in use. Old language called Kavi is that of early Javanese lit., of which there is a considerable amount. Modern Javanese lit. is unimportant. The natives are of three distinct races of Malayan stock—the Javanese themselves, the Sundanese in W., and Madurese in E. They are brown in colour, with prominent cheek-bones and thick lips. Foreign inhabitants include Chinese, Arabs, and Europeans. Pop. *c.* 30,100,000.

Cabaton, *Java, Sumatra, and the Other Lands of the Dutch East Indies* (1911); Scidmore, *Java* (1898).

JAVELIN, spear for casting by hand or with twisted thong; term less frequently used for stouter thrusting spear or pike. J.-throwing as a sport revived in modern Olympic Games.

JAWHAR (73° 20′ E., 19° 55′ N.), town and native state, Bombay, India. Pop. *c.* 50,000; of town, 4000.

JAWORÓW (49° 57′ N., 23° 3′ E.), town, Galicia, Austria. Pop. (1911) 10,208.

JAXARTES, SYR-DARYA (*q.v.*).

JAY, see under CROW FAMILY.

JAY, JOHN (1745–1829), Amer. lawyer and statesman; b. at New York; attended first and second Continental Congresses, and formulated addresses to Brit. and Canadian peoples; drew up constitution of New York State, 1777; chief justice of New York, 1777; entered Congress, 1778, and was chosen as pres.; went on diplomatic mission to Spain, 1780; helped to arrange peace with Great Britain, 1781–83; foreign sec., 1784; chief justice of U.S. Supreme Court, 1789; negotiated commercial treaty with Great Britain ('Jay's Treaty'), 1794; governor of New York, 1795; retired, 1801. Author of several political papers which appeared in the *Federalist*. His s., William J., was well known as an advocate of abolition of slavery.

W. Jay, *Life of John Jay* (1833).

JAZYGES, see IAZYGES.

JEAN CLOPINEL DE MEUN, MEUNG (d. *c.* 1305), Fr. poet; b. at Meun-sur-Loire; continued the *Roman de la rose* fifty years after Guillaume de Lorris had begun it (1230). The first part was only an allegory of love (the rose), the second, 18,000 verses long, a kind of encyclopædia; its mirth, satire, and

verbal excellence delighted France until well on into period of Renaissance.

JEANNE D'ARC, see JOAN OF ARC.

JEANNETTE (40° 19′ N., 79° 38′ W.), town, Pennsylvania, U.S.A. Pop. (1910) 8077.

JEBB, SIR RICHARD CLAVERHOUSE (1841–1905), Brit. classical scholar; b. Dundee; ed. Cambridge; prof. of Greek, Glasgow, 1875; Cambridge, 1889; knighted, 1900; famous for his translations of Sophocles, Theophrastus, and other Gk. writers; a great humanist and a brilliant translator.

JEBEIL, JEBAIL (34° 8′ N., 35° 43′ E.), walled town, Syria. Pop. *c.* 3000.

JEDBURGH (55° 29′ N., 2° 33′ W.), town, Roxburghshire, Scotland; ruins of beautiful Augustinian abbey founded by David I., XII. cent.; on site of old royal castle is disused county gaol; manufactures tweeds, woollens. Birthplace of Sir David Brewster. Pop. (1911) 3982.

JEDDA, see JIDDA.

JEEJEEBHOY, SIR JAMSETJEE, Bart. (1783–1859), Parsi merchant and philanthropist; b. Bombay; in business partnership with his father-in-law, Framjee Pestonjee, at early age; amassed immense fortune by 1820, and gave away *c.* £250,000 in philanthropy between 1822 and 1858. First native of India to be made a baronet of United Kingdom, 1857.

JEFFERIES, RICHARD (1848–87), Brit. naturalist and author; made his first success with *The Gamekeeper at Home*, and later wrote many books on open-air subjects.

JEFFERSON CITY (38° 34′ N., 92° 6′ W.), capital, Missouri, U.S.A.; has government armoury and penitentiary; manufactures boots and shoes, and has railway works. Pop. (1910) 11,850.

JEFFERSON, JOSEPH (1829–1905), Amer. comedian, celebrated for his representation of Rip van Winkle.

JEFFERSON, THOMAS (1743–1826), great Amer. statesman; third Pres. of U.S.; b. at Shadwell, Virginia; became lawyer; entered Virginia House of Burgesses, 1769; was chosen member of State Convention, 1774, and, being unable to be present, wrote his *Summary View of Rights of British Americans*, attacking policy of Mother Country; member of Continental Congresses of 1775 and 1776; drew up the Declaration of Independence. After this he again devoted his services to Virginia, where he introduced some great legal reforms, and carried bills establishing religious liberty and abolishing primogeniture; he was in favour of giving a large measure of independence to individual states, and drew up the constitution for Virginia; became gov. of the state, 1779, and conducted affairs during the British invasion; he was subsequently criticised for his ineffective resistance to the invaders, and withdrew from Virginian politics.

He entered Congress, 1783, and had large share in introducing decimal coinage; in 1784 he was associated with Adams and Franklin in arranging commercial treaties with various European nations; minister to France, 1785; on returning to America in 1789 he was appointed Sec. of State under Washington, and became great opponent of Alexander Hamilton (*q.v.*) and head of the Democratic party. He resigned office in 1794, and retired to private life for a time, but in 1796 he became Vice-Pres. under Adams. Elected Pres. in 1801, he arranged the purchase of Louisiana by the U.S. from France in 1803; he also carried out various reforms, and insisted on retrenchment in public expenses; waged war against Tripoli, and admitted Ohio to the Union; his second term of office began in 1804, and was marked by the trial of Aaron Burr and the abolition of the slave trade. J. withdrew from public life in 1809.

A man of high principles and brilliant intellect, J. was one of the most remarkable personalities of his time. He gave a great deal of his attention to education, and founded the Univ. of Virginia at Charlottesville.

Forman, *Life and Writings of Thomas Jefferson* (1900).

JEFFERSONVILLE (38° 19′ N., 85° 40′ W.), town, Indiana, U.S.A.; state reformatory; railway engineering works. Pop. (1910) 10,412.

JEFFREY, FRANCIS, LORD JEFFREY (1773–1850), Scot. judge and critic; ed. at Glasgow and Edinburgh Univ's; advocate, 1774; edited the *Edinburgh Review* (Whig) from its foundation, 1803–29; Dean of the Faculty of Advocates, 1829; M.P. for Malton, 1831–32, and then for Edinburgh, 1832; Lord-Advocate, 1830–34; judge of the Court of Sessions, 1834; four vol's of contributions to the *Edinburgh*, pub. 1844.

Life, by Cockburn.

JEFFREYS, GEORGE, 1ST BARON JEFFREYS (1648–89), Eng. Lord Chancellor; b. at Acton, Denbighshire; called to the Bar, 1668, and by his great skill in cross-examination rose in his profession, becoming Recorder of London, 1678. After Monmouth's rebellion he was sent on Western Circuit to try the rebels, and at the 'Bloody Assizes,' which he opened at Winchester in 1685, he condemned 320 persons to death. Soon afterwards he was made Lord Chancellor of England, but after the flight of James II. he was imprisoned in the Tower, where he died.

H. B. Irving, *Life of Judge Jeffreys* (1898).

JEHLAM, see JHELUM.

JEHOIAKIM (fl. *c.* 600 B.C.), s. of Josiah, king of Judah (*2 Kings* and *2 Chronicles*).

JEHOL, CH'ENG-TE-FU (40° 59′ N., 118° E.), town, Chi-Li, China. Pop. *c.* 10,000.

JEHORAM.—(1) succ. his bro. Ahaziah as king of Israel, *c.* 854 B.C.; wounded at Ramoth-Gilead, *c.* 842 B.C. (2) s. of Jehoshaphat, king of Judah, *c.* 850–843 B.C.; m. Athaliah, sister of Jehoram of Israel.

JEHOSHAPHAT, son of Asa, king of Judah, *c.* 874–850 B.C.; f. of Jehoram.

JEHOVAH, the proper name of the God of Israel. It is now agreed that it should more properly be called JAHWEH, the form *Jehovah* having arisen through the addition to the consonants of the vowels of *Adonai* (Hebrew, 'My Lord'), as Jahweh itself being too sacred was not pronounced. When the Jews read the Scriptures aloud, it was always read 'Adonai.' In the Eng. versions it is rendered 'The Lord,' though this somewhat obscures the fact that it was originally the name simply of a tribal deity. According to *Exodus* 3^{14} the name was revealed to Moses on Mount Hebron (according to E); *Exodus* 6^{3} (P) also gives an account of its revelation to Moses; in J it is used from the beginning (E and P have Elohim, 'God,' in *Genesis*); thus there were varying traditions of its origin. Its etymological significance is disputed, but it is probably from the verb *hayah* (to be), and means *the self-existent* or *unchangeable One*, the *One who is*.

Driver, *Genesis* (Appendix on Divine Names); Burney, *Old Testament Theology*.

JEHU, son of Jehoshaphat; king of Israel, *c.* 842–816 B.C.; supported by the prophet Elijah.

JEJUNUM, part of small intestine. See DIGESTION.

JELÁL-UD-DIN, see PERSIA (*Language and Lit.*).

JELETZ, ELETS (*q.v.*).

JELLACHICH JOSEF, COUNT (1801–59), Croatian general; took part in crushing Hungarian rebellion, 1848.

JELLALABAD, JALALABAD (*q.v.*).

JELLY-FISH, see MEDUSA.

JEMAPPES (50° 26′ N., 3° 53′ E.), town, Belgium; French defeated Austrians, 1792; coal centre. Pop. 11,600.

JENA (50° 54′ N., 11° 35′ E.), town, Saxe-Weimar, Germany. Univ. dates from 1558. Schiller's *Wallenstein* and Goethe's *Hermann and Dorothea* were written here; town also has associations with Luther, Fichte, Hegel, Humboldt, Haeckel. Here Napoleon defeated Prussians, 1806. Pop. (1910) 38,487.

JENATSCH, GEORG (1596–1639), Fr. Prot. pastor and soldier; fought against the Catholic Planta

family; became governor of Valtelline; murdered at Coire.

JENGHIZ KHAN (1162–1227), Mongol emperor, and one of greatest conquerors of world; b. near river Onon, Mongolia; originally named Temujin; succ. to Mongol throne in 1175; after consolidating the various Mongolian tribes, he twice overran China; conquered Chinese states Hia and Kin (1208–14). His envoys to Transoxiana having been killed, he started in 1219 on his great career of conquest; looted Bokhara and Merv, and conquered Herat and other towns; drove the Turks into South-Eastern Europe, while his armies successfully ravaged S. Russia and N. India; d. while overrunning China for the third time.

Sir Robert K. Douglas, *Life of Jenghiz Khan* (1877).

JENKIN, HENRY CHARLES FLEEMING (1833–85), prof. of Engineering at Univ. Coll., London, 1865, at Edinburgh Univ., 1868.

JENKS, JEREMIAH WHIPPLE (1856–), prof. at New York Univ., U.S.A., since 1912; author of economic works.

JENNÉ (13° 4′ N., 5° 39′ W.), walled and fortified town, Fr. W. Africa; trading centre; boat-building. Pop. c. 8000.

JENNER, EDWARD (1749–1823), Eng. physician, the discoverer of vaccination; was born at Berkeley, Gloucestershire, 1749, third s. of Rev. Stephen J., vicar of the parish, and rector of Rockhampton; ed. at Wotton-under-Edge and Cirencester; became apprenticed to Daniel Ludlow, a well-known surgeon at Sudbury, near Bristol, proceeding afterwards to London to live with (for two years) and study under John Hunter. He commenced the practice of med. in his native place in 1773, and had considerable success, also carrying out investigations in biology. He obtained the degree of M.D. from St. Andrews in 1792. In his native county there was a popular belief that persons who had suffered from cow-pox could not contract small-pox, and, after much investigation, J. became of the opinion that cow-pox, 'grease' in horses, and small-pox were all types of the same disease, modified under different conditions. He carried out careful researches on the subject for sixteen years, and at length, in May 1796, he inoculated a boy, James Phipps, with cow-pox, so that, when the boy was inoculated with small-pox in July, an attack of the latter disease did not ensue. This experiment was followed by others, and in 1798 J. published the result of his investigations. He met with much opposition from the public and from many members of the medical faculty, but received support from many eminent physicians and surgeons, and honours were showered upon him by foreign sovereigns and learned societies at home and abroad, the College of Physicians being, however, a notable exception. He received grants of £10,000 and later of £20,000 from Parliament, and steps were taken, by the formation of the Royal Jennerian Society, which became defunct in a few years, the national vaccine establishment, and by other means, for the propagation of the benefits of his discovery. After his death, statues of J. were erected in Gloucester Cathedral and in London.

Baron, *Life and Correspondence*.

JENNER, SIR WILLIAM, Bart. (1815–98), Eng. physician; prof. of Pathology (1849) and afterwards of Clinical Med. and Med. at Univ. Coll., London; pres. of Coll. of Physicians (1881–88); he was the first to distinguish typhus from typhoid fever.

JENNINGS, SARAH, see MARLBOROUGH.

JENOLAN CAVES (*c.* 149° 40′ E., 33° 20′ S.), stalactite caves, N.S.W., Australia.

JENSEN, ADOLF (1837–79), Ger. composer, famous for song-writing.

JEPHTHAH, Israelite judge; son of Gilead (*Judges* 11, 12).

JERASH, see GERASA.

JERBA (33° 45′ N., 10° 50′ E.), island, Gulf of Gabes, off Tunisian coast, Africa; area, 425 sq. miles; sponges, dates, olives, woollens. Pop. *c.* 40,000.

JERBOAS, small terrestrial and nocturnal rodents with exceedingly long hind legs and tail; found burrowing in the desert plains of Europe, Asia, and Africa; relatives, JUMPING MICE (*Zapus*), are Amer.

JEREMIAH, Old Testament prophet; received his call in the time of King Josiah, *c.* 626 B.C.; he played a prominent part in the religious and political history of Israel from 604, when the Assyrian power under Nebuchadnezzar conquered the Egyptians at Carchemish. J. saw that it was best that Israel should yield to Assyria, but his word was not heeded, with the result that the nation went into captivity, and J. after various sufferings was carried off to Egypt. The book of J. is the longest and one of the greatest of the prophetical books. It is probably largely the work of J. himself, but to some extent recast, and the arrangement is often unchronological.

Driver, *Book of the Prophet Jeremiah*; Peake, *Jeremiah*; *Jeremiah and Lamentations* (Century Bible).

JEREMY, EPISTLE OF, see APOCRYPHA.

JERÉZ DE LA FRONTERA, formerly XERES (36° 40′ N., 6° 8′ W.), town, Spain; centre of sherry trade. Pop. (1910) 62,628.

JERÉZ DE LOS CABALLEROS (38° 15′ N., 6° 48′ W.), town, Spain. Pop. 10,500.

JERICHO (31° 23′ N., 35° 46′ E.), town, Palestine; taken by Israelites under Joshua; in later times destroyed by Romans; rebuilt by Hadrian; finally ruined during Crusades.

JEROBOAM (son of Nebat), king of Israel; first of northern kingdom, *c.* 932–912 B.C., on rupture after death of Solomon, J. refusing to acknowledge Rehoboam; denounced later as one who 'made Israel to sin.'

JEROME BONAPARTE, see BONAPARTES.

JEROME, JEROME KLAPKA (1859–), Eng. humorist; author of *Idle Thoughts of an Idle Fellow* (1886), *Three Men in a Boat* (1889), and the play *The Passing of the 3rd Floor Back* (1907).

JEROME OF PRAGUE (d. 1416), Bohemian theologian; studied at Prague, Oxford, Paris, Cologne, and Heidelberg; an admirer of Wycliffe, and friend of Huss; got into trouble with the authorities of the Church; arrested, 1415; imprisoned and recanted; afterwards defended his former positions, and was burnt as a heretic.

JEROME, ST., HIERONYMUS (340–420), doctor of the Church; ed. Rome; spent his life in Gaul, the East, and at Rome as fellow-worker with Pope Damasus. J. was a scholar rather than a saint, and his great work was his translation of the Bible into Lat.—the Vulgate, in use in the West since his days. He began in 383 by revising the existing Old Lat. versions of the Gospels, of which there were several, then the rest of the New Testament, then the Old Testament, finished *c.* 404. He also wrote commentaries, letters, controversial works, etc. Cutts, *Jerome*.

JERROLD, DOUGLAS WILLIAM (1803–57), Brit. dramatist, wit, and man-of-letters; became a dramatic critic; and in 1829 produced his famous *Black-Eyed Susan* at the Surrey Theatre; contributed to *Punch*, in his characteristic light vein. His *Mrs. Caudle's Curtain Lectures* enjoyed a great vogue.

JERSEY (49° 13′ N., 2° 7′ W.), largest of Channel Islands, belonging to United Kingdom; area, 45 sq. miles; surface undulating, mostly cultivated; potatoes, apples; good fishing; famous strain of cattle; butter produced. Chief town, St. Helier. J. is administered by lieut.-gov. and bailiff nominated by Crown. Pop. (1911) 51,903. See CHANNEL ISLANDS.

JERSEY CITY (40° 44′ N., 74° 6′ W.), town, on Hudson, New Jersey, U.S.A.; practically a suburb of New York; important railway terminus; excellent harbour; meat-packing, manufactures of iron, steel, machinery, chemicals, tobacco, pottery; has fine system of parks. Pop. (1910) 267,779.

JERSEY, EARLS OF, title in Villiers family, created, 1697; the family has an hereditary interest in Child's Bank.

JERUSALEM (31° 47′ N., 35° 15′ E.), sacred city of

Palestine, standing on hills of Zion, Acra, Moriah, and Bezetha, and thus a natural fortress almost impregnable in ancient times. Its earliest inhabitants, the Jebusites, were defeated by Joshua and David; latter made it his capital, fortified it, and selected situation for Temple, built in Solomon's reign. After separation of Israel and Judah, J. was frequently engaged in war against kings of Israel, and suffered successive attacks by Egyptians, Philistines, Assyrians, and Babylonians; taken and sacked by Nebuchadnezzar, king of Babylon, in 188 B.C., when chief inhabitants were carried off to Babylon. First return of exiles under Zerubbabel occurred *c.* 536 B.C.; new Temple was completed by 515 B.C.; and under Ezra and Nehemiah the city was rebuilt in V. cent. B.C.

For many years it knew no peace; was captured in succession by Persians, Macedonians, Syrians, and Egyptians; sacked by Ptolemy Soter of Egypt; only regained independence for brief period under the Maccabees, *c.* 165 B.C.; came under sway of Rome, 37 B.C., and flourished under Herod; destroyed by Titus, 70 A.D., and again by Julius Severus, 132 A.D.; rebuilt under Hadrian, with name of Ælia Capitolina; sacked by Chosroes II. of Persia, 614; captured by Muhammadans, 637, from whom it was taken by Crusaders under Godfrey de Bouillon, in 1099; recaptured by Saladin, 1187, remaining subject to Egypt till 1517, since when it has belonged to Turks. J. is episcopal see of Anglican, Greek, and R.C. Churches; site of several monasteries; among notable buildings are Church of Holy Sepulchre, said to occupy site of our Lord's tomb, Mosque of Omar, and Russ. cathedral. Pop. *c.* 60,000.

JERUSALEM ARTICHOKE, see ARTICHOKE.

JERUSALEM HADDOCK, see OPAH.

JERUSALEM, SYNOD OF (1672), on behalf of the Eastern Church denounced Calvinism.

JERVIS, SIR JOHN, see ST. VINCENT, JOHN JERVIS, EARL OF.

JESI (43° 32′ N., 13° 13′ E.), town, Italy; seat of bishopric. Pop. 24,000.

JESSAMINE, see JASMINE.

JESSE, f. of David, king of Israel, and therefore in the New Testament genealogies an ancestor of Christ.

JESSEL, SIR GEORGE (1824–83), Eng. judge, of Jewish birth; ed. at Univ. Coll., London; called to Bar, 1847; M.P. for Dover, 1868; Solicitor-General, 1871; Master of Rolls, 1873; under Judicature Act (1881) pres. at first Court of Appeal; a good judge and brilliant lawyer.

JESSORE.—(1) (23° 10′ N., 89° 8′ E.) district, Bengal, India; area, 2925 sq. miles; produces sugar, timber, rice. Pop. *c.* 1,800,000. (2) (23° 8′ N., 89° 8′ E.) town, capital of above. Pop. 9000.

JESTER, prominent member of mediæval society; retainer in noble households, where they were expected to make jokes to order: best description of j. is Touchstone in *As You Like It.*

JESUITS, a famous religious community of the R.C. Church, founded (1540) by a Span. soldier, St. Ignatius of Loyola (*q.v.*). It came into existence, first as a band of missionaries destined for the conversion of the Turks, then, as the practical impossibility of this task became apparent, it broadened into a society, whose work it should be to become a weapon, adaptable for every purpose the Church might need. To secure this object the more effectively, every outward sign of an especial Order with an especial aim was omitted. Monastic life and monastic habit alike were given up. To the triple vow, taken in all religious communities of the R.C. Church (poverty, chastity, obedience), St. Ignatius added a fourth, that of going without question or delay wherever the pope might see fit to send them for the salvation of souls. This was taken for the first time on Aug. 15, 1534. Soon after, 1540, a definite rule was composed and presented to Paul III. By a Bull, dated Sept. 27, 1540, Paul III. solemnly confirmed the new 'Company of Jesus,' and in April 1541 St. Ignatius was elected the first General. His *Book of Constitutions* (first pub. 1558) shows the purposes of the society, his *Spiritual Exercises* its inward force and efficacy.

It is natural that the organisation of Loyola should be military and autocratic, with all the advantages and disadvantages of such a system. The obedience demanded (save in matters of sin) is absolute. The General has practically unlimited power, though he can be deposed by a General Congregation of the whole society. The various grades into which the Order is divided are—(*a*) *Professed*, who, after several years, have been admitted to final vows. From these only can the Superiors and Professors of Theology be chosen; (*b*) *Coadjutors*, whether priests or lay-brothers, who carry on the affairs of the society; (*c*) *Scholastics*, who in their study and preaching are preparing themselves for the priesthood and their future work; (*d*) *Novices*, who by purely manual and spiritual tasks are being trained and tested. The work of the society has been, through the influence of Claudio Aquaviva (*q.v.*)—General, 1581–1615—mainly educational and missionary; but preaching, natural science, and theology owe much to Jesuit enterprise. In the last-named department, the society has always leaned to the broadest interpretation of moral principles, and thus gave colour to the brilliant attack of Pascal's *Provincial Letters*, the effects of which have been felt till our own day.

Its force and military organisation made it feared and hated by political rulers, and it has been repeatedly suppressed in various countries of Europe. After a career of splendid success and triumphs, both missionary and intellectual, it became so unpopular that, 'for the peace of the Church,' Clement XIV., by a Bull of July 21, 1773, *Dominus et Redemptor Noster*, without approving or denying any of the charges made against the society, suppressed it in all the states of Christendom. But it was too useful and too powerful to suffer anything more than a temporary eclipse, and it was re-established by Pius VII., Aug. 7, 1814—*Solicitudo Omnium Ecclesiarum*. It now numbers about 15,000 members. It is still forbidden in certain countries of Europe (Germany, Switzerland, Portugal, etc.). In England its work is mainly educational, with its brilliant colleges of Stonyhurst, Beaumont, etc.

Crétineau, *Histoire de la Compagnie de Jésus* (1845); Parkman's *Jesuits in N. America in the 17th Cent.* (1886); Ethelred Taunton, *Jesuits.*

JESUS, son of Sirach. See ECCLESIASTICUS.

JESUS CHRIST ('Jesus' is a personal name; 'Christ,' 'The anointed one,' a title) was born between 8 and 4 B.C., and crucified at Jerusalem between 29 and 37 A.D. Despite all the ingenuity of scholars, the exact dates have never been arrived at with certainty. Our authorities for His life are the New Testament writings; Jewish tradition and extra-canonical sources contribute hardly anything of value. A few of the non-canonical sayings may be authentic, but that is all. The apocryphal gospels are entirely untrustworthy. The life of Christ cannot be studied apart from New Testament criticism. It seems undoubted that we have in *Mark* a fairly primitive account of the life of Christ based partially on St. Peter's reminiscences, and that there are other independent sources, one particularly of Sayings of Jesus embedded in the First and Third Gospels. The historical value of the Fourth Gospel has been more questioned, but it is probable there are independent traditions enshrined in it.

The chronology of the life of Christ is complicated by the Gospel narrative covering the same ground, but with varied arrangement. Mark is chronological, but the other material arranged and combined by Matthew and Luke is often uncertain in chronology. To combine the Johannine with the Synoptic is very difficult. The life of Christ can scarcely even be summarised here, but some facts stand out. His first thirty years, or thereabouts, were passed in obscurity; His public work immediately followed that of John the Baptist; Jesus' work was not only healing and teaching but had for its central point the proclamation of the imminence of the kingdom of God; His proclamation of Himself as

Messiah was not made public at first, though after Peter's confession at Cæsarea Philippi made known to the disciples; the turning-point in the life of Christ was His setting forth on the journey to Jerusalem, conscious of His own death as the result; it is impossible not to see the impression of gloom and coming disaster in the later sayings and parables, which form one of the strongest proofs of the essential historicity of the Gospel narrative; the difference of tone in the narrative of the earlier and latest parts of the ministry could not be due to accident or intention; it is undeniable that the Crucifixion meant to the Apostles the crushing of all their hopes, and that, whatever explanation of the Resurrection accounts we accept, it cannot be denied that within a short time of the death of Jesus those who had known Him on earth were convinced that they had seen Him alive.

For the teaching of Jesus on its practical side the Gospel evidence is clear and indisputable. Of its theological and personal side it is not so easy to speak with certainty. The phrase 'Kingdom of God' has been recently much discussed (see ESCHATOLOGY). Did it mean the slow growth of righteousness in the world or a violent catastrophe in which the old order would be swept away? Many scholars now assert that Jesus expected the immediate coming of the kingdom, and identified Himself with the Son of Man who in the later Judaism was expected to bring it in.

The place of Christ in Christian theology cannot be discussed here, but it must never be forgotten that Christ is the centre of His own religion, more even than other religious leaders have been in theirs.

Several attempts have been made to prove that Jesus never existed, and that the Gospels are pure myth—the humanising of a Divine hero. These vagaries of criticism have won no acceptance among competent scholars.

The bibliography is stupendous; a recent list enumerates 7000 works, and this cannot be complete. See CHURCH HISTORY, CHRISTIANITY, RELIGION, THEOLOGY. The best-known *Lives* of Christ are those of Keim, Edersheim, Renan, and Weiss, though none are entirely satisfactory; Sir J. Seeley's *Ecce Homo* is original; Farrar is devout, but deficient in critical ability; Sanday's *Life of Christ in Recent Research* and other writings, particularly *Christologies, Ancient and Modern*, are important; Schweitzer's *The Quest of the Historical Jesus* is a brilliant book.

JET, compact black variety of lignite (brown coal), easily carved and polished, and so especially suitable for making mourning ornaments and trimmings. Whitby (Yorks) was once the seat of a flourishing industry; but the use of jet has been supplanted by that of vulcanite.

JETHRO, Old Testament character; father of Zipporah, the wife of Moses.

JETSAM, see FLOTSMAN, JETSAM, AND LAGAN.

JETTY, term used in engineering to designate structures thrown out (Fr. *jeté*) from shore into river or sea for various purposes; wooden j's projected into harbours to facilitate loading and coaling, or to contract breadth of river in order to deepen channel; pile-work; largely used in Venice to narrow channel and prevent formation of sand-bar; used at narrow river-mouth where water tends to spread.

JEVER (53° 35′ N., 7° 54′ E.), town, Oldenburg, Germany. Pop. (1910) 5787.

JEVONS, WILLIAM STANLEY (1835–82), Eng. philosopher and economist; assayer to Mint in Sydney, 1854–59; then studied at London Univ.; prof. at Owens College, Manchester, 1866, and at Univ. College, London, 1876; his life was cut short by drowning; eminent both in logic and economics; specially emphasised doctrine of utility and mathematical aspects of economics; his works, *Pure Logic* (1864), *Theory of Political Economy* (1870), *Principles of Science* (1874), show independence of thought.

JEW FISHES, see BASSES.

JEW, THE WANDERING.—According to the legend a Jew mocked Jesus when bearing the cross by saying, 'Go faster,' and Jesus replied, 'I go, but thou shalt wait till I return.' The origin of this legend is a pamphlet printed at Leiden, which states that the bp. of Schleswig had met a Jew called Ahasuerus at Hamburg, who claimed to be eternal and condemned to await Christ's return. The pamphlet spread over Europe, and for centuries claimants appeared under different names. Around the legend has grown a mass of lit., the subject being specially popular during the Romantic revival. The real source of the legend is probably *Matthew* 16^{28}, 'There be some of them that stand here which shall in no wise taste of death till they see the Son of Man coming in his kingdom.'

JEWEL, JOHN (1522–71), Eng. theologian; bp. of Salisbury, 1559; pub. *Apologia ecclesiæ Anglicanæ* against Rom. Church, 1562; engaged in controversy with Thomas Harding; at first of Prot. sympathies, but became anti-Puritan.

JEWELLERY, articles of personal adornment, often of great value owing to their being manufactured from precious metals and set with precious stones. Term includes such articles as swords, the scabbards or handles of which are set with gems; and caskets and insignia of various knightly orders. J. is not to be confused with gems (*q.v.*), which are engraved stones. Probably the first articles of j. were carved beads; native gold was used from an early date, and from the many examples of ancient j. it is evident that the ancients had a complete command over the metal, hammering it into very thin plates or drawing it into very fine wires for plaiting or twisting. The metal was sometimes very beautifully chased and embossed. Rings found in their tombs show that the early Egyptians were skilful engravers, and could chase, solder, and enamel metals and also set precious stones. The ancient Greeks and Romans were highly artistic; the Etruscans were very fine metal-workers, and one of their lost arts is the giving of a granulated appearance to a golden surface. The Celts and Scandinavians were skilful engravers, and some results of their work is seen in the ancient brooches of Scotland and Ireland. Sometimes very fine examples of inlaying and filigree work (*q.v.*) are seen in these brooches.

The Hindoos have always been fond of rich j., and have produced much beautiful filigree work and enamelling. Ancient j. was produced entirely by craftsmen, but in modern times machinery is much used, especially in the manufacture of cheap j. The centre of this industry is Birmingham, but nearly all the better-class goods are made at Clerkenwell, London. Silver and pebble j. is made in Scotland, while in Ireland tiny ornaments are carved from bog oak. Jet (*q.v.* ornaments of all descriptions come from Whitby.

The j. trade is carried on in most of the large cities of the world, but especially at Paris, Vienna, and New York. Fine filigree work is done at Malta, and red coral j. comes from Naples.

Jewellery, by Clifford Smith, by Davenport.

JEWS, a Semitic race descended from Abraham, through his grandson Jacob, from whose sons the twelve tribes were traditionally descended. So called because the majority of those who returned to S. Palestine after the captivity in Babylon were of the tribe of Judah; also known as ISRAELITES, from the name given to Jacob, and as the HEBREWS, a name which may possibly be derived from the Habiru, who are found in Palestine in the XV. cent. B.C. Greater part of early history of race is covered by books of Old Testament, which, however, must not be regarded as unimpeachable authority. Abraham is said to have settled in Canaan about 2000 B.C., having migrated thither from his native place, 'Ur of the Chaldees,' on the W. bank of Euphrates; and after Jacob's return from Gilead he and his family settled at Shechem and afterwards at Beersheba.

They were subsequently driven by famine to migrate to Egypt, on the invitation of Joseph, Jacob's son, who had become Viceroy there. The children of Israel re-

mained in Egypt for 215, or, according to some chronologists, 400 years; at first well treated, they were afterwards subjected to oppression and reduced to slavery, from which they were finally delivered by Moses, after the tenth plague had frightened Pharaoh into allowing them to go. After crossing the Red Sea they are said to have wandered in the wilderness forty years, during which time they received from God a code of social, political, and religious laws, and at the end of which they successfully invaded the Promised Land, their ancestral home under the leadership of Joshua, c. 1270 B.C. The country to the W. of Jordan was apportioned to Asher, Benjamin, Dan, Ephraim, Issachar, Judah, Naphtali, Simeon, Zebulon, and the half-tribe of Manasseh; while that to the E. of the river was given to Gad, Reuben, and the other half-tribe of Manasseh. The Levites were given a number of towns in different parts of Canaan, and received also a tenth of the produce of the earth. The period succeeding the death of Joshua is marked by disputes among the tribes, anarchy, and infidelity, and by the attempts of surrounding nations to dispossess the Israelites of their country.

From time to time Judges, or Deliverers, arose, who shook off the foreign yoke: thus Ehud delivered the nation from Eglon, king of Moab; Gideon from Midianites; Jephthah from Ammonites; Samson from Philistines; while the seer Samuel prepared the people for the establishment of a monarchy.

Kings of Israel.—The first king was Saul, who conquered many surrounding peoples, but was defeated by the Philistines at Mt. Gilboa, when he killed himself. His successor, David, the greatest figure in the history of Israel, and the founder of a long line of kings, carried out a series of successful wars, and gave to the nation the full possession of the country from Euphrates to river of Egypt, as promised to Abraham in *Genesis* 15[18]. David was succeeded by his son Solomon, who was celebrated for his wisdom and vast wealth, and built the Temple, but, subsequently, lapsed into idolatry; after his death the kingdom was rent in two; ten tribes revolted under Jeroboam, and formed the *kingdom of Israel*, while the other two, Judah and Benjamin, formed the *kingdom of Judah* under Rehoboam, Solomon's son. Among the nineteen kings of Israel, most of whom 'did evil in the sight of the Lord,' perhaps the most notorious were Jeroboam, s. of Nebat, 'which made Israel to sin' by establishing worship of the Golden Calf, and Ahab, whose name is a synonym for cruelty. The last king of Israel, Hoshea, was conquered and imprisoned by Shalmanezer, king of Assyria, who also carried off the people into captivity, whence they never returned, their ultimate destiny being veiled in obscurity.

The history of **Judah** presents a less uniform spectacle of depravity than that of the northern kingdom; among the kings of David's line, although many were addicted to idolatry, there were several, such as Hezekiah and Josiah, who were enthusiastic in the cult of the national religion, and who also carried out numerous reforms. At its best, however, the prosperity of Judah was intermittent; and after a long struggle against Assyria, Egypt, and the Chaldeans, which endured for over 130 years, the southern kingdom was overtaken by the same fate as the northern; Jerusalem was taken by Nebuchadnezzar in 588 B.C., and the nation was carried off to *Captivity* in Babylon. Unlike the kingdom of Israel, however, Judah remained a separate people, retaining its own institutions in exile, and never becoming merged with the conquerors. Some account of the *Exile* is given in books of Daniel, Ezekiel, and other prophets; the exiles apparently settled down in comfort, if not content, and were treated with consideration.

Persian and Greek Domination.—In 539 B.C. they came under the rule of Persia, and three years later a number of them were allowed by Cyrus the Great to return; Jerusalem and the Temple were rebuilt under direction of Ezra and Nehemiah, who also established a system of government in Palestine. Supreme administrative control was at first held by Zerubbabel, from whom it afterwards passed to others, and a Council of Elders was founded which inaugurated an epoch of great literary activity. Study of law was carried on by a special class of scholars, who exercised supreme control in spiritual matters, and are represented in later times by the *Sanhedrin* or great council of the Jews.

The period of Gk. domination begins with the break-up of the Persian Empire before the victorious forces of Alexander the Great, to whom Jerusalem surrendered in 332 B.C. The Jews received many privileges from the conqueror, who invited many of them to settle in his new city of Alexandria. After his death in 323 B.C. the country came to hands of one of his generals, Laomedon, from whom it was subsequently taken by Ptolemy Soter; between 314 and 301 it was in possession of Antigonus of Syria, but reverted to the Ptolemies at the latter date. Under the Ptolemies the Jews enjoyed considerable prosperity, and were allowed to build synagogues in all their settlements. During several decades the possession of Palestine was contested by the Seleucids, and eventually the country was captured by Antiochus the Great in 198 B.C. He also granted the Jews various privileges, as well as religious liberty; but his successors, Seleucus Philopator and Antiochus Epiphanes subjected them to merciless persecution; the former pillaged the Temple, the latter slew and enslaved many of the people and dedicated the Temple to Jupiter Olympias.

His determination to eradicate Judaism and to hellenise the people resulted in a **national rebellion**, the standard of liberty being raised by Mattathias, a priest, and head of the Asmonæan family. Mattathias died in 166 B.C.; and his son, Judas Maccabæus, after a series of magnificent victories, succeeded in expelling the Syrians and establishing the *Maccabæan* or *Asmonæan dynasty*, under which the Jews attained a splendour resembling that of the time of David. On Judas's death his bro's Jonathan and Simon reigned in turn with wisdom and success; Simon was succeeded in 135 by his son, John Hyrcanus, who conquered Edom and Samaria, and supported the Sadducees, who, like the Pharisees, became an important sect during his reign. His son and successor, Aristobulus I., was first to assume kingly title. About this time the power of the Asmonæans began to decline; civil wars disturbed the reign of Alexander Jannæus (103–79 B.C.), and after the death of his wife Alexandra, who reigned 79–69, quarrels arose between their sons Hyrcanus and Aristobulus.

Roman Government.—This led to the intervention of the Romans, who in 63 took Jerusalem and established their supremacy in Judæa. Hyrcanus II. was nominated high priest by Pompeius, but he weakly allowed Antipater the Idumæan to take the control of affairs into his own hands; the result of this was that Antipater was in 47 appointed procurator of Judæa by Julius Cæsar, and his son Herod the Great became governor of Galilee. Herod was made king of Judæa in 40 B.C., and three years later he seized Jerusalem and deposed Antigonus, last prince of Asmonæan family. After Herod's death in 4 B.C. his kingdom was subdivided into a set of principalities; his son Archelaus received Idumæa, Judæa, and Samaria; Herod Antipas became tetrarch of Galilee and Peræa, and Herod Philip tetrarch of districts beyond Jordan. Soon afterwards Judæa and Samaria became provinces of Rome and were ruled by Rom. procurators; Pontius Pilate, during whose administration occurred the crucifixion of Jesus Christ, was procurator from 26–36 A.D.

After Pilate's death the old kingdom of Palestine was temporarily restored under Herod Agrippa, who was allowed by Claudius to reign over whole country; his reign was marked by persecution of Christians, but lasted only for three years. When he died, the country was again placed under administration of Rom. governors.

many of whom treated the Jews with great severity, with the result that insurrections were of frequent occurrence. Among the most merciless governors were Alexander, an apostate Jew, Felix, Albinus, and Gessius Florus. Under the last-named an open revolt broke out against Rome in Cæsarea, 66 A.D., and spread in all directions. The suppression of this rebellion was entrusted by Nero to Vespasian, who, on succeeding to the imperial throne, left the conduct of affairs in Judæa to his son Titus. Titus brought to a successful issue the siege of Jerusalem, planned by his father; and the utter destruction of the city in 70 A.D. finally deprived the Jews of their national habitat, their history henceforward being that of a people scattered all over the world. Great numbers fled to Egypt, Italy, Spain, Cyprus, and elsewhere. Those remaining in Palestine made one or two further attempts at insurrection, the last of which was led by Bar-Cochba and was put down by the Romans after a three years' war, 133-35 A.D.; during this war great numbers of Jews were slain, and those remaining were forbidden to enter the new city of Ælia Capitolina, built by Hadrian on site of Jerusalem.

The national religion, however, survived all catastrophes, and the Jews everywhere retained their own religious customs and traditions. Everywhere persecuted, they were yet everywhere successful; and it has been suggested that their material prosperity was the cause of the ill-treatment to which they were from time to time subjected by the nations among whom they lived. Little more than half a century after the suppression of Bar-Cochba's rebellion there were two regularly organised Jewish communities; of these one was under the Prince of the Captivity, to whom all Eastern Jews acknowledged allegiance; and the other was under the patriarch of Tiberias, and included all the Jewish inhabitants of the Rom. Empire. Compilations of oral laws were begun by scholars, and when complete were called the *Talmud*; the Palestinian Talmud was finished in IV. cent., the Babylonian Talmud in 500 A.D.

Emigration and Persecution.—Already in Rom. times great numbers of Jews settled in Europe; they were generally subjected to severe persecution by the Christians, partly on account of their practice of usury, but continued to prosper, and by their genius for finance and commerce made themselves masters of international trade. In Arabia the rise of Muhammadanism resulted in the expulsion of the Jews of Homeritis; but in most Muhammadan countries they were, although heavily taxed, allowed to live in comparative comfort. In Spain they attained their greatest prosperity and lived on terms of close friendship with the Moors; many of them held offices of state, and letters and scholarship reached a high development; but they were banished from Spain, along with the Moors, late in the XV. cent. In Germany in early and mediæval times they were mercilessly persecuted, reduced to a condition of slavery, and frequent massacres took place; from time to time they were expelled, and persecution continued even in the XVIII. cent.; in 1812 an Edict of Toleration removed many of their disabilities, but they are still looked down upon by the Christian population, and at present day no Jew is allowed to become an officer in the German army.

In France they were at first regarded with toleration, but from the XI. cent. onwards they were decimated by a series of massacres, and in the XIV. cent. they were banished from the country; in 1791 their citizenship was established by the National Assembly, and in 1805 a Jewish Sanhedrin was established. In England they were regarded with favour by the first two Norman kings, but in the XII. cent. hostility to them broke out, and during the Crusades they were subjected to cruel oppression. In 1290 they were banished, and for several cent's few were to be found in Britain; since the XVII. cent. they have been tolerated and have received many concessions, so that they are now on terms of perfect equality with the rest of the population, the highest offices of State being open to them. In Russia and Rumania they met with great cruelty, and are still harshly dealt with in these countries. In the U.S. they have had rights of citizenship since 1783.

About 1880 an anti-Semitic movement began in Europe among those nations whose jealousy was excited by the continually increasing wealth and influence of the Jewish inhabitants (see ANTI-SEMITISM). In 1893 the idea of an autonomous Jewish State was revived by Theodor Herzl, founder of the Zionist movement, which aimed at establishing such a state in Palestine.

Milman, *History of the Jews* (1878); H. Graetz, *Geschichte der Juden* (Eng. trans., 5 vol's, 1891-92), *Jewish Encyclopædia*; Leroy-Beaulieu, *Israel among the Nations* (1895).

JEW'S HARP, JEW'S TRUMP, small musical instrument in form of metal lyre held between teeth and played by plucking vibrating tongue.

JEYPORE, see JAIPUR.

JEZEBEL, the wife of Ahab, king of Israel; represented as a depraved woman and the enemy of Israel's God.

JHABUA (22° 45′ N., 74° 38′ E.), town and native state, Central India. Pop. *c.* 82,000.

JHALAWAR (25° 7′ N., 77° 4′ E.), native state, Rajputana, India. Pop. *c.* 92,000. Capital, **Jhalrapatan** (24° 31′ N., 76° 8′ E.), is commercial centre. Pop. 8000.

JHANG.—(1) (31° 18′ N., 72° 25′ E.) district, Punjab, India. Pop. 380,000. (2) (31° 16′ N., 72° 23′ E.) town, capital of above. Pop. 25,000.

JHANSI.—(1) (25° 24′ N., 79° 10′ E.) district, United Provinces, India; area, with Lalitpur, *c.* 3600 sq. miles; produces cereals, cotton; frequently suffers from famine. Pop. 618,000. (2) (25° 37′ N., 78° 35′ E.) walled town, capital of above; has fort. Pop. (1911) 55,724.

JHELUM, JEHLAM.—(1) (33° 12′ N., 72° 30′ E.) district, Punjab, Brit. India; area, 3995 sq. miles; crossed by Salt Mountains and J. River. Pop. (1901) *c.* 595,000. (2) (32° 56′ N., 73° 41′ E.) town, capital of above. Pop. 15,500.

JHELUM, JEHLAM (34° N., 73° 27′ E.), river, India; unites with Chenab.

JHERING, RUDOLF VON (1818-92), Ger. jurist; prof. of Rom. Law at Basel, Rostock, Kiel, Giessen, Vienna, and Göttingen successively; wrote *Geist des römischen Rechts auf den verschiedenen Stufen seiner Entwickelung*, famous work on Rom. law; also *Der Kampf ums Recht*, and other works.

JHIND, see JIND.

JIBUTI (11° 36′ N., 43° 9′ E.), capital, Fr. Somaliland; fine harbour; exports coffee, rubber, ivory, live stock. Pop. (1911) *c.* 11,000.

JIDDA (21° 30′ N., 39° 22′ E.), port, Arabia, on Red Sea; important as chief port of Mecca, many thousand pilgrims landing here every year; extensive harbour; exports mother-of-pearl, coffee, carpets, balsams. Pop. variously estimated, 18,000 to 30,000.

JIG, dance of cheerful nature common among peasants, especially popular in Ireland, where it has assumed a national character; generally written in ⅜ time ('jig-time').

JIGGER, CHIGOE, SAND-FLEA (*Sarcopsylla penetrans*), Amer. parasitic flea; female buries abdomen in skin, usually of human feet, and distends greatly with eggs; unless tampered with, the wound is harmless. See also FLEAS.

JIMENES, see XIMENES DE CISNEROS.

JIND (29° 17′ N., 76° 22′ E.), native state and town, Punjab, India. Pop. (1911) 271,728; of town, 9000.

JINGOISM, hysterical, aggressive imperialism; term derived from song popular during Brit. Anti-Russian Movement, 1878, 'We don't want to fight, but, by jingo, if we do.'

JIU-JITSU, see JU-JITSU.

JIZAKH (40° 12′ N., 1° 50′ E.), fortified town, Western Turkestan. Pop. 17,000.

JOAB, s. of Zeruiah and nephew of King David (*2 Samuel*).

JOACHIM I. (1484–1535), elector of Brandenburg, 1499; vigorous opponent of Reformation.

JOACHIM II. (1505–71), elector of Brandenburg; succ. his f., Joachim I., 1535; strengthened position in Brandenburg; in ecclesiastical questions took a *via media*.

JOACHIM, JOSEPH (1831–1907), violinist and composer; b. near Pressburg, Hungary; studied in Vienna and Leipzig; royal conductor of concerts, Hanover, 1853–66; m. famous contralto, Amalia Weiss; app. head of Berlin Hochschule, 1866; organised J. Quartet; foremost violinist of his day.

Moser, *Life of Joachim* (1899); Maitland, *Joseph Joachim* (1905).

JOACHIM OF FLORIS (1145–1202), Ital. theologian and mystic; b. in Calabria; abbot of Corazzo, 1177, then founded abbey on Monte Nero; his theological view is that there are three stages of revelation, those of the Father, Son, and Holy Spirit—the last yet to come; his influence was considerable in heretical circles in France and Italy.

JOACHIMSTHAL (50° 23′ N., 12° 54′ E.), town, Bohemia, Austria; silver, nickel, uranium, lace, gloves; first *thalers* coined here, 1519 (see DOLLAR). Pop. (1911) 7550.

JOAN, POPE, a woman, who, pretending to be a man, became Pope John XII., 855; Döllinger proved the story a myth.

JOAN OF ARC, ST., JEANNE D'ARC, 'The Maid of Orleans' (c. 1410–31), Fr. patriot; b. at Domrémy; moved by visions and voices of saints calling her to deliver France, she sought Charles the Dauphin, who entrusted her with leadership of an army; she entered Orleans in triumph in April 1429; and after several victories over the English she was captured by the Burgundians when leading a sally from Compiègne. She was then handed over to the English, who burnt her at Rouen as a sorceress. Beatified, 1908.

Andrew Lang, *The Maid of France* (1908); *Life*, by Fabre (1892), Mrs. Oliphant (1896), Murray (1902), Anatole France (1909), Grace James (1910).

JOANNA (1479–1555), queen of Castile, 1504; lost her reason; married Philip, son of Maximilian I.; their son was Emperor Charles V.

JOANNA I. (1327–82), queen of Naples; married (1) Andrew of Hungary, (2) Louis of Taranto, (3) James of Majorca, (4) Otto of Brunswick.

JOANNA II. (1371–1435), queen of Naples; succ., 1414; reign marked by intrigues between queen, her ministers and lovers, and the rulers of Anjou and Aragon.

JOANNES DAMASCENUS, see JOHN, ST., OF DAMASCUS.

JOB, BOOK OF, belongs to the 'Wisdom Literature,' and deals with the problem of suffering, which, in the later stages of Old Testament theol., perplexed men. Formerly it was held that all suffering comes as punishment for sin, and it is against this J. was written. J. was a wealthy and prosperous, and also a pious, man, and the Satan (*i.e.* Adversary), whose function it is to try men, is allowed by God to see whether J.'s piety is merely the result of his prosperity. He does so, and J. is cast down by misery. J.'s friends try to persuade him that he has done wrong. J. is bewildered and sometimes defiant, and his friends do not really help him solve the problem. The solution is due to Elihu, who helps J. see the real meaning of his trial. Elihu's speeches, which some think a later addition, are meant to emphasise the discipline of suffering.

The text of J. is shorter in the LXX than the Hebrew. The date is uncertain. Formerly it was thought to be patriarchal, as J. leads a patriarchal life, and it was conjectured that he was Moses, as the book was then taken as literal history. But its whole tone and reflection on moral and spiritual problems indicate a much later date. These questions scarcely pressed for solution among the Israelites before the VI. cent. B.C. Its language, too, shows traces of Aramaic and Arabic influence which would not be possible earlier, so J. is probably V. cent.

Driver, *Book of Job*; Peake, *Job* (Century Bible); Froude, *Short Studies*, vol. i.

JOCASTA, see ŒDIPUS.

JOCKEY, see RACING.

JODHPUR, MARWAR (26° 20′ N., 72° 30′ E.), native state, Rajputana, India; area, 34,963 sq. miles; watered by Luni and its affluents; produces salt (from Sambhar and other salt lakes), tin, iron, marble, cereals; joined Mutiny, 1857. Pop. (1911) 2,057,553. **Jodhpur** (26° 19′ N., 73° 2′ E.), the capital, a walled town, has a huge fortress in which are several ancient palaces. Pop. (1911) 60,437.

JOEL, BOOK OF, one of 'minor prophets.' The first part, to 2^{17}, contains a description of the approach of the 'day of Jehovah' heralded by portents, but there is still time for repentance. The latter part recounts God's mercy, and contains the famous passage, 'And it shall come to pass afterward that I will pour out my spirit upon all flesh, etc.'; the people are to prepare for war; the day of Jehovah will come, Judah will prosper, but Edom will be a 'desolate wilderness.' The date of J. is disputed; formerly it was thought the reign of Joash was suitable, but now criticism inclines to the view that it is post-exilic. There are close parallels with the *Book of Amos*.

Driver, *Joel and Amos* (Cambridge Bible).

JOHANNESBURG (26° 12′ S., 28° E.), important commercial city and mining centre of S. Africa, situated in Witwatersrand goldfield in Transvaal; founded in 1886 on discovery of gold, and rapidly grew in importance; during war J. taken by British in 1900; city possesses many spacious streets and squares and handsome structures; among public buildings are stock exchange, law courts, Univ. Coll., clubs, theatres, and churches; has several large suburbs; other industries besides mining are printing, milling, brewing, and founding. Pop. (1911) 237,220.

JOHANNISBERG (53° 37′ N., 21° 49′ E.), village and castle, Germany; produces Johannisberger wine.

JOHN (c. 1167–1216), king of England; youngest s. of Henry II.; succ., 1199; murdered nephew Arthur, 1203. On his mother's death he lost Anjou, Normandy, Maine, Touraine; quarrelled with pope over Langton's election as abp. of Canterbury, and was excommunicated; signed Magna Carta, 1215. J. was unscrupulous, false, gross—'the worst king England ever had.' See ENGLAND (*History*).

JOHN, name of twenty-three popes: **John XII.** (955–64) was deposed by Otho the Great, but drove out Leo VIII., his successor.—**John XXI.** (1276–77), probably same as 'Peter the Spaniard,' a learned medical writer.—**John XXII.** (1249–1334), b. at Cahors, France; elected to papal chair on death of Clement V., 1316; supported Frederick of Austria in his struggle against Louis of Bavaria for the imperial throne; excommunicated Louis, who in 1328 deposed him and secured the election of another pope, Nicholas V. J., however, regained the pontificate in 1330; wrote the decretals called *Extravagantes*, and pub. the *Constitutions of Clement V.*, 1317.—**John XXIII.** (d. 1419), antipope; original name, Baldassare Cossa; passed years before entering Church as corsair; was elected on death of antipope, Alexander V. (1410). Gregory XII. still reigned and the antipope, Benedict XIII. John XXIII. was deposed (1415) by Council of Constance; was imprisoned for three years in Germany; app. bp. of Tusculum, 1419.

JOHN, DON, OF AUSTRIA (1546–78), illegitimate s. of Charles V.; defeated Moors in Granada, 1569–71; commanded fleet against Turks, on whom he inflicted severe defeat at Lepanto, 1571; occupied Tunis, 1573; governor of Netherlands, 1576; won battle of Gembloux, 1578; d. same year.

JOHN OF AUSTRIA (1629–79), Span. soldier;

putative s. of Philip IV. of Spain; put down Neapolitan rising, 1647; Catalonian revolt, 1651–52; fell from favour for subsequent defeats, but ultimately obtained chief power after Philip's death.

JOHN (1296–1346), king of Bohemia; aided Louis of Bavaria against Frederick of Austria in struggle for imperial throne; put down several risings in Bohemia; annexed Silesia; twice invaded Italy; supported France against England; killed at Crécy; lost eyesight in 1340.

JOHN VI., or V., CANTACUZENE, Byzantine emperor, 1341–54; became joint-emperor, by revolution, with pupil, John Palæologus; feeble, extortionate ruler; forced to abdicate; wrote a history of his time.

JOHN II., THE GOOD (1319–64), king of France; defeated by Black Prince at Poitiers, 1356; taken prisoner to England.

JOHN II. (1397–1479), king of Aragon; m. Blanche of Navarre, and through her became lifelong possessor of the throne of Navarre.

JOHN ALBERT (1459–1501), king of Poland; succ., 1492; planned an invasion of Turkey; defeated by hospodar of Moldavia, 1496.

JOHN III., SOBIESKI (1624–96), king of Poland; had share in driving Charles XII. from Poland; saved Poland from Cossacks and Tatars, and afterwards from the Turks; elected king in 1674, and in 1683 gained brilliant victory over Turks, who were besieging Vienna; freed Hungary from Turkish domination. His efforts to reform country were frustrated by nobles.

JOHN (1801–73), king of Saxony; put down revolt, 1848; succ., 1854; supported Austria against Prussia, 1866; subsequently joined North Ger. Confederation and took part in Franco-Ger. War, 1870–71.

JOHN I. (d. 1294), Duke of Brabant and Lorraine. By defeating Henry III. of Luxemburg, acquired duchy of Limburg, 1288.

JOHN, DUKE OF BURGUNDY (1371–1419), aided Hungarians against Turks; succ., 1404; carried on struggle for several years with Louis of Orleans, whose assassination he contrived in 1407; took little part in wars between France and England; reconciled to the Dauphin, 1419; killed by followers of Dauphin.

JOHN (1468–1532), elector of Saxony, 1525; strong supporter of Luther.

JOHN GEORGE I. (1585–1656), elector of Saxony; succ., 1611; allied himself with Sweden, 1631; defeated by Wallenstein; signed Peace of Prague, 1635; warred against Sweden; defeated, 1636.—**JOHN GEORGE II.** (1613–80), encouraged art.—**JOHN GEORGE III.** (1647–91), fought against France.—**JOHN GEORGE IV.** (1668–94), quarrelled with Emperor.

JOHN FREDERICK I., THE MAGNANIMOUS (1503–54), elector of Saxony; succ., 1532; promoted Lutheran religion; defeated duke of Saxony, 1546; captured by Charles V., 1547; temporarily deprived of electorate.

JOHN MAURICE OF NASSAU, THE BRAZILIAN (1604–79), Dutch gov.-gen. of Brazil, 1636; organised new colony and extended its frontiers; subsequently took part in European wars; made famous collection of pictures.

JOHN ZAPOLYA (1487–1540), king of Hungary; put down peasant rebellion, 1514; elected king of Hungary, 1526; claim disputed by Ferdinand, Ger. king, whom J. Z. eventually defeated.

JOHN (1513–71), margrave of Brandenburg, 1535; became Protestant, 1538.

JOHN OF ASIA, OF EPHESUS (fl. 550), early Syriac historian; founded great number of religious houses; suffered persecution under Justin II.; author of *Ecclesiastical History* and other works.

JOHN OF GAUNT, see **LANCASTER, JOHN OF GAUNT, DUKE OF.**

JOHN OF LEYDEN, **BUCKHOLDT, JOHANN** (*q.v.*).

JOHN OF RAVENNA.—(1) (b. *c.* 1347) Secretary to Petrarch, and an extensive traveller; (2) (fl. 1370) a prof. at Florence; (3) **MALPAGHINI** (b. *c.* 1356), also a prof. at Florence, and teacher of Poggio Bracciolini.

JOHN OF SALISBURY (*c.* 1115–80), friend and adviser of Becket; bp. of Chartres; wrote a *Life of Becket*, and *Polycraticus*, a satire on the vices of court circles.

JOHN, THE APOSTLE, bro. of James and s. of Zebedee; traditional author of *Gospel of John*, *Epistles of John* and *Revelation* (q.v.); called 'disciple whom Jesus loved' (*John* 13^{23}); said to have lived at Ephesus, dying in extreme old age; another tradition makes him die earlier; sometimes identified with John the Presbyter (Elder).

John, Gospel of, the fourth of the Gospels and a unique book. It has been almost more than any other book the battleground of criticism. It differs markedly from the first three 'Synoptists.' The discourses in it are quite unlike those in *Matthew* and *Luke*. Alone it gives the turning of water into wine, and the raising of Lazarus. Scholars are still sharply divided as to whether it is from the hand of J., the s. of Zebedee. Its defenders argue it is the work of an eye-witness, a Jew, a Jew of Palestine, an apostle, the Apostle St. J. Its assailants argue such a work could not be the work of one who had known Jesus, and that its style and theology are later. The question of evidence is exceedingly complicated, and here it can only be said that the external evidence is doubtful; the internal evidence is curiously conflicting, but on the whole, against the traditional authorship. Even its defenders allow that the thought of Christ's discourses is coloured by the writer, while, on the other hand, it is generally admitted that J.'s date for the Crucifixion is right as against the Synoptists. It can hardly be earlier than 90 A.D., or much later than 110 (Schmiedel, 140, is too late), though it is uncertain it was used by Justin Martyr. It has been attributed to J. from Irenæus downwards. Some think it is the work of a presbyter J., confused with the apostle and s. of Zebedee. It seems impossible to deny the difficulties in accepting it entirely, or to deny not only its spiritual but hist. value. It can hardly be unconnected with the other Johannine writings, or, ultimately, with the apostle.

Green, *Ephesian Canonical Writings*; M'Clymont, *John* (Century Bible); Drummond, *Character and Authorship of Fourth Gospel*; Peake, in *Critical Introduction to New Testament*; works by Westcott, Schmiedel, Wendt, Bacon, Sanday, Abbott, Wellhausen, Réville.

John, Epistles of, three in number. *1 John* has been held to be by the author of the Gospel since Irenæus, and only a few critics deny it. The traditional authorship is supported by the Muratorian fragment on the Canon, Origen, Clement of Alexandria, and Tertullian. It probably dates from the first quarter of the II. cent. The heresy denounced is probably Docetism. *2* and *3 John* were sometimes reckoned among the 'doubtful' writings. They appear in the Muratorian fragment, but the early Syriac Church did not recognise them. *2 John* is addressed to an 'elect lady,' and by this some Asian Church is probably signified. *3 John* is written to Gaius, and is probably closely connected with *2 John*. All three Epistles are of the same school, and are connected with the Gospel.

Commentaries by Plummer in *Cambridge Gk. Testament*, Bennett in *Century Bible*, Westcott, and Harnack.

JOHN THE BAPTIST, in New Testament s. of Zacharias and Elisabeth, and forerunner of Jesus; preached repentance and baptized in wilderness; imprisoned and slain by order of Herod, whom J. rebuked for marrying his bro. Philip's wife.

JOHN, ST., OF DAMASCUS (d. *c.* 754), Gk. Father and theologian; entered Palestinian monastery; strong opponent of iconoclasm; wrote works which, though not in themselves remarkable, sum up Gk. theology; wrote original of hymn, *The Day of Resurrection*; his Christology tended towards Apollinarianism.

JOHN DORY, see **DORY.**

JOHN O' GROAT'S HOUSE (58° 39′ N., 3° 3′ W.), traditional site of John Groot's octagonal house, Caithness, Scotland; synonymous with most northerly point of Scotland.

JOHN, SIR WILLIAM GOSCOMBE (1860–),

Brit. sculptor; R.A.; works include statue of King Edward VII. at Cape Town, memorial to Lord Salisbury in Westminster Abbey; he designed insignia for Prince of Wales' investiture.

JOHNS HOPKINS UNIVERSITY, Baltimore, Maryland, U.S.A.; founded by Johns Hopkins (1794–1873), a wealthy merchant, who appointed the first trustees, and endowed it with $3,500,000; formally opened, 1876; important scientific school. It is non-sectarian, and in 1910 had staff of 198, and 785 students (mostly following post-graduate courses).

JOHNSON, ANDREW (1808–75), Amer. statesman; 17th Pres. of U.S.; b. at Raleigh, N. Carolina; entered Congress, 1843; gov. of Tennessee, 1853; Senator, 1857; was a prominent anti-secessionist, and remained loyal to Federal government during Civil War; military governor of Tennessee, 1862. On Lincoln's assassination he became Pres. of U.S.; opposed enfranchisement of negroes, and vetoed many bills passed by Congress on this subject; impeached by Congress in 1868 for violating the Tenure of Office Act, which had been passed despite his veto in 1867, but was acquitted. Retired, 1869.

Foster, *Life and Speeches of Andrew Johnson* (1866); Jones, *Life* (1902).

JOHNSON, EASTMAN (1824–1906), Amer. artist; famous for portraiture and pictures of national life.

JOHNSON, SAMUEL (1709–84), Eng. man of letters; s. of a Lichfield bookseller; ed. Lichfield, Stourbridge, and Pembroke Coll., Oxford; left Oxford (1731) without a degree. Till 1762 he had a severe struggle with destitution; after failing as a schoolmaster, started journalism in connection with Cave's *Gentleman's Magazine*, on which he was parliamentary reporter. Published poem *London* (1738), and started (1747) work on a new *Dictionary of the English Language*; there followed *Vanity of Human Wishes*, *The Rambler* (1752), the novel *Rasselas* (1759), and the periodical essay paper *The Idler* (1758). In 1735 he had married a Birmingham widow, who died in 1752. In 1762 he was given a royal pension of £300 a year, and lived comfortably after that. In 1763 began his friendship with BOSWELL (*q.v.*), and soon after the Literary Club was founded, with Burke, Boswell, Hawkins, Goldsmith, Johnson, among its members. J. now began to travel both in Britain and on the Continent with newly made friends, Mr. and Mrs. Thrale. In 1773 he visited Scotland. The rest of his life was embittered by ill-health, and the death or defection of many of his friends. The only literary fruits of this period were the *Journey to the Hebrides* and the *Lives of the Poets* (1781). He was buried in Westminster Abbey.

His Work.—In criticism J. belongs to the 'correct' school; he deprecates Milton's freedom of prosody; he objects to the Romantic Movement, and is suspicious of Gray's poetry. Yet he is a great critic, in spite of his 'correctness.' *The Vanity of Human Wishes* is not great poetry; it is too correct, too scholarly. The novel *Rasselas* fails in character delineation; nominally it is a tale of Imlac, an Abyssinian prince; in reality it is a book of wisdom and literary criticism. His prose, 'Johnsonese,' is much Latinised, sometimes ponderous; it is balanced, but regular antithesis makes it rhetorical sometimes.

Boswell, *Life*; Raleigh, *Six Essays on J.* (1910).

JOHNSON, SIR WILLIAM (1715–74), Brit. soldier; b. in Ireland; emigrated to America, 1738; acquired great influence over Indians; appointed sole superintendent of Indian affairs, 1755; took part in the expedition against Canada, and compelled the surrender of Niagara, 1759.

JOHNSTON, ALBERT SIDNEY (1803–62), Amer. soldier; in Civil War became general on Confederate side; killed at battle of Shiloh.

JOHNSTON, ALEXANDER KEITH (1804–71), Scot. geographer; pub. numerous atlases and geographical works.

JOHNSTON, ARTHUR (1587–1641), Scot. physician; after studying at Aberdeen and at Padua, lived in Sedan with Andrew Melville (*q.v.*), and later practised med. at Paris; became rector of King's Coll., Aberdeen, 1637; author of translation of the Psalms into Latin verse, and of other Latin poems, mainly in an anthology of works of Scot. poets which he produced.

JOHNSTON, JOSEPH EGGLESTON (1807–91), Amer. soldier; distinguished himself in war with Mexico; joined Confederates in Civil War, and became general; defeated Federalists at Bull Run, but was wounded at Fair Oaks; after offering stout resistance to Sherman's opposing force, he had to surrender in April 1865.

JOHNSTON, SIR HENRY HAMILTON (1858–), Eng. traveller, administrator, and writer; explored Portuguese Congo, 1883; led Kilimanjaro scientific expedition, 1884; consul in Kamerun, 1887; restored order in Nyasa district, 1889; helped to establish Brit. Central African Protectorate, of which he became consul-general, 1891; commissioner in Uganda, 1899–1901; wrote various works on Africa.

JOHNSTONE (55° 51′ N., 4° 31′ W.), town, Renfrew, Scotland; cotton, flax, iron, machinery, shoelaces. Pop. (1911) 12,045.

JOHNSTOWN.—(1) (42° 59′ N., 74° 25′ W.) town, New York, U.S.A.; manufactures gloves, clothing; Americans defeated British here in 1781. Pop. (1910) 10,447. (2) (40° 19′ N., 78° 57′ W.) town, Pennsylvania, U.S.A.; iron and steel manufactures. Pop. (1910) 55,482.

JOHOR (*c.* 1° 46′ N. to 2° 39′ S., 103° 50′ to 105° E.), independent sultanate, southern extremity of Malay peninsula; area, including islands to S., 9000 sq. miles; surface low-lying; forested; produces timber, sago, pepper, gambier. Foreign policy controlled by Britain. Pop. *c.* 200,000. J. BAHRU (1° 46′ N., 103° 56′ E.), chief town.

JOIGNY (47° 59′ N., 3° 24′ E.), town, Yonne, France; interesting churches. Pop. 5000.

JOINERY is a development of carpentry. The carpenter is chiefly concerned with the construction of solid and usually rather rough timber work, such as is used to give strength and solidity to buildings; whereas the joiner is employed in more complicated work where perfect fit and finish is important. Most of the joiner's work consists of planing and sawing, and preparing and finishing all varieties of joints; there is a wide range of side and angle joints. Mouldings are largely used to give relief to plain surfaces. Small mouldings, such as beadings, are generally directly worked on to the framing; large ones are mostly worked separately and screwed into position. The joiner's work includes the making of floors (plain, woodblock, or parquet), skirtings, dados, doors, window-frames, etc., and the fixing of hinges, locks, window-sash fastenings, finger-plates, etc. The making of shop-fronts and the fitting of church interiors are two important and special branches of j. In England the wood most used is Scandinavian pine, other woods being mahogany, teak, oak, and Amer. pine.

JOINT, in anatomy, the structure which unites two parts of the skeleton. J's may be immovable, or *synarthroses*, when the two bones are united by a prolongation of the periosteum between them, or by a plate of cartilage, both forms being exemplified in the skull; or they may be movable, *amphiarthroses* and *diarthroses*. Of the former there are two varieties, in the simpler type the bones being joined by bundles of strong fibro-cartilage, as the j's between the vertebræ, while in the other, surfaces of cartilage on each bone are joined by strong fibro-cartilage in the centre of which is a small cavity lined with synovial membrane, as in the case of the j. of the *symphysis pubis*. Diarthroses are freely movable j's, the ends of the two bones involved having each a surface of cartilage, so that they move upon each other with as little friction as possible. The cavity between them is lined with synovial membrane secreting a synovial fluid which acts as a lubricant.

The bones are bound together outside the j. by

strong fibrous ligaments. There are several varieties of this type, in the knee and the j. of the lower *maxilla*, there are pads of cartilage in the j. cavity, so that there is greater elasticity in the j. In hinge-j's, as, for example, the j's of the fingers and toes, there are elevations on the cartilage surface of one bone, which fit into corresponding depressions in the other, so that movement can only be effected in one direction. In ball-and-socket j's the end of one bone is cup-shaped, and into it the end of the other, which is spherical, fits, and is kept in place by a ligamentous capsule which surrounds the j.; this type of j. gives the widest range of movement, examples being the hip-j. and shoulder-j. In a rotary j. one projecting bone fits into a ring formed by the other, and is held in place by suitable ligaments, movement being permitted in a rotary direction, as, for example, the j. between the axis (second vertebra) and the atlas (first vertebra).

A j. may be affected by inflammation of the synovial membrane, or *synovitis*, in which the j. is hot, swollen, and painful—treated by absolute rest, elevation of the limb, and hot fomentations; adhesions may form and may require to be broken down under an anæsthetic. In *arthritis* the cartilage of the j. is involved as well as the synovial membrane, there is severe pain, fever, the j. is swollen, and the fluid in it soon becomes purulent. In regard to treatment the j. must be opened and washed out by a surgeon, the prognosis being best when this is carried out at an early stage. A *loose body* may be formed in a j., a cartilaginous piece of synovial fringe being detached, or it may be formed of fibrin, and the j. may be locked when the loose body is caught between the articular surfaces; the j. must be opened by a surgeon and the loose body removed.

See ANKYLOSIS, TUBERCULOSIS, RHEUMATOID ARTHRITIS.

JOINT-STOCK COMPANY, see COMPANIES, LIABILITY.

JOINTS, used in engineering to prevent leakage of steam, air, or water; generally made of packing, *e.g.* asbestos or hemp; j's in gas or petrol engines made gas-tight with a washer of asbestos surrounded with a ring of copper; j's in wood made by 'grooving' or caulking with oakum. J's in building are made with mortar.

JOINTS (in geology), cracks in rocks which run along natural planes of division and render quarrying of large regular blocks of stone practicable. Although often irregular, in sandstones they are nearly always at right angles to the bedding of the stone. Horizontal beds of rock generally have vertical j's. They are probably due to several causes—strain imposed upon rocks by movements of earth's crust in contraction; drying of sedimentary rocks; cooling of igneous rocks, etc. The latter effect produces a regular columnar structure, as at the Giant's Causeway, Ireland.

JOINTURE, in law, originally estate settled jointly on husband and wife, now estate belonging to wife alone. See DOWRY.

JOINVILLE, FRANÇOIS FERDINAND PHILIPPE LOUIS MARIE, PRINCE DE (1818–1900), third s. of King Louis Philippe; distinguished soldier; exiled at Revolution, 1848, but returned to France and sat in National Assembly, 1871–76.

JOINVILLE, JEAN, SIRE DE (1224–1319), Fr. historian; entered service of Thibaut of Champagne; subsequently went on crusade with Louis IX. of France, 1248–54; after his return he lived a good deal at court, but refused to go on second crusade. Towards close of his life he wrote his *Histoire de St. Louis*, an important work describing the king's life and character, and giving an interesting account of the Crusades; it also includes a number of personal reminiscences, and is written in an easy and conversational style of considerable charm.

H. F. Delaborde, *Jean de Joinville* (1894).

JOKAI, MAURUS (1825–1904), Hungarian writer; b. Komorn; his output was enormous, and consisted of novels, romances, and poems. Some famous volumes are *The New Landlord*, *The Modern Midas*, *God is One*, and *Timar's Two Worlds*.

JOKJAKARTA, JOKJOKARTA (7° 56′ S., 110° 30′ E.), residency, Java, Dutch East Indies; sugar, indigo; chief town, J., has large citadel. Pop. *c.* 900,000.

JOLIET (41° 30′ N., 88° 3′ W.), town, Illinois, U.S.A.; iron and steel. Pop. (1910) 34,670.

JOLY DE LOTBINIÈRE, SIR HENRI GUSTAVE (1829–1908), Fr. Canadian statesman; lieut.-gov. of Brit. Columbia, 1900–6.

JOMINI, ANTOINE HENRI (1779–1869), general and military writer, of Swiss birth; served with French at *Austerlitz* and *Jena*; went over to Russ. army, 1813; wrote extensively on military subjects.

JONAH, Hebrew prophet, mentioned in *2 Kings* 14^{25} as s. of Amittai, under Jeroboam II. (VIII. cent. B.C.); traditional author of Book of *Jonah*, which probably dates from V. cent., and is allegorical rather than historical.

JONAH, RABBI (*c.* 990–1050), great Hebrew exegete and lexicographer; b. Cordova; revolutionised Biblical criticism by basing his arguments on linguistic evidence.

JONATHAN, name of Old Testament characters: (1) son of Saul and friend of David; (2) a Maccabean prince.

JONES, HENRY ARTHUR (1851–). Eng. playwright; has written successful comedies and problem plays.

JONES, INIGO (1573–1652), Eng. architect; arranged scenery for Jonson's masques; surveyor-gen. of royal buildings; designed banqueting hall (now Chapel Royal), Windsor.

JONES, JOHN PAUL (1747–92), Amer. sailor; b. Scotland; shipmaster's apprentice, 1759; took part in slave trade; made lieut. on outbreak of War of Independence, 1775; fought for France in war with Britain, 1778; went back to America, 1781; served under Empress Catharine of Russia, 1788, in Turk. campaigns; lived in Paris, 1790–92; called 'Father of Amer. Navy.' *Life*, by Brady (1900).

JONES, RICHARD (1790–1855), Eng. prof. of Political Economy, and author of economic works.

JONES, SIR WILLIAM (1746–94), Brit. Orientalist; b. in London. In 1783 he was appointed judge in Bengal, and during his stay in India studied Hindu law; works include *Digest of Hindu Law* (1800), *Institutes of Manu* (1794), a *Persian Grammar* (1772), and *Moallakat* (a trans., 1783).

JÖNKÖPING (57° 47′ N., 14° 12′ E.), town, Sweden; manufactures matches, carpets, paper, arms. Pop. (1910) 26,971.

JONSON, BEN (1573–1637), Eng. dramatist and poet; b. London; posthumous son of minister of Scottish extraction; ed. Westminster; for a short time followed his stepfather's trade of bricklaying, but abandoned it for the army; served in campaigns in the Netherlands; returned to London and married, 1591–92; the union was not happy, and J. survived his family; became actor-playwright, fraternising and sometimes working in conjunction with Dekker, Porter, and others; was tried for killing a fellow-actor in a duel, pleaded benefit of clergy, escaped death, but suffered branding and confiscation of property, 1598.

His first play, *Every Man in his Humour*, was staged about 1596, and taken over by Shakespeare in 1598, and produced at the Globe Theatre—a bright play, abounding in variety of interest; its sequel, *Every Man out of his Humour*, is flat when compared with the original. Then followed several comedies, including *Cynthia's Revels* (1600), *The Poetaster* (1601, in which his dramatic rivals were satirised), *Volpone* (1605), *Epicene* (1609), *The Alchemist* (1601), *The Magnetic Lady* (1633). *Sejanus* (1603) and *Catilina* (1611) are two rather dull tragedies. *The Alchemist* is his masterpiece; Sir Epicure Mammon is a gem of character portrayal, the situations are good, the story absolutely coherent, the minor parts worked out accurately.

After the production of this, J.'s work grew inferior in quality.

J. wrote about 40 masques, mostly written in collaboration with Inigo Jones; they are charmingly beautiful, and form some of his best work. His poems are many and varied, ranging from graceful lyrics to scurrilous epigrams; they are classical in form and phraseology, but are nevertheless independent in spirit. The elegies on his eldest son and daughter are characterised by tenderness and affection. Of his songs, 'Drink to me only with thine eyes' is still popular.

J.'s prose marks a step in advance of Jacobean floridity; it is compressed and expressive without ornateness; his *English Grammar*, and *Discoveries*, a collection of 171 short pieces, are extant.

His last years were made unhappy by poverty and disease; his tomb is in Westminster Abbey.

Life, by Symonds (1886).

JOPLIN (37° N., 94° 20′ W.), town, Missouri, U.S.A.; centre of zinc and lead district; smelting works. Pop. (1910) 32,073.

JOPPA, JAFFA (32° 2′ N., 34° 47′ E.), port, Palestine; centre of fruit trade. Ancient town is frequently mentioned in Old and New Testaments; associated with St. Peter. Pop. *c.* 45,000.

JORDAN (31° 45′ N., 35° 35′ E.), sacred river, Palestine; headstream, Hasbany, rises on slopes of Mt. Hermon and unites with Banias and Leddan about lat. 33° 14′ N.; river then flows in S. direction and enters Sea of Galilee at its N. extremity, emerging at other end and flowing still S. till it empties itself into Dead Sea. See *The Jordan Valley*, by Libby and Hoskin.

JORDAN, CAMILLE (1771–1821), Fr. politician; urged moderate reform at Revolution; proscribed, 1797; led constitutional party at Restoration.

JORDAN, DOROTHEA (1762–1816), Irish actress; played for thirty years in Drury Lane; mistress of Duke of Clarence (William IV.).

JORDANES, JORNANDES (fl. VI. cent.), writer on Gothic history; entered service of Gunthigis, a Gothic chieftain, but subsequently, embracing Christianity, became a monk; said to have been bp. of Kroton. His most notable work is *De Origine Actibusque Getarum*, a history of Goths down to fall of Ostrogothic kingdom in Italy; narrative mainly taken from a lost history by Cassiodorus. J. also wrote *De Breviatione chronicum*, generally known as the *Romana*, a history of world down to Justinian's time; without hist. value except for period after middle of V. cent.; edition (with Preface) by Mommsen.

JORDANUS, JORDAN CATALANI (fl. 1321–30), Fr. Dominican missionary; worked in India; bp. of 'Columbum,' Kulam, Travancore, 1330; author of *Epistles* urging a papal fleet in Indian Ocean, and of *Mirabilia*, containing famous descriptions of manners, customs, climate, fauna, and flora of India.

JORIS, DAVID (1501–56), heretic; at outbreak of Reformation violently attacked Catholicism and became Anabaptist; viewed himself as revealer of new dispensation, calling himself CHRISTUS DAVID; lived at Basel and wrote several works.

JORNANDES, see JORDANÉS.

JOSAPHAT, see BARLAAM.

JOSEPH, in New Testament, husband of Mary and 'father' of our Lord; not mentioned during Ministry, so was probably dead.

JOSEPH, in Old Testament, s. of Jacob; sold by his bro's into Egypt; rose to power under Pharaoh.

JOSEPH, BARSABAS, follower of Jesus, deemed worthy of nomination as one of the Twelve Disciples in Judas's place.

JOSEPH, king of Naples, afterwards of Spain. See BONAPARTES.

JOSEPH II. (1741–90), Holy Rom. emperor; b. Vienna; Ger. king, 1764; emperor, 1765; shared authority in Austria with his mother, Maria Theresa, who retained supreme power; signed treaty for partition of Poland, 1772; opposed Frederick the Great; succ. to Austrian throne, 1780; established religious toleration; furthered education, abolished serfdom, subordinated Church to State; joined Russia against Turkey with little success.

JOSEPH, FATHER (1577–1638), Fr. ecclesiastic famous for his connection with Richelieu, whose secretary and confidant he became; tried to convert Huguenots.

JOSEPH OF ARIMATHÆA, in New Testament, comes after the Crucifixion and asks Pilate for the body of Jesus: called in *Mark* a 'wealthy councillor'; *Matthew*, a 'rich man'; *Luke*, 'councillor'; according to *John*, a 'secret disciple for fear of the Jews.' He buries Jesus in his own new rock-tomb.

JOSÉPHINE (1763–1814), empress of France; b. Martinique; m. Vicomte de Beauharnais (*q.v.*), who was executed during Terror; subsequently m. Napoleon Bonaparte, 1796; no son being b., Napoleon had marriage dissolved for State reasons, 1809; J. retired to Malmaison. See *The Empress Joséphine*, by Sergeant.

JOSEPHUS, FLAVIUS (*c.* 37–97 A.D.), celebrated Jewish historian; became a Pharisee; was leader in Jewish rebellion in Galilee, but on his capture was spared by Vespasian, and subsequently marched with Titus against Jerusalem; author of *Jewish Antiquities* and *The Jewish War*, both dealing with history of the Jews.

JOSETSU (XIV. cent.), Jap. artist; left his mark chiefly as teacher, being the master of Sokokuji Shiubun, Sesshiu, and Kano Masanobu, founders of three distinct types of Jap. art.

JOSHEKAN (33° 16′ N., 51° 14′ E.), province, Persia. Pop. *c.* 5000.

JOSHUA, BOOK OF, separated in Jewish canon from the *Torah* (Law), or Pentateuch, but really by structure and origin to be grouped with them to form the Hexateuch. Chaps. 1–12 describe the crossing of the Jordan and the conquest of Canaan by the Israelites, and chaps. 13–24 the division of the land among the tribes. *Joshua* is composed from the same sources as the Pentateuch; it is probable that J and E (two narratives of about the IX. cent. B.C.) were combined into one first, then these were combined with other material by a Deuteronomic editor, and the whole united into the Priestly Code. The latter part of *Joshua* is rather fragmentary, and in the earlier forms of the narrative the conquest seems to have been much more gradual and by no means so thorough as it was afterwards supposed to have been: the partition among the tribes is represented as it was later.

Driver, *Introduction to Old Testament Lit.*; Carpenter and Harford-Battersby, *Hexateuch*; Robinson, Commentary in *Century Bible*.

JOSHUA THE STYLITE (V. cent.), traditional author of Syrian chronicle of importance for history of Eastern Empire.

JOSIAH, s. of Amon, king of Judah (639–609 B.C.); during his reign Jeremiah preached, and a religious reformation took place.

JÓSIKA, BARON MIKLÓS (1796–1865), Hungarian writer of romances, mostly historical.

JOTUNHEIM, JOTUN FJELDE (61° 30′ N., 8° 20′ E.), mountainous district, S. Norway; traditional home of Norse giants (*Joturs*).

JOUBERT, BARTHÉLEMY CATHERINE (1769–99), one of youngest, most promising generals in Napoleon's army in Austrian invasion, 1798–99; commander of Ital. army, 1799; slain at *Novi*.

JOUBERT, JOSEPH (1754–1824), Fr. *littérateur*; most brilliant figure in salon of Madame de Beaumont, author of *Pensées*, maxims on ethics, theol., lit., and politics.

JOUBERT, PETRUS JACOBUS (1834–1900), Transvaal commandant-general; defeated British at *Laing's Nek*, *Ingogo*, *Majuba Hill* (1881); d. during last South African War.

JOUFFROY, THÉODORE SIMON (1796–1842), Fr. philosopher; assistant prof. in Paris, 1817; de-

voted himself to lecturing and literary work; became follower of Scot. philosophers; prof. at Collège de France, 1833; emphasised distinction between physiology and psychology; a learned populariser of ideas rather than an original philosopher.

JOUGS, chain with iron collar attached, used in Scotland, XVI.–XVIII. cent's, as pillory.

JOULE, JAMES PRESCOTT (1818–89), Eng. physicist; b. Salford; pupil of Dalton; formulated law of production of heat by passage of electric current in a conductor. By a long series of laborious experiments, determined mechanical equivalent of heat, *i.e.* the number of work units required for a given rise of temperature. See ENERGY.

JOURDAN, JEAN BAPTISTE, COUNT (1762–1833), Fr. soldier; defeated Austrians at *Wattignies*, 1793; at *Fleurus*, 1794; commanded in Rhine campaign, 1795; defeated at *Amberg* and *Würzberg*, 1796; *Stockach*, 1799; marshal of France, 1804.

JOVE, see JUPITER.

JOVIANUS, FLAVIUS (332–64), Rom. emperor, succeeding Julian, 362; reversed pagan policy of Julian.

JOVIUS, PAULUS, PAOLO GIOVIO (1483–1552), Ital. historian; b. Como; studied med. at Padua and Pavia, but renounced the profession in favour of lit.; Leo X. advanced him, and he became attached to the family of the Medici; great work was a history of his own times.

JOWETT, BENJAMIN (1817–93), Anglican scholar and divine; ed. Balliol Coll., Oxford; became tutor of his coll.; prof. of Greek, 1855; Master of Balliol, 1870; suspected for his liberal views in theology; had enormous influence in Oxford; best known as a scholar for his translations of Plato, Aristotle, and Thucydides.

Abbott and Campbell, *Life and Letters* (2 vols., 1897); Tollemache, *Memoir*.

JOYEUSE (44° 29′ N., 4° 15′ E.), small town, Ardèche, France; gave name to noble family whose ducal title passed to Guise family in XVII. cent.

JUAN FERNANDEZ ISLANDS (33° 42′ S., 78° 45′ W.), volcanic islands (belonging to Chile), S. Pacific; largest is Mas-a-Tierra, where Alexander Selkirk (prototype of Robinson Crusoe) lived, 1704–9; few inhabitants.

JUAN MANUEL (1282–1349), Infante of Castile; served in many military campaigns, specially in Moorish wars; known even better as author; though active in other ways, wrote much; among his writings are—*Cronica abreviada*, *Libro de la caza*, *Cronica de España*, *Cronica complida*; learned in classical and Oriental lore.

JUANGS, primitive Indian race, living in forests of Orissa.

JUBA, JUB (0° 30′ S., 42° 30′ E.), river, E. Africa; headwaters, Ganale, Webi, Dawa, rise in S. Abyssinia, unite near Dolo; river then flows S., separating Ital. Somaliland from Brit. E. Africa, and enters Ind. Ocean below Gobwen.

JUBA I., king of Numidia, 61–46 B.C., who assisted Pompey and slew himself after *Thapsus*. His S., **Juba II.**, received his f.'s kingdom from Augustus (30 B.C.), but surrendered it in return for Mauritania (25 B.C.); he wrote works of scholarship, now lost.

JUBBULPORE, JABALPUR (23° 9′ N., 79° 58′ E.), town, Central Provinces, India; manufactures cotton, carpets. Pop. (1911) 160,651. J., district, has area *c.* 3920 sq. miles. Pop. 685,000. J., division, has area *c.* 18,600 sq. miles. Pop. *c.* 2,090,000.

JUBILEE YEAR, celebration in R.C. Church every 25th year, when faithful are granted indulgence if they visit specified churches; 'extraordinary' jubilees on special occasions are also held.

JUBILEE, YEAR OF, the 50th year, which, it is commanded in *Leviticus* 25, should always be observed by not gathering then the harvest—even of wild fruits or plants; nor was there to be sowing or reaping; property which had been alienated was to be restored; these regulations were not observed.

JUBILEES, BOOK OF, Old Testament apocryphal book, written about II. cent. B.C., to defend Judaic nationalism against encroachments of Hellenic civilisation. The Jewish law had existed in heaven from eternity; its author, a Pharisee, believed in gradual coming of Messianic age; book is preserved in an Ethiopic version, and fragments in Gk., Latin, and (possibly) Syriac; Latin and Ethiopic were made from Gk.; original language probably Hebrew.

Charles, *The Book of Jubilees or the Little Genesis*.

JUCAR (39° 10′ N., 0° 13′ W.), river, E. Spain; flows to Mediterranean.

JUDÆA, term applied to S. Palestine in time of Christ.

JUDAH (31° 30′ N., 35° 15′ E.), district of ancient Palestine, between Philistia and Dead Sea; belonged to tribe of Judah in Old Testament times; tributary to Egypt, 608 B.C.; conquered by Babylon, 587 B.C.; by Greece, *c.* 333 B.C.; by Rome, *c.* 63 B.C. See JEWS.

JUDAS ISCARIOT was chosen as one of Apostles by Christ (meaning of *Iscariot* uncertain, perhaps *man of Kerioth*); given thirty pieces of silver for betraying Christ. According to *Matthew* 27^5, Judas repented and hanged himself; according to *Acts* 1^{18}, he burst asunder; his place in the Twelve was filled by Matthias.

JUDAS TREE (*Cercis*), genus of tree of order Leguminosæ; *C. siliquastrium*, a S. European tree with rose-coloured flowers, is, in legend, the tree on which Judas hanged himself.

JUDE, Epistle written in the name of Jude, bro. of James, bro., therefore, also of Christ; whether actually written by him is doubtful, for its attestation is not particularly strong. It was accepted by 200 A.D., witness the Muratorian fragment on the Canon. Origen, Tertullian, and Clement of Alexandria quote it. It presents close literary parallels with *2 Peter*, and the probability is that *2 Peter* is dependent on Jude, though some scholars invert the relation. Jude quotes the apocryphal Book of *Enoch*.

Commentaries by Bigg in *International Critical Commentaries*; Bennett in *Century Bible*.

JUDGE, an officer of the law whose chief functions are deciding on points of law, and passing of sentence. In England *Puisne* j's of the High Court must be barristers of not less than ten years' standing; County Court j's, barristers of not less than seven years' standing.

JUDGE-ADVOCATE-GENERAL, Eng. judge who advises the Crown in military matters; title of two officers in the U.S.A. War and Navy Departments respectively, who control administration of martial law.

JUDGES, BOOK OF, so named from the 'Judges' who ruled over Israel. 1^1–2^5 contains an account of the land itself; 2^6–16 gives in detail the history of the thirteen judges. Reckoned consecutively with the intervals between them, the total period of the judges would be 410 years. But, as this is far too long, it is probable that several may have been contemporary, and the author has pieced the separate stories into one continuous narrative. Chapters 17–21 contain a sort of appendix. The book shows traces of the incorporation of older materials. The 'Song of Deborah' is among the most ancient parts of Old Testament lit.

Moore, *Judges* in *International Critical Commentaries*; Thatcher, in *Century Bible*; Driver, *Introduction to Old Testament Lit.*

JUDGMENT, see PSYCHOLOGY.

JUDICATURE ACTS, Eng. statutes, simplifying legal procedure; first enactment, Supreme Court of Judicature Act, passed 1873; subsequent Acts passed on various dates between 1875 and 1899. Under these Acts all the courts now sitting at Royal Courts of Justice in Strand were united and consolidated into one Supreme Court of Judicature, consisting of two permanent bodies, Court of Appeal and High Court of Justice. Latter is divided into three sections: (1) Chancery; (2) King's Bench; (3) Probate, Divorce, and Admiralty.

JUDICIAL COMMITTEE, see PRIVY COUNCIL.

JUDICIAL SEPARATION, see DIVORCE.

JUDITH, BOOK OF (Apocrypha), religious romance; relates saving of Jerusalem by Judith, who kills Holofernes, general of Nebuchadnezzar; hardly historical; its date may be Maccabæan, or more probably *c.* 50 B.C., as it somewhat resembles *Psalms of Solomon*.

JUDSON, ADONIRAM (1788–1850), Amer. Congregationalist minister; missionary to Burma, 1812; became Baptist; translated Bible into Burmese; one of earliest and most important of Amer. missionaries.

JUEL, JENS (1631–1700), Dan. diplomatist; ambassador to Sweden, 1660–68, 1672, 1674, 1697; approved of Griffenfeldt's policy of alliances to isolate Sweden; established ostensible friendship with Sweden.

JUEL, NIELS (1629–97), Dan. admiral; commander of first rank; by victories over Sweden temporarily relieved humiliating position of Denmark; won battle of *Kjöge*, 1677, against enormous odds.

JUGGERNAUT, town in Bengal, famous for annual rites, when idols of Hindu gods are drawn outside the city; formerly accompanied by immorality and human sacrifice.

JUGURTHA (II. cent. B.C.), king of Numidia; served in Numantia, 134 B.C.; co-ruler of Numidia with his cousins, Hiempsal and Adherbal, 118; assassinated former, defeated and killed latter, 112; waged war with success against Romans, 110; subsequently defeated by Quintus Metellus; finally captured by Marius and put to death at Rome, *c.* 104.

JUJU, W. African generic term for any kind of charm; a witch-doctor may 'lay' j. on a man or object; the man probably dies. The object is considered sacred, hence j. in certain cases resembles taboo (*q.v.*).

JU-JITSU is defined by Inazo Nitobe in *Bushido: the Soul of Japan*, as 'an application of anatomical knowledge to the purpose of offence and defence. It does not depend upon muscular strength, but consists in clutching or striking such part of an enemy's body as will make him numb and incapable of resistance.' Incapacity, not death, is its object.

JUJUBE (*Zizyphus*), shrubs of order Rhamnaceæ; fruit of *Z. vulgaris*, when dried, is a sweetmeat. J. sweets, made of sugar and gum-arabic, have no connection with plant.

JUJUY (23° 30′ S., 66° 30′ W.), province, N.W. Argentina, S. America; mountainous; produces salt, gold, silver-lead, copper, petroleum, cereals. Pop. (1910) *c.* 62,400. Chief town, Jujuy, has pop. *c.* 6000.

JULIAN (331–63), 'THE APOSTATE,' Rom. emperor; s. of Julius Constantius and nephew of Constantine the Great; obtained title of Cæsar and governorship of Gaul, 355; gained great victory over Alemanni, 357, and reduced Frankish tribes to submission; became emperor in 361, and proclaimed toleration of all religions, while personally preferring paganism to Christianity. In 363 he prepared to invade Persia; and, having led a powerful army through Mesopotamia and Assyria, crossed the Tigris and prepared to besiege Ctesiphon, but abandoned project, and marched inland to meet Shapur II.; was surrounded by Persian army, and mortally wounded. He was remarkable as last champion of paganism.

JULIAN CALENDAR, see CALENDAR.

JÜLICH, JULIERS (50° 55′ N., 6° 21′ E.), town, Rhenish Prussia, Germany; formerly fortified; manufactures sugar. Pop. (1911) 6620. Was capital of former DUCHY OF JÜLICH, created 1356, succession to which was question of great political importance in XVII.–XVIII. cent's; annexed by France, 1801; acquired by Prussia, 1814.

JULIEN, STANISLAS (*c.* 1797–1873), Fr. Chinese scholar; great gift of tongues; librarian at Fr. Institut (1827); Conservateur of Royal Library (1839); administrator of the Collège de France (1859); wrote on Taoism and Buddhism, and trans. many important Chin. works.

JULIUS I., pope; elected to papal chair, 337; supported Athanasius in Arian dispute.—**Julius II.** (1443–1513) became pope, 1503; banished Cesare Borgia from Italy, and recovered Romagna; arranged league of Cambrai with Maximilian I. and Louis XII. against Venice, 1508; subsequently concluded Holy League against France, 1511; opened 5th Lateran council; encouraged the fine arts and lit.—**Julius III.** (1487–1555), pope, 1550; favoured Jesuits; founded Collegium Germanicum.

JULLUNDUR, JALANDHAR (31° 19′ N., 75° 28′ E.), town, Punjab, India. Pop. 69,000. District has area *c.* 1330 sq. miles. Pop. 920,000.

JULPIGOREE, see JALPAIGURI.

JULUS, a genus of Millipeda. See MYRIAPODA.

JULY, 7th month of year; *Quintilis* (5th month) in Rom. calendar; named after Julius Cæsar, who fixed days at 31.

JUMIÈGES (49° 27′ N., 0° 49′ E.), town, Seine-Inférieure, France; ruined Benedictine abbey.

JUMILLA (38° 27′ N., 1° 18′ W.), town, E. Spain. Pop. 16,700.

JUMMOO, see JAMMU.

JUMNA, JAMUNA (25° 20′ N., 81° 57′ E.), river, N. India; rises in W. Himalayas, flows S. through Silawik Hills to form boundary between Punjab and United Provinces; turning S.E., it crosses United Provinces, and unites with Ganges near Allahabad.

JUMPING.—(1) high jump; competitor must clear bar and land on his feet for fair leap; each allowed three attempts; (2) long jump from mark; ground is broken to allow easy descent; competitors must not overstep mark, and must maintain balance on alighting.

JUMPING MICE, see JERBOAS.

JUNAGARH, JUNAGADH (21° 29′ N., 70° 22′ E.), town, Bombay, India. Pop. 34,500. JUNAGARH, feudatory state, has pop. 397,000.

JUNCTION CITY (38° 40′ N., 96° 50′ W.), town, Kansas, U.S.A.; flour-milling. Pop. (1910) 5598.

JUNE, 6th month of year; 4th in Rom. calendar, where it had 26 days; Julius Cæsar added 4 days.

JUNEAU (58° 20′ N., 134° 25′ W.), town, Alaska, N. America; formerly called HARRISBURG; gold mines. Pop. (1910) 1644.

JUNG-BUNZLAU (50° 25′ N., 14° 24′ E.), town, Bohemia, Austria; former seat of Moravian sect. Pop. (1911) 16,340.

JUNGERMANNIALES, see under BRYOPHYTA.

JUNGFRAU (46° 32′ N., 7° 58′ E.), mountain, Bernese Oberland, Switzerland (13,669 ft.); J. means the 'maiden.'

JUNIN (10° 53′ S., 75° 28′ W.), central department, Peru, S. America. Pop. *c.* 305,000.

JUNIPER, coniferous shrubs possessing needle-shaped leaves in the majority of cases (e.g. *Juniperus communis*). *J. Sabina* has closely packed scaly leaves, like the cypress, but exhibits the simpler type in the seedling. The so-called 'berry' is due to the cone scales becoming fleshy on ripening. The berries are used for flavouring gin (see SPIRITS), which derives its name from j. From the unripe nuts is obtained the oil of j.

JUNIUS, pseudonym of contributor of *Letters of Junius to Public Advertiser*, London, 1769–72; attacked George III. and his ministers in a way that showed the author knew the inner secrets of the government; attributed to several politicians, Burke, Wilkes, Temple, Horne, Tooke, etc., especially Sir Philip Francis, enemy of Warren Hastings. As lit. the letters are bombastic and cheaply rhetorical, arrogant, and scurrilous, although tricks of style and rhythm to some extent redeem them.

Francis, *Junius Revealed* (1894); Smith, *Junius Unveiled*.

JUNIUS, FRANZ, two Huguenot scholars.—(1) the elder (1545–1602) made a famous translation of the Old Testament (1590). (2) son of the above; a theologian and an authority on Old English and the old Teutonic languages.

JUNO, see HERA.

JUNOT, ANDOCHE, Duke of Abrantes (1771–1813), Fr. soldier; served in Italy and Egypt under Napoleon; in 1807 commanded Fr. force which invaded Portugal and captured Lisbon; gov. of Portugal, 1807; expelled by Wellington.

JUNTA, Spanish word for an assembly of men.

JUPITER, the largest planet; mean distance from sun, 483 million miles; period, 11·86 years; rotation period, about 10 hours; diameter, nearly 11 times that of earth; has five satellites, whose orbits lie almost in that of J.; surface shows belts of dark and light shade, which are usually parallel to each other, undergo quick changes, and seem to merge into one another. Different spots, even in the same latitude, have different periods of rotation, and hence it is reasonable to suppose we see the gaseous envelope of the planet, and not its actual surface. The great 'Red Spot' of J. (first observed, 1877) has persisted up till now, though it has often faded and been lost since then. The spot is to be found at the southern edge of the great equatorial belt. From rapid changes which constantly take place in J.'s atmosphere, it is seen that J. itself must possess great internal heat. See Planets, Astronomy.

JUPITER, Jove, identified with Gk. Zeus, was the chief deity of the Romans. He was regarded as the lord of heaven, wielding thunder-bolts and casting lightning. His chief temple as guardian of the Rom. people was situated on the Capitol, and his formal title was J. Optimus Maximus. At the temple of J. on the Capitol ended the great triumphal processions, and the victorious general sacrificed white oxen to the god.

JURA (*c.* 47° N., 6° 30′ E.), mountain range stretching from N.E. to S.W. along borders of France and Switzerland between Rhine and Rhône for nearly 200 miles; forms a high plateau rising in several parallel chains to heights of from 5000 to over 5600 ft. above sea-level. Highest peaks are Crêt de la Neige and Reculet, both over 5600 ft., La Dôle and Mont Tendre, over 5500 ft. Climate varies with elevation. N. part is well wooded, and chain is crossed by several railways. Rivers rising here are Ain, Creuse, Doubs, Loue, Orbe, some of which disappear into ground, reappearing at considerable distance. Geological composition is chiefly limestone, range giving its name to *Jurassic* system; caves frequently occur, some of which have fine stalactites. The German Jura begin at the Rhine and run N.W. for some 300 miles to the Main valley, in two ranges—the *Schwäbischer Jura* and the *Fränkischer Jura.*

JURA (46° 45′ N., 5° 40′ E.), E. department, France; area, *c.* 1950 sq. miles; drained by Doubs, Ain, Orbe; large forests; vines, cereals, cheese, salt. Pop. (1911) 252,712.

JURA (55° 57′ N., 5° 55′ W.), mountainous island, Inner Hebrides, Scotland.

JURASSIC, series of Mesozoic rocks, which includes the Lias and overlies the Oolites; well developed in Jura Mts.—hence name; found in Yorkshire from Tees to Filey, Lincolnshire, across Midlands to Bristol Channel, and again at Lyme Regis; also seen in Germany, Caucasus, Spain, and India. *Life of period*—Land plants: conifers, ferns, cycads, and equisetums. Animal life: Foraminifera, corals, crinoids, and starfish. Crustaceans: decapods and crabs. Insects: forms of grasshopper, cockroach, earwig, ant, and fly. Reptiles: very abundant, including turtles, lizards, and crocodiles. Sea saurians: Ichthyosaurus, Plesiosaurus. See Geology, Reptiles.

JURAT, term applied to certain officials in Channel Islands.

JURIEU, PIERRE (1637–1713), Prot. theologian, ordained in Anglican Church, then in France; prof. at Sedan and Rotterdam; an able controversialist.

JURISPRUDENCE (Lat. *jurisprudentia,* knowledge of the law) is best defined as 'the formal science of positive law' (T. E. Holland). In ancient Rome, Republican and Imperial, the *jurisprudentes* were men skilled in law, who foretold what the legal issue would be in novel and doubtful cases, and the *jurisprudentia* was the body of law built up and developed by their interpretations. But in modern times John Austin's *Province of Jurisprudence Determined,* and the work of Holland, Maine, Pollock, and others, have brought a general acceptance of the definition above. According to Austin it was the function of j. to distinguish between laws proper and improper; to determine what are the essential elements in our conception of law; to analyse and define the relations of law to rights and duties. J. has nothing to do with what are called 'natural laws,' and it carefully distinguishes between 'commands' and 'laws,' and between positive law and the 'laws of God,' 'the dictates of the heart,' the 'light of reason,' and all other similar authorities that claim the obedience of man. Positive law is not exclusively a matter of legislation; it may be common law, the result of custom, or it may be the work of judicial decisions—judge-made law.

Although the great 'analytical' school, as it is called, represented by Hobbes and Austin and their followers, maintains that j. is only concerned with positive law, another school, the natural-law jurists, argue that law is antecedent to the State, is to be grasped by pure reason, and is only the application of ethics to everyday life. This school has the foundations of its doctrines in the Stoic philosophy and the Roman j., and it was predominant in the XVII. and XVIII. cent's, when the natural rights 'of men,' a mythical state of nature, and the republican 'democracies' of classical Greece and Rome were the watchwords of revolutionaries and the ideals of political reformers. In the XIX. cent. *natural* rights had to be given up before the scientific knowledge that revealed evolution, and all the false teaching built up on an alleged primitive happiness in nature crumbled. Only in the U.S.A. to-day can any considerable number of natural-law jurists be found.

Analytical j., by insisting on the importance of authority as a condition of positive law, helped to get an answer to the question that troubled legal and political philosophers in the XVII. cent., viz., Where sovereignty resides? It showed that authority was here and there strong enough in custom to compel obedience to law, and that in other places it was found in the duly qualified legislator or the duly appointed judge. Thus the influence of this j. can be seen very plainly in the theories and practice of Brit. j.—Whig constitutionalists, with their checks and safeguards in the relations of the Crown, and Parliament, and people. Yet Hobbes, the first to declare the principles of analytical j., was equally convinced that absolute monarchy alone gave the stable authority that could ensure obedience to law, and his teaching has been generally the doctrine of Toryism.

Comparative Jurisprudence is concerned with historical methods and the study of the evolution of law. It demands that each existing system of national law shall be studied historically and scientifically, and that the various national systems shall be compared at similar stages of development. It seeks to learn the origin of all legal institutions. Then by the knowledge of origins and by comparisons the normal course of legal development may be discovered, and that which is universal and human be distinguished from that which is local, tribal, or peculiar to a particular nation or a special stage of development. So we get at the idea of a history of the legal institutions and decrees of the world. Here the absorbing question is, of course, not, What is law? but, Do general common principles of law exist amongst the peoples of the world? The studies of legal historians and ethnologists are mutually assistant on this point, and in the region of early family customs and primitive marriage law (for instance) an enormous number of interesting facts have been collected. One result of all these investigations is the obstacles they set up against hasty generalisations on the subject of primitive man. Leaving out of the discussion all question of Divine Providence, comparative j. shows that all sorts of

causes may be responsible when a similar law is found in widely different communities. By various experiments civilised nations and savage tribes achieve law. Savage tribes are seen to be in different stages of development, differing as widely in customs and habits as the nations of Europe, so that it becomes worse than useless to argue from present-day customs of savage tribes to the institutions of primitive man in Europe. Many tribes and nations have remained in a backward state of civilisation through missing the right experiment in social progress, or through failing to discern the significance of some experiment.

Another important point brought out by comparative j. is the steady stream of borrowing of race from race, and the power of racial influence on race, that have been at work from the beginning of human intercourse in the world, and throughout the ages. The susceptibility to influence and the readiness to borrow ideas from more highly developed races and nations are seen as vividly in legal institutions as in social customs.

Of the early periods of the world comparative j., assisted by the scientific investigations of the historian and ethnologist, has added to our knowledge, and still more has taught us how to avoid false generalisations, and the lines of work for further knowledge. At the present time the Fr. Société de Législation Comparée publishes monthly and annual reports of home and foreign legislation, while the *Journal* of the Brit. Society of Comparative Legislation is concerned with the progress of legislation throughout the Empire.

J. Austin, *Lectures on Jurisprudence*; T. E. Holland, *Elements of Jurisprudence*; Sir F. Pollock, *A First Book on Jurisprudence*; Sir H. Maine, *Early History of Institutions*.

JURY, a body of men, selected according to law, whose function it is to decide, under the guidance of a judge, what is the truth in questions of fact arising in the course of a trial, whether in a civil or a criminal case. In civil cases, either a *common* or a *special* j. is summoned. In the majority of cases the former is the method; but either plaintiff or defendant may apply for a special j., and the applicant is liable to the costs over and above those which would have been incurred had a common j. been engaged, unless the judge specially certifies for a special j. If he so certifies, then the costs of the special j. fall in the ordinary way on the loser of the action. Every man in England and Wales between the ages of twenty-one and sixty, possessing property to the extent of £10 freehold, or £20 leasehold, or being assessed to the Poor Rate at £20 (Middlesex £30), is liable to serve in his county as a *juryman*. In the city of London the qualification is £100. Peers, Members of Parliament, professional men, and public servants are exempt. *Special jurymen* are either esquires, knights, or baronets, or bankers, or persons of considerable property. A duly summoned juryman failing to attend, and not showing reasonable cause for absence, is liable to a fine. Women cannot act on a j. except to determine whether a woman convicted of murder is pregnant. For that purpose a j. of matrons is empanelled, for no pregnant woman can be sentenced to death.

In criminal cases a *grand* j. of not more than twenty-three and not less than twelve persons decides whether there is a *prima facie* case for a *petty* j. in the case of every person committed for trial at the sessions or assize. In County Court cases when the claim exceeds £5 either party has the right to demand trial by j., and even in cases under £5 the judge may order a j. to be summoned. A *Coroner's* j. consists of not less than twelve, nor more than twenty-three, 'good and lawful men,' summoned to decide under the Coroner's guidance the cause of death where no medical certificate has been granted.

JUS GENTIUM, see ROME (LAW).

JUS PRIMÆ NOCTIS, supposed mediæval privilege of overlord to deflower vassal's daughters on their wedding night; relic of barbarism; no traces of legal foundation can be discovered.

JUSSERAND, JEAN ADRIEN ANTOINE JULES (1855–), Fr. writer; ambassador to U.S.A. (1902–); brilliant critic of Eng. lit.; authority on Shakespeare.

JUSSIEU, DE, Fr. family of botanists.—ANTOINE (1686–1758) edit. Tournefort's *Institutiones rei herbariæ*. BERNARD (1699–1777) arranged plants in Trianon. ANTOINE (1748–1836) wrote *Genera Plantarum*, foundation of modern classification of plants. ADRIEN (1797–1853) wrote *Botanique*, a hand-book. LAURENT (1792–1866) wrote *Simon de Mantua*.

JUSTICE OF THE PEACE, 'J.P.', title of the petty county or borough magistrate, who sits to administer summary justice in minor matters, and to see that the peace is kept; first app. by Edward I., 1327, and now app. by the Lord Chancellor; property qualification for the office abolished 1906.

JUSTICIAR (judge).—From reign of Henry II. king's chief minister was called chief j.; originally officer who acted in king's absence; after 1231 j.'s place was taken by chancellor.

JUSTICIARY COURT, highest Scot. criminal court; usually sits in Edinburgh; circuit courts 6 times a year in Glasgow, 4 in Perth, Aberdeen, Dundee, 2 in Inverness, Ayr, Jedburgh, Dumfries; judges are those of Court of Session; no appeal to House of Lords.

JUSTIFIABLE HOMICIDE, see MURDER.

JUSTIN I. (450–527), Roman emperor, 518; uncle of Justinian.

JUSTIN II. (d. 578), Rom. emperor, succeeding his uncle Justinian, 565; defended Italy against Lombard attacks.

JUSTIN MARTYR (fl. II. cent.), one of 'Apostolic Fathers'; b. in Samaria; lived at Ephesus; after being Stoic and Pythagorean, converted to Christianity; then went to Rome, where he was martyred c. 165; addressed his *Apology* to Emperor Antoninus, wherein he meets Pagan attacks on Christianity; wrote also *Dialogue with Trypho the Jew*, very valuable for history of early Christian thought and worship, and for Old and New Testament Canon.

JUSTINIAN I., FLAVIUS ANICIUS JUSTINIANUS (483–565), Byzantine emperor; b. at Tauresium, Illyria; of barbarian extraction, but was adopted by his uncle, Justin I., whom he succ. on imperial throne, 527. By the aid of his wife Theodora, who exercised great influence over him, and of his two great generals, Belisarius and Narses, who subdued the Vandals and Ostrogoths in Africa and Italy, he restored these countries to the Byzantine empire; but his war against Chosroes of Persia was unsuccessful, and he could only obtain peace by agreeing to pay an annual tribute. After the foreign wars the most notable event of his reign was the outbreak of the Nika riot at Constantinople in 532, which was eventually put down with great severity.

J. is best known for the thorough revision of the whole system of law which he caused to be made; he appointed commissioners to draw up codes both of the *jus novum*, or later imperial statutes, and of the *jus vetus* or earlier ordinances; this resulted in the publication of four legislative works, which under the collective name of *Corpus Juris Civilis*, constituted the Rom. law in Europe for the next four cent's. The *Corpus Juris Civilis* includes: (1) The *Institutiones*, an introductory treatise, pub. 533; (2) the *Codex Constitutionum*, a compilation of imperial ordinances, pub. 529; (3) the *Pandects*, or *Digesta*, a selection of earlier decrees and writings, pub. 533; and (4) the *Novellæ Constitutiones*, containing subsequent reforms and amendments and pub. between 535 and 565. J.'s reign was also marked by the building of many forts and strengthening of the Empire's frontiers; he also built many palaces and churches, of which most famous is the Church of St. Sophia at Constantinople, now used as a mosque. His extravagance in these matters made necessary the severe taxation of his subjects, which caused revolts

on various occasions. During most of his life J. was an orthodox Christian, and persecuted heathens and heretics with considerable severity.

Holmes, *Age of Justinian and Theodora* (1905); Bury, *Later Roman Empire* (1889).

JUSTINIAN II. (669–711), Eastern emperor, 685 to 695, when he was deposed; ruled again from 704.

JUSTINUS JUNIANUS, wrote history of Macedonia; lived (probably) in II. cent.

JUTE (*Corchorus capsularis*), an annual plant belonging to the family of Brit. lime tree (*Liliaceæ*). It produces little-branched stems, growing to a height of about 12 ft., and a thickness of 1½ in. On these are borne fairly large leaves, lance-shaped, and with serrate edges. The flowers are yellowish in colour, and occur in clusters. The plant is a native of Bengal, and has been cultivated in India for many thousand years. Of late, attempts have been made to grow it in other tropical countries where the climatic conditions are suitable—it requires moisture, and an even, fairly high temperature. Economically it is important as yielding a fibre which may be manufactured into coarse cloth. In Bengal it is sown in March and cut four months later. The stems are freed from foliage, and rotted in slow-running water. After a few days they are beaten to break up the wood, and combed to separate out the bast fibre. This is pressed into bales for export. The export of j. from India to the United Kingdom amounted in 1911 to almost £6,000,000. J. was first made known to this country in 1795, but only in 1830 was much attention paid to it. In that year it began to be manufactured in Dundee, and since then Dundee has possessed the most extensive jute-mills in the world. It is used for the manufacture of sacking and other coarse fabrics. For India it is fortunate that a great decrease in domestic consumption—due to the introduction of cotton, which soon usurped the place of jute as a clothing for the natives—was accompanied by an enormous increase in export trade.

JÜTERBOG, GÜTERBOG (51° 59′ N., 13° 2′ E.), town, Brandenburg, Prussia. Pop. (1910) 7634.

JUTIGALPA, JUTICALPA (14° 55′ N., 85° 30′ W.), town, Honduras, Cent. America. Pop. (1910) 17,800.

JUTLAND (56° 30′ N., 9° 20′ E.), peninsular province, Denmark; area, *c.* 9898 sq. miles; surface generally level, rising to 560 ft. in S.E.; large part of area under wood; drained by Gudenaa, Skjerne, and other streams. Chief centre of Baltic trade is Aarhus. Pop. (1911) 1,198,457.

JUVENAL, DECIMUS JUNIUS JUVENALIS (*c.* 60–140 A.D.), Rom. satirist. There is not a reliable biography extant, but the following statements, taken from the many existing 'lives,' are probably near the truth: b. Aquinum, s. of prosperous freedman; successful as amateur declamator; aroused anger of prominent actor, favourite of emperor; banished (possibly to Egypt, in military capacity) at an advanced age. An inscription, relating to the dedication of an altar to Ceres by Junius Juvenalis, was found at Aquinum; this man, who may have been the poet, was tribune of 1st Dalmatian cohort and provincial magistrate.

J.'s *Satires*, 16 in number (collected into 5 books), were probably composed between 100 and 130; they deal mainly with abuses prevalent in Domitian's reign; the sixth is slashing condemnation of woman.

J. possesses considerable graphic and descriptive force; undoubtedly coarse in parts, and his intimate knowledge of contemporary vice, coupled with a reference in Martial, seem to indicate that his own character was not above reproach. He has, however, a genuine hatred of the tyranny and savage cruelty and, above all, the vile system of espionage (*delatio*) which at that time characterised the Rom. Empire.

JUVENILE OFFENDERS.—By the Summary Jurisdiction Act, 1879, and the Children Act, 1908, juvenile offenders are to be tried summarily, instead of being committed for trial by jury. Special juvenile courts of summary jurisdiction were established by the Act of 1908, and to these courts children under 14, and 'young persons' between 14 and 16, charged with offences against the law are brought. A child under 16 cannot be sentenced to death, or sent to penal servitude. Children under seven years of age are held incapable of committing a crime. Children between 7 and 14 years of age are also held to be incapable of committing a crime unless it can be shown that the child has sufficient capacity to know that the act is wrong. The law presumes that between these ages innocence still continues; but if it can be shown that malice, revenge, or cunning exist, then the doer of the act is held responsible—*Malitia supplet ætatem.* Any children's court may order the parent or guardian of a child under 16 to pay the fine, damages, or costs imposed on a j. o. Male j. o's between 7 and 14 years of age may be punished by strokes with a birch rod, and j. o's of either sex convicted of a crime punishable by imprisonment may be sent to an industrial school if under 12, or to a reformatory if over 12 and under 16. The cost of maintaining a child, or young person, in a reformatory or industrial school may be recovered from parent or guardian. Children under 14 found begging, or destitute, or in the company of thieves and prostitutes, or who are beyond parents' or guardians' control, may also be sent to an industrial school.

K, 11th letter of alphabet, was evolved from Egyptian symbol for a bowl; generally replaced by *C* in Lat. alphabet derivatives; first seen in England in XII. cent.

K$_2$, Mt. Godwin-Austen (35° 54′ N., 76° 30′ E.), mountain, Muztagh Mountains, Himalayas; second highest in world—*c.* 28,260 ft.

Ka'ba, see Mecca.

Kabardia (43° 20′ N., 43° 30′ E.), district, Terek, S. Russia; horses bred; inhabited by Circassian race. Pop. *c.* 70,000.

Kabba (*c.* 7° 55′ N., 6° E.), province, Brit. N. Nigeria; cereals, rubber, tobacco, indigo, tin. Pop. *c.* 70,000.

Kabbabish, an Egyptian Arab tribe.

Kabbalah (late Hebrew, *received lore*), name given to a body of Jewish theosophy and mysticism, traditionally supposed to have been handed down from the patriarchs. It owes its origin to a conglomeration of Jewish, Gk., Egyptian, and Babylonian elements in Alexandria about I. cent. B.C. The chief doctrine of the K. is its cosmogony. There are ten *Sephiroth*, or emanations from God; these are the heavenly man, the archetype of man on earth. God is called *En Soph*, the boundless one, and created the universe through the Sephiroth (intelligences). The universe consists of four worlds, and last of all came man. These ideas are all said to be in the Scriptures, but to obtain them resort was had to mystical and allegorical exegesis paralleled elsewhere, *e.g.* in Philo. The influence of the K. in Judaism has been on the whole good, as it formed a counteractive to formalistic tendencies. But it sometimes led, as mystical ideas have done in Christianity, to neurotic and exaggerated forms of piety, and to the practice of magic and much superstition. As the K. contained Messianic conceptions similar to Christian, but not elsewhere developed in Jewish theol., it was much studied by Christians, particularly in the XV. and XVI. cent's.

Schechter, *Studies in Judaism*; elaborate article, *Cabala*, in *Jewish Encyclopædia*.

Kabinda, Cabinda (*c.* 5° S., 12° 25′ E.), detached part of Portug. colony of Angola, W. Africa, on coast between Belg. and Fr. Congo. Chief town, Kabinda (5° 35′ S., 12° 15′ E.). Pop. *c.* 10,000.

Kabir (d. *c.* 1449), Ind. reformer; at first Muhammadan; after his death both Muhammadans and Hindus asserted he belonged to them, and his teaching was undoubtedly syncretistic; believed in a personal God, and thought falsehood was the root of all evil; thought by some that his teaching was ultimately in part derived from Christianity, which penetrated into India.

Kabul (34° 53′ N., 69° E.), capital, Afghanistan (*q.v.*), on K. River; an ancient town containing high citadel and Emir's palace. Situated on trade route between Central Asia and Punjab, K. has large transit trade; was known to Greeks through Alexander the Great by Ind. campaign; was seized by Timur, 1394; by Nadir Shah, 1739; destroyed by British, 1842; occupied by Lord Roberts, 1880. Pop. *c.* 145,000.

Kabul River (34° 20′ N., 70° 50′ E.), river, Afghanistan; source in Hindu Kush; joins Indus.

Kabyles, Berber tribes of N. Africa, akin to, but not the same as, Arabs. They belong to Islam, and have no written lit.

Kach Gandava, Kachhi (28° 30′ N., 68° 10′ E.), level district, Baluchistan. Pop. 86,000.

Kachin Hills (*c.* 26° 15′ N., 97° 30′ E.), hill region, N. Burma, Farther India; area, *c.* 19,180 sq. miles; crossed by several mountain chains; watered by Irrawady; inhabited by numerous native tribes. Pop. 66,000.

Kadur (*c.* 13° 30′ N., 75° 30′ E.), district, Mysore, India; well forested. Pop. *c.* 367,000.

Kaempfer, Engelbrecht (1651–1716), Ger. physician and traveller; went in an embassy from Charles XI. of Sweden to Persia, travelling through Russia; voyaged to Arabia, India, Java, Siam, and Japan, where he remained two years; returned to Europe, 1693, and practised med. in his native town, Lemgo; from his unpub. MSS. a valuable history of Japan was prepared.

Kaffa (*c.* 7° 30′ N., 36° 40′ E.), region, N.E. Africa; tributary to Abyssinia; produces coffee; chief towns, Bonga, Jiren.

Kaffirs (sometimes spelt *Caffres*), an African Bantu race, which, including Zulus and Kaffirs proper, forms the bulk of the natives of S. Africa. The name is Arabian, and signifies 'infidel,' *i.e.* who refuses the creed of Islam. A K. *kraal* consists of conical huts, and while the men mind the cattle the women work on the land. At intervals throughout the XIX. cent. Great Britain was engaged in suppressing this stalwart and warlike people, and in annexing their land. On the Stock Exchange *Kaffirs* is the name given to S. African mining shares.

Kidd, *Kaffir Socialism*; Stow, *Native Races of South Africa*.

Kaffraria, old name for region of S. Africa now called Transkeian Territories (*q.v.*).

Kafiristan (35° 30′ N., 71° E.), district, Afghanistan. Its history, both early and modern, is veiled in obscurity, although country is occasionally mentioned by travellers. K. came into contact with British in XIX. cent. Brit. government formally acknowledged it to be under Afghan control in 1895, since when it has been ruled by the Amir, concerning whose methods of enforcing his authority and the Muhammadan religion the rest of the world remains in ignorance. K., roughly speaking, is bounded by Hindu Kush Mt's, Chitral, Kabul, and Panjshir Rivers; area, *c.* 5000 sq. miles. Surface is mountainous, with numerous narrow glens and valleys between the hills; drained by various affluents of Indus and Kabul, of which largest is Bashgal. Climate is hot in summer, severe in winter. Inhabitants are called Kafirs, from Muhammadan word, meaning infidel; they include many tribes of same race; of medium height and brown in colour, though some of the mountain tribes are fair. Native religion was a low form of animism, but it is probable that this has been suppressed and Muhammadanism enforced since the establishment of Afghan rule. Men wear garments made of goatskin. Women, who are, comparatively speaking, of low stature, wear woollen robes; they hold an inferior position, and carry out great deal of heavy work. Polygamy is practised, and morality, in European sense of the word, is unknown. Pop. *c.* 175,000. See Afghanistan.

Robertson, *The Kafir of the Hindu Kush* (1897).

Kagera (0° 59′ S., 30° 50′ E.), river, E. Africa; head-water of Nile; enters Victoria Nyanza.

Kagoshima (35° 10′ N., 139° 36′ E.), town, Kiusiu Island, Japan; arms, cotton, pottery; bombarded by British, 1863. Pop. 63,640.

Kahlur, Bilaspur (31° 20′ N., 77° 50′ E.), native Ind. state in Punjab. Pop. *c.* 95,000.

Kahulaui, see Hawaiian Islands.

K'ai-fêng fu (34° 50′ N., 114° 35′ E.), walled town, capital of Honan, China; near Hwang-ho R.; gov.'s seat; several mosques. Pop. *c.* 180,000.

Kailas (31° 4′ N., 81° 15′ E.), Hindu sacred mountain, Tibet.

Kain.—(1) (33° 40′ N., 59° 5′ E.) walled town, Khora-

san, Persia; ruined mosque and castle. Pop. *c.* 4000. (2) sub-province, Khorasan, Persia. Pop. *c.* 150,000..

KAIRA.—(1) (22° 50′ N., 72° 50′ E.) district, Bombay, India; rice, cotton; often ravaged by famine. Pop. 720,000. (2) (22° 46′ N., 72° 37′ E.) walled town, K., India; also called KHEDA. Pop. 11,000.

KAIRWAN, KAIROUAN (35° 40′ N., 10° 3′ E.), ancient walled town, Tunisia, Africa; sacred to Muhammadans; has citadel and many beautiful mosques, of which most remarkable are Mosque of the Companion (Prophet), which stands beyond walls, and that of Okba, founder of K.; visited by many pilgrims. Pop. *c.* 24,000.

KAISER, see CÆSAR, GERMAN EMPIRE.

KAISER WILHELM'S LAND, see NEW GUINEA.

KAISERSLAUTERN (49° 26′ N., 7° 46′ E.), town, Bavaria, Germany; manufactures iron goods, cotton, woollens; here Prussians defeated French, 1793–94. Pop. (1910) 54,659.

KAISERSWERTH (51° 20′ N., 6° 48′ E.), town, Rhenish Prussia, Germany; deaconesses' house established here by Fliedner.

KAITHAL, KYTHAL (29° 45′ N., 76° 24′ E.), town, Punjab, India. Pop. 16,500.

KAKEMONO, name for Jap. picture on paper or silk, with roller at foot. They are exposed for a day only at a time, after which they are rolled up and put away. A *gaku* is a picture stretched on a frame. A folding screen with pictures painted thereon is called a *biyobu.*

Morrison's *The Painters of Japan.*

KAKODYLE, CACODYL (*q.v.*).

KALA-AZAR, DUM-DUM FEVER, tropical disease characterised by remittent fever, anæmia, and an enlarged spleen, resembling malaria, and due to a parasitic protozoon. The treatment, as in malaria, is to give quinine promptly, in doses up to 30 grs. in twenty-four hours in the early stages, and continued until slight singing in the ears is experienced, the dose being then gradually reduced, treatment being continued, however, for about three months.

KALABAGH (32° 58′ N., 71° 27′ E.), town, Punjab, India; salt and alum extensively worked. Pop. 6000.

KALACH, DONSKAYA (48° 42′ N., 43° 20′ S.), town, Don Cossacks County, Russia. Pop. *c.* 1100.

KALAHANDI (*c.* 19° 35′ N., 83° E.), native state, Bihar and Orissa, India. Pop. *c.* 355,000.

KALAHARI DESERT (*c.* 20° to 27° S., 19° to 25° E.), vast steppe region, N. of Cape Province, S. Africa, with elevation of 3000 to 4000 ft.; almost waterless; inhabited by agricultural race called *Bakalahari,* and by nomadic Bushmen or hunters; many parts covered with vegetation; cattle raised, crops grown; big game abundant.

KALAMATA (37° 2′ N., 22° 7′ E.), town, Greece; archiepiscopal see; exports silk and olive oil. Pop. 14,500.

KALAMAZOO (42° 20′ N., 85° 37′ W.), town, Michigan, U.S.A.; railway centre; machinery, flour, etc. Pop. (1910) 39,437.

KALAT (29° N., 66° 36′ E.), capital and fortress, Baluchistan; citadel contains khan's palace; occupied by British, 1839. K. district had pop. 356,000.

KALAT-I-GHILZAI (32° 20′ N., 61° 15′ E.), fort, Afghanistan.

KALBE, CALBE (*q.v.*).

KALEIDOSCOPE, optical instrument invented by Sir David Brewster (*q.v.*), 1815; consists of tube containing mirrors having their reflecting surfaces inclined at 60° or other sub-multiple of 360°; coloured glass pieces at foot of tube by reflection assume beautiful regular forms, which vary when tube is shaken.

KALEWALA, KALEVALA, see FINLAND (*Language and Literature*).

KALGAN (40° 55′ N., 114° 58′ E.), fortified town, Chih-Li, China; has extensive transit trade. Pop. *c.* 80,000.

KALGOORLIE (30° 50′ S., 123° 19′ E.), town, Western Australia; goldfields; terminus of railway from Perth; is being linked by rail with South Australia. Pop. 7000.

KALI (Hindu myth.), Ind. goddess, wife of Siva; wears a string of human heads round her neck.

KÂLIDÂSA (fl. *c.* 550 A.D.), famous Sanskrit writer; greatest work is drama *Sâkuntala* ('The Lost Ring'), which has been translated into several European languages; second to his masterpiece is *Vikramorvasi* ('The Hero and the Nymph'); two epics and several poems are also ascribed to him.

KALIF, see CALIPH.

KALIMPONG, village, Darjeeling, Bengal, India; mission centre.

KALINGA, CALINGA (*c.* 16° N., 84° 9′ E.), ancient kingdom, S. India.

KALINJAR (25° N., 80° 30′ E.), hill fortress and town, United Provinces, India. Pop. 3100.

KALISZ (51° 45′ N., 18° 5′ E.), town, Russ. Poland; episcopal see. Pop. 47,000.

KALK (50° 56′ N., 7° E.), town, Rhenish Prussia, Germany; incorporated with Cologne (*q.v.*).

KALLAY, BENJAMIN VON (1839–1903), Austro-Hungarian statesman; sent as finance minister and administrator to newly occupied province of Bosnia and Herzegovina, 1882; created national feeling and prosperity.

KALMAR (56° 39′ N., 16° 22′ E.), port and cathedral town, Sweden; former fortress. By *Union of K.,* 1397, Sweden, Norway, and Denmark were united as a single kingdom. Pop. (1910) 15,536.

KALMUCK, KALMYK STEPPE (45° 50′ N., 43° E.), region inhabited by Mongol race of same name, Astrakhan, Russia; area, *c.* 37,000 sq. miles; many Buddhist monasteries.

KALNÓKY, GUSTAV SIEGMUND, COUNT (1832–98), Austro-Hungarian statesman, who, as ambassador to Russia in 1880, and Foreign Minister, 1881–95, brought about the commercial treaty of 1894.

KALOCSA (46° 31′ N., 18° 58′ E.), town, Hungary; archiepiscopal see. Pop. 12,000.

KALPI, CALPEE (26° 6′ N., 79° 45′ E.), town, United Provinces, India; mutineers defeated here, 1858. Pop. 10,500.

KALUGA.—(1) (54° 20′ N., 35° 30′ E.) government, Russia; area, 11,942 sq. miles; surface generally flat; watered by Oka; iron and glass works, textiles, leather, cereals. Pop. (1910) 1,387,100. (2) (54° 32′ N., 36° 18′ E.) cathedral town, K., Russia; leather, tallow, K. cakes. Pop. (1910) 53,854.

KALYAN (19° 13′ N., 73° 10′ E.), town, Bombay, India. Pop. 11,500.

KAMCHATKA (51° to 61° 40′ N., 155° 40′ to 163° E.), peninsula, E. Siberia, E. of Sea of Okhotsk; area, *c.* 104,280 sq. miles; traversed by mountain range, of which notable volcanic peaks are Kluchevskaya, Belaye Sopka, Kojerevska; drained by K. and other streams; thermal springs; produces valuable furs; annexed to Russia, XVII. cent. Pop. *c.* 8000. See SIBERIA.

KAMENETS PODOLSKIY, PODOLIAN KAMENETS (48° 36′ N., 26° 30′ E.), town, Podolia, Russia; R.C. and Gk. cathedrals. Pop. (1910) 46,707.

KAMENZ (51° 17′ N., 14° 5′ E.), town, Saxony. Pop. (1910) 11,533.

KAMERUN, CAMEROON, Ger. colony, equatorial W. Africa; bounded N. by Lake Chad, E. and S. by Fr. Congo, W. by Bight of Biafra and Nigeria; area, 291,950 sq. miles. Surface generally consists of series of plateaus in interior and low-lying coastal strip. K. mountains are in N., near coast; culminate in Mongo ma Loba (13,000 ft.); drained by K. River, Sanaga, Mungo, etc. Buëa is seat of government; Duala, Victoria, and Campa are important trading stations. Administration is by imperial gov., assisted by three councillors; colony is subdivided into four administrative districts. Inhabitants include about 1300 whites, most of whom are Germans; natives include numerous Bantu tribes. Pop. *c.* 4,000,000.

Soil is extremely fertile round coast; large quantities of cocoa, copper, rubber, kola, tobacco, produced;

cattle reared; principal exports, palm oil and kernels, rubber, ivory, cocoa; imports, textiles, timber, hardware, spirits, salt; railway mileage over 300 miles. K. has been Ger. colony since 1884, when territories obtained by Ger. traders from natives were handed over to imperial government, and boundary treaties

have since been concluded with France and Britain. In 1911 the area of K. was extended by the inclusion of 107,270 sq. miles from Fr. Congo (included above), ceded by France as compensation for recognition by Germany of her suzerainty over Morocco.

René, *Kamerun* (Berlin, 1905).

KAMES, HENRY HOME, Lord (1696–1782), Scot. philosopher; pub. works on law, economics, and philosophy.

KAMMIN, Cammin (53° 32′ N., 17° 30′ E.), town, Prussia, Germany. Pop. 6000.

KAMPEN (52° 33′ N., 5° 55′ E.), town, Holland; monastic ruins and fine mediæval church. Pop. 20,000.

KAMPTEE, Kamthi (21° 15′ N., 79° 20′ E.), town, Central Provinces, India. Pop. 40,000.

KAMRUP (26° 24′ N., 91° 20′ E.), district, Assam, India; area, *c.* 3800 sq. miles; crossed by Brahmaputra; rice, timber. Pop. 593,000.

KAMYSHIN (50° 5′ N., 45° 18′ E.), town, Russia. Pop. *c*, 17,000.

KANAOKA, KOSÉ NO (fl. 928–87), Jap. artist; most famous of ancient native masters, who, breaking from Chin. influence, founded a school which remained dominant until XV. cent.; famed for landscapes, portraits, and animals. See Japan (Art).

KANARA, NORTH, Canara (15° N., 74° 30′ E.), district, Bombay, India; area, *c.* 3930 sq. miles; produces rice. Pop. 455,000. **K., South** (13° N., 75° E.), district, Madras; area, *c.* 4000 sq. miles. Pop. 1,134,713.

KANARIS, CONSTANTINE, Canaris (1790–1877), Gk. leader; fought in Gk. War of Independence; victorious in several naval battles; Prime Minister, 1864–65.

KANAUJ (27° N., 79° 55′ E.), ancient Hindu town, United Provinces, India. Pop. 19,500.

KANCHINJANGA, Kinchinjunga (*q.v.*).

KANDAHAR, Candahar (31° 36′ N., 65° 35′ E.), town, Afghanistan (*q.v.*), commanding western entrance of Bolan Pass; traditionally founded by Alexander the Great; captured in turn by Mahmoud of Ghaznai, Jenghiz Khan, Timur, Baber, Abbas, and Nadir Shah; modern town founded by Ahmed Shah, XVIII. cent.; occupied by British, 1839, 1879–81; siege relieved by Lord Roberts, 1880. Situated on main route between India and Persia, K. trades largely with Herat, Samarcand, Bokhara, and Bombay; produces silks and felts in large quantities; imports cotton goods; exports raw wool, fruit, vegetables, provisions. K. is encircled by walls; on high rock to N, is strong fortress.

KANDI (23° 58′ N., 88° 5′ E.), town, Bengal, India. Pop. 12,500.

KANDY (7° 18′ N., 80° 41′ E.), town, Ceylon; many native temples (one containing Buddha's tooth), and ruined royal palace. Pop. 27,000.

KANE, town, Pennsylvania, U.S.A. Pop. (1910) 6626.

KANE, ELISHA KENT (1820–57), Amer. explorer; surgeon to first, commander of second, expedition in search for Franklin.

KANGAROO RAT, see Pocket Gophers.

KANGAROOS, see under Marsupials.

KANGRA (32° 5′ N., 76° 16′ E.), town, Punjab, India; damaged by earthquake, 1905. Pop. 5000. K. district has area *c.* 9980 sq. miles. Pop. *c.* 786,000.

KANIZSA, see Nagykanizsa.

KANKAKEE (41° 6′ N., 87° 54′ W.), town, Illinois, U.S.A. Pop. (1910) 13,986.

KANKER.—(1) (*c.* 20° 20′ N., 81° 20′ E.) native state, Central Provinces, India. Pop. 105,000. (2) (20° 14′ N., 81° 32′ E.) town, K., India. Pop. *c.* 4000.

KANO (11° 59′ N., 8° 19′ E.), walled town, capital of K. province, N. Nigeria; has royal palace; is great

trading centre; manufactures leather, cottons, slippers, etc.; occupied by British, 1903. Pop. estimated at 100,000. K. province (*c.* 11° 38′ N., 8° 20′ E.) has area (including Katagum, with which it was united in 1905) of over 30,000 sq. miles. Pop. *c.* 2½ millions.

KANSAS (37° to 40° N., 94° 40′ to 102° 1′ W.), a central state of U.S.A.; bounded N. by Nebraska, E. by Missouri, S. by Oklahoma, W. by Colorado; area, 82,080 sq. miles. Surface generally consists of undulating prairie, rising from 800 ft. in S.E. to 4000 ft. in N.W.; drained by Kansas and Arkansas and their tributaries, flowing to the Missouri and Mississippi. Principal towns are Kansas City, Topeka (capital), Wichita, Leavenworth. Climate is healthy, although subject to occasional extremes of both heat and cold.

K. was originally inhabited by various Ind. tribes, to one of which it owes its name. It was partially explored by Span. adventurers in XVI. cent., and was held by France for some years in XVIII. cent. Greater part was included in Louisiana Purchase in 1803, and it was organised as territory of U.S. half a century later. Scene of great political struggle between slavery and emancipation parties for several years, in course of which occurred hostilities almost amounting to civil war. K. was admitted as state to Union in 1861; during Civil War supported Federalist army by sending force consisting of about one-fifth of total population. After close of war great number of settlements sprang up, and the state has since then steadily increased in prosperity. Administration is carried out by gov., assisted by six ministers; legislative authority vested in Senate of 40 members and House of Representatives of 125 members, elected by popular vote for four and two years respectively; sends to Congress two Senators and eight Representatives. Principal religious denominations are Methodist, R.C., Baptist. Education is free and obligatory. Army numbers 1512 in all.

K. is pre-eminently an agricultural state; produces large crops of maize, wheat, oats, sorghum, beet, cotton. Live stock is largely raised, horses, cattle, sheep, pigs. Minerals include vast quantities of coal; oil, petroleum, zinc, limestone, lead, salt, gypsum also found. Industries include meat-packing, flour-milling, dairying. Railway mileage is over 9000.

Inhabitants include Americans, Europeans, negroes, Indians. Total pop. (1910) 1,690,949.

Spring, *History of Kansas*; Ewing, *The Struggle for Freedom in Kansas* (1894).

KANSAS CITY (39° 7′ N., 94° 38′ W.), town, Kansas, U.S.A., on Missouri; practically part of K. City, Missouri, which it adjoins; has Methodist Univ. and other educational establishments; noted for meat-packing and live stock trade. Pop. (1910) 82,331.

KANSAS CITY (39° 7′ N., 94° 37′ W.), town, Missouri, U.S.A., on right bank of Missouri River, adjoining Kansas City, Kansas; important railway and trading centre; served by seventeen railways; has grain elevators, stockyards, meat-packing houses; deals in butter substitutes, lumber, beer, grain, and in live stock, an important show of animals being held every year; fine system of parks, various educational and charitable institutions, public library, many churches. Pop. (1910) 248,381.

KANSK (56° 20′ N., 95° 50′ E.), town, Siberia. Pop. 8000.

KAN-SUH (36° N., 105° E.), province, China; drained by Hwang-ho. Pop. *c.* 10,000,000.

KANT, IMMANUEL (1724–1804), Ger. philosopher; founder of Transcendental or Critical Philosophy; b. Königsberg, where he lived all his life. Univ. lecturer, 1755; prof. of Philosophy, 1770; of frail constitution, and prolonged life by adherence to strict routine. Chief works, *Kritik of Pure Reason*, *Theory of Ethics*, *Prolegomena*, *Kritik of Judgment*.

K.'s mental development shows three stages: (1) earliest, adherence to views of Wolff and Leibnitz; (2) partly influenced by Eng. empiricism; (3) the period of 'critical' philosophy, dating from *c.* 1770.

The critical philosophy investigates and determines the limits of reason before essaying a systematic philosophy. Through omission to do this, Wolffism attempts problems beyond the power of reason, and leads to scepticism. A distinction must be made between phenomena and noumena (things-in-themselves). Of the latter we can know nothing, not even that they exist, whence the old rational psychology, cosmology, and theology, professing knowledge respectively of the soul, the world, and God, must be rejected. Knowledge, however, is possible so long as the reason confines itself to phenomena. These phenomena exist not in themselves, but only in relation to mind, and must therefore conform to the laws of the constitution of the mind. The 'matter' of cognition is distinguished from its 'form.' The matter consists of sense-data; these are taken up and combined by the synthetic activity of the mind. The mind furnishes first, in order to perception, pure intuitions of space and time, prior to all experience and inseparable from our intelligence. Perceptions are combined by the understanding through certain *à priori* conceptions, or 'forms of synthesis' (categories—cause, existence, substance, etc.), and give a connected view of the external world. Understanding is limited to the empirical; but for Reason, the Absolute Totality of all possible experience, though itself no experience, is a necessary problem. Whence Reason contains in itself the grounds of 'Ideas' of such necessary conceptions not given in experience. These Ideas, corresponding to the forms of the Syllogism, are the Psychological (of the soul), Cosmological (of the world), Theological (of God). These make progress up to the limits of Reason necessary, and lead to contact with the void, of which we know nothing (noumena). Only in the cognition of things-in-themselves can Reason see its desire for completeness satisfied.

The distinction between phenomena and things-in-themselves is carried into K.'s ethics. All that is good is the goodwill, which is good only in virtue of the volition itself. An action, to be good, must be done from duty, *i.e.* from respect for the law. Every inclination, everything material, is excluded; the mere form, the universal conformity to law in general, alone remains. Hence the Categorical Imperative, never to act otherwise than so that I could will that my maxim should become a universal law. This law applies to all rational beings, and implies freedom of the will, for the bare form of the law can be conceived only by reason, and is not an object of the senses, so that the idea of it, which determines the will, must be independent of the natural laws controlling phenomena. The moral law thus affirms a double system of nature—sensible, existing under empirically conditioned laws, and supersensible, according to laws belonging to the autonomy of pure reason; of this latter, only freedom is known, and only in relation to the moral law. Though material principles, *e.g.* desire for happiness, are thus excluded from morality, K. postulates immortality of the soul to secure perfect accordance with the moral law, and the existence of God to secure happiness proportionate to virtue.

Sidgwick, *Lectures on Kant*; Adamson, *The Philosophy of K.* (1879); Kelly, *K.'s Ethics and Schopenhauer's Criticism* (1910); Bowne, *K. and Spencer* (1912); Stuckenberg, *Life of K.* (1882).

KAOLIN, a pure white clay, also known as *China clay*; k. is a hydrous aluminium silicate, and is used largely in manufacture of china and porcelain, rendering the paste plastic; found originally in China; first discovered in England (1750) in Cornwall.

KAPUNDA (34° 20′ S., 139° E.), town, S. Australia. Pop. 1805.

KAPURTHALA (31° 27′ N., 75° 22′ E.), native state, Punjab, India; area, *c.* 635 sq. miles. Pop. (1911) *c.* 268,244.

KARA SEA (73° N., 64° E.), part of Arctic Ocean between Novaya Zemlya and N.W. Siberia.

KARACHI, KURRACHEE.—(1) (25° N., 67° 40′ E.) district, Bombay, India; area, *c.* 12,000 sq. miles; pro-

duces rice, millet. Pop. 609,000. (2) (24° 53′ N., 66° 57′ E.) town; good harbour; trading and railway centre; exports wheat, cotton. Pop. (1911) 151,903.

KARAGEORGE, Tserni Petrovitch (*c.* 1752–1817), founder of Servian independence; stormy youth stained by murder and patricide and life of haidouk (robber chief); chosen leader of revolutionary party, 1804; Turks expelled and Belgrade captured by 1807; Russia sent reinforcements, but made peace with Turkey, 1812; Turks reoccupied Servia, 1813; assassinated; fierce, barbarous leader of genius.

KARAGEORGEVITCH, see Servia.

KARA-HISSAR, ICHJE, Isoha (40° 15′ N., 38° 22′ E.), village, Asia Minor; marble quarries. See also Afium K.-H.

KARA-HISSAR SHARKI (40° 15′ N., 38° 22′ E.), town, Asiatic Turkey; alum mines. Pop. *c.* 13,000.

KARAJICH, VUK STEFANOVICH (1787–1864), Servian author; broke away from old 'Slavonic-Servian' traditions in lit., and adopted the Servian vernacular as the literary language; best work is perhaps his songs and ballads.

KARA-KIRGHIZ, see Kirghiz.

KARAKORUM.—(1) (46° 58′ N., 102° 12′ E.) ancient capital of Uigur kingdom, Mongolia, China; ruins remain. (2) (*c.* 47° 27′ N., 102° 35′ E.) old capital of Mongol kingdom; founded, 1234.

KARA-KUL, GREAT (38° 40′ N., 72° 5′ E.), lake, Ferghana, Russian Turkestan. **Kara-Kul, Little** (44° N., 70° 30′ E.), lake, Ferghana, Turkestan.

KARA-KUM (46° N., 66° E.), desert, in Trans-Caspian province of Western Turkestan, between Amu Darya on N.E. and Persia on S.W.; area, 110,000 sq. miles.

KARAMAN (37° 9′ N., 33° 2′ E.), town, Asia Minor. Pop. *c.* 7000.

KARAMANIA (*c.* 37° N., 33° E.), region, Asia Minor.

KARAMNASA (25° 30′ N., 83° 58′ E.), river, India, joins Ganges.

KARAMZIN, NIKOLAI MIKHAILOVICH (1765–1826), Russ. historian; imperial historiographer; author of *History of Russian Empire*, *Letters of a Russian Traveller*, and a number of essays and stories; a master of Russ. prose.

KARASU-BAZAR (45° 3′ N., 34° 37′ E.), town, Crimea, Russia. Pop. *c.* 14,000.

KARATEGHIN (39° N., 71° E.), province of Bokhara, Russ. Central Asia; live stock, fruit, corn. Pop. *c.* 70,000.

KARAULI, Kerowlee (26° 27′ N., 77° 4′ E.), capital, native state of K., Rajputana, India. Pop. 24,000; of state, 156,786.

KAREZAG (47° 19′ N., 20° 56′ E.), town, Hungary. Pop. 21,000.

KAREN-NI (18° 55′ to 19° 51′ N., 97° 8′ to 97° 50′ E.), region between Siam and Lower Burma, consisting of number of small native states under Brit. control; inhabited by Red Karems and other tribes, said to be diminishing in numbers; produces teak, rice, tin. Pop. *c.* 30,000.

KARIKAL (10° 34′ N., 79° 40′ E.), Fr. possession, Coromandel Coast, India. Pop. (1911) 56,577.

KARLI (18° 46′ N., 73° 30′ E.), famous cave-temple and village, Bombay Presidency, India.

KARLINGS, see Carolingians.

KARLOWITZ, Karlocza (45° 10′ N., 19° 58′ E.), town, Croatia-Slavonia, Hungary. Pop. 6000.

KARLSBAD, Carlsbad (*q.v.*).

KARLSBURG, see Gyula-Fehérvár.

KARLSKRONA (56° 9′ N., 15° 39′ E.), port, Sweden. Pop. (1910) 27,448.

KARLSRUHE (49° N., 8° 25′ E.), capital of Baden, Germany; founded by Karl, margrave of Baden, 1715; has grand-ducal palace; manufactures machinery, hardware, chemicals. Pop. (1910) 134,313.

KARLSTAD (59° 23′ N., 13° 30′ E.), town, Sweden. Pop. (1910) 17,191.

KARLSTADT (45° 30′ N., 15° 34′ E.), town, Hungary. Pop. 7000.

KARMA, see Buddhism.

KARNAK, Carnac (25° 40′ N., 32° 43′ E.), village, Egypt, on Nile, where ancient Thebes (*q.v.*) stood; site of great Egyptian temple of K. and other ruins; building of great temple is due to many successive kings; especially celebrated is the Great Hall of Columns, remarkable for perspective and fine lotus capitals. On either side of principal temple are smaller temples, from one of which, built by Rameses III., an avenue of sphinxes leads to temple of Luxor (*q.v.*).

KARNAK, see Architecture (Egyptian).

KARNAL.—(1) (29° 36′ N., 76° 58′ E.) district, Punjab, India; cotton, sugar, cereals. Pop. 885,000. (2) (29° 42′ N., 77° E.) town. Pop. 23,700.

KÄRNTHEN, see Carinthia.

KARROO (33° 2′ S., 19° 42′ E.), scrubby tablelands, Cape Province, S. Africa; nearest coast is Little K., while Great K., farther inland, leads up to central S. African plateau; clay soil; pasturage; transformed from wilderness into verdant plains after rains.

KARS (40° 36′ N., 43° 9′ E.), fortress and cathedral town, Kars, Transcaucasia; K. was gallantly defended by Turks under Gen. Fenwick Williams against Russians, June to Nov. 1855; taken from Turks by Russians, 1877. Pop. 25,000.

KARS (40° 38′ N., 43° 12′ E.), province, Transcaucasia, Russia; surface on elevated plateau crossed by mountains; area, 7238 sq. miles. Pop. (1910) 370,600.

KARSHI (38° 43′ N., 68° E.), town, Bokhara, W. Turkestan. Pop. *c.* 25,000.

KARST (45° 50′ N., 13° 42′ E.), mountainous region, Carniola, Austria; limestone formation.

KARUN (31° 10′ N., 48° 30′ E.), river, Persia; has its source in mountains of Bakhtiari; unites with Shat-el-Arab at Mohammerah, by the Hafar Canal; open to foreign navigation as far as Ahvaz.

KARWAR (14° 48′ N., 74° 16′ E.), port, Bombay, India. Pop. 17,000.

KARWI (25° 12′ N., 80° 56′ E.), town, United Provinces, India. Pop. 7800.

KASAI, Cassai (3° 9′ S., 16° 15′ E.), river, Africa; source in Portug. W. Africa, which it separates from Belg. Congo; then flowing N.W. unites with Kwango and joins Congo near Ngato.

KASBEK (42° 41′ N., 44° 29′ E.), mountain peak, Caucasus; *c.* 16,550 ft.

KASCHAU, see Kassa.

KASHAN (33° 50′ N., 51° 47′ E.), province, Persia. Pop. over 30,000.

KASHGAR (39° 20′ N., 76° 4′ E.), town, Eastern Turkestan, on trade route between India, China, and Russia; divided by Kizil River into new and old towns, Yangi Shahr and Kuhna Shahr, both fortified and surrounded by clay walls. Yangi Shahr contains gov.'s palace; Kuhna Shahr contains Hazrat Afak's shrine, and mosque built by Yakub Beg; manufactures silks, cottons, carpets, saddlery; in Chinese hands since 1758, but under Russ. influence. Pop. estimated at 60,000.

KASHMIR, Cashmere (*c.* 34° N., 74° 50′ E.), native state, N.W. India; area, 80,900 sq. miles. Surface consists of mountains and rich valleys, the latter 5000 ft. above sea-level; forms basin of Upper Indus and is crossed by the Jhelum, which widens into several lakes, and its tributaries. Chief town is Srinagar. K. has fine climate and is much visited as health-resort. K. was inhabited in early times by various Aryan tribes; Buddhism introduced in III. cent. B.C., eventually superseded by Hinduism; came under Muhammadan control in XIII. cent.; invaded by Mongols under Timur, XIV. cent.; belonged to Afghans in XVIII. cent. and to Sikhs in early XIX. cent. After Sikh defeat by British in 1846 K. was sold by Brit. government to Golab Singh, prince of Jammu, who was acknowledged as independent ruler.

Soil is fertile, producing rice, maize, and other cereals, fruits and vegetables. Silkworms are reared. Principal industries are silk-weaving, shawl and carpet manufacture, metal work. Inhabitants belong chiefly to Muhammadan faith, but there are considerable numbers of Hindus, Buddhists, and Sikhs. Pop. (1911) 3,158,126.

Younghusband and Molyneux, *Kashmir* (1909); Wardle, *Kashmir and its Silk Industries* (1904); Neve, *Picturesque Kashmir* (1900).

KASHMIRI, language commonly spoken in Kashmir by over 1,000,000 people. It is an Indo-European or Aryan language forming a small sub-group by itself with Shinā, Khovvār, Kāfir, and Kōhistan. These are mere unliterary dialects, but K. has a lit. of its own. It is an old language, the first record of it being undoubted K. words in a Sanskrit MSS. of the XII. cent. A.D. Its lit. is small in bulk, and continuous to the present day. The language appears to have altered very little since the first extant work written wholly in K., the *Lallā-vākya*, a philosophical poem of disputed authorship.

KASHUBES, a Slav race inhabiting the shores of the Baltic in Prussian territory.

KASIMBAZAR, see COSSIMBAZAR.

KASIMOV (54° 53′ N., 41° 29′ E.), town, Russia. Pop. 14,000.

KASSA, KASCHAU (48° 42′ N., 21° 17′ E.), town, Hungary; has magnificent Gothic cathedral, built XIII. to XV. cent's; episcopal see. Pop. (1910) 44,211.

KASSALA (15° 30′ N., 36° 10′ E.), fortified town, Sudan, Egypt; important centre of trade. Pop. *c.* 19,000.

KASSASSIN, village, Egypt; British defeated Egyptians, 1882.

KASSEL, CASSEL (*q.v.*).

KASSITES, a non-Semitic people among the ancient Babylonians, in whom they were ultimately merged.

KASTAMUNI, KASTAMBŪL (41° 23′ N., 33° 43′ E.), capital, K. vilayet, Turkey in Asia. Pop. *c.* 16,500. K. vilayet has area 19,570 sq. miles. Pop. 961,200.

KASTORIA (40° 34′ N., 21° 19′ E.), town, Turkey in Europe. Pop. *c.* 10,000.

KASUR (31° 5′ N., 74° 30′ E.), town, Punjab, India. Pop. 22,500.

KATABOLISM, see ANIMALS.

KATAGUM (12° 23′ N., 10° 4′ E.), district, Kano, N. Nigeria; united with Kano in 1905; chief town, Hadeija; manufactures leather, cottons; watered by Waube.

KATANGA (*c.* 10° 52′ S., 27° 20′ E.), region, Belgian Congo, N. of Rhodesia; rich in copper; connected by rail with Cape Town, and objective of Benguella railway. Pop. *c.* 1,000,000.

KATER, HENRY (1777–1835), physicist; b. Bristol; of Ger. descent; invented K. pendulum for the accurate determination of gravity.

KATHA (24° 5′ N., 96° 7′ E.), region, Upper Burma; chief town, KATHA; area, *c.* 7000 sq. miles. Pop. 180,000.

KATHIAWAR, KATTYWAR (21° 40′ N., 71° E.), peninsula, W. coast, India, between Gulf of Cambay and Gulf of Cutch; area, 20,559 sq. miles; produces cotton. Pop. *c.* 2½ millions.

KATMANDU (27° 35′ N., 85° 21′ E.), town, Nepal, India. Pop. *c.* 51,000.

KATRINE, LOCH (56° 14′ N., 4° 27′ W.), lake, Perthshire, Scotland; scene of Scott's *Lady of the Lake*.

KATSENA.—(1) (11° 30′ N., 6° 50′ E.) district, N. Nigeria, W. Africa. (2) (12° 57′ N., 7° 30′ E.) town, capital of above, formerly important centre of learning. Pop. *c.* 7500.

KATSURA, TARO (1847–), Japanese politician and general.

KATTOWITZ (50° 16′ N., 19° 2′ E.), town, Silesia, Prussia. Pop. (1910) 43,170.

KATWA, CUTWA (23° 37′ N., 88° 4′ E.), town, Bengal, India. Pop. 7500.

KAUAI, see HAWAIIAN ISLANDS.

KAUB, CAUB (*q.v.*).

KAUFBEUREN (47° 53′ N., 10° 37′ E.), walled town, Bavaria, Germany. Pop. (1910) 8948.

KAUFFMANN, ANGELICA (1741–1807), Swiss painter; worked first in Italy, afterwards in London, where she attained fame for her classic and mythological pictures and her portraits. She was a friend of Reynolds and Goldsmith, and was one of the earliest of the Royal Academicians.

KAUKAUNA (44° 20′ N., 88° 10′ W.), town, Wisconsin, U.S.A. Pop. (1910) 4712.

KAULBACH, WILHELM VON (1805–74), Ger. painter; director of the Academy, Munich (1849). His pictures are mostly of a grandiose, realistic style. He illustrated works of Shakespeare, Goethe, Klopstock, and Wieland, and painted some portraits.

KAUNITZ-RIETBURG, WENZEL ANTON, PRINCE VON (1711–94), Austrian statesman; ambassador in Rome, Florence, Turin, and afterwards in Austrian Netherlands; member of Peace Congress at Aix, 1748; ambassador in Paris, 1750; Chancellor, 1753; negotiated alliances with France and Turkey; former resulted in Seven Years War.

KAVADH, name of two kings of Persia.—KAVADH I. (449–531) reigned 488–531; fought against Rom. Empire under Anastasius and Justin I.—KAVADH II. reigned some months, 628.

KAVALA, CAVALLA (40° 56′ N., 24° 23′ E.), port, Turkey-in-Europe; Rom. aqueduct; tobacco exported. Pop. *c.* 5000.

KAVERI, CAUVERY (*q.v.*).

KAVIRONDO, two immigrant races, Bantu and Nilotic, inhabiting the valley of the Nzoia River and the N.E. coast of Victoria Nyanza, Brit. E. Africa; fine physique; independent, peaceful, and brave; honest, and of strict sexual morality; unchastity was formerly a capital offence amongst the K.; agricultural, both men and women working in the fields, and cultivating sorghum, maize, tobacco, and hemp; increasing in numbers, owing to their clean living; under Brit. protection.

KAWARDHA (22° N., 81° 15′ E.), native state, Central Provinces, India. Pop. *c.* 60,000.

KAYE, SIR JOHN WILLIAM (1814–76), Eng. historian; wrote works on Ind. military history.

KAY-SHUTTLEWORTH, SIR JAMES PHILLIPS (1804–77), Brit. statesman; father of present (1913) Lord Shuttleworth.

KAZAKS, see KIRGHIZ.

KAZALA, KAZALINSK (45° 46′ N., 62° 8′ E.), fortified town, Russ. Turkestan. Pop. 7000.

KAZAN.—(1) (*c.* 54° 40′ to 57° N., 46° to 51° 45′ E.) government, Russia; area, 24,587 sq. miles; crossed by Volga; produces rye, oats; large forests. Pop. (1910) 2,711,000. (2) (55° 49′ N., 49° E.) capital of above; has fortress containing governor's castle, arsenal, monastery, cathedral; Gk. archiepiscopal see; univ., established 1804; centre of trade with Siberia, Bokhara, Persia. Pop. (1910) 167,400.

KAZERUN (29° 35′ N., 51° 47′ E.), town, Persia. Pop. *c.* 8000. Kazerun district has pop. *c.* 15,000.

KAZVIN (36° 11′ N., 49° 56′ E.), province and town, Persia; produces grain. Pop. *c.* 45,000.

KEAN, EDMUND (1787–1833), Eng. actor; b. London; s. of Nance Carey, actress; father unknown; after playing in various touring companies, made first appearance in London at Drury Lane as Shylock, 1814, which gained him popular favour. His misconduct in England drove him to America (1825–26), but he regained popularity on his return; acted last in Othello, March 1833; a great tragedian, but incapable of playing unemotional or dignified rôles.

Molloy, *Life*, 1888.

KEARNEY (40° 35′ N., 99° 9′ W.), town, Nebraska, U.S.A. Pop. (1910) 6202.

KEARNY (40° 45′ N., 74° 10′ W.), town, New Jersey,

U.S.A.; manufactures machinery. Pop. (1910) 18,659.

KEARNY, PHILIP (1815–62), Amer. military officer, killed in Civil War.

KEARSLEY (53° 33′ N., 2° 24′ W.), town, Lancashire, England; coal, paper, cotton, bricks. Pop. (1911) 9676.

KEATS, JOHN (1795–1821), Eng. poet; s. of livery-stable keeper; apprenticed to surgeon, 1810; became dresser at Guy's Hospital, 1816; abandoned med. for lit.; first poems pub., 1817; *Endymion* appeared, 1818; *Lamia, Hyperion*, and other poems, 1820; attacked by various journals, notably *Quarterly Review*; unfortunate in his love; driven from England by consumption; d. in Rome. K.'s poetry is immature, and much of it is mawkish in its sentimentality, but such poems as *La Belle Dame sans Merci, The Ode on a Grecian Urn*, and his sonnets are unsurpassable.

Life, by Sidney Colvin (E.M.L., 1887).

KEBLE, JOHN (1792–1866), Eng. priest and poet; b. Fairford; ed. at home and Corpus Christi College, Oxford, where he had a brilliant career; ordained priest, 1816; elected tutor of Corpus Christi, 1818; retired, 1823; published *Christian Year*, a book of meditations in verse for holy days, 1827; prof. of Poetry at Oxford, 1831–41; founder of Tractarian movement, which tried to produce a spiritual and modern awakening within the Eng. Church; closely associated with Newman and Pusey, with whom he issued *Tracts for the Times*. K. laid special stress upon the spiritual nature of the Church, thereby offending the supporters of the State Church theory, and disagreed with the Evangelical party in matters of taste and erudition.

K. College, Oxford, was founded in his memory, 1870.

KECSKEMÉT (46° 54′ N., 19° 44′ E.), town, Hungary; manufactures soap and leather. Pop. (1910) 66,834.

KEELING ISLANDS, Cocos Islands (*c.* 12° 8′ S., 96° 50′ E.), about twenty small coral islands, Indian Ocean; belong to Ross family; under Brit. protection since 1857; produce cocoa-nuts, copra; visited by Darwin, 1836; cable station.

KEENE (42° 53′ N., 72° 19′ W.), town, New Hampshire, U.S.A.; manufactures furniture, boots. Pop. (1910) 10,068.

KEENE, CHARLES SAMUEL (1823–91), Eng. black-and-white artist; chiefly celebrated by his drawings for *Punch*, to which he contributed from 1851 till near his death.

KEEP, see Castle.

KEEWATIN (*c.* 67° 45′ to 50° 30′ N., 85° to 100° W.), district, Canada, between Hudson Bay on E. and Mackenzie, Athabasca, Saskatchewan, and Manitoba on W. The portion south of 60° N. was in 1912 divided between Manitoba and Ontario (*qq.v.*).

KEF (36° 8′ N., 8° 44′ E.), fortified town, Tunisia, N. Africa. Pop. *c.* 6000.

KEHL (48° 35′ N., 7° 48′ E.), river-port, Baden, Germany; has trade in timber, tobacco, and coal. Pop. (1910) 8860.

KEI ISLANDS, archipelago, Dutch E. Indies; include Great K. (5° 30′ S., 133° E.) and Little K. (5° 30′ S., 132° 44′ E.). Pop. *c.* 23,500.

KEIGHLEY (53° 52′ N., 1° 55′ W.), town, W. Yorkshire, England. Pop. (1911) 43,490.

KEIM, KARL THEODOR (1825–78), Ger. Prot. divine; pub. *Jesus of Nazareth* and other works.

KEITH (57° 33′ N., 2° 57′ W.), town, Banffshire, Scotland; has annual horse and cattle fair. Pop. (1911) 4499.

KEITH, Scot. family; Sir William became 1st Lord K. and earl marshal, *c.* 1430; William, 7th earl, supported Montrose during Civil War; the 10th earl and his brother James, s. of 9th earl, were implicated in Jacobite rebellion of 1715. The Earls of Kintore are of same stock, being descended from Sir John K., brother of 7th earl.

KEITH, FRANCIS EDWARD JAMES (1696–1758), Scot. field-marshal in Pruss. service; slain in the Seven Years War; noted for valour.

KEITH, VISCOUNT, George Keith Elphinstone (1746–1823), Brit. admiral; defeated French, 1793; shared in reduction of Cape of Good Hope, 1795, and defeated Dutch in Saldanha Bay, 1796; suppressed mutiny at Nore, 1797; captured Genoa, 1800; naval commander in Egypt, 1801.

KEJ, Kech, Kiz, fort and group of villages, Baluchistan; produces dates.

KEKULÉ, FRIEDRICH AUGUST (1829–96), Ger. organic chemist; added marsh gas to Gerhardt's types; established constitution of benzene (C_6H_6); d. of overwork.

KELÁT, Kalat (*q.v.*).

KELLER, GOTTFRIED (1819–90), Ger. novelist and poet; wrote excellent short stories (*Die Leute von Seldwyla*, etc.), *Der Grüne Heinrich* (novel), *Neuere Gedichte* (lyric poems), etc.

KELLER, HELEN ADAMS (1880–), Amer. blind and deaf lady who won academic honours.

KELLERMANN, FRANÇOIS CHRISTOPHE DE, Duke of Valmy (1735–1820), supported Revolution; defeated Prussians at Valmy, 1792; marshal of France, 1803; duke, 1808. François Étienne, Duke of Valmy (1770–1835), his s.; won battle of Marengo, 1800, and further distinguished himself at Austerlitz, during Peninsular War, and at Quatre Bras.

KELLS (53° 43′ N., 6° 53′ W.), town, Meath, Ireland; where illuminated Book of K. was prepared in X. cent.

KELLY, NED (1854–80), Australian desperado who defied the Government from a stronghold in the hills for a long time; finally taken and executed.

KELP, ash of burnt seaweed; yields iodine, potassium chloride, paraffin oil, naphtha, ammonium sulphate.

KELSO (55° 37′ N., 2° 26′ W., town, Roxburghshire, Scotland, on Tweed, which is here crossed by a five-arched bridge; site of ruined abbey, which dates from 1128 and was destroyed in XVI. cent.; ruined abbey church is fine example of late Norman and early Gothic styles. Pop. (1911) 3982.

KELT, see under Salmon Family.

KELVIN, WILLIAM THOMSON, Baron (1824–1907), most eminent physicist of his time; b. Belfast; ed. Glasgow and Cambridge; second wrangler and Smith's prizeman; studied for a year at Paris under Regnault; at twenty-two appointed prof. of Nat. Phil., Glasgow Univ., a post he held for fifty-three years. His work covered every branch of physical science, and he published over three hundred original papers; made valuable contributions to science of thermodynamics, made submarine telegraphy a possibility, invented practically all the instruments at present used by electrical engineers for measurements, invented sounding apparatus, pressure gauge, tide gauge, tide predictor, and made great improvements in mariner's compass. Full list of his inventions would cover pages. He was honoured by numerous learned societies; knighted, 1866; pres., Royal Soc., 1890; peer, 1892; received Grand Cross, Royal Victorian Order, 1896. *Life*, by Russell (1912), by Fitzgerald (1899), by Thompson (1910).

KEMBLE, Eng. theatrical family: **John Philip** (1757–1823), first London appearance was as Hamlet in Drury Lane (1783); leading tragedian of his day. His bro. **Charles** (1775–1854) succeeded best in second parts when John played first, *e.g.* Laertes, Cassio, Macduff. **Frances Anne,** Fanny (1809–93), dau. of Charles, noted for her rendering of tragic parts and her Shakespearean readings. Her sister **Adelaide** (1814–79) was a distinguished operatic performer and author of some tales.

KEMBLE, JOHN MITCHELL (1807–57), Eng. philologist; s. of Charles K., the actor; licenser of plays; pub. *Beowulf* with trans. (1837), O.E. charters, 6 vols. (1839–48), *History of Saxons in England* (1849).

KEMP, GEORGE MEIKLE (1795–1844), Scot. architect; designed Scott Monument, Edinburgh, but was drowned before its completion.

KEMPE, JOHN (*c.* 1380–1454), bp. of Chichester, then London, 1421; chancellor and abp. of York, 1426; cardinal, 1439; abp. of Canterbury, 1452.

KEMPEN (51° 23′ N., 6° 26′ E.), town, Rhenish Prussia, Germany; manufactures silk goods, glass, etc. Pop. (1910) 7375.

KEMPIS, THOMAS À (1379–1471), religious writer; b. Kempen, near Cologne; joined *Brothers of Common Life*; became a priest, 1413, and lived in a convent till death. Most famous work is his *Imitation* (*of Christ*), which has been translated into nearly every language.

Life, by Montmorency (1906).

KEMPTEN (47° 43′ N., 10° 18′ E.), town, Bavaria, Germany; site of ancient abbey. Pop. (1910) 20,001.

KEN (25° 35′ N., 80° 17′ E.), affluent of river Jumna, N. India.

KEN, THOMAS (1637–1711), Eng. ecclesiastic; ed. Winchester and Oxford; ordained, 1662; prebendary of Winchester, 1672; bp. of Bath and Wells, 1684; one of bp's who resisted James II.'s Declaration of Indulgence, 1688; refused to take oath to William III.; deposed, 1691; author of well-known hymns.

KENÂ, KENEH (26° 11′ N., 32° 45′ E.), town, Upper Egypt; manufactures pottery, and has trade in grain and dates with Arabia. Pop. 20,100.

KENDAL (54° 19′ N., 2° 46′ W.), town, Westmoreland, England; has old Gothic church and ruined castle where Catharine Parr was born; manufactures heavy woollens, paper, leather; near are traces of Rom. occupation. Pop. (1911) 14,033.

KENEALY, EDWARD VAUGHAN HYDE (1819–1900), Irish lawyer; counsel in Tichborne case, 1873; expelled from Bar, 1874.

KÊNG-TÛNG (*c.* 21° 7′ N., 99° 51′ E.), Shan state, Burma, Asia; area, *c.* 12,000 sq. miles; surface generally mountainous; drained by affluents of Salwen and Mekong. Chief town is K.-T. (21° 23′ N., 99° 40′ E.). Pop. 5800. Region produces rice, sugar, cotton, opium, teak, pottery. Pop. *c.* 192,000.

KENILWORTH (52° 22′ N., 1° 35′ W.), town, Warwickshire, England; contains beautiful ruined castle, given to Leicester by Queen Elizabeth, and destroyed by Roundheads. Pop. (1911) 5776.

KENITES, ancient Palestinian folk, probably of Midianite stock.

KENMORE (56° 35′ N., 4° W.), village, Perthshire, Scotland.

KENMURE, WILLIAM GORDON, 6TH VISCOUNT, Jacobite, executed for complicity in rebellion, 1716; the title was then attainted; restored, 1824; dormant, 1847.

KENNEDY, Scot. family; 1st Lord K. received his title *c.* 1457, and early in XVI. cent. his grandson became 1st Earl of Cassilis; Gilbert, 3rd earl, held office during Mary Queen of Scots' minority. Archibald, 12th earl, was raised to marquisate of Ailsa in year 1831.

KENNEDY, BENJAMIN HALL (1804–89), Eng. schoolmaster; head at Shrewsbury, 1836–66; app. prof. of Gk., Cambridge, 1867; best-known work, *Public School Lat. Grammar*.

KENNETH I., MAC ALPIN (d. *c.* 860), Scot. king; defeated Picts; frequently invaded Northumbria. **KENNETH II.** (d. 995) led two expeditions into Northumbria; killed by his own followers.

KENNICOTT, BENJAMIN (1718–83), Eng. theologian; ed. at Oxford; a great Hebrew scholar; collated MSS. of Old Testament and pub. *Vetus Testamentum*, 1776–80.

KENNINGTON (51° 31′ N., 0° 5′ W.), southern district of London, England.

KENORA (49° 50′ N., 94° 30′ W.), town, Ontario, Canada; flour-mills, sawmills, gold. Pop. 5400.

KENOSHA (42° 33′ N., 87° 49′ W.), town, Wisconsin, U.S.A.; manufactures brass beds, motor-cars. Pop. (1910) 21,371.

KENSINGTON (51° 30′ N., 0° 11′ W.), borough of London; contains K. Gardens, with the palace in which Queen Victoria was born, Natural History and South K. Museums, St. Mary Abbot's Church, Brompton Oratory. Pop. (1911) 172,402.

KENT (*c.* 51° 15′ N., 0° 35′ E.), county in S.E. extremity of England, between Thames estuary and Eng. Channel; area, 1555 sq. miles; surface undulating in interior, rising in the Downs to over 800 ft.; drained by Thames, Medway, Stour, Darent; in S.E. is marshy district and in S. is region known as the Weald, famed for its scenery; N.W. corner is practically a suburb of London, with Woolwich Arsenal and Government dockyards of Sheerness and Chatham. K. suffered from Dan. invasions in X. cent. and was scene of various battles and insurrections from Norman times onwards; invaded by French in XIII. cent.; here occurred Wat Tyler's rebellion, 1381, Jack Cade's, 1450. During Civil War K. was subdued by Roundheads. In 1667 Dutch fleet destroyed ships in Medway. Most important towns are Gillingham, Chatham, Maidstone, Tunbridge Wells, Folkestone, Rochester, Ramsgate, Canterbury. K. is called the 'garden of England' from its beautiful scenery and rich cultivation. There are large tracts of woodland, with oaks and other valuable trees. Agriculture is chief industry; produces cereals, hops, fruits, vegetables; sheep and cattle raised; dairying and market-gardening carried on. At Whitstable and Faversham are oyster beds. Manufactures include gunpowder, bricks, paper. Pop. (1911) 1,019,870.

Jerrold, *Kent* (1908).

KENT, KINGDOM OF, Anglo-Saxon kingdom; said to have been established by Hengest and Horsa; here Christianity was first introduced into England during reign of Ethelbert, who d. 616; laws were codified by two of his successors, Hlothhere and Wihtred. K. apparently suffered from Saxon invasions in VII. cent.; in later times it was under control of earls.

KENT, EARLDOM AND DUKEDOM OF, titles held at various dates by Plantagenets, Hollands, Nevilles, Greys, and by members of royal family; important holders were William Neville, Earl of K. (d. 1463); supported Edward IV. in Wars of Roses; Edward Augustus, Duke of K. (1799–1820), was f. of Queen Victoria.

KENT, WILLIAM (1685–1748), Eng. artist and pioneer in landscape gardening.

KENTIGERN, ST. (*c.* 518–603), also called **St. Mungo**; bp. of Cumbria; founded monastery at Cathures (Glasgow); fled to Wales and founded monastery of St. Asaph, named after his disciple. His feast-day is Jan. 13.

KENTON (40° 41′ N., 83° 32′ W.), town, Ohio, U.S.A. Pop. (1910) 7185.

KENT'S CAVERN, KENT'S HOLE (50° 28′ N., 3° 31′ W.), cavern, near Torquay, England, where palæolithic tools, bone implements, remains of extinct animals have been found.

KENTUCKY (*c.* 36° 30′ to 39° 5′ N., 82° to 89° 37′ W.), state, U.S.A.; bounded N. by Illinois, Indiana, Ohio; E. by West Virginia and Virginia; S. by Tennessee; W. by Missouri; area, 40,400 sq. miles. Surface is undulating; mountainous in E., rising to about 3000 ft. in Alleghany plateau, which is continuation of Appalachians. In S.W. are great cypress swamps. Principal rivers are Ohio, which forms northern boundary, and its tributaries, Big Sandy, Licking, Kentucky, Green, Tradewater, Cumberland, Tennessee, and other streams; Mississippi forms part of W. boundary. There are some remarkable caves. Chief towns are Louisville, Covington, Lexington, Newport. Climate is temperate. K. was originally inhabited by various Ind. tribes, and was first explored by white men in latter half of XVIII. cent. John Finlay led an exploring expedition in 1752 and Daniel Boone visited country in 1769; first colony founded in 1774 by Harrod, from whom its name of Harrodsburg was derived. In 1776 K. became a county of

Virginia. During Revolutionary war K. was left by Virginia to its own resources; suffered from Indian raids instigated by British in 1777, but in 1778 settlers repulsed attack on Boonesborough and gained some victories against Indians and British, through aid of force under Colonel Clark. After this great number of settlements sprang up, and original county of K. was subdivided into counties of Jefferson, Lincoln, and Fayette. In 1782 occurred further and fiercer struggle against Indians, who were ultimately defeated. After peace was arranged between Britain and U.S., demand for independent existence arose in K. Between 1784 and 1790 nine conventions met upon this question, and in 1790 mother state consented to separation so universally desired. In 1792 K. was admitted as state to Union and a constitution was framed.

Administration is carried out by governor, assisted by 8 ministers; legislature consists of Senate of 38 members and House of Representatives of 100 members, elected by popular vote for four and two years respectively. K. sends 2 Senators, 11 Representatives to Congress. Principal religious denominations are Baptist, Roman Catholic, Methodist. Education is free and obligatory. Army numbers 1712 in all.

RESOURCES, ETC.—K. is pre-eminently an agricultural state, most fertile district being the Blue Grass country; produces more tobacco and hemp than any other district of U.S., while it has also large crops of maize, wheat, and great quantities of fruit. Stock-raising is largely carried on; especially famous for horses, while mules, cattle, sheep, and pigs are also raised in great numbers. There are large forests containing valuable timber. Extensive coal-fields are found in both E. and W., other minerals including iron, lead, salt, fluorspar, sandstone, petroleum. Among industries are lumbering, distilling, flour-milling, tanning, manufacture of cotton-seed oil, hardware, clothing, cigars. Railway mileage exceeds 4000. Population includes Americans, Germans, British, negroes. Pop. (1910) 2,289,905.

Shaler, *Kentucky* (1886).

KENYA (0° 10′ S., 37° 22′ E.), high volcanic peak, Brit. E. Africa; now extinct; its two points, Nelion and Batian, are both *c.* 17,000 ft.; lower slopes forested.

KEOKUK (40° 22′ N., 91° 28′ W.), town, Iowa, U.S.A.; railway centre; river trade. Pop. (1910) 14,008.

KEONJHAR (21° 30′ N., 85° 30′ E.), state, Bihar and Orissa, India. Pop. *c.* 288,000.

KEONTHAL, hill state, Punjab, India. Pop. 23,000.

KEPLER, JOHANN (1571–1630), Ger. astronomer; b. near Weil, Württemburg; studied at Tübingen univ.; app. prof. of Astron. at Gratz (Styria), 1593; owing to religious persecutions accepted Tycho Brahe's invitation to Prague, to assist in preparation of Rudolphine tables; succeeded Tycho as imperial astronomer; pub. great work, *The New Astronomy; Commentaries on the Motions of Mars*, 1609. The discoveries which this volume records form the basis of physical astronomy. In it K. enunciated his first two laws relating to the motion of the planets; enabled to establish these laws only by means of accurate astronomical data, obtained by Tycho. The third law was contained in *The Harmonies of the World* (1619), dedicated to James I. K. was continually embarrassed financially. His patrons were the Emperors Rodolph and Ferdinand, and the Dukes of Württemburg and Wallenstein.

Life, by Müller (1903), by Günther (1905).

KEPPEL, AUGUSTUS, VISCOUNT (1725–86), Brit. admiral; concluded treaty with Dey of Algiers, 1761; prominent at Quiberon, 1759; had share in capture of Havannah, 1762; held command against French, 1778; and fought unsuccessful action at Brest; First Lord, 1782.

KEPPEL, SIR HENRY (1809–1904), Brit. sailor; fought in China, 1837, and in Crimea, 1853.

KER, JOHN (1673–1726), an unscrupulous Scot who served Covenanters, then Jacobites, getting money by betraying secrets on both sides; 'worked' also in London and Vienna; pub. 'Memoirs.'

KERAK (32° 42′ N., 36° 23′ E.), town, Palestine; walled and fortified; taken by Saladin, 1188. Pop. *c.* 7800.

KERASUND (40° 55′ N., 38° 38′ E.), fortified town, Asiatic Turkey. Pop. *c.* 9800.

KERBELA, MESHAD-HOSAIN (32° 35′ N., 44° 7′ E.), town, Asiatic Turkey; site of shrine of Hosain, visited annually by pilgrims. Pop. *c.* 65,000.

KERCH, KERTCH (45° 22′ N., 36° 29′ E.), important fortress and seaport of S. Russia, on Strait of Yenikale, between Azov and Black Sea; has interesting catacombs and tombs, where wall-paintings and other works of art have been found; old Byzantine church; exports cereals, iron. Greatly damaged during Crimean War. Pop. (1910) 53,340.

KERGUÉLEN ISLAND, DESOLATION ISLAND (*c.* 50° S., 70′ E.), in Southern Ocean; named after discoverer, Kerguélen-Trémarec (1772); mountainous; highest peak, Mt. Ross (6140 ft.). Produces vegetable called K. cabbage. Annexed by France in 1893. Area, *c.* 1450 sq. miles. Uninhabited.

KERKUK, QERQUQ (35° 27′ N., 44° 22′ E.), town, Turkey-in-Asia. Pop. *c.* 13,500.

KERMADEC (30° 40′ S., 178° 30′ W.), islands, belonging to New Zealand, Pacific Ocean. Pop. (1911) 4.

KERMAN (29° 25′ N., 57° E.), province, Persia; area, *c.* 59,500 sq. miles; surface generally mountainous, especially in S., with great expanses of desert in N. and N.E.; produces cotton, dates, wool. Pop. *c.* 600,000. Capital, KERMAN, is fortified; manufactures carpets. Pop. *c.* 60,000.

KERMANSHAH, KERMANSHAHAN (34° 20′ N., 47° E.), town, K. province, Persia; carpets. Pop. *c.* 38,000. K. province has pop. *c.* 400,000.

KERMES, crimson dye from the dried female insect *Coccus ilicis*, found on *Quercus coccifera* in region of Mediterranean; inferior to, and largely superseded by, *cochineal*, but used for dyeing Turk. fez.

KERNER, JUSTINUS ANDREAS CHRISTIAN (1786–1862), Ger. poet of the 'Swabian school'; b. Ludwigsburg, Württemberg; wrote *Reiseschatten von dem Schattenspieler Lux*, *Romantische Dichtungen* and *Der letzte Blütenstrauss*; also works on animal magnetism.

KEROUALLE, LOUISE DE, see PORTSMOUTH, DUCHESS OF.

KEROWLEE, see KARAULI.

KERRY (52° N., 9° 50′ W.), W. coast county, Munster, Ireland; bounded N. by Shannon, E. by Limerick, Cork, S. by Cork, W. by Atlantic; area, 1813 sq. miles; coast deeply indented; surface generally mountainous, crossed by Macgillicuddy's Reeks, rising to 3410 ft. in Carran Tual, highest peak in Ireland. Rivers are unimportant. K. contains famous Lakes of Killarney, celebrated for beautiful scenery. Mineral springs occur in various parts. K. produces potatoes, oats, slate; well-known strain of cattle reared; dairy-farming carried on. Pop. (1911) 159,268.

KERSAINT, ARMAND GUY SIMON DE COETNEMPREN, COMTE DE (1742–93), Fr. naval officer; of noble birth, but joined Revolutionists; supported deposition of Louis XVI., but was against his execution; owing to increased opposition K. was tried and executed.

KERTCH, see KERCH.

KESHUB CHUNDER SEN (1838–84), Ind. religious leader; read Western theology; joined Brahma Samaj, 1867; visited England, 1870; disliked Western materialism and Westernising of the East; wrote *Jesus Christ, Europe and Asia*, and other works.

KÉSMÁRK (49° 8′ N., 20° 28′ E.), town, Hungary. Pop. 6000.

KESTREL, a member of HAWK FAMILY (*q.v.*).

KESWICK (54° 36′ N., 3° 8′ W.), town and tourist centre, Cumberland, England; manufactures lead pencils. Pop. (1911) 4403.

KESWICK CONVENTION, annual evangelical religious meetings, founded 1875.

KETCHUP, condiment made from tomato, mushroom, or walnut, boiled with salt and spices.

KETI (24° 7′ N., 67° 28′ E.), port, Sind, India. Pop. 2127.

KETONES, compounds of the carbonyl group, CO, with two hydrocarbon radicles; they are simple or mixed, aliphatic or aromatic; name derived from *acetone, dimethylketone*, $CH_3.CO.CH_3$, the simplest ketone. General method of preparation—by heating suitable calcium salts, *e.g.* $Ca\begin{matrix}/OOCCH_3\\\backslash OOCCH_3\end{matrix} = CaCO_3 + CO\begin{matrix}/CH_3\\\backslash CH_3\end{matrix}$; methylethylketone, $CH_3.CO.C_2H_5$ (mixed); acetophenone (aliphatic-aromatic), $CH_3.CO.C_6H_5$; benzophenone (aromatic), $C_6H_5.CO.C_6H_5$. Derivatives: oximes, $\begin{matrix}R_1\\R_2\end{matrix}\!\!>\!C=NOH$, phenylhydrazones, $\begin{matrix}R_1\\R_2\end{matrix}\!\!>\!C=N.NHC_6H_5$. Diketones $= R_1.CO.CO.R_2$.

KETTELER, WILHELM EMMANUEL, BARON VON (1811–77), Ger. politician; a staunch defender of the rights of the Catholic Church to freedom from State control.

KETTERING (52° 24′ N., 0° 44′ W.), town, Northamptonshire, England. Pop. (1911) 12,899.

KETTLEDRUM, musical instrument of percussion, consisting of wood or metal frame over which is stretched skin or parchment, which is beaten with drumsticks of whalebone, having wooden knob at end covered with sponge or other soft material. K. is of Eastern origin, generally cylindrical in shape, and plays a definite note in harmony with the music which it accompanies. Two or three are required with full orchestra, one large with compass from F to C, and smaller ones B♭ to F on bass stave. The k. is often used in cavalry bands, which use two, mounted one on each side of horse. Most effective operation is 'rolling,' which is accomplished by giving single and alternate strokes very rapidly.

KEUPER, term given to the uppermost division of the Triassic system. In Great Britain the K. are divided into Rhætic or Penarth beds, the Upper K. marl and the Lower K. sandstone.

The Rhætic contains rock salt, which is mined in Cheshire and other localities. K. has a few fossil remains including few plants of cypress order, calamites, and fishes.

KEW (51° 29′ N., 0° 18′ W.), town, suburb of London, Surrey, England; site of Royal Botanic Gardens, founded 1759 by mother of George III.

KEWANEE, town, Illinois, U.S.A. Pop. (1910) 9307.

KEWATIN, KEEWATIN (*q.v.*).

KEY, simplest form designed (by ancient Egyptians) to raise pegs placed through staples; later form to compress springs which hold lock. Modern locks consist of series of wards, to which key is shaped.

KEY, THOMAS HEWITT (1799–1875), Lat. scholar; prof. at London, 1832–42.

KEY WEST (24° 30′ N., 81° 53′ W.), seaport, Florida, U.S.A.; situated on small coral island; exports cigars, sponges, turtles, salt, fruit. Pop. (1910) 19,945.

KEYBOARD, a succession of keys set in the case or framework of certain musical instruments; supposed to have come into use about XIV. cent.; Spinet, one of oldest instruments, had k. consisting of black 'naturals' and white 'sharps,' compass four octaves and a half-tone; most modern pianofortes have white 'naturals,' black 'sharps,' and compass of seven octaves; in instruments having more than one k. (*e.g.* organ), each row is called a *manual*.

KHABAROVSK, CHABAROWSK (48° 28′ N., 135° 32′ E.), cathedral town, Russia-in-Asia; centre of trade in sables. Pop. (1910) 41,050.

KHAIBAR PASS, see KHYBER PASS.

KHAIRAGARH (21° 15′ N., 81° E.), native state, Central Provinces, India. Pop. 140,000.

KHAIRPUR.—(1) (26° 50′ N., 69° 10′ E.) native state, Bombay, India. Pop. (1911) 223,822. (2) (27° 33′ N., 68° 50′ E.) town, capital of above. Pop. 14,500.

KHAJRAHO (*c.* 25° N., 77° 35′ E.), village, Chhatarpur, Central India; fine old temples.

KHAKI, see UNIFORMS.

KHALIF, CALIPH (*q.v.*).

KHALIFA, THE (1846–99), Arab. MAHDI; assisted the Mahdi Muhammad Ahmed in agitation in the Sudan; succeeded him (1885), and died defending the Sudan against Britain.

KHAM, KHAMS (*c.* 31° N., 97° 30′ E.), province of Tibet; chief town, Chiamdo.

KHAMGAON (20° 45′ N., 76° 45′ E.), town, Berar, India; cotton, opium. Pop. 18,600.

KHAMSEH (36° 34′ N., 48° E.), province, Persia; chief town, Zenjan.

KHAN (Turk., Persian, and Arab.), word meaning 'lord' or 'ruler,' used sometimes simply as title of respect.

KHANDESH, EAST (20° 56′ N., 75° E.), district, Bombay, India; area, 4545 sq. miles. Pop. (1901) 957,728. K. WEST (21° 28′ N., 74° 10′ E.), district, Bombay, India; area, 5496 sq. miles. Pop. 475,000.

KHANDWA (21° 50′ N., 76° 24′ E.), town, Central Provinces, India. Pop. 20,000.

KHANIA, CANEA (*q.v.*).

KHAR (33° 16′ N., 58° 53′ E.), province, Persia; produces wheat, barley, and rice in great quantities. Pop. *c.* 10,000.

KHARAGHODA (23° 22′ N., 71° 35′ E.), village, on Little Runn of Cutch, Bombay, India; salt factory. Pop. 2108.

KHARGA, GREAT OASIS (*c.* 25° 30′ N., 30° 30′ E.), celebrated oasis in a deep depression in S. of Libyan Desert, Egypt; has Rom. and Egyptian remains; produces dates, cereals; chief town, K.; inhabited by Berber tribes. Pop. (oasis) 8500, (town) 5500.

KHARKOV.—(1) (49° 40′ N., 37° E.) government, S.W. Russia; area, *c.* 21,041 sq. miles; horses, cattle, sheep, silkworms, beet. Pop. (1910) 3,245,900. (2) (50° N., 36° 14′ E.) town, capital of above; seat of Gk. abp.; univ. established, 1805; famous for great fairs. Pop. (1910) 219,600.

KHARPUT (38° 45′ N., 39° 30′ E.), town, Asiatic Turkey; rich in minerals. Pop. *c.* 25,000.

KHARSAWAN (22° 50′ N., 85° 50′ E.), native state, Bengal, India. Pop. 37,000.

KHARTUM (15° 34′ N., 32° 31′ E.), capital, Sudan, Egypt; near junction of Blue and White Niles; for nearly a century served as emporium for ivory and gum of Sudan, and until recently was great slave market. Celebrated for Gordon's defence against Mahdi, who captured it in 1885. Retaken by Kitchener, 1898, since when it has been rebuilt; contains Gordon Memorial College. Pop. 18,235.

KHASI AND JAINTIA HILLS (*c.* 25° 30′ N., 91° 30′ E.), district, between Brahmaputra and Surma Rivers, Assam, Brit. India; area, 6025 sq. miles; mountainous; produces coal. Pop. *c.* 205,000.

KHASKOY (42° N., 25° 35′ E.), town, Bulgaria. Pop. 15,000.

KHATMANDU, KATMANDU (*q.v.*).

KHAYYAM, OMAR, see OMAR KHAYYAM.

KHAZARS, ancient people inhabiting the shores of the Caspian Sea and the country of the Caucasus, as far as the Crimea, and conducting the carrying trade between Persia, Armenia, Byzantium, and Russia. Origin of the race is much disputed, but it is generally agreed that they are related to the Georgians, the 'Iberians,' or the Turks. An important people from 190 A.D. to 1100 A.D., and at the height of their influence from 600 A.D. to 950 A.D. Chief cities, Itil, on the Volga, Tarkhu, and Sarkel, on the Don. The nation was conquered and dispersed by the Russians at the end of the X. cent.

KHEDA, see KAIRA.

KHELAT, KALAT (*q.v.*).

KHERI (30° 3′ N., 77° 56′ E.), district, United Provinces, India; area, 2960 sq. miles. Pop. 905,000.

KHERSON.—(1) (47° 40′ N., 32° 30′ E.) government, S.W. Russia, bordering on Black Sea; area, *c.* 27,337 sq. miles; produces cereals, tobacco. Pop. (1910) 3,447,100. (2) (46° 39′ N., 32° 32′ E.) town, capital of above; timber trade. Pop. (1910) 85,200.

KHEVENHÜLLER, LUDWIG ANDREAS (1683–1744), Austrian soldier; served in Wars of Span. Succession and Austrian Succession, etc.; Knight of Golden Fleece.

KHEVSURS, Caucasian race of low state of civilisation; they retain heathen rites though nominally Christian.

KHINGAN, GREAT (*c.* 43° to 54° N., 117° to 122° E.), mountain range, Chin. Empire, E. Asia, to E. of Gobi Desert; rises to *c.* 8000 ft. LITTLE K. is range to E. of Great K.

KHIVA (42° N., 58° E.), Russ. vassal State, Central Asia; area, *c.* 24,000 sq. miles; watered by Amu; produces cereals, fruits, tobacco, cotton, silk. K. has had relations with Russia since early XVII. cent., and was occupied by Russ. military force in 1873, when a heavy indemnity was exacted. Inhabitants are chiefly Turkomans; religion, Muhammadanism. Pop. *c.* 800,000. Capital, KHIVA, has pop. of *c.* 5000.

KHOI (38° 37′ N., 45° 5′ E.), town; capital of K. district, Azerbaijan, Persia; fortified. Pop. *c.* 33,000.

KHOJENT (40° 15′ N., 69° 32′ E.), walled town, Russ. Turkestan; silks, cottons. Pop. (1910) 40,520.

KHOKAND, KOKAND (41° 22′ N., 70° 38′ E.), town, Ferghana, Asiatic Russia; commercial centre; produces silk, cotton. Pop. (1910) 112,800. The former khanate of K. came under Russ. control in 1876, and now forms government of Ferghana (*q.v.*).

KHOLM (51° 8′ N., 23° 32′ E.), town, Russ. Poland. Pop. 20,000.

KHORASAN, KHORASSAN (34° 40′ N., 56° E.), province, N.E. Persia; area, *c.* 170,000 sq. miles; surface generally mountainous, with desert plains in S.; chief mountains, Elburz range; produces best wool in Persia, also rice, wheat, tobacco, aromatic plants, fruit, turquoises; manufactures carpets, textiles; capital, Meshed. Pop. *c.* 1,000,000.

KHORREMABAD (33° 30′ N., 48° 30′ E.), town, Persia. Pop. *c.* 6000.

KHORSABAD (*c.* 36° 26′ N., 43° 10′ E.), village, Asiatic Turkey, where Sargon's palace, dating from VIII. cent. B.C., was excavated by Fr. archæologists in XIX. cent.

KHOTAN (37° 4′ N., 80° 36′ E.), town and oasis, E. Turkestan; centre of oasis producing cereals, fruits; local products are carpets, silk, and jade. Pop. *c.* 5000. District has area 400 sq. miles; pop. *c.* 150,000.

KHOTIN (48° 32′ N., 26° 29′ E.), town, S. Russia; strongly fortified. Pop. 20,000.

KHULNA (22° 30′ N., 89° 32′ E.), district, Bengal, India. Pop. (1901) 1,253,043. KHULNA, chief town. Pop. 10,800.

KHUNSAR (33° 10′ N., 50° 24′ E.), town, Persia. Pop. *c.* 10,000.

KHURJA (28° 14′ N., 77° 52′ E.), town, United Provinces, India; important commercial centre. Pop. 30,000.

KHYBER PASS, KHAIBAR PASS (34° 14′ N., 71° E.), great pass from India to Afghanistan, through Safed Koh and Sulaiman mountains, 33 miles long, 10 to 450 ft. wide, with rocky precipices rising on each side to heights of 1400 to over 3300 ft. Summit is at Landi Kotal.

KIAKHTA (50° 21′ N., 106° 42′ E.), frontier town, Siberia; tea trade. Pop. *c.* 19,000.

KIANG, see under HORSE FAMILY.

KIANG-SI (28° N., 116° E.), province, E. China; area, *c.* 69,480 sq. miles. Pop. (1911) 26,532,125.

KIANG-SU (34° N., 119° E.), coast, province, China; area, *c.* 38,600 sq. miles. Pop. (1911) 13,980,235.

KIAOCHOW BAY (36° 18′ N., 120° 10′ E.), harbour, S. of Shantung peninsula, China.

KIDD, WILLIAM (1645–1701), Scot. captain and pirate; employed as privateer by Eng. Government, but turned pirate in the W. Indies; hanged.

KIDDERMINSTER (52° 23′ N., 2° 15′ W.), town, Worcestershire, England; important carpet manufactures; has old parish church. Pop. (1911) 24,333.

KIDNAPPING, abduction (*q.v.*) of children.

KIDNEY, term applied to each of two glands, forming part of the urinary system (*q.v.*), the function of which is the excretion of the urine. In man they are situated against the posterior wall of the abdomen, one on each side of the vertebral column, covered by the twelfth rib and opposite the last dorsal and first three lumbar vertebræ, the right k. being slightly lower in position than the left. In form they are characteristic, having a convex outer border and a concave inner border, with somewhat bulging extremities, the average length being rather over 4 in., and the weight 4 to 6 oz., while their colour is a brownish red. There is a fissure on the concave inner border at which the ureter, which conveys the urine to the urinary bladder, the branches of the renal vein, and the renal artery enter the k., the ureter dilating within to form a sac termed the pelvis of the k. A tough fibrous coat envelops the k., and if a longitudinal section is made through the organ it is found to consist of two more or less distinct layers, the outer termed the cortex, and the inner the medulla. The former contains minute round bodies, termed Malpighian bodies, to each of which runs an afferent artery, and from each of which comes an efferent vein, while from the capsule of the body goes a uriniferous tubule, the function of the Malpighian bodies being the excretion of the urine from the blood. The medulla consists of about a dozen pyramidal masses, each of which is composed of uriniferous tubules, the apices pointing into the pelvis of the k. The pelvis is lined with mucous membrane which is continuous with that of the ureter and the urinary bladder, and this sac acts as a preliminary receptacle for the urine before it is conveyed to the bladder.

Diseases of the Kidney.—The most important affections of the k. are the non-suppurative forms of inflammation included under the name of *Bright's Disease* (q.v.). An examination of the urine should be carried out in all cases of suspected k. disease. Albumen may be found in the urine, being due either to diseased conditions of the k., such as Bright's disease, waxy degeneration, renal calculi; or to disease of the urinary passages below the kidneys; to blood diseases, *e.g.* anæmia, leucocythæmia; to congestion supervening on liver, heart, or lung disease; to certain fevers, *e.g.* scarlatina; or to certain poisons, *e.g.* phosphorous, arsenic. Other symptoms will denote to which of these conditions it is due, but rest, bland fluids, and a non-nitrogenous diet are always of value. Blood in the urine may be due either to disease of the kidney or of the urinary apparatus below; or may be caused by injury, by scurvy (particularly in children), irritating drugs, or certain parasites. Bile salts and bile pigments in the urine usually are subsidiary signs to more obvious symptoms of jaundice, and denote some derangement of the liver and its functions.

Pyelitis, or inflammation of the pelvis of the k., may be due to calculi, tuberculous disease, extension of septic infection from the bladder or other parts of the urinary system, or to pyæmia, and is treated by removal, if possible, of the cause. *Abscess* of the k. may occur in extension of suppuration into the k. substance from the pelvis, or to pyæmia, and is treated by incision into the kidney, and drainage, or by more radical operative treatment.

Tuberculosis of the k. may be primary or secondary,

and is treated by a more or less radical surgical operation, part or all of the kidney being removed.

Floating k. most commonly occurs in women after parturition, and is treated by wearing a suitable belt and pad, or by holding the kidney in place by a surgical operation in more extreme cases. *Renal colic*, see COLIC.

KIDWELLY (51° 45′ N., 4° 18′ W.), town, Carmarthenshire, Wales; old castle. Pop. (1911) 3035.

KIEFF, KIEV (*q.v.*).

KIEL (54° 19′ N., 10° 8′ E.), town, Schleswig-Holstein, Prussia, on inlet of Baltic; near entrance to Kaiser Wilhelm Canal; important Ger. naval station; fine harbour, strongly fortified; has univ., observatory, museum, old palace; shipbuilding, foundries. Pop. (1910) 211,044.

KIELCE (*c.* 50° 30′ N., 20° 30′ E.), province, Russ. Poland; produces iron, coal, cereals. Pop. (1910) 965,200. KIELCE, the capital, has a pop. of 30,818.

KIEPERT, HEINRICH (1818–99), Ger. cartographer; issued many atlases and maps.

KIERKEGAARD, SÖREN AABY (1813–55), Dan. writer and student; original of Ibsen's 'Brand.'

KIEV.—(1) (50° N., 30° E.) province, S.W. Russia; surface forms plateau, well wooded; drained by Dnieper; produces beetroot, cereals, tobacco, oil; manufactures sugar, spirits, machinery, bricks, iron goods. Pop. (1910) 4,556,000. (2) (50° 27′ N., 30° 34′ E.) chief town of above; once capital of Muscovite empire; important ecclesiastical centre since 988, when Christianity was here introduced into Russia by St. Vladimir; Cathedral of St. Sophia, dating from XI. cent., is oldest in Russia; site of Pecherskoi Monastery, which, traditionally founded by St. Anthony, XI. cent., is annually visited by many thousand pilgrims and has famous catacombs; univ., established 1834, has over 5000 students; commercial centre for S.W. Russia; five annual fairs; strongly fortified. Pop. (1910) 446,800.

KILBARCHAN (55° 51′ N., 4° 33′ W.), town, Renfrewshire, Scotland; manufactures textiles, paper. Pop. (1911) 7491.

KILBIRNIE (55° 46′ N., 4° 41′ W.), town, Ayrshire, Scotland. Pop. (1911) 7618.

KILBRIDE, WEST (55° 40′ N., 4° 50′ W.), town, Ayrshire, Scotland. Pop. (1911) 3104.

KILDARE (53° 12′ N., 6° 45′ W.), county, Leinster, Ireland; area, 654 sq. miles; most of surface is flat, with bogs in N.; watered by Liffey, Boyne, Barrow, and crossed by two canals. Chief industry is agriculture; produces potatoes, oats, barley; live stock raised. Brewing and distilling are carried on. K. has numerous monastic ruins and some ancient earthworks and round towers. Pop. (1911) 66,498. KILDARE (53° 9′ N., 6° 54′ W.), the county town, has a cathedral.

KILHAM, ALEXANDER (1762–98), Eng. follower of John Wesley; became founder of Methodist New Connexion.

KILIA (45° 30′ N., 29° 20′ E.), town, S.W. Russia. Pop. 12,000.

KILIMANJARO (3° 5′ S., 37° 22′ E.), extinct volcanic mountain to E. of Victoria Nyanza, Ger. E. Africa; highest point is volcanic cone of Kibo (*c.* 19,700 ft.), which is connected with Kiwamenzi (*c.* 17,000 ft.) by high plateau 7 miles in length.

KILKEE (52° 41′ N., 9° 38′ W.), town, County Clare, Ireland.

KILKENNY (52° 35′ N., 7° 15′ W.), county, Leinster, Ireland; area, *c.* 798 sq. miles; surface undulating, rising in N.E. to over 1000 ft.; drained by Barrow, Nore, Suir. Produces black marble, anthracite coal; manufactures beer, whisky, flour, woollens. K. has several monastic ruins. Pop. (1911) 74,821.

KILKENNY (52° 39′ N., 7° 14′ W.), town, K., Ireland; name derived from cathedral of St. Canice, built here in XIII. cent.; ruins of Franciscan and Dominican abbeys and old round tower remain; castle, dating from XII. cent., is residence of Marquesses of Ormonde. Has R.C. cathedral. Pop. (1911) 10,513.

KILLALA (54° 13′ N., 9° 14′ W.), town, County Mayo, Ireland; has cathedral. Pop. 510.

KILLALOE (52° 48′ N., 8° 26′ W.), town, County Clare, Ireland; XII.-cent. cathedral. Pop. 885.

KILLARNEY (52° 3′ N., 9° 30′ W.), town, County Kerry, Ireland; has R.C. cathedral; in vicinity are the lakes of K., famous for beautiful scenery. Pop. 5656.

KILLDEER, see PLOVER FAMILY.

KILLIECRANKIE (56° 44′ N., 3° 47′ W.), pass, Perthshire, Scotland; where Claverhouse defeated Mackay, 1689.

KILLIFISHES (*Cyprinodontidæ*), herbivorous, worm- or insect-eating bony fishes, with long slender bodies, scarcely ever a foot long. Most interesting is the Double-Eyes or Four-Eyed Fish (*Anableps*), so called because each eye is divided into an upper and lower portion, for observing upwards into the air and downwards at the same time. Found in the warmer fresh or brackish waters of both hemispheres.

KILLIGREW, THOMAS (1612–83), Eng. dramatist; b. London; groom of the bedchamber to Charles II.; plays include *Claracilla*, *The Pilgrim*, and *The Parson's Wedding*.

KILLIN (56° 28′ N., 4° 19′ W.), small town, Perthshire, Scotland.

KILLIS (36° 43′ N., 37° 8′ E.), town, Syria. Pop. *c.* 20,000.

KILLYBEGS (54° 38′ N., 8° 27′ W.), town, Donegal, Ireland.

KILLYLEAGH (54° 24′ N., 5° 39′ W.), town, County Down, Ireland.

KILMALLOCK (52° 29′ N., 8° 34′ W.), town, Limerick, Ireland. Ruined abbey.

KILMARNOCK (55° 37′ N., 4° 29′ W.), town, Ayrshire, Scotland; manufactures carpets, textiles, cheese, iron goods. Pop. (1911) 34,725.

KILMAURS (55° 39′ N., 4° 31′ W.), town, Ayrshire, Scotland.

KILOGRAMME, see WEIGHTS AND MEASURES.

KILPATRICK, NEW, or **EAST** (55° 57′ N., 4° 21′ W.), town, Dumbartonshire, Scotland. Pop. (1911) 13,798.

KILPATRICK, OLD (55° 56′ N., 4° 27′ W.), town, Dumbartonshire, Scotland. Pop. (1911) 45,345.

KILRUSH (52° 38′ N., 9° 28′ W.), town, County Clare, Ireland. Pop. 4200.

KILSYTH (55° 59′ N., 4° 5′ W.), town, Stirlingshire, Scotland. Pop. (1911) 8106.

KILT, see HIGHLAND DRESS.

KILWA-KISIWANI (9° S., 39° 29′ E.), ancient walled town, on island, Ger. E. Africa; ruined mosques, palace.

KILWA-KIVINJE (8° 40′ S., 39° 25′ E.), seaport, Ger. E. Africa. Pop. (1910) 100,791.

KILWINNING (55° 40′ N., 4° 41′ W.), town, Ayrshire, Scotland; coal, ironwork, engineering; ruined monastery. Pop. (1911) 4945.

KIMBERLEY (28° 46′ S., 24° 51′ E.), town, Cape Province, S. Africa; besieged by Boers, 1899–1900; famous diamond mines, including Du Toit's Pan, Bultfontein, K., De Beers, and Wesselton; annual output of stones worth over £5,000,000. Pop. (1911) 29,519.

KIMBERLEY, JOHN WODEHOUSE, 1ST EARL OF (1826–1902), Brit. statesman; cr. earl, 1866; held various important portfolios in Liberal Cabinets from 1852 to 1895.

KIMERIDGE CLAY, a bluish shaley clay found at Kimeridge, in Dorset; is dark and bituminous, some varieties so much so as to be used for fuel; contains numerous fossils, including ammonites and dinosaurian reptiles. The clay is used for pottery (flower pots), bricks, tiles.

Kimeridgian, term used by geologists to describe the division of Upper Oolites in Jurassic system.

KIMHI, Qimhi, family of Jewish grammarians of XII. and XIII. cent's. (1) Joseph, a native of S. Spain, wrote a *Book of Demonstration* on Hebrew philology, etc. (2) Moses, author of a Hebrew grammar. (3) David wrote a *Book of Completeness*, embracing Hebrew grammar and etymology.

KINCARDINESHIRE (56° 58′ N., 2° 25′ W.), also called **The Mearns**, eastern maritime county, Scotland; area, *c.* 382 sq. miles; rises from coast to Grampian Mountains, which run E. and W. across county; watered by North Esk, Bervie, Dee, and other streams; chief towns, Stonehaven (capital), Laurencekirk, Bervie, Banchory; no important manufactures; produces oats; cattle and sheep raised; fishing important. Pop. (1911) 41,007.

KINCHINJUNGA (27° 45′ N., 88° 8′ E.), high mountain peak, Himalayas, over 28,000 ft.

KINDERGARTEN, see Education, *Infant Schools.*

KINEMATICS, see Dynamics, Mechanics.

KINETICS, see Dynamics, Mechanics.

KING, title of sovereignty; O.E. *cyning*, signified chief of the tribe; word found in various forms in all Teutonic languages; principle of heredity may be called the fundamental characteristic of kingship; at first any member of king's family might be chosen to succeed him, but at later date the system of primogeniture was established. The Divine Right theory, which still obtains in Germany, reached its apogee in England during the reign of Charles I.

KING BIRD, BEE-BIRD, BEE-MARTIN (*Tyrannus carolinensis*), an Amer. Tyrant Flycatcher whose names are due to the boldness with which it attacks birds trespassing near its nest, and to its alleged preference of honey-bees for food.

KING, EDWARD (1829–1910), bp. of Lincoln, 1885; high Churchman, and of saintly character.

KING, RUFUS (1755–1827), Amer. politician; prominent member of Federalist party; entered Congress, 1784; Senator, 1789; advocated abolition of slave trade; twice ambassador in London. His s., John, was gov. of New York, 1857; and his grandson, Rufus, was sent on embassy to Papal States in 1863.

KING, WILLIAM (1663–1712), Eng. poet and writer. In the controversy regarding the Ancients *v.* the Moderns, King supported Boyle against Bentley. Dr. Johnson includes him in the *Lives of the Poets.*

KING WILLIAM'S TOWN (32° 48′ S., 27° 30′ E.), town, Cape Province, S. Africa. Pop. (1911) 9023.

KING-CRAB (*Limulus*), a peculiar, old-fashioned Arachnoid, entirely covered by large horseshoe-shaped and hexagonal shields. It lives in shallow waters in the W. Pacific and Atlantic Oceans, burrowing in the mud or sand of sheltered bays, and subsisting on worms. Occurs as a fossil from Upper Jurassic times. Forms the order Xiphosura amongst Arthropods.

KING-FISH, see Opah.

KINGFISHERS (*Alcedinidæ*), a family of Picarian birds with 200 species scattered all over the world. The Water-K. have long, slender bills, frequent streams, and feed on fish; while the Wood-K. or King-Hunters have stouter, rounded or compressed bills, inhabit woodlands, and subsist mainly on locusts, crabs, and even reptiles, although a fish meal is not disdained. The Common K. (*Alcedo ispida*), the only Brit. native, belongs to the former group.

KINGHORN (56° 4′ N., 3° 11′ W.), town, Fifeshire, Scotland. Alexander III. was killed here, 1286.

KINGLETS and GOLDCRESTS (*Regulidæ*), a family of minute perching birds occurring in the northern hemisphere. They have straight, sharp beaks and are wren-like in appearance. Brit. examples are the Firecrest (*Regulus ignicapillus*) and Goldcrest (*R. regulus*).

KING-OF-THE-HERRINGS, see Ribbon Fishes.

KINGS, 1 AND 2, books of the Bible containing history of Israel from the end of David's reign (*c.* 1000 B.C.) to 562 B.C., when Jehoiachim was let out of prison in Babylon. The books are obviously made up of older materials. *1 Kings*, chapters 1 to 11 deal with Solomon's nomination as David's successor and his reign; *1 Kings* 12 to *2 Kings* 17 with the divided monarchy; and *2 Kings* 18 to 25 with the Kingdom of Judah. The 'Book of the Acts of Solomon' and the 'Book of the Chronicles of the Kings of Israel' (that of Judah) are referred to as sources. Many of the narratives are very brief, summarising political events, and are probably taken from official sources; others, which are longer, relate stories of the prophets, and are probably from independent sources. As there is much about the Temple, it is possible that special Temple documents were procured by the author. Driver thinks he can distinguish a pre-Deuteronomic framework of *1 Kings* 1 to 11 which describes the splendours of Solomon's reign, with other portions and less favourable details added by a Deuteronomic editor. Likewise the history of the two kingdoms has different strata, the stories of Elijah and Elisha are an important insertion, and may not themselves all come from the same source. They are among the most striking chapters of the Old Testament. *2 Kings* 18 to 25, dealing with the Southern Kingdom, begins with King Hezekiah. Some passages are the same as those in Isaiah. *1* and *2 Kings* were perhaps put together about 600 B.C.; a few passages which seem to refer to the Exile may have been added afterwards. The book is written from a Deuteronomic standpoint; its attitude to the Northern Kingdom is unfriendly.

Barnes, *1 and 2 Kings* (Cambridge Bible); Skinner, *1 and 2 Kings* (Century Bible); Driver, *Introduction to Old Testament Lit.*; Wade, *Old Testament History.*

KING'S BENCH, COURT OF, so called because in former times frequently the king sat there in person. It is presided over by the Lord Chief Justice and 14 puisne judges, who go on circuit through the county towns of England and Wales holding assizes for the trial of civil and criminal cases. The powers of the court are very great, and include the hearing of actions for writs of certiorari, prohibition, mandamus, and Habeas Corpus.

KING'S COUNSEL, in England and Ireland a barrister app. by letters-patent; wears silk gown instead of alpaca gown of 'utter' (outer) barrister, hence phrase 'take silk.' K. C's do not accept pleading or conveyancing, but in court they are the leaders. Colonial K. C's are app. by Brit. Lord Chancellor. See Barrister.

KING'S COUNTY (53° 15′ N., 7° 30′ W.), county, Leinster, Ireland; area, 771 sq. miles; surface generally level, with Bog of Allen in centre, Slieve Bloom Mts. in S.; drained by Shannon, Brosna, Barrow, Boyne; crossed by Grand Canal; dairy farming, live stock. Pop. (1911) 56,769.

KING'S EVIDENCE, see under Evidence.

KING'S EVIL, old term applied to scrofula, a condition usually of childhood manifested by enlargement and cheesy degeneration of the lymphatic glands, especially of the neck, with a tendency to chronic inflammation elsewhere, so named because of a popular belief that it could be cured by the royal touch. The sovereigns of France and of England were alone believed to have this power, James II. being the last English king to touch, but the practice was continued by his descendants, James, the Old Pretender, and his sons Charles (the Young Pretender) and Henry, also by Queen Anne.

KING'S LYNN, Lynn Regis (52° 46′ N., 0° 24′ E.), port, Norfolk, England; has remains of Franciscan friary, XII.-cent. church dedicated to St. Margaret, and XIV.-cent. chapel of St. Nicholas; large harbour; exports coal, oil-seed, shrimps; chief industries are fishing, iron-founding, brewing. Pop. (1911) 20,205.

KING'S MOUNTAIN, mountain, N. and S.

Carolina, near which Americans defeated British, 1780.

KINGSBRIDGE (50° 17′ N., 3° 46′ W.), town, Devonshire, England; has old church; shipbuilding yards and iron foundries. Pop. (1911) 3049.

KINGSLEY, CHARLES (1819–75), Eng. clergyman and novelist; b. Dartmoor, Devon; ed. Cambridge; became rector of Eversley, Hampshire, 1844. Pub. *Andromeda and other Poems* (1858), which included some excellent songs and ballads. His first novels, *Alton Locke* and *Yeast*, show K.'s 'Christian Socialism.' His romances and novels, *Hypatia*, *Westward Ho!*, *Two Years Ago*, *At Last*, and the inimitable *Water Babies*, are famous.

K.'s Letters and Memoirs, edit. by his wife (1899).

KINGSLEY, MARY HENRIETTA (1862–1900), Eng. author; niece of Charles and Henry K.; travelled in Africa and wrote *The Story of W. Africa*; d. while nurse in S. African War.

KINGSMILL ISLANDS, see GILBERT ISLANDS.

KINGSTON.—(1) (41° 52′ N., 74° 4′ W.) town, New York, U.S.A.; railway and canal terminus, trades in hydraulic cement and pavement; manufactures beer, leather, iron goods, flour, tobacco. Pillaged by British, 1777. Pop. (1910) 25,908. (2) (41° 14′ N., 76° 2′ W.) town, Pennsylvania; British defeated Americans, 1778. Pop. (1910) 6449. (3) (44° 22′ N., 76° 23′ W.) fortified town, Ontario, Canada; episcopal see of Anglican and R.C. Churches. Pop. (1911) 18,874. (4) (18° 1′ N., 76° 48′ W.) capital, Jamaica; greatly damaged by earthquake, 1907. Pop. (1911) 57,379.

KINGSTON, ELIZABETH, DUCHESS OF (1720–88), notorious for scandalous life; bigamously m. 2nd Duke of Kingston, 1769; tried at suit of his nephew and declared guilty, 1776.

KINGSTON-ON-THAMES (51° 25′ N., 0° 18′ W.), municipal borough, Surrey; has XIV.-cent. church, near which ancient royal chapel formerly stood. Pop. (1911) 37,977.

KINGSTON-UPON-HULL, EARLDOM AND DUKEDOM OF, titles held by Pierrepont family, 1628–1773. Evelyn, 5th earl and 1st duke (d. 1726), was Lord Privy Seal.

KINGSTON, WILLIAM HENRY GILES (1814–80), Eng. writer of boys' novels, e.g. *Peter the Whaler*, *The Three Midshipmen*; wrote over 120 books of healthy tone.

KINGSTOWN (53° 17′ N., 6° 8′ W.), town, Dublin, Ireland; mail packet station. Pop. (1911) 17,227.

KING-TÊ-CHÊN (29° 7′ N., 117° 31′ E.), town, China; noted for manufacture of porcelain. Pop. *c.* 1,000,000.

KINGUSSIE (57° 4′ N., 4° 2′ W.), town, Inverness-shire, Scotland; summer resort. Pop. (1911) 1171.

KIN-KIANG FU (29° 40′ N., 116° E.), town, Kiang-si, China; treaty port. Pop. (1910) 36,000.

KINNING PARK (55° 50′ N., 4° 16′ W.), suburban district, Glasgow, Scotland; engineering works, soap, paint.

KINO, drug consisting of the juice obtained from incisions in the trunk of a tree, *Pterocarpus marsupium*, of natural order *Leguminosæ*, growing in West Africa and the East Indies; obtained commercially in the form of angular, glistening, reddish-black, brittle fragments; inodorous, soluble in alcohol and boiling water. The chief constituent is kino-tannic acid. Used medicinally, being a powerful astringent, in gargles and diarrhœa mixtures.

KINORHYNCHA, a class of minute animals, comprising the single genus *Echinoderes*, of which there are somewhat less than a score of species. They are minute, segmented, spinous worms, occurring in the sea in mud and on seaweed, and living upon organic débris.

KINROSS-SHIRE (56° 13′ N., 3° 28′ W.), county, Scotland; area, 82 sq. miles; surface consists of hills encircling central plain in which is Loch Leven; watered by Leven R.; chief industry, agriculture; produces barley; sheep and cattle raised. County town, Kinross. Pop. (1911) 7528.

KINSALE (51° 42′ N., 8° 32′ W.), port, County Cork, Ireland; fishing trade. Pop. 4300.

KINTORE (57° 14′ N., 2° 21′ W.), town, Aberdeenshire, Scotland.

KIOTO (35° N., 135° 45′ E.), old capital, Japan; seat of Imperial Univ.; famed for splendid temples; old imperial palace; enamels, brocades, embroidery, porcelain. Pop. (1908) 442,462.

KIPLING, RUDYARD (1865–), Brit. poet and novelist; b. Bombay; awarded Nobel Prize for Lit., 1907; one of the greatest writers of the short story, cf. *Soldiers Three*; has pub. longer novels, e.g. *The Light that Failed*, *Kim*, and the realistic school-story, *Stalky and Co.*; poems, e.g. *Barrack-Room Ballads*, are great verse, rugged, strong, humorous. A master of terseness, K. paints a picture in two words; in spirit he is imperialistic, he sings of discipline and its glory; shows unique knowledge of native Indian life and technicalities of the sea.

KIPPER, popular term for herring cured by smoke-drying the split fish; origin of word apparently 'kip,' cartilaginous beak developed by male salmon. See SALMON FAMILY.

KIRCHHEIM-UNTER-TECK (48° 39′ N., 9° 28′ E.), town, Württemburg, Germany. Pop. (1910) 9669.

KIRGHIZ, a nomadic people of Tatar-Mongolian race, who inhabit the steppes of Asia between Ural and Altai Mountains; they number about 3,000,000, speak a Turk. dialect, and, though professing Muhammadanism, still retain many heathen customs; generally subdivided into two groups, the K. Kazaks and the Kara-K. The KAZAKS are found in Ural and other provinces of Russia; they number over 2,500,000, and have been under Russ. control since 1819. The KARA-K. (Black K.) inhabit the uplands of Pamir and Turkestan, and other regions in Central Asia; their numbers are variously estimated at from 350,000 to 800,000; and they also are subject to Russia.

Parker, *A Thousand Years of the Tartars* (1895).

KIRIN (43° 52′ N., 126° 53′ E.), town, K. province, Manchuria. Pop. *c.* 100,000. K. province has area, 105,000 sq. miles. Pop. 6,000,000.

KIRK, SIR JOHN (1832–), Brit. naturalist; ed. Edinburgh University; chief of Livingstone's Govt. Expedition to Africa, 1858; Brit. representative at African Conference, Brussels, 1889.

KIRKCALDY (56° 7′ N., 3° 9′ W.), town, Fifeshire, Scotland; has small harbour; great linoleum and floorcloth industries, potteries, breweries, linen manufactures; was Adam Smith's birthplace; called the 'Lang Toun' from its great length. Pop. (1911) 39,600.

KIRKCALDY, SIR WILLIAM, KIRKCALDY OF GRANGE (d. 1573), one of Scot. 'Lords of the Congregation'; party to murder of Cardinal Beaton, 1546; led opposition to Mary, Queen of Scots; but upheld her cause after her imprisonment; executed.

KIRKCUDBRIGHT (54° 50′ N., 4° 2′ W.), town, Scotland; royal burgh since 1455; has ruined castle; finest harbour in S. Scotland. Pop. (1911) 2191.

KIRKCUDBRIGHTSHIRE (55° N., 4′ W.), maritime county, S.W. Scotland, with rocky coast; surface hilly, rising in N.W. to over 2760 ft. in Mt. Merrick; drained by Dee, Fleet, Ken, Urr; area, *c.* 900 sq. miles. Chief towns, Kirkcudbright, Maxwelltown, Dalbeattie, Castle-Douglas. Great part of surface is under grass; cattle, sheep, horses raised; dairy-farming carried on; large quantities of granite quarried. Monastic ruins include Dundrennan, Lincluden. K. was frequently overrun by Danes and Saxons in X. and XI. cent's, and in later times was scene of hostilities between Scots and English, and of private feuds between great Border families. Pop. (1911) 38,363.

KIRKEE, KIRKI (18° 34′ N., 73° 53′ E.), town, Bombay, India. Pop. 11,000.

KIRKINTILLOCH (55° 58′ N., 4° 13′ W.), town, Dumbartonshire, Scotland; coal and iron works. Pop. (1911) 11,923.

KIRK-KILISSE (41° 43′ N., 27° 11′ E.), town,

Turkey-in-Europe; taken by Bulgarians, 1912. Pop. *c.* 16,000.

KIRKSVILLE (40° 10′ N., 92° 38′ W.), town, Missouri, U.S.A. Pop. (1910) 6347.

KIRKWALL (58° 59′ N., 2° 57′ W.), capital, Orkney, Scotland; cruciform cathedral, chiefly Norman, dedicated to St. Magnus, dates from XII. cent.; ruined episcopal and baronial palaces; royal burgh since 1486; shipping, distilling, fishing. Pop. (1911) 3310.

KIRRIEMUIR (56° 41′ N., 3° 1′ W.), town, Forfarshire; birthplace of Sir J. M. Barrie, Bart., who, in his novels, calls the town THRUMS. Pop. (1911) 3776.

Alan Reid, *The Regality of Kirriemuir* (1909).

KIR-SHEHR (39° 10′ N., 33° 59′ E.), town, Asia Minor. Pop. 10,000.

KIRWAN, RICHARD (1733–1812), Irish scientist; b. Cloughballymore; pres., Royal Irish Academy, 1791; wrote on chemistry, geology, magnetism, meteorology, philology.

KISFALUDY, KÁROLY (1788–1830), Hungarian author; b. at Téte; composed his tragedy *Gyilkos* (The Murder), 1808, and martial poems; wrote *Kldra Zdch*, a tragedy, 1812. The composition of three plays, *Ilka*, *Voivode Stiber*, and *The Petitioners*, placed him first among Hungarian writers. In 1822 he founded the *Aurora*, the pioneer journal of Hungarian romanticism.

KISH, KENN, KEISH (26° 32′ N., 54° E.), island, Persian Gulf; pearl-fisheries.

KISHANGARH.—(1) (26° 20′ N., 75° E.) native state, Rajputana, India. Pop. (1911) 87,093. (2) (26° 33′ N., 74° 54′ E.) town, capital of above. Pop. 13,000.

KISHINEV (47° N., 28° 52′ E.), town, Bessarabia, Russia; archiepiscopal see; cathedral. Pop. (1910) 118,610.

KISHM.—(1) (26° 45′ N., 55° 50′ E.) island, Persian Gulf; area, *c.* 500 sq. miles; salt, sulphur. Pop. *c.* 18,000. (2) (26° 58′ N., 56° 28′ E.) chief town. Pop. *c.* 5000.

KISKUNFÉLEGYHÁZA (46° 44′ N., 19° 50′ E.), town, Hungary; railway centre. Pop. (1911) 34,924.

KISLOVODSK (43° 50′ N., 42° 48′ E.), town, Terek, Russia. Pop. 5500.

KISMET, Muhammadan word for 'fate.'

KISS, token of salutation or, more frequently, affection, used since earliest times; Russ. peasants thus salute each other on Easter Day.

KISSINGEN (50° 12′ N., 10° 4′ E.), town, Bavaria; spa; mineral springs. Pop. (1910) 5830.

KISTNA, KRISHNA (*c.* 16° 10′ N., 81° 10′ E.), district, Madras, India; watered by K. and other rivers; produces cereals, tobacco, cotton; chief town, Masulipatam. Pop. *c.* 1,748,000.

KISTNA, KRISHNA (15° 57′ N., 81° 8′ E.), river, S. India; source in W. Ghats; enters Bay of Bengal.

KITAZATO, SHIBASABURO (1856–), Jap. physician and bacteriologist; studied under Koch (1885–91); discovered the bacilli of tetanus, diphtheria, and (in conjunction with Aoyama) plague.

KITCHENER, HORATIO HERBERT, VISCOUNT K. OF KHARTUM (1850–), Brit. field-marshal; Sirdar of Egyptian Army, 1892; broke power of Khalifa at Omdurman, 1898; ended Boer War in S. Africa, 1902; commander-in-chief, India, 1902–9; Brit. agent and Consul-Gen. in Egypt, 1911.

KITE, a member of the HAWK FAMILY (*q.v.*).

KITE-FLYING is largely practised as pastime by Chinese and Japanese; since the middle of XVIII. cent. has been used in Britain for scientific and later for military purposes. Franklin extracted electricity from clouds by this means in 1752; now used for measuring force of wind, barometric pressure, temperature, etc. Box kites have now superseded older patterns. Military kites are used for reconnaissance or photographing strategical positions.

KIT'S COTY HOUSE, see under STANDING STONES.

KITTIWAKE, see under GULL FAMILY.

KITTUR (15° 35′ N., 74° 46′ E.), village, Bombay, India. Pop. 5000.

KITZINGEN (49° 44′ N., 10° 8′ E.), town, Bavaria. Pop. (1910) 9108.

KIUNG-CHOW-FU, see HAINAN.

KIUSTENDIL, KÖSTENDIL, KUSTENDIL (43° 42′ N., 23° 24′ E.), town, Bulgaria; thermal springs. Pop. 13,000.

KIVU (*c.* 2° S., 30° E.), lake, Central Africa; surface *c.* 4800 ft. above sea-level; contains several islands, of which largest is Kwijwi.

KIWI, see under RUNNING BIRDS.

KIZIL IRMAK (41° 42′ N., 46° E.), river, Asia Minor; enters Black Sea.

KIZLYAR (43° 46′ N., 46° 44′ E.), town, Terek, Russia; textiles, wine. Pop. 8000.

KIZYL-KUM (43° 30′ N., 64° E.), desert tract, W. Asia.

KJÖBENHAVN, COPENHAGEN (*q.v.*).

KLADNO (50° 8′ N., 14° 7′ E.), town, Bohemia; coal, iron, steel. Pop. (1911) 19,339.

KLAGENFURT (46° 37′ N., 14° 19′ E.), town, Austria; cathedral, episcopal palace. Pop. (1911) 28,958.

KLAUSENBURG, see KOLOZSVÁR.

KLAUSTHAL, CLAUSTHAL (*q.v.*).

KLÉBER, JEAN-BAPTISTE (1753–1800), Fr. general; served with distinction at Fleurus (1794) and in Vendean, Egyptian, and Syrian campaigns; won battles of Mount Tabor and Heliopolis in Syria, 1799; assassinated.

KLEIST, HEINRICH BERNT WILHELM VON (1777–1811), Ger. dramatist; b. Frankfort-on-Oder; after unhappy life shot himself near Berlin; best works, *Prinz Friedrich von Homburg*, *Die Hermannschlacht* (dramas), *Der Zerbrochene Krug* (comedy), *Michael Kohlhaas* (romance).

KLEPTOMANIA, stealing by insane person; term generally used in relation to rich people with a weakness for purloining shop goods, etc., they could easily buy.

KLERKSDORP (26° 53′ S., 26° 42′ W.), town, Transvaal, S. Africa. Pop. 4500.

KLINGER, FRIEDRICH MAXIMILIAN VON (1752–1831), Ger. dramatist; b. Frankfort-on-Main; wrote *Sturm und Drang*, play which gave its name to literary epoch; *Die Zwillinge* (tragedy), etc.

KLINGER, MAX (1857–), Ger. painter and sculptor; a great etcher; combines classicism with modernism.

KLONDIKE (65° N., 140° W.), district, Yukon Territory, Canada; drained by K.; richly auriferous; gold first discovered, 1896; Dawson City is mining centre; output has decreased since 1901.

KLOPSTOCK, GOTTLIEB FRIEDRICH (1724–1803), Ger. poet; b. Quedlinburg; studied theology at Jena and Leipzig; lived in Copenhagen, 1751–70; d. Hamburg; K. was the first genuine Ger. poet of XVIII. cent.; aimed at giving the Ger. nation a Christian epic, viz. *Der Messias* (20 cantos pub. in 4 vols.); wrote numerous odes, lyric poetry, and several dramas.

KLOSTERNEUBURG (48° 18′ N., 16° 18′ E.), town, Austria; site of institution of Augustine Canons. Pop. (1911) 14,786.

KNARESBOROUGH (54° 1′ N., 1° 28′ W.), town, Yorkshire, England; has ruined castle; behind Dropping Well is Mother Shipton's Cave; St. Robert's Cave was where Eugene Aram murdered Clarke. Pop. (1911) 5315.

KNEE, see SKELETON.

KNELLER, SIR GODFREY (1648–1723), portrait painter; b. Lübeck; studied under Rembrandt, became Court painter to Charles II. of England, and died famous enough to have a monument in Westminster Abbey.

KNICKERBOCKER, Dutch family settled in New York since end of XVII. cent. See also IRVING, WASHINGTON.

KNIGHTHOOD.—Existing orders of k. in Great Britain are: (1) the most noble *Order of the Garter*, instituted by Edward III., c. 1348; tradition connecting its origin with a Countess of Salisbury is now discredited; consists of Sovereign, Prince of Wales, twenty-five knight-companions; officers are the Prelate, Chancellor, Registrar, King-of-Arms, and Usher of Black Rod; ribbon, Garter blue. Insignia consists of *Star, Collar, and George* (figure of St. George slaying the dragon), and *Garter*. (2) The most ancient and most noble *Order of the Thistle*, revived by James II., 1687, and after a period of desuetude re-established by Queen Anne, 1703; consists of Sovereign, princes of the blood, and sixteen knights, who are generally peers; officers are the Dean, Secretary, Lyon King-of-Arms, Gentleman Usher of Green Rod; ribbon, green. The chapel of the Order, in St. Giles' Cathedral, Edinburgh, was opened by King George V. in 1911. (3) The most illustrious *Order of St. Patrick*, instituted by George III., 1783; consists of Sovereign, Grand Master, and twenty-two knights; officers are Chancellor, Secretary, Genealogist, Usher of Black Rod, Ulster King-of-Arms, and Athlone Pursuivant; ribbon, sky-blue. (4) The most honourable *Order of the Bath*, founded in 1399, revived in 1725, enlarged in 1815, 1847, and on other occasions; there are three classes, Knights Grand Cross (G.C.B.), Knights Commanders (K.C.B.), and Companions (C.B.); officials are Dean, King-of-Arms, Secretary, and Usher of Scarlet Rod; ribbon, red. (5) The most exalted *Order of the Star of India*, founded by Queen Victoria, 1861, and enlarged in 1866 and 1876; there are three classes, and officers are Secretary and Registrar; ribbon, sky-blue, with white stripe near both edges. (6) The most distinguished *Order of St. Michael and St. George*, founded in 1818; extended in 1868; there are three classes; officials are Prelate, Chancellor, Secretary, King-of-Arms, Registrar, and Gentleman Usher of Blue Rod; ribbon, scarlet, between two stripes of Saxon blue. (7) The most eminent *Order of the Indian Empire*, founded in 1878; in three classes; officers are Registrar and Secretary; ribbon, purple. (8) The *Royal Victorian Order*, founded 1896; in five classes; officers are Lord Chamberlain and Keeper of His Majesty's Privy Purse; ribbon, dark blue, with narrow edge on either side of red, white and red stripes.

Among European orders the most illustrious is the *Toison d'Or* or *Golden Fleece* of Spain and Austria, established in 1429 by Philip of Burgundy; other important continental orders are: the *Order of Christ*, a papal order established by pope, John XXII., and Denis I. of Portugal in early XIV. cent.; the *Legion of Honour*, a Fr. order of Napoleon's foundation in 1802; the Prussian *Order of the Black Cross*, established by Frederick I. in 1701; the Bavarian *Order of St. Hubert*, instituted in 1444; the Russ. *Order of St. Andrew*, of Peter the Great's foundation in 1698; and the Ital. *Order of the Annunziata*, which dates from 1362. There are many others, of more or less importance. Orders also exist in many eastern countries, such as Persia, Japan, Siam, and in some of the states of the western world.

The origin of knighthood is veiled in obscurity; the word knight is derived from the Anglo-Saxon *cniht*, a youth or attendant, with which the Ger. *Knecht* may be compared; it afterwards came to be the equivalent of the Ger. *Ritter* and the Fr. *chevalier*, so that the term knighthood is practically identical with the term chivalry, though in general the former is taken to denote the estate itself, and the latter, the principles and usages of the upper classes in mediæval times. The institution of k. may perhaps be traced to the Gallic and Teutonic peoples who inhabited Western Europe from prehistoric times, and who established a distinction between the noble and gentle classes and the rest of the world.

K. in England developed later than on the Continent, and on lines somewhat different from those prevailing elsewhere. Except that King Alfred is said to have knighted his grandson Athelstan, there is little or no evidence of the institution in this country before the time of the Norman Conquest, although some writers are of opinion that it may have been among the Norman customs introduced by Edward the Confessor; at all events its development as a feudal institution, a part of military system, and a class in the social hierarchy, dates from Norman times. Under the system of feudalism (*q.v.*) established by William the Conqueror the king or overlord had power to compel every one who held a knight's fee to become a knight and perform a certain fixed amount of military service; these services were at a later date commuted for money payments, a custom which eventually developed into the levying of a war tax called *scutage*. A later custom, whereby subjects were allowed to compound by money payments for refusing the honour of knighthood, led to many abuses and ultimately resulted in the abolition of knight service after the Restoration of 1660.

In conferring knighthood different ceremonies obtained at different times, but there were two distinctive forms. The first of these was the simple *dubbing* of a knight, in which the entire ceremony consisted in the *accolade* or blow with the sword. The second was a much more intricate ceremonial of a religious nature, and was preceded by prayer and fasting and other preparations; the dubbing was performed by fastening the spurs and girding the sword on the candidate, whom the person conferring the honour then struck on face or neck; and in conclusion the knight swore to serve the Church and protect those in distress. The establishment of such militant religious orders as the Hospitallers and Templars was probably largely responsible for the religious nature of the investiture.

Simple knighthood now exists only in England, where it is still conferred by the accolade, the recipients being known as *knights bachelor*. In former times the degree of *knight banneret* might be conferred upon any one who performed an act of valour during battle; but it is generally considered that this degree fell into disuse soon after the middle of the XVI. cent.

F. W. Cornish, *Chivalry* (1901); Froissart, *Chronicles*.

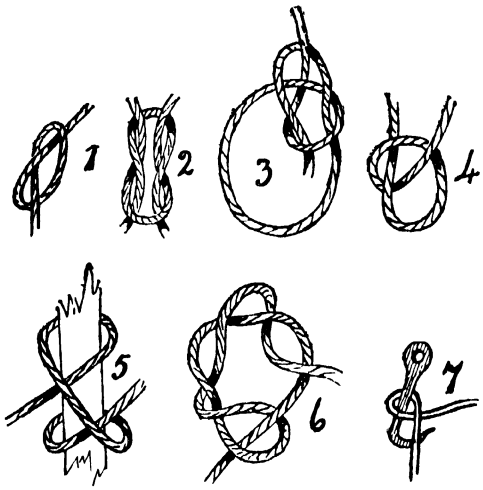
Knight-Service.—System of land tenure in feudal times. Land was divided into knight's fees, for each of which one armed knight had to be provided by holder of fee to serve forty days in the field when summoned. Holder of knight's fee was also subject to obligations of relief, wardship, marriage, and feudal aids.

KNIGHTS OF LABOR, organisation founded, 1869, in U.S.A.; wider compass than trade unions; included clerks, etc.: membership was 700,000 in 1886, but diminishes yearly.

KNIGHTS OF MALTA, see HOSPITALLERS.

KNIGHTS OF RHODES, see HOSPITALLERS.

KNIGHTS OF THE GOLDEN CIRCLE, society formed in U.S.A. during Civil War to stop the war; membership about 250,000.



KNIGHTS TEMPLARS, see TEMPLARS.

KNIPPERDOLLING, BERNT (1490–1536), Ger. religious leader; a Münster merchant, became burgomaster, 1534, and then an Anabaptist leader; on crushing of Anabaptist movement K. was tortured and executed.

KNOLLYS, FRANCIS, BARON (1837–), private sec. to Edward VII. and George V.; cr. baron, 1902. One of his ancestors, Sir Francis K. (d. 1596), held various offices under Elizabeth; and another, William K. (d. 1632), was cr. earl of Banbury in 1616; the title afterwards lapsed.

KNOT, in its simplest form is a knob on end of a rope or cord to prevent slipping. More elaborate k's are used for fastening rope to rope, or rope to ring or

beam. Common k's used by sailors are the Overhand (Fig. 1), Reef (Fig. 2), Bowline (Fig. 3), Half Hitch

(Fig. 4), Clove Hitch (Fig. 5), Timber Hitch (Fig. 6), Blackwall Hitch (Fig. 7).

KNOWLES, SIR JAMES (1831–1908), Eng. architect and writer; with Tennyson founded the Metaphysical Soc., 1869; became edit. of *Contemporary Review*, 1870; founded the *Nineteenth Century*, 1877.

KNOW-NOTHING PARTY, Amer. political party, founded about middle of XIX. cent.; so called because members invariably answered 'I don't know' when asked questions concerning it. It aimed at depriving foreign-born inhabitants of political rights by strict naturalisation laws. It reached the height of its power between 1853 and 1856, and in latter year proposed Fillmore for Presidency. It ceased to exist *c.* 1860.

KNOX, JOHN (1505?–72), Scot. reformer: b. Haddington, Scotland; took orders as secular priest, and practised as a notary in Haddington *c.* 1540. In 1546 he came under influence of Wishart. After Wishart's arrest K. went to St. Andrews, where in 1547 he preached Protestantism in parish church. When St. Andrews was taken by the French in 1547 he was taken prisoner, and for nearly two years worked in Fr. galleys. On his release he returned and became minister at Berwick and afterwards at St. Andrews, being also appointed chaplain to Edward VI. During Mary's reign he lived on the Continent. In 1559 he returned to Scotland, joined Lords of Congregation, and drew up *Confession of Faith*, 1560. With Mary, Queen of Scots, he had several heated debates concerning her religion. His sermons after the marriage of Mary and Darnley resulted in his being forbidden to preach; nevertheless, after Mary's abdication he preached the coronation sermon of James VI. at Stirling. In 1569 he retired to St. Andrews, but returned to Edinburgh in 1572 and preached in St. Giles on the subject of the massacre of St. Bartholomew's eve. His *History of the Reformation in Scotland* is an important work. Other writings include the *Blast of the Trumpet against the Monstrous Regiment of Women.*

Life, by Hume Brown (1895), Cowan (1905), Andrew Lang (1905).

KNOXVILLE (35° 57′ N., 83° 57′ W.), town, Tennessee, U.S.A.; contains State univ.; fine public parks; important centre of trade; coal mines and marble quarries in neighbourhood; manufactures iron goods, flour, textiles, bricks; meat-packing carried on. Besieged by Federalists in Civil War. Pop. (1910) 36,346.

KNUCKLEBONES, ancient game played by Greeks; still survives as children's game, played with joint-bones of sheep; object to throw them up and catch them in various ways; five generally used.

KNUTSFORD (53° 18′ N., 2° 22′ W.), town, Cheshire, England; described in Mrs. Gaskell's *Cranford*; manufactures leather, cottons. Pop. (1911) 5760.

KOALA, see under MARSUPIALS.

KOBDO (47° 57′ N., 89° 58′ E.), town, Mongolia; fortified; sheep raised in district. Pop. *c.* 6000.

KOCH, ROBERT (1843–1910), Ger. bacteriologist; famous for his discoveries and isolation of the bacilli of anthrax, Asiatic cholera, and tuberculosis, and for his modes of preventative inoculation.

KODAIKANAL, health-resort, Madras province, India.

KODUNGALUR, CRANGANUR (10° 13′ N., 76° 12′ E.), town, Madras, India. Traditionally connected with St. Thomas. Pop. 30,000.

KOESFELD (51° 57′ N., 7° 9′ E.), town, Westphalia, Prussia. Pop. (1910) 9420.

KOHAT.—(1) (33° 25′ N., 71° 20′ E.) district, Peshawar, India; area, *c.* 2770 sq. miles; salt mines. Pop. (1910) 217,865. (2) (33° 33′ N., 71° 23′ E.) town and capital of above. Pop. (1901) 30,762.

KOHAT PASS (33° 35′ N., 71° 27′ E.), pass leading from Peshawar to Kohat, India.

KOH-I-NUR, see DIAMOND.

KOHISTAN (35° N., 73° 20′ E.), mountainous region, N.W. India; crossed by Indus. Pop. *c.* 15,000. K. (35° N., 70° E.), district, Afghanistan.

KOKOMO (40° 31′ N., 86° 5′ W.), town, Indiana. Pop. (1910) 17,010.

KOKO-NOR (36° 50′ N., 100° E.), lake, Tibet.

KOKSTAD (28° 30′ S., 29° 25′ E.), town, Griqualand East, S. Africa. Pop. 3000.

KOLA (67° 30′ N., 36° E.), peninsular district, Russia, between White Sea and Arctic Ocean; Ekaterininsk superseded Kola as capital, 1899.

KOLABA (18° 25′ N., 73° 12′ E.), mountainous district, Bombay, India; rice. Pop. 607,000.

KOLAPUR, KOLHAPUR (*q.v.*).

KOLAR.—(1) (13° 5′ N., 78° 5′ E.) district, Mysore, India; area, *c.* 3000 sq. miles; gold mines. Pop. (1901) *c.* 700,000. (2) (13° 6′ N., 78° 7′ E.) town, Mysore. Pop. 12,500.

KOLBERG (54° 10′ N., 15° 32′ E.), port, Pomerania, Prussia; former fortress; joined Hanseatic League. Pop. (1910) 24,909.

KOLDING (55° 29′ N., 9° 28′ E.), town, Denmark. Pop. (1911) 14,219.

KOLGUEV (69° N., 48° 45′ E.), island, off N. coast, Russia, in Arctic Ocean.

KOLHAPUR.—(1) (16° 30′ N., 74° 10′ E.) native state, Bombay; area, 3165 sq. miles; rice, tobacco; manufactures textiles. Pop. (1911) 833,441. (2) (16° 43′ N., 74° 13′ E.) town, capital of above; ruined Buddhist shrines. Pop. (1911) 54,373.

KOLIN, NEU-KOLIN (50° 4′ N., 15° 14′ E.), town, Bohemia. Here Austrians defeated Prussians, 1757. Pop. (1911) 16,442.

KÖLLIKER, RUDOLPH ALBERT VON (1817–1905), Swiss physiologist, anatomist, and zoologist. His microscopical researches into the minute structures of the tissues of man and of the lower animals, his studies of the embryological development of vertebrates and invertebrates, and his general zoological inquiries gave an early stimulus to a refined type of microscopical analysis.

KOLLONTAJ, HUGO (1750–1812), Polish reformer; left Poland because of reactionary government, 1791; imprisoned in Austria, 1795–1802.

KÖLN, see COLOGNE.

KOLOMEA (48° 31′ N., 25° 1′ E.), town, Galicia, Austria. Pop. (1910) 42,676.

KOLOMNA (55° 7′ N., 38° 46′ E.), cathedral town, Moscow, Russia. Pop. 21,500.

KOLOZSVÁR, KLAUSENBURG (46° 44′ N., 23° 33′ E.), town, Hungary; has univ., Gothic church, citadel; Episcopal see of Unitarian and Reformed Churches;

birthplace of Matthias Corvinus. Pop. (1910) 60,808.

KOLPINO (59° 33′ N., 30° 5′ E.), town, Russia; Crown ironworks. Pop. 8000.

KOLYVAŃ (55° 10′ N., 82° 40′ E.), town, Tomsk, Siberia. Pop. (1897) 12,000.

KOMÁROM (47° 46′ N., 18° 7′ E.), town, Hungary; strongly fortified. Pop. 17,000.

KOMATI (25° 45′ S., 32° 42′ E.), river, S.E. Africa; source in S.E. Transvaal; enters Delagoa Bay.

KOMOTAU (50° 27′ N., 13° 26′ E.), town, Bohemia; textiles, fruit, beer. Pop. (1911) 19,545.

KOMURA, JUTARO, COUNT (1855–), Jap. politician and diplomat.

KONG (8° 58′ N., 3° 23′ W.), town, Fr. Ivory Coast, W. Africa. Pop. *c.* 14,000. K. district has pop. *c.* 400,000. K. hills reach height of over 4500 ft.

KONGSBERG (59° 36′ N., 9° 43′ E.), town, Norway; silver mines. Pop. 6000.

KONIA (*c.* 37° 53′ N., 32° 19′ E.), vilayet, Asiatic Turkey; area, 39,410 sq. miles. Pop. *c.* 1,069,000. K., capital, was for several cent's Seljuk seat of government; manufactures carpets, woollens. Pop. *c.* 45,000. See ICONIUM.

KONIECPOLSKI, STANISLAUS (1591–1646), Polish general; defeated Swedes at Homerstein, 1627; Trzciand, 1629; also defeated Tatars, Turks, and Cossacks.

KÖNIG, KARL RUDOLPH (1832–1901), Ger. physicist and manufacturer of tuning-forks; made important investigations in acoustics.

KÖNIGGRÄTZ (50° 13′ N., 15° 49′ E.), town, Bohemia; XIV.-cent. cathedral. Pop. (1911) 11,064.

KÖNIGINHOF (50° 27′ N., 15° 46′ E.), town, Bohemia, founded by Wenceslaus II., XIII. cent. Pop. (1911) 15,062.

KÖNIGSBERG (54° 43′ N., 20° 29′ E.), town, Prussia, Germany; commercial and industrial centre of E. Germany, and a great tea centre of Europe; important military and naval fortress; has royal palace, univ., XIV.-cent. cathedral; various educational and charitable institutions; birthplace of Kant. Machinery, sugar, tobacco, beer manufactured. Exports cereals, timber, etc. Pop. (1910) 245,853.

KÖNIGSBORN (51° 33′ N., 7° 41′ E.), watering-place, Westphalia, Prussia; saline springs.

KÖNIGSHÜTTE (50° 19′ N., 18° 56′ E.), town, Silesia, Prussia. Pop. (1910) 72,642.

KÖNIGSLUTTER (52° 15′ N., 10° 56′ E.), town, Brunswick, Germany. Pop. 3300.

KÖNIGSSEE (47° 34′ N., 13° E.), lake, Bavaria, Germany.

KÖNIGSTEIN (50° 53′ N., 14° 3′ E.), town, Saxony, Germany; formerly important fortress; citadel used as State prison. Pop. (1910) 3924.

KÖNIGSWINTER (50° 40′ N., 7° 12′ E.), town, Rhenish Prussia, Germany. Pop. 4000.

KONITZ (53° 43′ N., 17° 34′ E.), town, W. Prussia, Germany. Pop. (1910) 12,010.

KONKAN (17° to 19° N., 73° E.), coast district, W. India; produces rice, salt.

KONRAD, CONRAD (*q.v.*).

KONTAGORA, province, Brit. N. Nigeria, Africa; under Brit. control since 1901.

KOORINGA (33° 42′ S., 138° 59′ E.), town, S. Australia. Pop. 2600.

KÖPENICK (52° 35′ N., 13° 32′ E.), town, Brandenburg, Prussia; manufactures carpets, sealing-wax. Pop. (1910) 30,882.

KOPRÜLÜ, KUPRILI (41° 43′ N., 21° 56′ E.), town, Turkey-in-Europe. Pop. *c.* 20,000.

KORA (13° 26′ N., 77° 6′ E.), old town, United Provinces, India. Pop. 3000.

KORAN, AL KORAN, QUR'ÁN, AL QUR'ÁN, the 'Bible' of Muhammadans, and the work of Muhammad himself. A divine inspiration is claimed for it by believers more rigid and absolute than the Christian Church has ever claimed for the Bible. The K. for Muhammadans is uncreated, having existed eternally in the mind of God until it was revealed to Muhammad; the K., therefore, exists in heaven, and that on earth is only a 'copy.' It is composed of chapters, called *Suras*, though the exact meaning of the word is uncertain. It covers a great variety of subjects, and confusion is produced by the suras having sometimes got out of their original order; but even when this is preserved, change is often abrupt. Muhammad, too, was a mystic rather than a systematic thinker, so the 'chaotic' character (as it has been called) of the book is not surprising. The K. is fiercely monotheistic, and the worship of Christ as Son of God is therefore denounced.

The subject-matter is largely taken from the Old Testament, and there are several references to Jesus and to the Virgin Mary, who is confused with Miriam, the sister of Moses. But it betrays little intimate knowledge of Judaism and none of Christianity. Its outlook is confined to Arabia. The K. is not only the first real literary production in Arabic prose, but is regarded by devout Muslims as faultless in form and phrase. This opinion is not shared by some competent Muslim scholars, and is rejected by all Europeans. It is rhetorical rather than poetical—is sometimes described as 'rhymed prose.' Though this style is suitable for parts of it, competent Arabic scholars declare it is monotonous in others. It was not written all at one time, but belongs partly to the Meccah and partly to the Medina period of the prophet's life. The latter part is easier to grasp in its hist. bearings, as more is known of this than the earlier time.

The K. attacks Jews more than Christians, with whom Muhammad seems to have come but little into contact. At the beginning of 29 of the suras certain letters stand, the meaning of which both native and European scholars have endeavoured to discover, but without success. The first sura has been called the 'Lord's Prayer' of Muslims. That portion of the K. which is concerned with women is the least edifying of the whole. It has been disputed whether Muhammad himself could write—probably he could a little; but his thoughts and revelations were certainly written during his lifetime, whether by his own hand or another. At his death the K. was both scattered and fragmentary. These were collected, and there was much dispute over the correct version. Finally, all copies except one were ordered by the Caliph Othman to be burnt, and the one was copied by Zaid. From this all existing MSS. (some of which go back to the I. cent. after the Flight) are derived, though sometimes other readings are found. But it is fairly certain our K. contains no interpolations. Several mediæval and modern commentaries exist.

Eng. trans. by Sale, Rodwell, and Palmer; various lives of Muhammad; Gibbon's *Decline and Fall* (Bury's edition); Margoliouth, *Mohammedanism.*

KORAT (15° 23′ N., 102° 20′ E.), town, Siam. Pop. *c.* 6500.

KORDOFAN (12° 30′ N., 31° 30′ E.), province, Anglo-Egyptian Sudan, W. of White Nile; area variously estimated at from 41,000 to 130,000 sq. miles; rolling plains, 1300 to 1900 ft., with isolated peaks rising to 2600; no rivers; millet, gums; cattle and camels reared; exports gum, hides, ivory, gold. K. belonged in turn to rulers of Senaar, Darfur, Egypt; passed under control of reorganised Sudan Government, 1899. Pop. over 5 millions, including persons of Arab, Turkish, Egyptian, and negro descent.

KOREA (34° to 43° N., 124° 30′ to 130° 30′ E.), peninsular country, E. coast of Asia. In early times K. included three independent kingdoms which, owing to Chinese influence, attained considerable degree of civilisation. After various vicissitudes, K. became an independent kingdom in X. cent.; overrun by Mongols under Jenghiz and Kublai Khan in XIII. cent.; came under suzerainty of Ming emperors of China in XIV. cent.; invaded and ravaged by Japanese in 1592–98, since when it has been subject of continual

dispute between China and Japan. In 1894 Chino-Japanese War broke out, which resulted in defeat of Chinese and proclamation of Korean independence. In 1904 occurred Russo-Japanese War, at end of which Japan obtained formal recognition of her right to control Korean affairs. In 1907 Emperor of K. abdicated, and in 1910 the country was annexed to Japanese empire. Administered by governor-general, who represents Japan.

K. lies between Yellow Sea and Sea of Japan; area, *c.* 82,000 sq. miles. Surface is mountainous, traversed from N. to S. by range which rises to height of over 8000 ft.; drained by Han, Tai-dong in W., Yalu, Tumen in N., and other streams. Chief towns, Seoul (capital), Ping-Yang, Songdo. Climate generally cool and bracing.

Principal industry is agriculture; about 5,600,000 acres are under cultivation, but agricultural methods are extremely primitive. K. produces rice, wheat, and other grains, tobacco, cotton, cattle. There is some whale-fishing. Minerals include gold, which is extensively worked, coal, copper, iron. Exports cereals, gold, ginseng, hides, cattle. Railway mileage, *c.* 700.

Religions are ancestor worship and Confucianism; Buddhism is not now important, and there are many converts to Christianity. Inhabitants, besides Koreans themselves, include Chinese, Japanese, Americans, English, French, Germans. Pop. (1911) 13,125,027.

Griffis, *Korea* (1905); Hulbert, *The Passing of Korea* (1906).

KOREA (23° 30′ N., 82° 30′ E.), feudatory state, India. Pop. 37,000.

KORIN, OGATA (*c.* 1655–1716), Jap. artist; painter of very individual gifts; examples much sought after by collectors; gave his name to the Korin school. Morrison, *The Painters of Japan.*

KÖRMÖCZBÁNYA, KREMNITZ (48° 42′ N., 18° 46′ E.), town, Hungary. Pop. 4500.

KÖRNER, KARL THEODOR (1791–1813), Ger. poet; b. Dresden; wrote patriotic poetry (*Leyer und Schwert*) and plays.

KORNEUBURG (48° 25′ N., 16° 21′ E.), town, Austria. Pop. (1911) 9058.

KOROCHA (50° 49′ N., 37° 14′ E.), town, Russia. Pop. 15,000.

KORSÖR (55° 19′ N., 11° 8′ E.), port, Denmark. Pop. (1911) 8065.

KORTCHA (40° 43′ N., 20° 51′ E.), cathedral town, Albania. Pop. *c.* 10,000.

KORYAKS, tribe in extreme N.E. Asia; have offered desperate hostility to Russ. power.

KOSCIUSCO (36° 22′ S., 148° 20′ E.), mountain peak, Australia (*c.* 7325 ft.).

KOSCIUSZKO, TADEUSZ ANDRZEJ BONAWENTURA (1746–1817), Polish statesman and general; b. at Mereczowszczyzna, Lithuania; served in Amer. army, 1776–86, becoming adjutant to Washington in 1777; returning to Poland, he became a leader in the reform of 1790, and served with distinction against Russia in 1792. He afterwards withdrew to Leipzig, whence he returned in 1794 to take command in the Polish rising of that year; gained some slight successes at first, and defeated Russians at Raclawice; but he was subsequently routed at Rawka, and after other reverses was finally defeated and captured at Maciejowice, Oct. 4, 1794. He was released from prison by Paul I. in 1796, and after twenty-one years spent in America, France, and Switzerland, he died at Salothurn, 1817.

Falkenstein, *Thaddäus Kosciuszko.*

KOSEL, see COSEL.

KÖSEN (51° 9′ N., 11° 44′ E.), small town, Germany. Pop. (1910) 3006.

KÖSLIN (54° 13′ N., 16° 10′ E.), town, Pomerania, Prussia. Pop. (1910) 23,247.

KOSSOVO (42° N., 22° E.), vilayet, Turkey-in-Europe; area, 12,700 sq. miles. Fruits, tobacco, cereals. Pop. *c.* 1,038,100.

KOSSUTH, LAJOS (1802–94), a noted Hungarian patriot; b. at Monok, Hungary; imprisoned in 1838 for circulating reports of debates in National Diet; after his release he edited the *Pesti Hirlap,* a party periodical, for several years, and in 1847 he entered Diet and became leader of National League, which aimed at Hungarian independence. In 1848 the Diet declared independence of Hungary, and app. K. governor; after suppression of the revolt by Emperor of Austria, he had to take refuge in Turkey; he subsequently lived in England and Italy, his hostility to Austria preventing him from taking advantage of general amnesty. Author of *Memories of My Exile.*

Stiles, *Austria in 1848–49.*

KÖSTENDIL, see KIUSTENDIL.

KOSTROMA (57° 10′ N., 42° E.), government, Central Russia; area, 32,432 sq. miles; surface, undulating plateau; timber. Pop. (1910) 1,700,900. KOSTROMA, capital, an old cathedral town, manufactures linen. Pop. (1910) 46,700.

KÖSZEG, GUNS (47° 23′ N., 16° 31′ E.), town, Hungary. Pop. 7500.

KOTAH.—(1) (25° N., 76° E.) native state, Rajputana, India; area, 5684 sq. miles; cereals, tobacco. Pop. (1911) 639,089. (2) (25° 8′ N., 75° 47′ E.) town. Pop. 35,000.

KÖTHEN, CÖTHEN (*q.v.*).

KOTKA, port, Viborg, Finland. Pop. (1904) 7628.

KOTRI (26° 8′ N., 71° 5′ E.), town, Sind, India. Pop. 7700.

KOTZEBUE, AUGUST FRIEDRICH FERDINAND VON (1761–1819), Ger. dramatist; b. Weimar; held high official post in St. Petersburg, 1871; app. director of Viennese Burgtheater, 1797; assassinated, 1819; wrote numerous plays; *Menschenhass und Reue* (drama) for long the most popular play in Germany and England.

KOTZEBUE, OTTO VON (1787–1846), Russ. Arctic explorer and traveller in Pacific.

KOUMISS, beverage prepared by the Tartars since ancient times by fermenting mare's milk; but may be made by dissolving ½ oz. of grape sugar in 4 fl. oz. of water and 20 gr. of yeast in 4 fl. oz. of cow's milk, pouring both into a quart bottle, which is then filled up with milk, corked, kept cool, and shaken frequently for four days; it is a valuable stimulant food in conditions of exhaustion and in convalescence after severe illness, being easily digested and containing a little alcohol.

KOUMOUNDOUROS, ALEXANDROS (1814–83), Gk. politician; Prime Minister, 1865.

KOUSSO, Cusso, drug consisting of the dried panicles of pistillate flowers of a tree, *Brayera anthelmintica,* of natural order *Rosaceæ,* growing in Abyssinia; obtained commercially in form of rolls, 1 ft. to 2 ft. long; has a bitter taste and tea-like odour, its active principle being the neutral *Koussin* ($C_{31}H_{38}O_{10}$); employed medicinally as anthelmintic for all kinds of tapeworms, but is rarely given in Britain.

KOVALEVSKY, SOPHIE, SONJA (1850–91), Russ. mathematician; did brilliant work on partial differential equations.

KOVNO.—(1) (55° 50′ N., 23° 30′ E.) government, Russia; area, 15,518 sq. miles; surface flat; watered by Niemen, Dvina; cereals, live stock, dairy produce. Pop. (1910) 1,775,900. (2) (54° 56′ N., 23° 53′ E.) fortified town, capital of above; trading centre. Pop. (1910) 79,600.

KOVROV (56° 21′ N., 41° 21′ E.), town, Central Russia. Pop. 17,000.

KOYETSU, HONNAMI (d. 1637), Jap. artist and artificer; brilliant exponent of the Korin school, whose pictures chiefly were illustrations of his own poems.

KOZLOV (53° 52′ N., 29° 18′ E.), town, Tambov, Russia. Pop. (1910) 45,030.

KRAFFT, ADAM (1455–1507), Ger. ecclesiastical sculptor; some of his works survive.

KRAGUYEVATS (44° 1′ N., 20° 53′ E.), town, Servia. Pop. (1911) 18,452.

KRAJOVA, CRAIOVA (*q.v.*).

KRAKATOA (6° 9′ S., 105° 26′ E.), volcanic island, Strait of Sunda, between Sumatra and Java, where one of most terrible volcanic eruptions ever known occurred in 1883. Disturbances continued from May to Sep., culminating in explosions of Aug. 26–28, when greater part of island was blown up; followed by enormous ocean waves which destroyed several hundred villages and caused great loss of life. See *The Eruption of Krakatoa*, by G. J. Symons.

KRALYEVO (23° 40′ N., 20° 43′ E.), town, Servia. In vicinity is celebrated monastery of Studenitsa. Pop. 4000.

KRANTZ, ALBERT (1450–1517), scholar and divine; dean of Hamburg, 1508.

KRASNOVODSK (40° 7′ N., 53° E.), fortified port, Caspian Sea, Russia. Pop. 6500.

KRASNOYARSK (56° 6′ N., 93° E.), town, E. Siberia. Pop. (1910) 62,430.

KRASZEWSKI, JOZEF IGNACY (1812–87), Polish novelist.

KRAUSE, KARL CHRISTIAN FRIEDRICH (1781–1832), Ger. philosopher; pupil of Hegel. His system combined Theism with Pantheism; God is not personal, the Universe is organic and divine.

KRAWANG (6° 25′ S., 107° 30′ E.), residency, Java; thermal mineral springs; rice, coffee; linen manufactured.

KRAY VON KRAJOVA, PAUL (1735–1804), Austrian general; fought in Napoleonic wars.

KREMENCHUG (49° 4′ N., 33° 37′ E.), cathedral town, Poltava, Russia; manufactures tobacco, leather. Pop. (1910) 72,730.

KREMENETS (50° 7′ N., 25° 36′ E.), town, Russia. Pop. 18,000.

KREMNITZ, KOEMOCZBANYA (*q.v.*).

KREMS (48° 25′ N., 15° 36′ E.), town, Austria. Pop. (1911) 14,385.

KREMSIER (49° 18′ N., 17° 23′ E.), town, Austria. Pop. (1911) 16,523.

KREUTZER, RUDOLPH (1766–1831), Fr. violinist and composer; Beethoven composed for him famous K. Sonata.

KREUZBURG (50° 58′ N., 18° 13′ E.), town, Prussian Silesia, Germany. Pop. (1910) 11,590.

KREUZNACH (49° 50′ N., 7° 50′ E.), town, Rhenish Prussia; mineral springs; Roman remains. Pop. (1910) 23,193.

KRIEG-SPIEL, see WAR-GAME.

KRIEMHILD, heroine of the Nibelungenlied and wife of Siegfried, who married Attila on the murder of Siegfried in order to prosecute her scheme of revenge.

KRILOFF, IVAN ANDREJEWITCH, KRYLOW (1768–1844), Russ. fabulist; b. Moscow; wrote *Philomela and Cleopatra* and excellent fables.

KRIMMITSCHAU, CRIMMITZSCHAU (*q.v.*).

KRISHNA, see KISTNA.

KRISHNAGAR (23° 22′ N., 88° 34′ E.), town, Bengal, India. Pop. 25,000.

KRISTIANSTAD, CHRISTIANSTAD (56° 1′ N., 14° 9′ E.), port, Sweden; industrial centre. Pop. (1910) 11,569.

KRIVOY ROG (47° 52′ N., 33° 27′ E.), town, Kherson, Russia. Pop. 11,000.

KRONENBERG (51° 12′ N., 7° 21′ E.), town, Rhenish Prussia. Pop. (1910) 12,942.

KRONSTADT, BRASSO (45° 37′ N., 25° 30′ E.), town, leading commercial and industrial centre, Transylvania; principal building, XIV.-cent. Prot. church; ironworks, leather goods. Pop. (1910) 41,056.

KRONSTADT (60° N., 29° 46′ E.), town, Russia; founded by Peter I.; important fortress, naval arsenal, principal base of Baltic fleet; has three harbours; cathedral. Pop. (1910) 66,624.

KROONSTAD (27° 38′ S., 27° 16′ E.), town, Orange Free State, S. Africa. Pop. (1911) 5696.

KROPOTKIN, PETER ALEXEIVICH, PRINCE (1842–), Russ. author and Nihilist; b. Moscow. In 1864 he undertook a geographical survey expedition through Manchuria; visited Switzerland, 1872, and joined the International Working Men's Association, but subsequently became an anarchist and devoted his time to spreading Nihilist propaganda; has been frequently arrested.

KROTOSCHIN (51° 43′ N., 17° 27′ E.), town, Posen, Prussia. Pop. (1910) 13,061.

KRÜDENER, BARBARA JULIANA, BARONESS VON (1764–1824), Russ. religious mystic; b. Riga (Livonia); married Baron K., 16 years her senior; visited France and published *Valerie* (novel), 1803; then Switzerland and Germany, and came in contact with Adam Müller, a peasant prophet, Jung-Stilling, Jean Frédéric Fontaines, and other religious fanatics; gave herself up to preaching and prophesying; settled at Schlüchten (Baden), 1815; had interviews with Alexander of Russia, greatly influenced him, and was the supposed author of the Holy Alliance; d. Karasu Bazar (Crimea).

Ford, *Life and Letters of Madame de K.* (1893); Muhlenbeck, *Etude sur les origines de la Sainte-Alliance* (1909).

KRUGER, STEPHANUS JOHANNES PAULUS (1825–1904), Pres. of Transvaal; b. in Cape Colony; took part in Great Trek, 1836; rapidly rose to power in Transvaal; led Boers in 1881, when they asserted their independence, and became pres. in 1883; re-elected, 1888, 1893, 1898; his rooted hostility to the British and Uitlanders generally precipitated the S. African War of 1899–1902; fled to Europe, 1900, first settling in Holland, and lastly at Mentone. Imbued with strong puritanical spirit, he was an ardent Dutch-Afrikander patriot, and a 'slim' diplomatist; pub. *Memories* (1902). See SOUTH AFRICA, TRANSVAAL.

KRUGERSDORP (26° 9′ S., 27° 46′ E.), town, Transvaal, S. Africa. White pop. (1911) 13,187.

KRUMAU (48° 48′ N., 14° 20′ E.), town, Bohemia; has famous old castle, associated with Rosenberg family. Pop. (1911) 8716.

KRUMBACHER, CARL (1856–1909), Ger. scholar; studied mediæval and modern Gk. subjects; prof. at Munich; wrote history of Byzantine lit.

KRUMEN, tribe of negroes much employed by British of Guinea; speech related to Mandingo; useful as boatmen along the Pepper Coast.

KRUPP, Ger. firm of steel manufacturers; from small beginnings rose to be largest in world; founded (1810) in Essen by FRIEDRICH KRUPP (1787–1826), who was succ. by his s. ALFRED (1812–87), under whom the foundry developed amazingly; Bessemer process and steam-hammer adopted; steel guns manufactured. Alfred's s., FRIEDRICH ALFRED (1854–1902), carried on the work, and his dau., FRAU KRUPP VON BOHLEN-HALBACH, turned the business into a company (1903). At centenary celebrations (1912) Krupps owned some 500 mines, quarries, sand-pits, and clay-pits; had factories at Essen, Annen, Rheinhausen, Buckau; possessed Germania shipbuilding yard at Kiel-Tagel (Imperial Government advancing £2,500,000); supplied guns, armour-plate, etc., to every part of world; and employed staff of 70,000.

KRUSENSTERN, ADAM IVAN (1770–1846), Russ. sailor and explorer.

KRUSHEVATS (43° 34′ N., 21° 20′ E.), town, Servia. Pop. 10,500.

KSHATRIYAS, see under CASTE.

KU KLUX KLAN, secret society founded in Southern States of N. America in 1865; aimed at depriving negroes of political power, to which end various outrages were committed, a number of negroes being maltreated and even killed. In 1871 Congress took steps to put it down by passing the Enforcement Act, and it soon afterwards disappeared.

KUBAN.—(1) (c. 45° N., 40° E.) province, Caucasia, Russia; area, 36,645 sq. miles; S.W. occupied by W. Caucasus range; drained by Kuban R. and other streams; produces cereals, honey; sheep and horses raised; iron, coal, petroleum, mineral springs. Chief

towns are Ekaterinodar, Yeisk, Maikop. Pop. (1910) 2,625,800. (2) (45° 15′ N., 38° 5′ E.) river, Russia; source in Caucasus; enters Black Sea.

KUBLAI KHAN (1216–94), grandson of Jenghiz Khan, and emperor of the Mongols; succ. his bro. Mangu as khan, 1259; invaded China in 1267, and established there the Mongol dynasty; extended his conquests over Cochin China, Tibet, and beyond the Ural Mt's westward, thus creating one of largest empires ever known; his Jap. expeditions were, however, unsuccessful. Marco Polo (*q.v.*) describes the splendour of his court and wisdom of his rule. He established Buddhism in his dominions.

KUCH BEHAR, Cooch Behar.—(1) (26° 18′ N., 89° 25′ E.) native state, Bengal, India; area, 1307 sq. miles: produces rice, tobacco, jute; many rivers. Pop. (1911) 592,952. (2) (26° 18′ N., 89° 20′ E.) town. Pop. 10,700.

KUCHAN (37° 8′ N., 58° 26′ E.), town, Persia; destroyed by earthquake, 1895. Pop. *c.* 11,000. K. district, pop. *c.* 100,000.

KUEI-HUA-CHENG, see Kuku Khoto.

KUEN-LUN (*c.* 36° N., 76° 15′ to 112° 30′ E.), great mountain ranges of Central Asia, extending from the Pamir by N. of Kashmir, and in a curve round N. of Tibet into China proper; length, c. 2400 miles; breadth, 100 to 150 miles, or, if the eastern parallel ranges in Tibet and China be included, about 620 miles; reaches extreme height of *c.* 24,000 ft., and is crossed by passes from 15,000 to 19,500 ft. above sea-level. K. is one of oldest mountain systems of world, consisting of archaic rocks; may be divided into Western, Central, and Eastern K. Western K. consists of many parallel ranges, including Muz-Tagh and Raskem; it extends eastward by Ullugh-Tagh chain, which unites with Arka-Tagh and Altyn-Tagh, the highest parts of Central K. In these regions are many lakes and high plateaux. Central K. includes also Nan-shan range to N.E., and a number of parallel chains lying farther S.; here the Hwang-ho, Yang-tse-Kiang, Mekong, and other rivers of S.E. Asia have their source. Eastern K. narrows to the single chain of the Tsing-ling-shan in China. Great part of region is covered with snow, and storms of snow and sand frequently occur; in eastern districts coniferous trees abound.

KUFA (32° 3′ N., 44° 37′ E.), ruined Muhammadan town, Asiatic Turkey.

KUKA (12° 58′ N., 13° 23′ E.), town, Bornu, Nigeria; formerly great trading centre; ruined by Rabeh, 1898; has revived since 1902.

KUKU KHOTO, Kuei-Hua-Cheng (40° 52′ N., 111° 40′ E.), walled town, China; trading centre.

KULJA, Ili (43° 38′ N., 81° 38′ E.), walled town (and district), N.W. China; has citadel, mosques. Pop. *c.* 12,000. New K., to W., was ruined in 1868. K. district has area, *c.* 21,000 sq. miles; fertile, produces rice, fruits, cotton, tobacco, while horses, sheep, and cattle are bred; held by Russia, 1871–81. Pop. *c.* 136,000.

KULM (53° 21′ N., 18° 25′ E.), town, W. Prussia, Germany; Episcopal see. Pop. (1910) 11,720.

KULMBACH (50° 6′ N., 11° 28′ E.), town, Bavaria, Germany; large breweries. Pop. (1910) 10,713.

KULMSEE (53° 11′ N., 18° 37′ E.), cathedral town, W. Prussia, Germany. Pop. (1910) 10,612.

KULP (40° 2′ N., 43° 40′ E.), town, Transcaucasia, Russia. Pop. 3500.

KULU (32° 4′ N., 77° E.), region, Punjab, India; fruits; thermal springs. Pop. 70,000.

KUM (34° 37′ N., 50° 56′ E.), sacred city, Persia; tomb of Fatima, sister of Imam Reza, annually visited by pilgrims. Pop. *c.* 28,000. K. province has pop. *c.* 48,000.

KUMAON, Kumaun (30° N., 79° 20′ E.), division, United Provinces, India; great part occupied by southern Himalayas; forests yield valuable timber. Pop. 1,210,000.

KUMASI, Coomassie (6° 40′ N., 2° 16′ W.), capital, Ashanti, Brit. W. Africa; destroyed by Brit. force under Sir Garnet Wolseley, 1874; again occupied, 1896; Gov. and Brit. force besieged, but relieved, 1900; has fort; trading centre. Pop. (1911) 8853. See Ashanti.

KUMBHAKONAM, Conbaconum (10° 58′ N., 79° 25′ E.), sacred city, Tanjore district, India, in Cauvery delta; formerly capital of Chola kingdom; brass and metal ware. Pop. (1911) 59,673.

KUMISHAH (32° N., 52° 1′ E.), town (and district), Persia. Pop. *c.* 14,000.

KUMTA (17° 43′ N., 74° 11′ E.), town, Bombay, India. Pop. 11,000.

KUMYKS, a Caucasian people subdued by Russia in XVI. cent.

KUNAR (34° 25′ N., 70° 30′ E.), river, Afghanistan; has its source in S. slopes of Hindu-Kush Mountains, and joins Kabul R. near Jelalabad.

KUNDUZ (36° 20′ N., 70° 30′ E.), town and khanate, Afghanistan.

KUNENE (*c.* 17° 20′ S., 11° 40′ E.), river, Angola, S.W. Africa; flows to Atlantic.

KUNERSDORF (52° 22′ N., 14° 37′ E.), village, Brandenburg, Prussia; Prussians defeated by Austrians and Russians, 1759. Pop. 5000.

KUNGRAD (43° 12′ N., 59° 10′ E.), town, Turkestan.

KUNGUR (57° 21′ N., 57° 13′ E.), town, E. Russia. Pop. 15,000.

KUNLONG (23° 23′ N., 97° 50′ E.), ferry and small district, Burma; railway being constructed.

KUOPIO.—(1) (63° 10′ N., 28° 30′ E.) province, Finland; area, 16,500 sq. miles; cereals, cattle, iron. Pop. 314,000. (2) cathedral town; capital of above. Pop. 14,500.

KUPRILI, see Koprülü.

KUPRILI, MUHAMMAD (*c.* 1585–1661), Turk. statesman; app. grand vizier, 1656; put down Spahi revolt; defeated Venetians and took Tenedos, 1657; subdued Transylvania; organised finances. His s. Ahmed (*c.* 1632–76) was also grand vizier; warred against Poles. Another s., Mustafa (d. 1691), was grand vizier in 1689; slain at *Salankamen*. Hussein (d. 1702) was grand vizier under Mustafa II.; negotiated Treaty of Carlowitz, 1699.

KURAKIN, BORIS IVANOVICH, PRINCE (1676–1727), Russ. ambassador at various courts.

KURDISTAN (*c.* 38° N., 43° E.), an extensive mountainous district of W. Asia, S. of Armenia, chiefly round upper reaches of Tigris, belonging partly to Turkey and partly to Persia; area, *c.* 52,000 sq. miles. Great part of surface consists of grass-covered tablelands, where sheep are raised in large numbers; district watered by affluents of Euphrates and Tigris. The inhabitants are the turbulent and almost uncivilised Kurds; they were conquered in turn by Persians, Macedonians, Parthians, Sassanians, Romans, Turks, and are now practically governed by their own tribal chiefs, although owing nominal allegiance to Persia and Turkey. Generally brown in colour and of medium height, they speak a dialect of Persian derivation, and practise a form of Muhammadan religion. The Christians of Armenia have frequently suffered terrible outrages at their hands. The population is between 2 and 2½ millions.

KURDISTAN (35° 40′ N., 45° 40′ E.), mountainous province, Persia.

KURGAN (55° 32′ N., 65° 30′ E.), town, W. Siberia. Pop. 11,000.

KURIA MURIA ISLANDS (17° 30′ N., 56° E.), high rocky islets (British), off Arabian coast.

KURILES (*c.* 47° N., 154′ E.), series of 32 small volcanic islands between Kamchatka and Japan, belonging to latter, to whom they were ceded by Russia, 1875; area, *c.* 6156 sq. miles; largest are Kunashiri, Iturup; generally infested by fog; numerous hot springs; seal-hunting carried on. Pop. *c.* 4500.

KURISCHES HAFF (55° 12′ N., 21° E.), lagoon of Baltic, between Memel and Königsberg.

KURLAND, Courland (*q.v.*).

KURNOOL.—(1) (15° 33′ N., 78° 5′ E.) district,

Madras, India; area, *c.* 7550 sq. miles. Pop. 875,000. (2) (15° 47′ N., 78° 5′ E.) town. Pop. 26,000.

KURO SIWO, warm stream in Pacific Ocean, off Jap. coast.

KUROKI, GENERAL COUNT (1844–), Jap. soldier; general in Chino-Jap. War, 1894, and in Russo-Jap. War.

KUROPATKIN, ALEXEI NIKOLAIEVITCH (1848–), Russ. soldier; Minister of War, 1898; commander-in-chief during Russo-Jap. War; resigned, 1905, owing to continued failure.

KURRACHEE, see KARACHI.

KURRAM (33° 30′ N., 70° 30′ E.), river, N.W. Frontier Province, India; tributary of Indus; gives name to district, with area, 1280 sq. miles. Pop. 56,000.

KURSEONG (26° 55′ N., 88° 18′ E.), sanatorium, Darjeeling, Bengal, India. Pop. 4500.

KURSK.—(1) (51° 20′ N., 36° E.) government, Central Russia; area, 17,937 sq. miles; surface generally level, hills in E.; produces cereals, tobacco, wool, leather. Pop. (1910) 3,016,700. (2) (51° 44′ N., 36° 13′ E.) town; capital of above; Gk. Episcopal see; cathedral. Pop. (1910) 82,530.

KURUBAS, primitive people in S. India.

KURUMAN (27° 19′ S., 24° 16′ E.), town and mission station, Bechuanaland, S. Africa.

KURUMBAS, primitive people in S. India.

KURUNEGALA (7° 30′ N., 80° 30′ E.), town, Ceylon; produces rice, tea. Pop. 6500.

KURUNTWAD (16° 42′ N., 74° 30′ E.), feudatory state, Bombay, India. Pop. *c.* 80,000.

KUSHK (35° N., 62° E.), river, Afghanistan; name also of Russ. military station, Turkestan.

KUSTANAISK, town, Turgai, Asiatic Russia. Pop. 15,000.

KUSTENDIL, see KIUSTENDIL.

KUSTENLAND (*c.* 45° N., 13° 45′ E.), name applied to Istria, Trieste, Görz, and Gradisca, Austria.

KÜSTRIN, CÜSTRIN (*q.v.*).

KUTAIAH, KUTAYA (39° 26′ N., 29° 52′ E.), town, Asia Minor. Pop. 41,000.

KUTAIS (42° 21′ N., 42° 50′ E.), town (and government—area, 8166 sq. miles), Transcaucasia, Russia; ruined cathedral. Pop. (1910) 39,500; (govt.) 990,800.

KUTCH, see CUTCH.

KUT-EL-AMARA (32° 28′ N., 45° 47′ E.), town, Asiatic Turkey.

KUTTALAM (8° 52′ N., 77° 17′ E.), health-resort, Madras, India.

KUTTENBERG (49° 57′ N., 15° 17′ E.), town, Bohemia; disused silver mines; manufactures tobacco, sugar, textiles; old royal castle, several Gothic churches. Pop. (1911) 15,671.

KUWÊT (29° 19′ N., 48° E.), seaport, head of Persian Gulf, Arabia. Pop. *c.* 15,000.

KUZNETSK.—(1) (53° 49′ N., 46° 25′ E.) town, Saratov, Russia. Pop. 22,500. (2) (53° 48′ N., 87° 21′ E.) town, Tomsk, Siberia. Pop. 3500.

KWANGCHOW BAY (21° 28′ N., 109° 35′ E.), bay and harbour, Kwangtung, China; leased to France (1898).

KWANG-SI (24° N., 108° 30′ E.), province, S. China; area, 77,200 sq. miles. Pop. (1910) 5,142,330.

KWANG-TUNG (23° 30′ N., 114° E.), province, S. China; area, 99,970 sq. miles; surface mountainous; capital, Canton; produces silk, tea, sugar, coal, iron, gold. Pop. *c.* 31,865,000.

KWANZA (9° 16′ S., 13° 22′ E.), river, Angola, W. Africa; enters Atlantic.

KWEI-CHOW (27° N., 106° 30′ E.), province, S.W. China; area, 67,160 sq. miles; produces quicksilver. Pop. (1910) 7,650,282.

KYAUKPYU.—(1) (19° 25′ N., 94° E.) district, Lower Burma; area, 4386 sq. miles. Pop. (1901) 172,000. (2) (9° 22′ N., 93° 40′ E.) town, K. Pop. 3500.

KYAUKSÈ (*c.* 21° 42′ N., 97° 12′ E.), town, Burma. Pop. *c.* 6000. District (KO-KAYAING) has area, 1274 sq. miles. Pop. *c.* 145,000.

KYD, THOMAS (1558–94), Eng. dramatist; first important work was *The Spanish Tragedy*, an epoch-making work in the history of play-writing as being the first secular Eng. play with a well-constructed plot. His next surviving work of merit, *Soliman and Perseda*, also a tragedy, showed the same 'blood and thunder' and bombast. The great bulk of K.'s work has perished.

KYFFHÄUSER (51° 26′ N., 11° 6′ E.), forested hills, Thuringia, Germany; ruins of two old castles.

KYLOES, a race of CATTLE (*q.v.*).

KYNETON (37° 14′ S., 144° 31′ E.), town, Victoria, Australia. Pop. 3700.

KYÔTO, KIOTO (*q.v.*).

KYRIE (Gk. 'lord'), words, 'Lord, have mercy upon us,' used in various liturgies.

KYSHTYM (55° 44′ N., 60° 30′ E.), mining town, Perm, Russia. Pop. 13,000.

KYTHAL, see KAITHAL.

L, 12th letter of Eng. alphabet; a 'front palatal,' usually termed a 'liquid'; evolved from Phœnician 'ox-goad' character.

LA BADIE, JEAN DE (1610–74), Fr. theologian; joined Reformed Church; preacher in Geneva, London, and Amsterdam; became severe disciplinarian; believed in communism, and that believers should form a community apart.

LA BOURBOULE, see BOURBOULE.

LA BOURDONNAIS, BERTRAND FRANÇOIS, COUNT MAHÉ DE (1699–1753), Fr. sailor; captured Mahé, Malabar, 1727; commanded fleet in India, 1740–46.

LA BRUYÈRE, JEAN DE (1645–96), Fr. prose author of classical age; advocate in *Parlement* of Paris (1666–73); Treasurer of Finances at Caen (1673–87); tutor to Duke of Bourbon, Great Condé's grandson (1684–86); remained in house of Condé attached to person of Duc d'Enghien, Great Condé's s., and studied the world, which he depicted in his *Caractères* (first edition, 1668). Book contained 420 separate *caractères*, or portraits, or thoughts constituting a whole; the eighth edition, pub. before the author's death, contained 1120 *caractères*. La B. was admitted to Fr. Academy, 1693; depicted his acquaintances with such skill as to win immediate renown; some of his wit keeps its savour, but greater part has perished.

LA CALLE (36° 52′ N., 8° 23′ E.), port, Algeria, N. Africa; coral fishing, sardine trade. Pop. 4700.

LA CARLOTA (10° 22′ N., 122° 54′ E.), town, Negros, Philippine Islands. Pop. *c.* 20,000.

LA CHAISE-DIEU (45° 19′ N., 3° 43′ E.), town, Haute Loire, France; beautiful Gothic church. Pop. 1203.

LA CHARITÉ (47° 11′ N., 3° 2′ E.), town, Nièvre, France; site of famous priory; formerly fortified. Pop. 4000.

LA CLOCHE, JAMES DE (*c.* 1644–69), impostor who claimed to be natural s. of Charles II. of England; came from Jersey to Rome, 1668; by means of forged letters supposedly written by Charles II. obtained money from Oliva, Jesuit general; disowned by Charles, 1669; identity unknown.

LA CROSSE (43° 50′ N., 91° 11′ W.), town, Wisconsin, U.S.A.; railway centre; lumber trade; R.C. episcopal see. Pop. (1910) 30,417.

LA FAYETTE, MARQUIS DE, MARIE JOSEPH PAUL YVES ROCH GILBERT DU MOTIER (1757–1834), Fr. revolutionary; aided Amer. Colonies in War of Independence; on return, promulgated democratic ideas; member of Assembly of Notables, 1787, and advocated summons of States-General; as commander of citizen army established National Guard and originated *tricolor*; helped to form National Assembly; co-founder of *Feuillants* club of moderates, and lost favour of court and people; retired to country; on outbreak of war, app. to command army of Ardennes, and won victories of *Philippeville*, etc.; left France as Jacobins became supreme; thrown into prison by Austrians, and remained captive till 1797, when Napoleon demanded release; upheld Liberal tradition under restored monarchy; leader of revolution, 1830.

LA FAYETTE, MARIE-MADELEINE PIOCHE DE LA VERGNE, COMTESSE DE (1633–93), Fr. novelist; revolutionised novel-writing; chief work, *Princesse de Clèves* (1678); simple, natural style, opposed to grand eloquence of predecessors; had long liaison with La Rochefoucauld.

LA FERTÉ (47° 50′ N., 5° 36′ E.), town, Haute-Marne, France.—**LA FERTÉ ALAIS** (48° 29′ N., 2° 21′ E.), town, Seine-et-Oise, France.—**LA FERTÉ BERNARD** (48° 12′ N., 0° 38′ E.), town, Sarthe, France. Pop. 4500.—**LA FERTÉ FRESNEL** (48° 49′ N., 0° 31′ E.), town, Orne, France.—**LA FERTÉ MILON** (49° 12′ N., 3° 8′ E.), town, Aisne, France; Racine's birthplace. Pop. 6500.—**LA FERTÉ SAINT-AUBIN** (47° 43′ N., 1° 58′ E.), town, Loiret, France. Pop. 3500.

LA FLÈCHE (47° 43′ N., 0° 4′ W.), town, Sarthe, France. Pop. 10,700.

LA FONTAINE, JEAN DE (1621–95), Fr. poet. When twenty-six, he succeeded his *f.* as Maître des Eaux et Forêts at Château-Thierry (his birthplace); the study of animal life occupied him more than survey of the royal grounds, which he nominally performed for twenty years. His friend and protector, Fouquet, inaugurated his poetic celebrity, and received dedication of his first works, *Épîtres* and *Le Songe de Vaux*. When Louis XIV. dismissed Fouquet, La. F. wrote the *Élégie aux nymphes de Vaux*, incurring the king's displeasure. The *Contes*, free and licentious, in mediæval manner, but masterpieces of lightness and grace, commenced to appear, 1665; the famous *Fables* (12 vol's) in 1668. He created a new style of fable, viz. a frame into which poetry as well as satire and comedy could fit, the poetry being of the simplest and least pretentious kind. He took subjects from Æsop and old Fr. *fabliaux*; language, concise and beautiful; uses old words, provincialisms, and even *patois* when it fits his meaning; reproached with want of responsibility in work and life, but successive friends provided him with homes; first Fouquet, and later in life Mme de la Sablière for twenty years; at her death, Mme d'Hervart took in the old poet. He, Racine, Molière, and Boileau, his attached friends, formed famous club of Rue du Vieux Colombier, though La F. cared little for his partners' classical ideals.

LA GRAND' COMBE (44° 16′ N., 4° 2′ E.), town, Gard, France. Pop. 11,500.

LA GRANJA, SAN ILDEFONSO, Span. royal residence, situated on old monastic site among hills of Segovia; palace, dating from 1721, and grounds, among finest in world.

LA GUAIRA, LA GUAYRA (10° 35′ N., 67° 2′ W.), port, Venezuela, S. America; good harbour; exports coffee, cocoa, hides. Pop. *c.* 15,000.

LA GUÉRONOMIÈRE, LOUIS ÉTIENNE ARTHUR DUBREUIL HÉLION, VICOMTE DE (1816–75), Fr. statesman under Napoleon III.

LA HALLE, see ADAM DE LA HALLE.

LA HARPE, JEAN FRANÇOIS DE (1739–1803), Fr. dramatist and critic; disciple and protégé of Voltaire; principal play was *Warwick* (1763); other work poor, but excelled as contemporary literary critic; life of quarrels and hardships.

LA HOGUE, BATTLE OF, actions which took place off Cotentin peninsula, Normandy, May 19 to 23, 1692, ended in defeat of French by Dutch and Eng. allies at La Hogue.

LA LINEA, LA LINEA DE LA CONCEPCION (36° 10′ N., 4° 40′ W.), town, Cadiz, Spain; formerly fortified. Pop. (1910) 33,296.

LA MADDALENA (41° 13′ N., 9° 25′ E.), island and fortress, off Sardinia. Pop. 9400.

LA MARGHERITA CLEMENTE, COUNT (1792–1869), Savoyard politician of strong Catholic and anti-liberal tendencies.

LA NOUE, FRANÇOIS DE (1531–91), Huguenot captain; captured Orleans, 1567; fought in aid of Protestants in Low Countries, 1580.

LA PAZ (16° 27′ S., 67° 52′ W.), department,

Bolivia, S. America; area, *c.* 53,800 sq. miles; produces coca, coffee, rubber, copper, tin. Pop. (1910) *c.* 517,000.

LA PAZ, La Paz de Ayacucho (16° 29′ S., 67° 59′ W.), capital, Bolivia, S. America; important commercial city; copper, alpaca, wool, cinchona; contains an unfinished cathedral. Here Spaniards were defeated by revolutionaries during War of Independence. Pop. *c.* 80,000.

LA PÉROUSE, JEAN FRANÇOIS DE GALAUP, Comte de (1741–88), Fr. explorer; destroyed Eng. forts in Hudson's Bay, 1782; sought N.W. Passage, 1785–88, after which he was no more heard of till 1826, when remains of expedition were found.

LA PLATA (35° S., 57° 56′ W.), town, Argentina, S. America; harbour; manufactures cottons, woollens; seat of univ. Pop. (1910) 95,000.

LA PORTE (41° 32′ N., 86° 30′ W.), town, Indiana, U.S.A.; manufactures woollens; large ice trade. Pop. (1910) 10,525.

LA RÉOLE (44° 35′ N., 0° 2′ W.), town, Gironde, France; formerly fortified. Pop. 3500.

LA RÉVELLIÈRE-LÉPEAUX, LOUIS MARIE DE (1753–1824), Fr. revolutionary leader; pres. of Assembly, 1795; left public life after end of First Republic.

LA ROCHE (50° 11′ N., 5° 34′ E.), town, Belgium. Pop. *c.* 2500.

LA ROCHEFOUCAULD, FRANÇOIS DE (1613–80), Fr. author; descendant of one of greatest Fr. families. As Prince de Marcillac spent first part of his life in plots against Richelieu and Mazarin; left ill and ruined after Civil War of *Fronde*; retired for ten years to his castle, where he wrote his *Memoirs*; at fifty returned to society at Madame de Sablé's *salon*. Apothegms being then the fashion, La R. for ten years composed and improved with help of the *Précieuses* his own famous *Maximes* (1665), which still retain charms of wit, paradox, and sense of spacious intellect.

LA ROCHEFOUCAULD-LIANCOURT, FRANÇOIS, DUC DE (1747–1827), Fr. philanthropist; fled at Revolution; visited U.S.A., 1795–97, and pub. account; returned under Napoleon, and laboured at introduction of vaccination; established first Fr. savings-bank.

LA ROCHEJACQUELEIN, DE, Fr. family; Royalists during and after Revolution. Henri, Comte de la R. (1772–94), headed Vendéan rising. Louis, Marquis de la R. (d. 1857), tried to organise another Vendéan rising, 1815.

LA ROCHELLE (46° 9′ N., 1° 9′ W.), port, W. France; episcopal see; has old episcopal palace now used as museum, and XVIII.-cent. cathedral; strongly fortified; was Huguenot stronghold in XVI. and XVII. cent's, and successfully resisted siege in 1572–73. Manufactures glass, cotton yarns, brandy; shipbuilding. Pop. (1911) 36,371.

LA ROCHE-SUR-YON (46° 40′ N., 1° 27′ W.), town, Vendée, France. Pop. 14,000.

LA SALLE (41° 19′ N., 89° 1′ W.), town, Illinois, U.S.A.; cement works, zinc smelting. Pop. (1910) 11,537.

LA SALLE, or SALE, ANTOINE DE (*c.* 1398–*c.* 1461), Fr. poet; completed *Petit Jehan de Saintré*, 1456, a skilful satire on mediæval chivalry; reputed author of anonymous masterpieces of Middle Ages—*Les cents nouvelles nouvelles*, stories of kind of *Decameron*, and *Les Quinze joies du mariage*.

LA SALLE, RENÉ ROBERT CAVELIER, SIEUR DE (1643–87), Franco-Canadian traveller; b. Rouen; set out on expedition to discover mouth of Mississippi, 1678; crossed Canada to Lake Michigan, erecting forts; occupied Arkansas, entered valley of Illinois, descended Mississippi to Gulf of Mexico (1682), naming province through which it flowed *Louisiana*; returned, 1684, to found port at mouth of stream; small colony failed and L. S. was murdered by a follower.

Parkman, *La Salle and the Great West.*

LA TOUR D'AUVERGNE, THÉOPHILE MALO (1743–1800), Fr. grenadier; distinguished in wars, 1792–1800; wrote on Breton language; killed at Oberhausen.

LA TRÉMOILLE, Fr. family, several of whose members have been distinguished in history.

LA UNION.—(13° 19′ N., 87° 49′ W.) port, Salvador, Central America. Pop. *c.* 5000. (2) (37° 34′ N., 0° 50′ W.) town, Spain; iron mines. Pop. (1910) 29,599.

LA VALLIÈRE, LOUISE FRANÇOISE DE (1644–1710), mistress of Louis XIV.; superseded by Mme de Montespan; retired to Carmelite Convent, 1674.

LA VOISIN, Catherine Monvoisin (d. 1680), Fr. witch; concocted love powders, etc.; executed for complicity in plot to poison Louis XIV.

LAACHER SEE (50° 26′ N., 7° 25′ E.), lake, Rhenish Prussia, Germany; to W. is Benedictine monastery.

LABEL, see Heraldry.

LABIATÆ, herbaceous dicotyledons, with square stem and paired, decussate leaves, each pair borne at right angles to adjacent pairs; vegetative parts possess glandular hairs containing a volatile oil, often with characteristic odour (mint, lavender); inflorescence is cymose, the units often being sessile, and forming a verticillaster; flower is pentamerous and zygomorphic, with four stamens and a bicarpellary ovary, which forms four nutlets at maturity.

LABICHE, EUGÈNE MARIN (1815–88), Fr. dramatist; wrote with extraordinary success plays, half comedy, half farce, in which he embodied real individuality; became member of the Academy; pub. great number of farces, acted publicly and privately. Chief works—*Le Chapeau de Paille d'Italie* (1851), *Le Voyage de Monsieur Perrichon* (his masterpiece, 1860), *Célimare le Bien-Aimé* (1863), *La Cagnotte* (1864).

LABICI (41° 47′ N., 12° 45′ E.), old town, Latium, Italy; on site is modern Monte Compatri.

LABIENUS, TITUS, Rom. soldier and statesman; at first on Cæsar's side in Civil War, then joined Pompeius; killed, 45 B.C.

LABLACHE, LUIGI (1794–1858), operatic singer (bass); b. Naples; sang in Paris; Queen Victoria among pupils.

LABOUR, work, hard work, more usually manual work, especially such as is done for an employer. Interference with the right of free contract between employer and labourer in the latter's interest is a mark of socialism to be found in most modern states, but particularly in Great Britain. The democracies of antiquity employing slave labour were not faced with the problem of the exploitation of the free human unit of the State; and Teutonic tribes who settled in the Rom. Empire had a fixed custom as to services both before and after the evolution of the feudal system. Mediæval towns set a precedent of future State regulation of labour; rich tradesmen and craftsmen of a borough purchased a charter from its owner, by virtue of which they regulated their own affairs; every detail of communal life was regulated by the burgesses as exactly as every detail of manorial life was regulated by the feudal system; at the same time, nearly every town was a scene of conflict between burgesses and the unenfranchised population, who met with varying success in protecting their own interests.

First great Eng. labour laws are the *Statutes of Labourers*, 1351. The Black Death, which wiped out nearly half the population, threw out of gear municipal and manorial systems. Labourers, in novel position of being able to command prohibitive wages, were forced by law to accept a definite sum. This fixed amount became a terrible injustice by Tudor times, when prices had gone up and the currency was usually debased. To further ensure supply of labour it was also enacted by these statutes that branding should be the punishment for breach of contract by labourers, and fines be imposed on towns harbouring runaways. Statute of 1465 contained a measure for protection of workers, ordaining that payment should be in money, not in kind. Tudor

legislation was extraordinarily harsh against vagrants. In 1563 Parliament again enacted fines for giving or receiving higher than legal wage, and for first time State imitated towns in interfering with hours of labour, twelve hours being fixed as minimum in summer. Justices of the peace were given power of fixing wages locally.

The *Poor Law* of 1601 (in force till 1814) regulated apprenticeship, hours of labour, wages, settlement of disputes, etc. Tyranny of justices of the peace remained a great feature of Eng. country life till XIX. cent. General effect of Elizabethan legislation was that labour regulations, previously local, became nationalised. National control of labour remained principle of government, but became difficult to enforce in altered commercial conditions of modern times. The idle poor formed a considerable and tolerably immune body in XVII. and XVIII. cent's, while the State permitted the grave scandal of child labour.

In XIX. cent. it has been deemed expedient to keep down idleness merely by restrictions on begging. Penalty of breach of contract is no longer flogging or penal servitude, but simply a matter of damages. Workers have become free to emigrate. Growth of democracy has brought principle of protection of worker into foreground. The movement started in great industrial towns of north. Manchester Board of Health (established, 1795) drew up resolutions as to employment of children; embodied in first *Factory Act*, 1802, which enforced maximum hours of labour, sanitary conditions of work, etc., and provided for education, etc., of child operative. Terrible poverty of weavers after cheapening of cloth by introduction of machinery caused them to petition for *minimum wage*, which they claimed by Act of 1563; Parliament, swayed by economical policy long known as *laissez-faire*, replied by repeal of said Act, 1813, and in 1814, through pressure of the manufacturers, repealed Elizabethan law as to apprenticeship on which weavers sought to insist. Government preferred pauperising population to artificial regulation of wages, while labouring population commenced agitation for minimum wage as keen as XIV.-cent. employers for maximum wage. *Strikes* (see below) became political factors. *Laissez-faire* went out of fashion through preaching of Carlyle, but already philanthropists, led by Robert Owen, had forced government's hand. The Factory Act of 1802 allowed evasions; a second Act of 1819 ameliorated conditions of child labour; commission of 1833 revealed serious evils in factory system, and new Act limited hours of infant labour and appointed for first time local inspectors under central board; the last Act was made applicable to women, 1844; *Ten Hours Bill* for women and children, 1847, was amended, to avoid abuse of relay system, 1850; commission, 1843, made favourable report on conditions of agricultural labour; factory regulations applied to mines, 1842; *Mines Acts*, 1872, 1886–87, 1903, 1906, 1908, protect as far as possible life and health of miners, and Act of 1912 ensures miners a minimum wage.

Other manufactures besides weaving had now passed from cottage to steam-factory, and, with co-operation of employers, who found that they gained in end, were brought under State control. Bleaching and dyeing works, lace factories, bakehouses, etc., were brought under factory law, 1860–63, pottery, etc., 1864; regulations to protect workers in industries dangerous to health, 1864; *Sanitary Act*, 1866, to apply to trades not regulated by previous Acts; *Factory Act Extension Act*, 1867; *Workshops Regulation Act*, 1867, establishing special supervision of employment of women and young persons, amended, 1870; *Factory Act*, 1874, made 10 years minimum age; commission, 1876, made report which resulted in consolidation and amendment of previous measures by *Factory and Workshop Act*, 1878. Act of 1878 and succeeding Acts apply to textile factories, the various factories which produce iron, paper, etc., and workshops (distinguished from factories by non-employment of mechanical motor force) of which three kinds are recognised: (1) the ordinary workshop; (2) workshops in which women (that is, females above 18) are engaged; (3) family workshops, the room in which a person plies his handicraft at home.

This Act, with considerable additions, remained in force till new Act of 1901. In interim a great attempt was made to deal with *sweated industries*, inspection of home industries, regulation of hours of labour, and reform of sanitary conditions. Acts of 1883, 1889, 1891, 1895, laid down rules as to destruction of poisonous waste products, temperature and humidity of workrooms, space requisite for worker, ventilation, precautions against accidents, etc.; women inspectors were introduced, 1893; Act of 1895 brought laundries, wharves, buildings in process of construction, etc., under Factory Acts, restricted employers' practice of putting out work by stricter inspection of domestic workshop, and abolished *overtime* for young persons.

Act of 1901 forbids employment of child under 12, codified, with amendments, previous laws, and put factories under control of local district council instead of continuing direct supervision of Home Office; *Employment of Children Act*, 1903; *Accidents Act*, 1906; further *Factory and Workshop Act*, 1907, touching laundries; *Employment of Women Act*, 1907 Latest legislation is extension of principle of employers' responsibility for accidents incurred while in their employ or while employee is coming to or going from work (see EMPLOYERS' LIABILITY). Acts, 1892–99, limit hours of shop assistants under 18 to maximum of 74 weekly, including hours of meals, and enforce provision of seats for female assistants; early closing order may be obtained by local authority. *Truck Acts* were passed, 1831, 1874, 1887, and 1896, to prevent employees being deprived of their wages by intrigues of employer; but large classes are still unprotected.

The U.S.A., like Great Britain, repressed the labourer till the introduction of the modern commercial system and rise of modern democracy. Legislation dates from 1836 in Massachusetts, which was followed by other states, but in none are there the minute regulations of Britain. Age limit varies between 10 and 14 in various states, and where hours are state restricted between 12 and 21. Many states probibit employment in factories and workshops of illiterate under (c.) 16; hours of women and children generally restricted to from 6 to 11 per day; Sunday labour almost universally prohibited and employment of women and children in mines and other dangerous places. Principle of employer's liability generally enforced, and hours and conditions of labour controlled. Germany's industrial enactments are very similar to Britain's. All European countries now regulate employment of women and children, and Austria, Russia, and Switzerland have followed France in enactment of maximum day's work for adults.

Labour Church, The, a Socialist religious organisation without theological basis, founded in Manchester, 1891.

Labour Colonies relieve workers in exchange for work. In Britain Salvation Army Colony at Hadleigh and Central Body for London at Hollesley Bay train men in agricultural work. Belgium and Switzerland force vagrants to enter l. c's; so also Holland, where provision is made for settling whole families. In Germany a non-compulsory system obtains.

Labour Day, LABOR DAY, legal holiday in U.S.A. and Canada (1st Monday in Sept.) and in Australian States (varying dates); observed on May 1 in Europe by Labour demonstrations.

Labour Disputes.—A Strike is the refusal of the labourer to continue at work, while a Lock-Out is the refusal of the employer to allow the labourer to remain at work. A strike often provokes a lock-out, which in turn provokes a still more extensive strike. For instance, on the strike of a body of workmen at a

particular factory, all the employers federated in that industry will frequently respond by announcing a general lock-out until the strikers return to work; and the strikers will answer this by calling out the workmen in kindred trades. With the creation of employers' federations and the organisation of trade unionists into federations, the tendency is on both sides to avoid strikes and lock-outs and to rely on arbitration for the settlement of disputes. On the other hand, these federations make all serious disputes a far more severe struggle when once the strike or lock-out has been declared.

Certain workmen, distrusting Parliament as an agency for the amelioration of the labourer's lot, believe in the *general strike*, i.e. a strike not confined to one trade but of all sorts and conditions of employees, for compelling attention, sympathy, and redress of grievance, and there are employers who at times, when stocks have accumulated, are glad of a stoppage of work and welcome an excuse for a lock-out. See SYNDICALISM.

In France, Russia, Finland, Austria, Sweden, Norway, and Italy, the 'general strike' has been adopted at various times, and with varying degrees of success, for some purely political purpose, commonly the granting of the franchise or other constitutional change. In Britain the political strike is unknown, and the 'general strike' has hitherto been a very limited affair confined to workmen of the carrying trades and miners. The *sympathetic strike* takes place when workmen, with no particular grievance of their own, cease work to support other workmen already on strike. Carters, for example, will strike on sympathy when dock labourers are on strike, rather than remove goods unloaded by non-union labour. To conduct a strike successfully the strikers' places must not be filled, and *picketing* is the chief means to prevent employers obtaining the services of other persons (*blacklegs* or strike-breakers) at such times. Picketing is permitted by law on certain conditions. So long as the pickets do not intimidate, annoy, or use any physical force, they are acting within their rights, and there are no grounds for a criminal prosecution. Intimidation in this connection, however, includes the threat of physical violence, and it rarely happens that a strike takes place without charges of intimidation being brought against strikers.

The strike itself—that is, the decision agreed upon by a united body of workmen to cease work—was treated as a criminal offence over and over again in Great Britain in the XIX. cent., and as late as 1867 Baron Bramwell laid down in *Regina* v. *Druitt*: 'An agreement for co-operation against liberty of mind and freedom of will, irrespective of any intimidation or physical coercion, is a criminal conspiracy.' This comprehensive dictum fairly summarised the legal opinion of the day, and led to the appointment of a Royal Commission. Following the report of this Commission, a change in the law took place, and the Conspiracy and Protection Act of 1875 declared that: 'An agreement or combination of two or more persons to do or procure to be done any act in contemplation or furtherance of a trade dispute between employers and workmen, shall not be indictable as a conspiracy if such an act by one person would not be punishable as a crime.'

Strikes and lock-outs have taken place from time immemorial, and for all manners of reasons. Nowadays the principal reasons for the strike are the desire for shorter hours and better wages, or the resolve to resist a reduction of wages and a longer working day. Other causes are the determination to obtain recognition of the trade union (so that employers shall bargain collectively with the workmen through the accredited representatives of the latter), to prevent the employment of non-unionists, to defend trade union rules and customs, and to obtain the dismissal of some unpopular foreman or official.

Since the general public, and large numbers of persons in no way responsible for the strike or lock-out, often suffer hardship by the stoppage of work, it is urged that strikes and lock-outs should be declared illegal, at least until both parties in dispute have carried the case before a Court of Arbitration. It is also urged that obedience should be compelled to the decisions of the Court of Arbitration. Compulsory arbitration is, in fact, the law in New Zealand and elsewhere, but in Great Britain there exists on the side of both employers and employed a strong feeling against State interference. See TRADE UNIONS, ARBITRATION.

Howell, *Conflicts of Capital and Labour* (1890); Webb, *History of Trade Unionism, Industrial Democracy.*

Labour Exchanges, State bureaus (established in Britain by Act of 1909) where unemployed persons can register their names and occupations, and to which employers in need of labour apply. Labourers are transferred by means of the Exchanges from districts where no labour is wanted to districts where there is a shortage.

LABRADOR (*c.* 55° N., 63° W.), great peninsula, N. America, between Hudson Bay and Strait and Gulf of St. Lawrence; narrow strip of coast from Cape Chudleigh to Strait of Belle Isle is under Newfoundland government; remainder assigned by Dominion of Canada to Quebec which incorporated Ungava (*c.* 450,000 sq. miles) in 1912. Surface is mainly a plateau, 2000 ft. above sea-level; area, *c.* 520,000, sq. miles; crossed b
Bay. Along Atlantic coast cod, salmon, and herring fishing and sealing are important industries in summer. Pop. *c.* 15,000. L. was acquired by Britain in 1763. Part controlled by Newfoundland has area of 120,000 sq. miles. Pop. (1910) 4076.

Gosling, *Labrador* (1910).

LABUAN (5° 25′ N., 115° 18′ E.), island and Brit. crown colony, off N.W. Borneo, Malay Archipelago; produces large quantities of sago; considerable transit trade between Borneo and Singapore; acquired by Britain, 1846; incorporated with Singapore, 1907. Pop. (1911) 6546.

LABURNUM (*Laburnum vulgare*), a small tree with tripartite leaves, frequently cultivated for drooping, showy inflorescence of bright yellow flowers; all parts poisonous.

LABYRINTH, a maze or series of intricate passages through which it is difficult to find one's way. The L. of Crete was said to have been built by Dædalus for King Minos. Here was kept the Minotaur (*q.v.*). The Egyptian L. was situated not far from Crocodilopolis, above Lake Moeris in the district of the Fayum. It contained about 3000 rooms, and was half under and half above the ground. It was visited by Herodotus and Strabo, and was mentioned as one of the wonders of the world. The Clusium L. in Italy was built by the Etruscans as a sepulchre for King Porsenna. L's were also in existence at Lemnos and Samos, but their sites have not been discovered. Other l's existed at Nauplia, Sypontium, Italy, and at Val d' Ispica, Sicily.

L's in gardens are known as mazes, and are generally constructed of privet hedges so arranged that it is difficult for the visitor to find his way to the centre, or out again. The most famous is the Maze at Hampton Court, London.

LABYRINTHULIDEA, a Protozoan consisting of a naked mass of living matter, containing many nuclei and giving rise to numerous fine anastomosing processes —pseudopodia.

LAC, resinous exudation produced by insect puncture from branches of certain East. Ind. trees; becomes *shellac* when purified by water.

LACAILLE, NICOLAS LOUIS DE (1713–62), Fr. astronomer; made catalogue of 10,000 stars of southern hemisphere; numerous works on geometry, astron., and optics.

LACAITA, SIR GIACOMO (1813–95), Ital. politician; Neapolitan scholar; friend of Gladstone; gave important aid in England to Ital. freedom.

LACCADIVE ISLANDS (11° 20′ N., 72° 30′ E.), group of 14 coral islands in Ind. Ocean, off W. coast of Madras; area, *c.* 78 sq. miles; discovered by Vasco da Gama, 1498; belong to Britain; produce cocoanuts, coir, bananas, tortoise-shell. Pop. 10,500.

LACCOLITE, name given by Gilbert to intrusive igneous rocks which cover only a comparatively small area, but are very thick, as in Henry Mts., Utah (area, 5 miles, and thickness, 5000 ft.); also applied to intrusive rocks like gabbro masses in Isle of Skye, and granite masses in Cornwall.

LACE is an ornamental design carried out in linen, silk, cotton, gold, silver, or composite thread. It is made by needle, pillow and bobbins, or machinery. The products of the two first methods, *i.e.* 'needle-point' and 'pillow-lace,' are known as 'real' lace. The art of l.-making seems to have been learned by Venice from the East, and was a natural development as a branch of embroidery. Point l., the first appearance, originated from (1) the darning of patterns on fine net. This was called by the Italians *punto a maglia*, by the Fr. *lacis*, whence our 'lace.' In both point and pillow lace many succeeding kinds have a net background, others, such as guipures, being without. The net background of l. is known as *réseau*, or, when spotted, *réseau rosacé*. The design is worked on the *réseau* with the needle or stitched on it (*appliqué*) after completion. Other sources of l. were (2) cut-work (Ital. *punto tagliato*) and drawn-thread work (Ital. *punto tirato*)—these, now more usually classified as embroidery, were then embellished with embroidery; and (3) simply twisted threads used for personal decoration and known as l's.

The most fashionable of l's at the present moment is Venetian point. Irish point is highly prized, and artificial efforts are being made to stimulate the general production of Irish l., and train the peasants in design. Pillow-l., invented in either Italy or Flanders, was produced in the early XVI. or possibly late XV. cent.; a Flemish painting of this date (variously ascribed to Quentin and Jean Matsys) has the added interest of showing this occupation. The pattern is placed on a pillow on the l.-maker's lap, and the l. is made by plaiting and twisting threads with the aid of bobbins and pins. The background of either kind is now always made with machinery. The reticulated l., so-named because its design was based on the square or oblong of the old drawn or cut work, characterised late XVI. and early XVII.-cent. l. It was only in the XVII. cent. that the worker's skill sufficed for the introduction of Renaissance ornament; the circle and classical scroll (particularly suitable for borders) with rosette and leafage almost entirely replaced the square as the foundation of the design. The garland, shell, and other devices, which afterwards became a matter of mechanical imitation, also appeared, while at the same time every delicate design of free foliage was evolved. Louis XIV. gave great encouragement to this industry, and in the second half of this cent. Alençon and other Fr. towns won their fame. Venice l. of the XVIII. cent. retained its excellency, but, like most Fr. ornament of this period, Fr. l. became both trivial and heavy, and the simple Valenciennes little made up for the lost glories of point d'Alençon or point d'Argentan. Brussels, Mechlin, and Honiton pillow-l's are famous varieties.

The growing dislike to mechanically wrought ornament is especially strong with regard to l., but as l. is worth more than its weight in gold, the manufacture of the spurious article has brought great wealth to towns like Nottingham in England and Calais in France. In the middle of the XVIII. cent. the stocking-frame was modified by a Nottingham knitter called Hammond for the manufacture of l. In 1809 Heathcote invented a bobbin-net machine which, with the subsequent improvements of Leavers and others, is still used. Samuel Hall introduced the 'gassing' process, by which cotton is made to resemble linen, in the middle of the XIX. cent.

Pollen, *Seven Centuries of Lace* (1908); A. M. S., *Point and Pillow L.* (1899); Channer and Roberts, *Lace-Making in the Midlands* (1900).

LACEDÆMON (37° 5′ N., 22° 30′ E.), department, S.E. Peloponnesus, Greece; formerly another name for Laconia. Pop. 90,000.

LACÉPÈDE, COMPTE DE, BERNARD GERMAIN ÉTIENNE DE LA VILLE (1756–1825), Fr. scientist, especially interested in various branches of zoology.

LACERTÆ, see LIZARDS.

LACE-WING FLIES, GOLDEN-EYE FLIES, STINK FLIES (*Chrysopidæ*), a family of Neuropterous insects with delicate bodies and shining golden eyes. The adults, which are probably protected by their unpleasant smell, are voracious, and, like the larvæ, render service by destroying large numbers of green fly and plant lice; common in Britain and widely distributed throughout the world.

LACHES, legal term for negligence or dilatoriness in the performance of an act which a man is bound by law to perform.

LACHINE (45° 28′ N., 73° 40′ W.), town, Quebec, Canada; connected with Montreal by L. Canal. Pop. 5600.

LACHISH (31° 34′ N., 34° 45′ W.), town, Palestine; remains of eight different cities have been excavated; ruined by Joshua in Old Testament times.

LACHMANN, KARL KONRAD, FRIEDRICH WILHELM (1793–1851), Ger. philologist; pub. an edit. of the *Nibelungenlied*; most famous work was an examination of the *Iliad*, which he divided into 16 independent lays.

LACINIUM (39° 4′ N., 17° 13′ E.), cape, Italy; site of celebrated temple of Hero Lacinia, of which one column remains; modern, Capo delle Colonne.

LACONIA (43° 25′ N., 71° 28′ W.), town, New Hampshire, U.S.A.; summer resort; manufactures hosiery. Pop. (1910) 10,183.

LACORDAIRE, JEAN BAPTISTE HENRI (1802–61), Fr. Dominican theologian; first trained for law, then entered the Church; joined Lamennais in democratic and Catholic propaganda, but met with censure of ecclesiastical authorities; renowned preacher in Paris.

LACQUER, LACKER.—(1) shellac varnish for metals; prevents tarnishing. (2) varnish of Jap. *lacquer-ware*; juice of l. tree. See JAPANNING.

LACRETELLE, PIERRE LOUIS DE (1751–1824), Fr. politician; wrote *Fragments politiques et littéraires.*—JEAN CHARLES DOMINIQUE (1766–1855), his bro., wrote histories of Revolution, etc.

LACROIX, PAUL (1806–84), Fr. writer, under pseudonym P. L. JACOB, BIBLIOPHILE, of many hist. romances, plays, histories, biographies, etc.; chief merit lies in his history of Fr. manners from Middle Ages onward.

LACROMA (42° 37′ N., 18° 7′ E.), island, Adriatic Sea, belonging to Austria.

LACROSSE, a Canadian ball-game; played with a long stick (5 to 6 ft.) looped at the end and strung, like a tennis-racquet, with deerskin. The ball is scooped up and carried on the stick and passed by tossing, but it must not be touched with the hand or foot.

LACTANTIUS FIRMIANUS (*c.* 260–*c.* 340), Christian apologist of IV. cent.; great work is the *Divinarum Institutionum libri vii.*; his pure style won him the title of *The Christian Cicero.*

LACTEALS, see LYMPHATIC SYSTEM.

LACTIC ACIDS, α-hydroxypropionic acid (ethylidene lactic acid)$=CH_3.CHOH.COOH$. Dextro form in sour milk, levo form in meat extract. β-hydroxypropionic acid (ethylene lactic acid)$=CH_2OH.CH_2.COOH$.

LACY, FRANZ MORITZ, COUNT (1725–1801), Austrian soldier; served in War of Austrian Succession and Seven Years War; distinguished at Breslau, 1757; associated with Daun, field-marshal, 1766; reformed army.

LADAKH AND BALTISTAN (32° 30′ to 36° N.,

75° 35′ to 80° 30′ E.), province, Kashmir, India. B., the northern part, lies between Karakoram and Himalayas, and is crossed by Indus and its tributaries; contains Mt. Godwin Austen and other high peaks; capital, Skardu. L., southern part, is also drained by Indus and is crossed by various ranges connecting Himalayas with Kuen-Lun; capital, Leh. Province produces fruits, cereals, gold; sheep and goats raised. Inhabitants are of Tibetan stock. Pop. 170,000.

LADISLAUS, see WLADISLAUS.

LADISLAUS I., ST. (1040–95), king of Hungary, 1077; greatly strengthened Hungarian monarchy.

LADISLAUS IV. (1262–90), king of Hungary; succ., 1272; reign marked by civil wars; defeated Rumanians, 1282, who subsequently murdered him.

LADO ENCLAVE (*c.* 5° N., 30° 15′ W.), province, Anglo-Egyptian Sudan, adjoining Albert Nyanza; area, *c.* 15,000 sq. miles; formerly leased by Leopold II. of Belgium, after whose death it was restored to Anglo-Egyptian Sudan; crossed by two ranges of *mts.* and by Nile, Yei, and other rivers. Pop. *c.* 250,000.

LADOGA (60° 45′ N., 31° 30′ E.), lake, N.E. Russia; largest in Europe; area, nearly 7000 sq. miles; receives surplus water of Lakes Onega, Ilmen, Saima; entered by over sixty rivers; discharges by Neva into Gulf of Finland.

LADRONES, MARIANNES (*q.v.*).

LADY-BIRDS, see under POLYMORPHA.

LADY CHAPEL, one built in Gothic cathedrals generally east of the choir, and dedicated to the Virgin.

LADYBANK (56° 17′ N., 3° 7′ W.), town, Fifeshire, Scotland; coal, linen.

LADYBRAND (29° 6′ S., 27° 30′ E.), town, Orange Free State Province, S. Africa. Pop. 4000.

LADY'S MANTLE (*Alchemilla*), plant of order Rosaceæ (*q.v.*). Common L. M. (*A. vulgaris*) is a Brit. wayside yellowish flower.

LADYSMITH (28° 18′ S., 29° 43′ E.), town, Natal, S. Africa; named after wife of Sir Harry Smith (*q.v.*); memorable for Brit. defence, under General White, against Boers, Nov. 1899 to Feb. 1900, when relieved by Buller. Pop. (1911) 5595.

LÆLIUS, name of plebeian Roman *gens*. CAIUS LÆLIUS (*c.* 235–170 B.C.) won victories over Carthaginians and Numidians. His son, CAIUS LÆLIUS SAPIENS, consul 140 B.C., is prominent figure in Cicero's writings.

LAFAYETTE (40° 22′ N., 86° 51′ W.), town, Indiana, U.S.A.; has univ.; manufactures machinery, beer, flour, soap. Pop. (1910) 20,081.

LAFFITTE, JACQUES (1767–1844), Fr. financier-statesman; gov. of Bank of France, 1814; trusted agent of both Napoleon and Louis XVIII.; aided Revolution and became Premier, 1830; bankrupt.

LAFONTAINE, SIR LOUIS HIPPOLYTE, Bart. (1807–64), Canadian statesman; led Fr. Canadians; twice Premier; Chief Justice, Lower Canada, 1853.

LAGASH, ruins near Shatra, Asiatic Turkey, where remains of fortress, temple, and other buildings have been excavated, and many inscriptions, statues, and miscellaneous objects found. L. was an important centre of Sumerian culture in very early times.

LAGHMAN (*c.* 34° N., 69′ E.), district, Afghanistan; produces rice, sugar.

LAGOMORPHA, a sub-order of RODENTS (*q.v.*).

LAGOS (*c.* 6° 57′ N., 4° 10′ E.), province, Brit. S. Nigeria, W. Africa, bordering on Bight of Benin, between Dahomey and the eastern and central provinces of S. Nigeria, and with N. Nigeria to N.E.; area, *c.* 28,600 sq. miles; coastal regions low-lying, interior hilly; crossed by no streams of importance; climate unhealthy; mean temperature, 82° Fahr.; rainfall, *c.* 74 inches.

L. was a separate Brit. crown colony, including island and protectorate of L. from 1886 till 1906, when it was united with S. Nigeria in one colony and protectorate. Largest towns are Ibadan, Abeokuta, and Lagos. L. produces palm oil and kernels, rubber, cotton, ivory, timber, cocoa, coffee, tobacco, hides; crossed by several railway lines; administered by Provincial Commissioner. Native inhabitants are of negro stock. Pop. (1911) 2,152,848. See NIGERIA.

LAGOS (6° 28′ N., 3° 38′ E.), port, capital of S. Nigeria, W. Africa, on L. island; only good harbour within 1000 miles; mole under construction. Pop. (1901) 41,847.

LAGOS (37° 10′ N., 8° 37′ W.), port, S. Portugal; fortified; fine harbour; British defeated Fr. fleet in L. Bay, 1759. Pop. 8500.

LAGRANGE, JOSEPH LOUIS, COMTE (1736–1813), famous mathematician; b. at Turin, but of Fr. extraction (grandson of Descartes); prof. of Geometry at Turin Royal Artillery School at age of eighteen; app. by Frederick the Great to succeed Euler as director of Berlin Academy, 1759; went to Paris, 1787, and stayed there throughout Revolution, though in danger; loaded with honours by Napoleon; buried in Panthéon. His work on the *Nature and Propagation of Sound*, and invention of the *Calculus of Variations*, when only twenty-four, proved his wonderful abilities of analysis, and placed him at a very early age in the front rank of mathematicians. On five occasions he was awarded the prize of the Paris Academy for treatises on astronomical problems. In his *Méchanique Analytique*, he reduced mechanics to mere math's, and in his treatise on the *Libration of the Moon* he was the first to show the great use to which the principle of virtual work could be put.

LAGUERRE, JEAN HENRI (1858–), Fr. statesman.

LAGUNA, LA LAGUNA (28° 33′ N., 16° 29′ W.), cathedral town, Teneriffe, Canary Islands. Pop. *c.* 13,500.

LAHN (50° 19′ N., 7° 55′ E.), river, Germany; unites with Rhine.

LAHORE (31° 33′ N., 74° 16′ E.), town, district, and division, Punjab, India. Town is railway centre; has ancient Hindu temple, Muhammadan mosques, Anglican cathedral; site of Punjab Univ.; encircled by walls; manufactures textiles, carpets; flourished under Moguls, especially under Akbar, XVI. cent.; taken by Sikhs, 1758; became capital of Brit. Punjab province, 1849. Pop. (1911) 228,687. L. district has area of 3700 sq. miles. Pop. 1,168,000. L. division has area *c.* 17,000 sq. miles. Pop. *c.* 5,600,000.

LAHR (48° 20′ N., 7° 52′ E.), town, Baden, Germany. Pop. (1910) 15,191.

LAIBACH (46° 3′ N., 14° 31′ E.), capital, Carniola, Austria; iron trade, bell foundries, textile manufactures; cathedral, episcopal see. Conference held here, 1821, to consider Ital. affairs resulted in Britain dissociating herself from Austria, Russia, and Prussia on question of right of Powers to interfere in case of revolutions. Pop. (1910) 41,727.

LAING, ALEXANDER GORDON (1793–1826), Scot. soldier and traveller; employed in African commercial expedition, 1822; sought source of Niger, and increased knowledge of its basin; slain by natives in second expedition.

LAING, DAVID (1793–1878), Scot. antiquary; sec. to Bannatyne Club; librarian, Edinburgh Signet Library; edit. poems of Dunbar, Henryson, Lyndesay, and works of Knox.

LAING, MALCOLM (1762–1818), wrote various works on history of Scotland.

LAING'S NEK (27° 25′ S., 29° 40′ E.), defile in Drakensberg Mountains, Natal, S. Africa, where Boers defeated British, 1881.

LAIRD, MACGREGOR (1808–61), b. Greenock; founder of Brit. commerce with Niger; pub., with Oldfield, *Narrative of Expedition into the Interior of Africa*; founded shipping line.

LAISANT, CHARLES ANNE (1841–), Fr. soldier, statesman, and scientist.

LAISSEZ-FAIRE, phrase in politics meaning policy of competition without State interference.

LAI-YANG (37° 5′ N., 120° 48′ E.), walled town, Shan-tung, China. Pop. *c.* 50,000.

LAKANAL, JOSEPH (1762–1845), Fr. politician; member of Committee of Public Instruction, 1793; subsequently pres. of Education Committee; advocated national education.

LAKE, portion of water surrounded by land. **Fresh-Water Lakes** may be formed by (1) volcanic action—*Crater l's*; (2) obstruction—landslips, glaciers, river débris, etc.; (3) sinks, where soluble rocks disappear beneath earth surface; (4) rivers which dissolve limestone in its bed; (5) glacial movement; (6) earth movement, where crust is warped. Largest l. is Superior, over 31,000 sq. miles; deepest mountain l. is Baikal, over 4000 ft. **Salt-Water Lakes**, *e.g.* Dead Sea and Great Salt Lake, owe excessive saltness to evaporation. Caspian Sea is largest inland sea in world.

Lake Dwellings were a feature of prehistoric life and have existed in hist. times. It was the custom to drive piles into the bed of a lake near the shore, and then to build huts or dwellings on the top. The object was perhaps security from invasion or against floods. Some of the most famous are those in Switzerland, particularly the Lake of Neuchatel. Archæologists conclude that the inhabitants were by no means simple savages. Some belong to the Stone and some to the Bronze Age. L. d. existed in ancient Ireland, where they were called *crannog*. They exist at the present day in S. America, among Borneo Dyaks, and elsewhere.

Munro, *The Lake-Dwellings of Europe*.

LAKE CHARLES (30° N., 93° 10′ W.), town, Louisiana, U.S.A.; rice mills, lumber trade. Pop. (1910) 11,449.

LAKE CITY (30° 18′ N., 82° 40′ W.), town, Florida, U.S.A.; lumber, cotton, turpentine. Pop. (1910) 5032.

LAKE DISTRICT (*c.* 54° 30′ N., 3° 12′ W.), district round Lakes Windermere, Ulleswater, and Derwentwater, on borders of Cumberland, Westmoreland, and Lancashire; famed for beautiful lake and mountain scenery; interesting associations with Wordsworth, Coleridge, and Southey, who are called the *Lake poets*, and with Shelley, Keats, Matthew Arnold, and Ruskin; visited annually by thousands of tourists; chief towns, Ambleside, Bowness, Coniston, Keswick; among mountain peaks are Scafell, Skiddaw, Helvellyn.

LAKE GENEVA (42° 50′ N., 59° 4′ W.), town, Wisconsin, U.S.A.; dairy-farming. Pop. (1910) 3079.

LAKE, GERARD, VISCOUNT LAKE OF DELHI (1744–1808), Brit. general; commander-in-chief (1800–5) in Mahratta War, winning battles of Delhi, Assaye, and Laswary, 1803; highly praised by Wellesley.

LAKE OF THE WOODS (49° 23′ N., 94° 30′ W.), lake, S.W. Ontario and S.E. Manitoba, Canada.

LAKE PLACID (44° 17° N., 74° W.), village and lake, New York, U.S.A.; in vicinity is John Brown's grave.

LAKEWOOD (40° 5′ N., 74° 12′ W.), village, New Jersey, U.S.A. Winter resort. Pop. (1910) 5149.

LAKHIMPUR (*c.* 27° 30′ N., 95° 30′ E.), district, Assam, India; area, *c.* 4500 sq. miles; drained by Brahmaputra and tributaries; produces tea, petroleum, coal. Pop. *c.* 375,000.

LALANDE, JOSEPH JÉRÔME LEFRANÇAIS DE (1732–1807), Fr. astronomer; prof. of Astron. in Collège de France, 1762–1807; chief works, *Treatise on Astronomy*; *Practice of Navigation*.

LALÍN (42° 38′ N., 8° 4′ W.), town, Pontevedra, N.W. Spain; paper. Pop. 16,500.

LALITPUR (24° 45′ N., 78° 26′ E.), town, Jhansi, United Provinces, India. Pop. 11,600.

LALLY, THOMAS ARTHUR, COMTE DE (1702–66), fought in India against Britain.

LAMA, LLAMA, see CAMEL FAMILY.

LAMAISM, the name given to the religious system of Tibet which is on a joint political and ecclesiastical basis and is a modified form of Buddhism (*q.v.*). In the II. cent. A.D., about 700 years after the life and teachings of Gotama, there arose the doctrine of the *Great Vehicle*, which, while it professed to continue, largely modified the ideas of the founder (it was so called in distinction to the *Little Vehicle*, that of Gotama). Belief arose in a number of powerful angelic beings. Thus, there was a drift away from the simplicity of early Buddhism. Primitive superstitions revived and the Tantra system arose, a form of religion so degraded that scholars have turned with disgust from its lit. This debased Buddhism was introduced into Tibet by Srong Tsan Gampo in 622 A.D., but his successors persecuted its adherents, and it was not firmly planted till the next cent. It declined again and was reintroduced in 971.

In the XIII. cent. the Mogul Emperor, Kublai Khan, granted to the abbots of the Sahya monastery the temporal sovereignty of the country, and this combined spiritual and temporal power—temporal over Tibet, spiritual (as head of the Buddhist Church) throughout China—still endures. A reformation took place under Tsonghapa about 1400. On the death of the Grand Lama another is elected from recently born children.

Franche, *History of Western Tibet*; Waddell, *The Buddhism of Tibet*.

LAMALON-LES-BAINS, spa, Hérault, S. France.

LAMA-MIAO, DOLON-NOR (42° 36′ N., 116° 10′ E.), town, Chihli, China; trading centre. Pop. *c.* 28,000.

LAMAR, LUCIUS QUINTUS CINCINNATUS (1825–93), Amer. politician; senator, 1877; Sec. of Interior, 1885; Justice, Supreme Court, 1888; helped reunite North and South.

LAMARCK, JEAN DE (1774–1829), eminent Fr. zoologist; b. Picardy; ed. Amiens; served in the army but always had a love for nature; occupied important scientific posts in Paris, where he died. He is best known as the founder of **Lamarckism**, which attempts to explain the mechanism of evolution by assuming that characters acquired by an individual are transmitted to its offspring. See EVOLUTION, HEREDITY.

LAMARTINE, ALPHONSE MARIE LOUIS DE PRAT DE (1790–1869), Fr. poet; one of pioneers of Romantic school; had deep religious feeling, with some of monotony of verse of preceding age; wrote with ever-increasing facility; travelled a great deal, and mixed in politics, especially in 1848, when he showed great gifts of eloquence and was member of Executive Committee; scanty means compelled him to subsist on proceeds of pen; romantic feelings depicted in the *Méditations* (1820), *Les Nouvelles Méditations* (1823), among which is his masterpiece; *Le Lac*. *Jocelyn* appeared 1836, journal of a heroic soul; attempted new line, 1835, with *Voyage en Orient* in prose, which is not quite accurate and too facile for pleasure of later age; best prose work, rhetorical *Histoire des Girondins* (1847).

Legouis, *Jocelyn* (with preface: 1906).

LAMB, CHARLES (1775–1834), Eng. essayist; b. London; ed. Christ's Hospital, where formed friendship with fellow-scholar, Coleridge; held clerkships in South Sea House and India House; never m., but devoted life to mad sister Mary; himself under restraint, 1795–96; dabbled in verse and journalism; with Mary wrote *Tales from Shakespeare* (1807); fascinated by Elizabethan and XVII.-cent. poets; pub. *Specimens of English Dramatic Poets* (1808); contributed essays on wide variety of subjects, under name *Elia*, to *London Magazine* (1820–22). L. is one of most lovable characters and writers in Eng. lit., his essays, written in a unique indescribable style, mingling quaintness and delicacy, humour and pathos. He ranks high as a literary critic.

Ainger, *Works*; Lucas, *Works* and *Life*; Masson, *Charles Lamb*.

LAMB, WILLIAM, see MELBOURNE, VISCOUNT.

LAMBALLE (48° 28′ N., 2° 31′ W.), town, Côtes-du-Nord, France; pottery. Pop. 4500.

LAMBAYEQUE (6° 48′ S., 79° 52′ W.), maritime

department (and town), Peru, S. America; area, 4614 sq. miles. Pop. c. 124,000.

LAMBERMONT, AUGUSTE, BARON (1819–1905), Belg. politician; served in foreign office from 1842; secured removal of tolls on Scheldt.

LAMBERT, FRANCIS (*c.* 1486–1530), Fr. Reformer; became Franciscan, 1501; converted to Protestantism, 1522; present at Marburg Conference, 1549; supported by Philip of Hesse.

LAMBERT, JOHANN HEINRICH (1728–77), Ger. physicist, philosopher, and mathematician; first to make photometric measurements of intensity of light.

LAMBERT, JOHN (1619–83), Eng. general; Roundhead in Civil War; distinguished at siege of Hull, 1643, *Dunbar*, *Worcester*, and other battles and sieges; member of Committee of Safety, 1659; crushed Royalist rising under Booth, 1659; major-gen. of forces in England and Scotland, 1659; sent against Monk, whose march he was unable to oppose, owing to dwindling of army; arrested at Restoration; banished to Guernsey.

LAMBESSA, LAMBÈSE (35° 28′ N., 6° 13′ E.), village, Algeria, Africa; interesting Rom. remains include so-called prætorium, baths, temples, aqueducts, and great number of inscriptions.

LAMBETH (51° 28′ N., 0° 3′ W.), metropolitan borough, S. London; contains L. Palace, seat of abp's of Canterbury, which has fine library and portraits of abp's. Pop. (1911) 298,126.

LAMBETH CONFERENCES, attended by all Anglican bp's, meet at Lambeth Palace to bring about closer union and discussion of common interests between Eng. and colonial churches. The first Conference was held in 1867, second, 1878, third, 1888, fourth, 1897, fifth, 1908. Unlike Convocation they possess no formal authority, but have considerable influence; various questions, doctrinal, disciplinary, social, and educational, are discussed.

LAMBOURN (51° 31′ N., 1° 32′ W.), town, Berkshire, England. Pop. (1911) 4527.

LAMB'S LETTUCE, CORN-SALAD (*q.v.*).

LAMECH, patriarch in *Genesis*; legendary f. of Noah; name may be derived from Babylonian myth.; possibly connected with an Arabic word for a young man.

LAMEGO (41° 9′ N., 7° 41′ W.), town, N. Portugal; Gothic cathedral. Pop. 8500.

LAMELLIBRANCHIATA or BIVALVES, PELECYPODA, ACEPHALA, LIPOCEPHALA; a large class of Mollusca, containing more than 5000 species scattered throughout the waters of the world. Its members are in almost all cases readily distinguished from other molluscs by the obvious presence of a shell composed of two strong limy valves within which the animal is sheltered. The Bivalve body, moreover, is less body-like than that of the Univalves or Gasteropods, for there is no head with tentacles, and the structures lie in bisymmetrical layers, the body proper and the foot being enclosed on both sides by the gills, and these again by the mantle folds, which are attached to the valves of the shell. There is no radula rasping apparatus in the mouth, and the foot is a more or less inactive lobe of muscle, by which the creatures often plough their way through sand or mud. Often the foot produces strands of brown silky material — *byssus* — by which the animal is anchored to neighbouring stones or rocks.

The senses of Bivalves are of comparatively low order. Their eyes, simple or highly developed, are many in number, set along the edges of the mantle, peeping out as it were from the gape of the shell, or placed at the end of the respiratory tube. They feel with the edges of the mantle, hear, or at least balance, by means of a pair of small sacs (*otocysts*) in the foot, and perhaps smell by small sensory patches near the base of the gills. At the hinder end of the body the mantle frequently forms a respiratory tube or siphon, of the utmost importance in their economy. It may be short in the forms which live at the surface of the sea, or long in burrowing or boring species, and has two apertures. Though one of these, the inhalent aperture, a current of life-bringing water is drawn, carrying the minute organisms upon which the creatures feed, and purifying the blood by washing the gills; and through the other (exhalent aperture) the water, having served its purpose, is ejected.

The limy shells vary much in shape and beauty. They may be almost hemispherical (*Cyclas*), or exceedingly elongated, as in the Razor Shell; smooth externally or covered with strong ribs often furnished with spines and projections (*Spondylus*). The inner surface, however, is smooth and shiny, with a layer of iridescent mother-of-pearl or nacre. The shells are hinged with an elastic ligament, and can be opened or closed tightly by means of two strong muscles, although in some forms (Oysters, etc.) one of the muscles has disappeared.

Almost all Bivalves live in the sea, but a few, such as the Fresh-Water Mussels, inhabit rivers or lakes. The majority burrow and plough their way in the sand or mud at the bottom, feeding and respiring through the breathing tubes which project above the surface of the silt. Some, however, such as the footless Oysters and their relatives, lie passively on the bottom, while others bore deeply into wood (the Ship 'Worm' — *Teredo*) or even into rocks and stones (*Pholas*, *Saxicava*, *Lithodomus*). Bivalves are less active than Gasteropods; many remain permanently anchored by their byssus (Edible Mussels, etc.), the majority plough laboriously, some jump or jerk by aid of their foot (Cockles), and a few swim through the water by flappings of their shell-valves (Scallops, and *Lima*).

Their breeding habits are often interesting. *Lima* builds nests of old shells and stones, and the young of Fresh-Water Mussels remain sheltered in the body of the parent until, at the proper time, a Stickleback or similar fish swims near. Then the minute larvæ (*Glochidia*) snap their valves with great energy, and so approaching the fish, attach themselves to fins or gills, sinking into these, and developing there for the succeeding two to five weeks of their existence.

Lamellibranchs, with one or two exceptions, feed on the microscopic organisms, Diatoms and minute Algæ, Protozoa, small Crustacea, and organic débris, which are borne to them in the water currents they create.

Many are the uses of Lamellibranchs to man. He relishes as food such forms as Oysters (*q.v.*), Cockles, Clams, and Scallops. Pearl buttons, and many ornaments of greater beauty, if of less use, are manufactured from the shells of Pearl Oysters, which, along with the Fresh-Water Mussel, *Margaritana*, furnish the world's supply of pearls. Many species are extensively used as bait for fishes; the giant *Tridacna* makes excellent fonts, and the semi-transparent shells of *Placuna* form window-panes in China and the Philippines.

The class Lamellibranchiata is divided into four orders, according to gill structures:—

I. PROTOBRANCHIA, with simple plate-like gill filaments, e.g. *Nucula*.

II. FILIBRANCHIA, with gill filaments folded back upon themselves, e.g. *Placuna*, *Lithodomus*, and the Edible Mussel, *Mytilus*.

III. PSEUDO-LAMELLIBRANCHIA, with gill filaments loosely connected to form gill-plates, e.g. *Pinna*, the true Oysters (*Ostraca*), the Pearl Oysters (*Meleagrina*), *Lima*, and the Scallops, *Pecten*.

IV. EULAMELLIBRANCHIA, with gill filaments intimately connected into double gill-plates, *e.g.* Fresh-Water Mussels (*Margaritana*, *Unio*), the Clams (*Mactra*), the Cockles (*Cardium*), Razor-Shell (*Solen*), *Tridacna*, the various Rock- and Wood-Borers, and the curious Watering-Pot Shell (*Aspergillum*).

LAMENNAIS, HUGUES FÉLICITÉ ROBERT DE (1782–1854), Fr. ecclesiastical and political contro-

versialist; ordained he became prof. of Math's, 1811; strong defender of Catholicism, and condemned 'Gallican' liberties (partial independence of Fr. Church from papal control); became increasingly democratic, denouncing all connection of Church with state and with monarchy. Although he believed himself a devoted Catholic, his views met with papal disapproval, and he left the Church, devoting himself entirely to political propaganda; imprisoned for a year in 1840 for his book *Le Pays et le Gouvernement*; wrote numerous works, and his correspondence (some of it important) is published.

LAMENTATIONS, BOOK OF, in Hebrew canon, together with the *Song of Songs, Ruth, Ecclesiastes,* and *Esther,* forms *Megilloth* (Rolls). L. is made up of five separate poems, dealing with the woes that have befallen the Hebrew nation by the taking of Jerusalem in 586. The poems are beautiful, but are conscious art rather than spontaneous outpourings. The author is not named, but early tradition to be found in the LXX makes him Jeremiah. In favour of this can be urged the conception of natural misfortune as the result of sin, certain emotional traits, and some usages of metaphor; against it, differences of standpoint as regards Egypt, and (as a whole) phraseology; and also the poetic arrangement has an artificiality which seems unlike Jeremiah. The balance of probability is thought by competent scholars (*e.g.* Driver) to be against Jeremiah's authorship, but quite possibly it is by one of his disciples, and dates from a period not long after him: it is possibly not all by one writer.

Peake, *Jeremiah and Lamentations* (Century Bible).

LAMESSAN, JEAN ANTOINE DE (1843–), Fr. sailor, scientist, and politician; author of several works.

LAMETTRIE, JULIEN OFFRAY DE (1709–51), Fr. physician and materialist; considered man a machine, the soul a function of the brain.

LAMMERGEIER, member of VULTURE FAMILY (*q.v.*).

LAMNA, see under SHARKS AND DOG FISHES.

LAMORICIÈRE, CHRISTOPHE JUCHAULT DE (1806–65), Fr. soldier; fought in Algeria, 1847, and against Italy, 1860.

LAMP, a device for producing artificial light by inflammable liquid, oil, gas, or electricity. No doubt the first lamps were animals' skulls and later baked earth and metal—bronze being generally used. In 1784 Argand at Geneva invented a lamp with circular wick and glass chimney, which was considerably improved by Franchot in 1837. Nowadays oil lamps consist of a reservoir, for the oil, below the wick (either flat or circular, single or multiple), which is sucked up the wick by capillary action. Safety lamps (*q.v.*) are used by miners and acetylene lamps (*q.v.*) by motorists. See also LIGHTING.

LAMP-BLACK, see under CARBON, PIGMENTS.

LAMPEDUSA (35° 30′ N., 12° 30′ E.), island, between Malta and Tunis, Mediterranean Sea; belongs to Italy; has Rom. and Carthaginian remains. Pop. c. 2000.

LAMPERTHEIM (49° 36′ N., 8° 28′ E.), town, Darmstadt, Germany. Pop. (1910) 10,335.

LAMPETER (52° 7′ N., 4° 5′ W.), town, Cardiganshire, Wales; seat of St. David's Coll. Pop. (1911) 3566.

LAMPOON, a virulent satire in prose or verse, usually a personal attack. The name comes from the old burden sung to these libels, 'Lampone, lampone, camerada lampone.'

LAMPREYS (*Petromyzontidæ*), eel-like primitive fishes with round, sucking mouth, and seven gill-slits. They are carnivorous and feed on fishes, worms, and insects; 3 species occur in Brit. waters, living in the sea and spawning in rivers; some are esteemed as food.

LAMPRIS, see OPAH.

LAMPROPHYRES, name given to a group of rocks containing bright crystals of biotite, hornblende, olivine, or augite. They generally occur in dikes or thin sills, and are of a dark colour. There are two distinct groups, the first of which is accompanied by intrusive granites, while the second is associated with nepheline syenites.

LAMPSACUS (40° 19′ N., 26° 39′ E.), ancient Hellenic town, Asia Minor.

LANAI, see HAWAIIAN ISLANDS.

LANARK (55° 40′ N., 3° 48′ W.), town, Lanarkshire, Scotland; associated with Wallace; formerly site of Franciscan monastery. Pop. (1901) c. 6500. New L., to S., has cotton mills.

LANARKSHIRE (55° 45′ N., 3° 55′ W.), county, S.W. Scotland; area, 879 sq. miles; surface rises from N. to Lowther Hills in S.; watered by Clyde and its tributaries. In S. are sheep farms, in centre market gardens and orchards, in N. important coal-fields. L. is most populous and busiest manufacturing county in Scotland; contains Glasgow, Hamilton, Airdrie, and other industrial centres. Manufactures iron goods, steel, machinery, textiles. Pop. (1911) 1,447,113.

LANCASHIRE (53° 45′ N., 2° 35′ W.), N.W. county palatine, England; area, *c.* 1890 sq. miles; low, flat coast is much indented, so that there are many good harbours; surface rugged and mountainous in N. and E., reaching an extreme height of 2633 ft. in Coniston Old Man in N.; drained by Duddon, Lune, Ribble, Mersey, Irwell, and other rivers. L. suffered from ravages of Danes in IX. cent., towards end of which it came under sway of Northumbria. County was granted by Henry III. to his s. Edmund, and from him descended to John of Gaunt, whose s. became king as Henry IV. in 1399, since when it has belonged to the Crown, though its estates are separately administered. In reign of James I. witchcraft was prevalent here, especially in district of Pendle Forest, Whalley; and in 1612 twenty witches were put to death. Various battles and sieges occurred during Civil Wars of XVII. cent.; and in 1658 the county had considerable part in Royalist rising, which, however, was put down; had some share in Jacobite risings of 1715 and 1745. During last two cent's chief events have been the growth of cotton trade, with which the inventions of Hargreaves, Arkwright, and others are associated; opening of first English railway in 1830; and the cutting of various canals, of which the Bridgewater was the first. L. is most populous and busiest manufacturing county in England; contains large coal-field, which has become seat of greatest cotton industry in world, with centre at Manchester, while Bolton, Preston, Oldham, Blackburn, Burnley, Rochdale, Bury, Ashton, and Middleton are also engaged in this trade. Copper, slate, earthenware clay, fireclay, are also found, and in the N. are large deposits of iron ore which have developed great iron and steel industries, as at Barrow-in-Furness. Liverpool is an important centre of shipping trade, accounting for one-fourth of imports and two-fifths of exports of United Kingdom. Manufacture of machinery is also important; other industries include shipbuilding, dye-works, manufacture of glass, soap, leather, silk and woollen textiles. County is crossed by numerous railways, and by several canals, including the Manchester Ship Canal between Liverpool and Manchester. There are univ's at Liverpool and Manchester, which, with Lancaster, the capital, are assize towns. There are remains of many monasteries, finest of which is Furness Abbey, a Cistercian foundation. Pop. (1911) 4,825,739.

Victoria County Histories, *Lancashire.*

LANCASTER.—(1) (54° 3′ N., 2° 48′ W.) town, Lancashire, England; castle, now used as county prison, was built on site of Rom. castle in Norman times, and restored by John of Gaunt; fine old church, dedicated to St. Mary; connected with Kendal and Preston by L. canal; cabinetmaking, upholstery, cottons. Pop. (1911) 41,414. (2) (40° 2′ N., 76 °23′ W.) town, Pennsylvania, U.S.A.; manufactures tobacco, cottons. Pop. (1910) 47,227. (3) (39° 41′ N., 82° 29′ W.) town, Ohio, U.S.A.; agricultural trade. Pop. (1910) 13,093.

LANCASTER, HENRY, EARL OF (*c.* 1281–1345),

joined queen against Edward II.—HENRY, DUKE OF L., s. (c. 1300–61), distinguished soldier.

LANCASTER, HOUSE OF, family descended from Edmund, s. of Henry III., Earl of L. in 1267, whose s. Thomas led nobles in Edward II.'s reign and was executed for treason. His nephew Henry became duke, and was succ. by dau., Blanche; she m. John of Gaunt, s. of Edward III., who became Duke of L. and immediate ancestor of Lancastrian kings; he was suspected of aiming at succession to throne, and sent on missions to France. His s. Henry deposed Richard II., becoming first Lancastrian king. House fell in Wars of Roses.

LANCASTER, SIR JAMES (d. 1618), Eng. navigator; commanded E. India Company's expedition to E. Indies; encouraged Hudson and Baffin in polar exploration; **Lancaster Sound** named after him by Baffin.

LANCASTER, JOHN OF GAUNT, DUKE OF (1340–99), s. of Edward III.; b. Ghent; served in Spain, 1367, France, 1369; after second marriage, with Blanche of Castile, assumed title, king of Castile; towards close of Edward III.'s reign, attained great power in England; supported Wycliffe; after Richard's accession, supported king; unsuccessfully invaded Castile, 1387; Duke of Aquitaine, 1390; governed Aquitaine, 1395.

LANCASTER, JOSEPH (1778–1838), Brit. educationist; b. at Southwark of poor parents; started a school for poor children, charging no fees. His system, which depended greatly on teaching by monitors and mechanical drill, was copied throughout the country, but the resultant fame and wealth ruined his character.

LANCASTER, THOMAS, EARL OF (1277–1322), grandson of Henry III.; led barons against Edward II.; defeated and captured at Boroughbridge; executed for treason.

LANCE, the long spear used by a certain class of cavalry called lancers. The pennon at the spear-point frightened the horses of opponents. When not in use the lance is attached by a sling to the soldier's elbow. In Germany the lance is made of hollow steel.

LANCELET, see AMPHIOXUS.

LANCELOT, hero of Arthurian legend. The story is best known through Malory's beautiful version and Tennyson's poetical rendering. The most famous incidents in his life are his appearance at Arthur's court, his infatuation for Arthur's wife, Guinevere, his rescue of the queen, his unsuccessful Grail quest, which terminated only in a fleeting vision of the sacred vessel, his subsequent unconsciousness, lasting for as many days as he had spent years in sin.

LANCET, term applied to a two-edged, lance-pointed surgical instrument, for opening abscesses, etc.; in architecture, one form of the pointed arch.

LAN-CHOW-FU (36° 5′ N., 103° 55′ E.), town, Kan-su, China. Pop. variously estimated at from 80,000 to 500,000.

LANCIANO (42° 14′ N., 14° 25′ E.), cathedral town, Italy; seat of bishopric. Pop. 18,500.

LAND occupies about two-sevenths of the earth's surface, with an estimated area of 55,100,000 sq. miles. In primitive times men disputed ownership of l. with wild beasts, and gradually formed themselves into communities for purposes of protection; during the Neolithic Age (see ARCHÆOLOGY) they began to employ agriculture as a means of supplying themselves with food, and thus l. acquired value. The tide of Aryan invasion from the East, and, later, the restless movements of Teutonic and Slavonic peoples, did much to change ownership of l. in Europe, but by the Middle Ages it was comparatively settled.

With increase of civilisation came regulations regarding l. tenure to replace those of Rome which had been swept away by barbarism; the most important was FEUDALISM (*q.v.*), which flourished in France till the Revolution of 1780, and in England till the agrarian revolutions of the XV. and XVI. cent's, which turned great tracts of country into pasturage and created the large farmer. The XVIII. and XIX. cent's saw a reversion to agriculture, and at present the small farmer is being encouraged as much as possible in order to repeople the land (see SMALL HOLDINGS). Of late years the question of State ownership has been raised, especially by Socialists, while the fact that much common l. was annexed by landowners from XV. to XVII. cent. gives historical ground for their claims.

Round the coasts of Britain and other countries there are considerable tracts of land only partially submerged by the sea, and the term **reclamation of land** is used to describe the process of permanently excluding the sea in order to render such land fit for agricultural purposes. In estuaries, *e.g.*, silt is constantly being deposited at a more or less rapid rate, but owing to the shifting of the channel and the scouring action of the tide little permanent accretion takes place. If, however, the channel is fixed by embankments reaching high above water-level, the deposit goes on steadily and the foreshore gradually rises. Finally, the water is shut out altogether by embankments, which must be higher than the level of highest tide. It is also possible further to increase the deposit by allowing water to enter at high tide through openings or sluices in the embankments, and permitting it to escape gently after its silt is deposited. Sea marshes also, which are only submerged at high tide, can be reclaimed by high embankments. Holland provides the best examples of land reclamation, a large part of it having been won from the sea. See Beazeley, *Reclamation of Land from Tidal Waters.*

Land Registration.—Leases of forty years and upwards require registration, and in the County of London must be entered at the Registry. The owner of property wishing to register his title to it should take his title-deeds (it is generally better to employ a solicitor for the purpose) to the Land Registry. Particulars of the property and the ownership of it will then be entered in the register, his deeds will be stamped with a record of the registration, and he will be given a *land certificate,* which is a copy of the entry in the register. When once the property has been registered, all subsequent dealings with it must be registered. Generally the person entitled to register the property is the person entitled to its possession, though he may not be the absolute owner, but only a tenant for life or mortgagee. Two kinds of title may be applied for at the registry—absolute and possessory. The Registrar will generally allow the latter on production by the owner of the conveyance or on a statutory declaration. But the former will not be granted until the Registrar has satisfied himself that the title is good, though he may allow a qualified title to be registered.

See also LANDLORD AND TENANT; IRELAND, HISTORY (for Irish L. Question); RENT, and similar articles.

LANDAU.—(1) (49° 11′ N., 8° 6′ E.) town, Bavaria, Germany; formerly fortified; site of Augustinian monastery. Pop. (1910) 17,761. (2) (48° 41′ N., 12° 43′ E.) town, Lower Bavaria. Pop. 3200.

LANDECK (50° 21′ N., 16° 53′ E.), town, Pruss. Silesia, Germany; thermal springs. Pop. (1905) 3481.

LANDEN (50° 46′ N., 5° 4′ E.), town, Liège, Belgium. Pop. 3100.

LANDER, RICHARD LEMON (1804–34), and **JOHN** (1807–39), his bro., Eng. explorers; sent by Britain to explore Niger; discovered (1830) that it terminates, in several offshoots, in Bight of Benin; pub. *Journal,* 1832.

LANDES.—(1) (44° N., 0° 50′ W.) S.W. department, France; area, 3604 sq. miles; watered by Adour; large forests; produces resin, charcoal, rock-salt, iron; horses bred. Pop. (1911) 288,902. (2) (44° 30′ N., 0° 55′ W.) district, S.W. France, occupying parts of dept's of L., Gironde, and Lot-et-Garonne. Mainly covered by pine forests and fields.

LANDESHUT (50° 46′ N., 16° 3′ E.), town, Pruss. Silesia, Germany. Pop. (1905) 13,125.

LANDLORD AND TENANT, the tenant holds a property of the landlord for a certain limited period, subject, *inter alia*, to the payment of rent. He (or she) may be a *tenant at will*, when the tenancy may be ended by landlord or tenant at any moment without notice; or a *tenant at sufferance*, remaining in possession after expiration of tenancy, and liable to be turned out at any moment; and yet not a trespasser. If a tenant retains possession after receiving or giving notice to quit he is liable to be sued for double the rent. A tenancy is commonly from year to year, and if it is to be for less than a year the agreement with the landlord should state this quite clearly. There are four 'usual covenants' in the ordinary tenancy: (1) Tenant to pay rent; (2) tenant to pay rates and taxes, except landlord's property tax and tithe rent charge; (3) tenant to allow landlord to enter premises from time to time to see that they are in proper state of repair; (4) tenant to keep premises in proper state of repair, and to leave them in such a state at end of tenancy.

When rent is in arrear the landlord has the right to distrain for distress—that is, to seize a sufficient quantity of the tenant's goods to satisfy the debt. He may not, however, seize: (1) things in actual use at the time; (2) all fixtures except growing crops ripe for reaping; (3) goods delivered to the tenant in the course of his trade, including agricultural machinery, and live stock not the property of the tenant; (4) wild animals; (5) loose coin of the realm; (6) perishable goods; (7) looms used in silk, cotton, and woollen manufacture; (8) gas meters; (9) goods of a lodger —where the lodger complies with the Lodgers' Goods Protection Act; (10) wearing apparel, bedding, and trade implements not exceeding £5 in value. When a tenancy has come to an end, the landlord has a right of entry, but should proceed by legal action and not by force if his right is contested.

LANDOR, WALTER SAVAGE (1775–1864), Eng. prose-writer and poet; b. Warwick; ed. Rugby (removed at request of headmaster) and Trinity Coll., Cambridge (rusticated); headed volunteer force, raised at his expense, in Peninsular, 1808; travelled in Europe for several years; finally settled at Florence; friend of Southey and Browning. His works are distinguished by purity of style and delicacy of diction; sometimes striving after beauty leads to obscurity; wrote fluently in Eng., Lat., and Ital. Best-known works are *Poems* (1795), *Gebir* (revised ed., 1803), *Count Julian* (1812), *Imaginary Conversations* (1824–26), *Pericles and Aspasia* (1836), *Poemata et Inscriptiones* (1847), *Hellenics* (1847).

Life, by Forster (1869), Colvin (E.M.L., 1884).

LANDOUR (30° 26′ N., 78° 5′ E.), sanatorium, United Provinces, India. Pop. (1901) 1720.

LAND-RAIL, see RAIL FAMILY.

LAND'S END (50° 4′ N., 5° 43′ W.), headland, Cornwall; most westerly point of England.

LANDSBERG AM LECH (48° 4′ N., 10° 51′ E.), town, Bavaria, Germany. Pop. (1910) 7293.

LANDSBERG-AN-DER-WARTHE (52° 46′ N., 15° 13′ E.), town, Pruss. Brandenburg, Germany. Pop. (1910) 39,332.

LANDSBERG BEI HALLE (51° 32′ N., 12° 9′ E.), town, Prussia, Germany.

LANDSEER, SIR EDWIN HENRY (1802–73), Eng. painter; b. London, s. of an engraver; early began to sketch animals from life, and exhibited at the Royal Academy when 13. In 1818 he attracted attention by his *Fighting Dogs getting Wind*. Dogs and deer were his favourite subjects; and the Scot. Highlands furnished the scenes of some of his best pictures, all of which are familiar from engravings. The bronze lions of the Nelson Monument, London, were of his modelling. He is buried in St. Paul's Cathedral.

Life, by Stephens (1883), Manson (1902).

LANDSHUT (48° 32′ N., 12° 9′ E.), town, Bavaria, Germany; interesting old churches. Austrians defeated by Napoleon, 1809. Pop. (1910) 25,137.

LANDSKNECHTE, Ger. mercenary foot-soldiers, first raised by Maximilian I.; prominent in Ital. wars.

LANDSKRONA (55° 52′ N., 12° 49′ E.), port, Sweden; industrial centre. Pop. (1910) 16,041.

LANDSLIP, fall of rocks or earth due to undermining action of sea, or removal of underlying strata by heavy rains or melting snow; common in Alps and tropical countries where rainfall is excessive during wet seasons; severe l. in Glencoe, Argyllshire, Scotland, 1913.

LANE, EDWARD WILLIAM (1801–76), Brit. Arabic scholar; went to Egypt on account of his health; pub. *Manners and Customs of the Modern Egyptians*, a translation of the *Arabian Nights*, and the famous *Arabic Lexicon*, a standard work.

LANE, JAMES HENRY (1814–66), Amer. politician and general; joined Federalists in Civil War; recruiting commissioner, Kansas, 1862; senator, 1865; committed suicide.

LANFRANC (d. 1089), abp. of Canterbury; b. at Pavia; became jurist; monk at Bec, 1142, subsequently prior; opened school in monastery; defended doctrine of transubstantiation against Berengar of Tours. Obtained favour of William the Conqueror; became abbot of St. Stephen's, Caen, 1066; abp. of Canterbury, 1067; reformed ecclesiastic organisation; separated ecclesiastical from other courts; discovered and defeated conspiracy of 1075. *Life*, by Crozals (1877).

LANFREY, PIERRE (1828–77), Fr. republican statesman; wrote history

LANG, ANDREW (1844–1912), Scot. scholar; b. Selkirk; was a dainty poet, admiring and practising Old Fr. forms; wrote a full *History of Scotland*; with Butcher translated the *Odyssey*, with Leaf and Myers the *Iliad*; authority on folk-lore and fairy stories.

LANG, KARL HEINRICH, RITTER VON (1764–1835), Ger. historian; archivist in Munich, 1810–17; wrote *Memoiren*.

LANGDON, JOHN (1741–1819), Amer. politician; senator, 1789–1801; gov. of New Hampshire, 1805–9, 1810–12.

LANGE, FRIEDRICH ALBERT (1828–75), Ger. economist and philosopher, schoolmaster and journalist; wrote works on philosophic and social questions.

LANGEAIS (47° 20′ N., 0° 30′ E.), town, Indre-et-Loire, Franco. Pop. 4000.

LANGEN, JOSEPH (1837–1901), Ger. Old Catholic divine.

LANGENBECK, BERNARD RUDOLF KONRAD VON (1810–87), Ger. surgeon; prof. of Surgery at Kiel, 1842; director of Clinical Institute for Surgery and Ophthalmology at Berlin, 1848; acted as military surgeon in several campaigns, including Franco-Pruss. War, 1870–71; authority on gunshot wounds, etc.

LANGENSALZA (51° 7′ N., 10° 40′ E.), town, Pruss. Saxony, Germany; ruined monastery. Prussians defeated Hanoverians, 1866. Pop. (1910) 12,667.

LANGHAM, SIMON (d. 1376), abp. of Canterbury, 1366–68; cardinal, 1368.

LANGHOLM (55° 9′ N., 3° W.), town, Dumfriesshire, Scotland; textiles, leather, distilling. Pop. (1911) 3302.

LANGIEWICZ, MARYAN (1827–87), Polish national leader in rebellion against Prussia, 1863.

LANGLAND, WILLIAM, LANGLEY (c. 1332–1400), reputed author of *Piers the Plowman*; antiquaries have pieced together the following biographical facts: b. in Shropshire c. 1332; received monastic education; destined for priesthood, but married; lived precariously by chanting psalms for souls of departed. The poem attributed to him is allegorical, the Plowman a personification of Christ; writer is in deadly earnest, flails contemporary abuses in Church and State, and knows the curse of poverty.

Poem is in three forms, possibly rewritten by poet;

in alliterative metre with variety and cadence; shows transition from O.E. to modern prosody.

LANGLEY, SAMUEL PIERPONT (1834–1906), Amer. physicist and astronomer; sec. of Smithsonian Institution, 1887; invented the *bolometer*; discovered and explored infra-red portion of spectrum; made important investigations and experiments in aeronautics.

LANGPORT (51° 3′ N., 2° 49′ W.), town, Somersetshire, England; Perpendicular church. Pop. reg. district (1911), 6723.

LANGREO (43° 17′ N., 5° 44′ W.), town, N. Spain. Pop. 19,000.

LANGRES (47° 53′ N., 5° 20′ E.), fortified town, E. France; episcopal see; XII.-cent. cathedral; Rom. gateway remains. Pop. 9000.

LANGTON, STEPHEN (d. 1228), Eng. ecclesiastic; studied at Paris, elected abp. of Canterbury by Canterbury monks, 1207, joined with barons against King John, but it is doubtful how far he was responsible for *Magna Carta*; after John's death supported Henry III.

LANGUAGE, see PHILOLOGY.

LANGUEDOC, former province of France. Its capital was Toulouse; boundaries—on the N., Auvergne, Rouergne, Quercy, Forez; on the E., the lower Rhone; on S., the Mediterranean and Roussillon; on W., Comminges, Rivière-Verdun, Foix. L. possessed an Assembly, three archbishoprics, etc. Differing in history and therefore race from N. France, it received above name at time of final union to Fr. Crown, 1271, when different pronunciation of *oui* was seized on, i.e. *oc* instead of *oïl* of N. Reformation won great hold here in XVI. cent.; from time of Richelieu to Revolution, when it was abolished, L. was administered by royal *intendant*; noted from Rom. times for wines; racial characteristics still strong. See FRENCH LANGUAGE, FRANCE (HISTORY).

LANGUET, HUBERT (1518–81), Fr. Huguenot statesman; friend of Melanchthon; entered service of Augustus I. of Saxony, 1559; ambassador to Fr. court, 1561–72, and pleaded for Protestants but was compelled to fly; sent to Vienna, but found position untenable; correspondence important hist. source.

LANGUR MONKEYS, see under CERCOPITHECIDÆ.

LANIER, SIDNEY (1842–81), Amer. poet and writer of boy-stories; wrote *Science of Eng. Verse*, *The Eng. Novel*.

LANIUS, see SHRIKES.

LANJUINAIS, JEAN DENIS, COMTE (1758–1827), Fr. writer and politician; opposed 'Mountain.' —VICTOR AMBROISE, Vicomte, s. (1802–69), Minister of Commerce, 1849.

LANKESTER, SIR EDWIN RAY (1847–), Brit. zoologist; prof. at London (1874–90), Oxford (1891–98), director of natural history section of Brit. Museum (1898–1906); pres., Brit. Association, 1906; works include *Extinct Animals* (1905); *Kingdom of Man* (1907).

LANNES, JEAN, DUKE OF MONTEBELLO (1769–1809), marshal of France; served under Napoleon; distinguished at Acre, Montebello, Marengo, Austerlitz, Jena; commanded in Spain, 1808; captured Saragossa; killed at Aspern-Essling.

LANNION (48° 44′ N., 3° 25′ W.) town, Côtes-du-Nord, town, France; ruined castle in neighbourhood; fishing carried on. Pop. 5800.

LANOLIN (*adeps lanæ hydrosus*), a mixture of 7 oz. neutral wool fat with 3 fl. oz. water, the wool fat being obtained by purification of the grease extracted in the preparation of sheep's wool. It is slightly antiseptic, and is a common basis for ointments.

LANSDOWNE, hill station, Garhwal, United Provinces, India. Pop. 4000.

LANSDOWNE, 1ST MARQUESS OF, WILLIAM PETTY FITZMAURICE (1737–1805), Eng. statesman; served in Seven Years War; distinguished at Minden; pres., Board of Trade, 1763; Sec. of State, 1766; dismissed for policy of conciliation towards America, 1768; Premier, 1782.—HENRY, 3RD MARQUESS (1780–1863), Chancellor of Exchequer, 1806; advocated R.C. emancipation, abolition of slavery; Home Sec., 1827. Subsequently Pres. of Council.

LANSDOWNE, HENRY CHARLES KEITH PETTY-FITZMAURICE, 5TH MARQUESS OF (1845–), Brit. statesman; Lord of the Treasury, 1869; Under-Secretary of State for War, 1872; gov.-gen. of Canada, 1883; Viceroy of India, 1888; split with Gladstone's party on Home Rule; Secretary of State for War, 1893–1900; Secretary of State for Foreign Affairs, 1900–5; leader of Unionist party in House of Lords.

LANSING (42° 45′ N., 84° 33′ W.), capital, Michigan, U.S.A.; agricultural coll. Pop. (1910) 31,229.

LANTERN, metal case with glass shutter to protect flame from wind. *Hanging l's* found in Pompeii and Herculaneum have body of bronze and horn plates. *Dark l.* has shutter or slide by which the light may be cut off.

MAGIC OR OPTICAL L., instrument for projecting views on a screen, was invented by Kircher c. 1646; consists of body, generally of Russian iron, and a system of lighting, of which the most common is limelight (lime is made white-hot by flame of coal-gas and oxygen), and arrangement for *projection*; a condenser is used for rendering the rays of light parallel, and transparent slides (photographic positives) are introduced between condenser and projector.

LANTERN-FLIES, prettily coloured Bugs (*Hemiptera*) with a huge proboscis projecting in front of the head, and for long supposed to be luminous—hence the misnomer. The best known is the Chin. Lantern Fly (*Hotinus candelarius*), found in many parts of Asia.

LANTERNS OF THE DEAD, erections in France and elsewhere for marking burial-grounds.

LANTHANUM, rare metal belonging to cerium group, discovered by Mosander in 1839. Found in gadolinite, samarskite, and fergusonite, but usually obtained by complex process from cerite, which is a hydrated silicate of cerium. H. forms only one series of compounds as oxide, chloride, and sulphide, and is of little chemical interest and no practical value.

LANUVIUM (41° 41′ N., 12° 42′ E.), ancient town, near Rome, Italy; had famous temple. Modern Civita Lavinia.

LANZAROTE (29° N., 13° 34′ W.), volcanic island, Canary Islands, Atlantic; chief town, Arrecife. Pop. c. 18,000.

LAOAG (18° 10′ N., 120° 35′ E.), town, Luzon, Philippine Islands; exports rice. Pop. c. 36,000.

LAOCOON, in Gk. mythology Trojan priest and patriot; slain with his two sons by twin snakes sent by Poseidon; statue, in late Gk. style, representing his death-struggle, is preserved in the Vatican.

LAODICEA.—(1) (37° 49′ N., 29° 2′ E.) town, Asia Minor; traditionally founded by Antiochus II., III. cent. B.C.; one of seven churches of St. John's Revelation. Modern Dinizli. (2) (35° 30′ N., 35° 44′ E.) town, Syria; built by Seleucus I.; modern Latakia. (3) (34° 33′ N., 36° 30′ E.) or Tell Neby Mindu, ruined town, Palestine.

LAON (49° 34′ N., 3° 36′ E.), town, Aisne, France; important fortress since Rom. times; fine cruciform cathedral, dating from XII. cent., and old episcopal palace, both injured during Franco-Ger. War, 1870. Pop. 15,500.

LAOS (c. 16° N., 105° E.), region, central Indo-China, partly under Fr. protection, partly subject to Siam; bounded by Yunnan, Tongking, Annam, Cambodia, Siam, Brit. Shan States. Produces rice, cotton, tobacco, sugar-cane, fruits, indigo. Fr. L., acquired 1892, has area c. 98,000 sq. miles. Pop. c. 670,000. Capital, Vien-tiane.

LAOS, or LAOTIONS, inhabitants of Indo-China, chiefly in Siam and Burma. An amiable and civil race, mostly Buddhists in religion. Conquered by the Siamese, 1828, but a few tribes are still practically independent. 'Lao' meant originally 'man.'

LAO-TSZE (b. 604 B.C.), Chinese philosopher; founder of Taoism; see CHINA (*Literature*).

LAPIS LAZULI, a metal, sometimes called 'azure stone,' composed of silica and alumina with traces of sulphuric acid, soda, and lime; generally of a rich blue colour, although some varieties are of tinted green, red, or violet; has vitreous lustre, is opaque, and easily broken; sometimes spotted, or banded with white. Found associated with crystalline limestone in schists or granites, in Persia, Siberia, Tibet, Chile (Andes), China, and Asia. Used by ancients for ornamental vases; now for mosaics and for manufacture of ultramarine pigment.

LAPLACE, PIERRE SIMON, MARQUIS DE (1749–1827), Fr. mathematician and astronomer; b. Beaumont-en-Auge; s. of farmer; at early age teacher of math's at military school of native town; when eighteen, went to Paris, where, through influence of D'Alembert, was app. prof. of Math's at École Militaire; entered politics; cr. count by Napoleon, and app. Minister of Interior, but dismissed for incapacity after six weeks; in spite of many favours, he voted for Napoleon's dethronement in 1814; cr. Marquis by Louis XVIII. in 1817. In friendly rivalry with Lagrange, L. devoted his remarkable analytical powers to astronomical problems. He was the first to firmly establish the stability of the solar system, and his *Mécanique Céleste* ranks only second in importance to Newton's *Principia*. Its publication gained him a world-wide reputation. In *Système du Monde* is to be found his famous 'nebular hypothesis.'

LAPLAND, LAPPLAND (*c.* 68° N., 27° E.), region in extreme N. of Scandinavia and extending eastward to White Sea; has no separate political existence; surface of Scandinavian L. is mountainous, with deeply indented coasts and large lakes between the mountain ridges; Russ. part is comparatively level, with greater number of lakes, while a considerable area is covered by marshes and forests; crossed by Tana, Kemi, and other rivers. Summer lasts for three months, during which there is perpetual daylight; and for two months in winter darkness prevails. Lapps are a race of short stature, but of great endurance; they are generally hospitable and quiet, but are addicted to drunkenness, and are uncleanly in their personal habits. Of their early history little is known; since IX. cent. they have been in subjection to Norway, Sweden, or Russia, and for several cent's they were regarded as slaves. They are generally classified as Mountain, Forest, Sea, and River Lapps. Mountain Lapps are virile and energetic; a nomadic race, their wants are almost entirely supplied by the reindeer. Forest Lapps lead a less nomadic existence—live by hunting and fishing, and keep reindeer. River Lapps are a settled people, who engage to slight extent in agriculture, and Sea Lapps are an impoverished race who live by fishing. Language resembles Finnish. Religions—Lutheran, Gk. Church. Total number of Lapps, *c.* 30,000.

LAPPA (22° N., 114° E.), island, near Macao, S. China.

LAPPENBERG, JOHANN MARTIN (1794–1865), Ger. historian; wrote numerous works on Ger. and Eng. history.

LAPRADE, PIERRE MARTIN VICTOR RICHARD DE (1812–84), Fr. poet; follower of Lamartine (*q.v.*), and, like him, dealt with themes of nature, religion, and philosophy; has resemblance to Wordsworth, and, like him, distinguished exponent of aims of Romantic school.

LAPWING, see under PLOVER FAMILY.

LAR (27° 33′ N., 54° 8′ E.), town, Persia; partly ruined; tobacco, cotton. Pop. *c.* 9000.

LARA (*c.* 10° N., 69° 30′ W.), state, N.W. Venezuela, S. America; silver mines; produces cereals, tobacco, coffee; chief town, Barquisimeto. Area, 9296 sq. miles. Pop. *c.* 275,000.

LARAISH (35° 14′ N., 6° 9′ W.), seaport, W. coast, Morocco, Africa; walled and fortified; exports cereals, wool, goatskins, slippers, eggs. Pop. *c.* 6500.

LARAMIE (41° 15′ N., 105° 39′ W.), town, Wyoming, U.S.A.; seat of univ.; manufactures flour, leather, glass. Pop. (1910) 8237.

LARBERT (56° 1′ N., 3° 51′ W.), town, Stirlingshire, Scotland; coal. Pop. of parish (1911), 12,984.

LARCENY, see THEFT.

LARCH (*Larix*), a genus of hardy coniferous trees which possess deciduous foliage. This develops in the early spring, the leaves arising in two rows of dense, bright green clusters on the lateral shoots, and giving the plant a graceful and dainty appearance. The male cones are small, short-lived, oval structures, whilst the female cones, which mature in one year, are much larger. They are readily recognised, when young, by their red colour. The common European species, *Larix europæa*, is extensively cultivated for its timber, which is used in shipbuilding, and for railway sleepers, etc., whilst the bark is employed in tanning. *L. americana* is the Amer. black L., a species commonly grown in the New World, whilst among other species are *L. Ledebourii* (Russia) and *L. leptilepis* (Japan).

LAREDO (27° 32′ N., 99° 26′ W.), town, Texas; U.S.A.; manufactures bricks. Pop. (1910) 14,855.

LARES, Rom. deities of the household and family and of roads and cross-roads. The Lares being guardians of the house, were intimately associated with the Penates, or guardians of the store.

LARGENTIÈRE (44° 32′ N., 4° 18′ E.), town, S.E. France.

LARGS (55° 48′ N., 4° 52′ W.), town, Ayrshire, Scotland. Alexander III. defeated Norwegians, 1263. Pop. of parish (1911), 6029.

LARGUS, SCRIBONIUS (fl. in I. cent. A.D.), physician to Emperor Claudius; collected a large number of his own and other medical prescriptions (*Compositiones*), a work still studied.

LARIDÆ, GULL FAMILY (*q.v.*).

LARINO (41° 48′ N., 15° 54′ E.), town, Italy; cathedral; seat of bishopric. Pop. 7100.

LARISSA (39° 36′ N., 22° 24′ E.), town, Thessaly; many mosques; manufactures silk, leather, cotton. Ceded to Greece by Turks, 1881. Pop. 18,200.

LARISTAN (27° 45′ N., 54° 30′ E.), division of Fars province, Persia; area, *c.* 20,000 sq. miles. Pop. *c.* 90,000.

LARKHALL (55° 45′ N., 3° 59′ W.), town, Lanarkshire, Scotland; coal mines. Pop. (1911) 14,202.

LARKHANA (27° 27′ N., 68° 8′ E.), town, Bombay, India. Pop. 15,500. L., district, pop. 656,083.

LARKS (*Alandidæ*), a family containing about 250 species of perching birds found almost all over the world. They are distinguished by their dull, earth-coloured plumage, and by the long straight claw of the first toe. The SKY-LARKS (*Alanda*), the beautiful song of which filters from the clouds, nest on the ground in open country and congregate in flocks during the winter; while the WOOD-LARKS (*Lullula*) prefer fields bordering woods. The Horned or Shore Lark (*Otocorys*), with ear-like tufts of feathers in the male, is a winter visitor to Britain, but the only common Brit. resident is the common skylark (*Alanda arvensis*).

LARNACA, LARNICA, LARNECA (34° 57′ N., 33° 39′ E.), port, Cyprus, Mediterranean Sea. Pop. 8500.

LARSA (31° 33′ N., 45° 53′ E.), ancient city of Babylonia; site marked by ruins of Senkera.

LARVAL FORMS, LARVÆ, young independent stages which differ in essential structure from their adult form. Some are well known, *e.g.* the caterpillar and chrysalis stages of the butterfly, and many insects exhibit this two-staged youth, while most show modifications of this cycle, a quiescent period, or at least a period of moulting, preceding the attainment of adult characters.

It is amongst aquatic and especially marine organisms, however, that larval forms are most common and most diverse. Amongst such groups as Cœlenterates, Echinoderms, Worms, Arthropods, Molluscs, and among the Vertebrates—Tunicates, Cyclostomes, and Amphibians—all or any of the members reach adult life by indirect routes through larval bypaths.

Larval forms show that the apparently radially symmetrical Echinoderms are really bilateral in symmetry, that the inactive, backboneless Tunicate is product of an active chordate youth, and that such cases of degeneracy are frequent. Frequently they reveal the relationship of animals, by recapitulating in themselves earlier stages in the development of the race. Thus the Nauplius, Zoëa, and Mysis stages of some Crustacea in all probability indicate lower steps of Crustacean development; while the larvæ of Annelid Worms, of Polyzoa, Brachiopods, and Molluscs point to a common origin for these groups. Owing to peculiar conditions some larvæ retain this form throughout life—the most striking example being that of the Axolotl larva of the Salamander, *Amblystoma*, which becomes mature, and breeds in larval form.

LARYNX, the organ of voice, is situated in the upper part of the neck, communicating below with the windpipe, above with the pharynx. It is a sort of box, formed by a framework of five large cartilages: (1) *thyroid* cartilage, whose apex forms the prominence, *Adam's apple*; (2) *cricoid* cartilage, a ring below; (3) the *epiglottis*, a thin plate projecting from the thyroid cartilage into the pharynx; (4) two *arytenoid* cartilages, joined to the back of the thyroid cartilage. On each inner side of the l. are two pairs of folds. The free borders of the upper pair cover delicate fibrous bands, the false vocal cords, while the strong bands in the lower folds are the true *vocal cords*. The air from the windpipe plays directly on the vocal cords, causing them to vibrate, thus causing a note. The tenseness of the cords and size of the opening are controlled by muscles.

Laryngitis, inflammation of the mucous membrane of the larynx, may be *acute* or *chronic*, the former being usually due to exposure to cold or over-use of the voice, characterised by swelling of the mucous membrane of the throat, with at first diminished and then increased secretion, cough, sore throat, and huskiness of voice—the treatment being rest in bed, warmth, inhalation of steam with benzoin, and a purge; while chronic l. may be due to a preceding acute attack, to persistent strain of the voice, and chronic irritation, such as tobacco-smoke, the symptoms being the same as in acute, but more persistent, and treatment rest, change of air, care of general health, and application of an astringent to the throat. *Œdema glottidis* is a serious condition due to extension of inflammation from neighbouring parts, to injury by a corrosive or boiling water, or to septic infection often associated with scarlatina or other fever. The mucous membrane is very swollen, there is breathlessness, and suffocation may occur. The patient in this case is ordered to suck ice, the affected part is scarified and sprayed with ether, and tracheotomy (an incision into the trachea) may be necessary. See CROUP.

LAS BELA, LUS BEYLA.—(1) (26° 10′ N., 66° 25′ E.) small state, S.E. Baluchistan; triangular alluvial land on delta of Purali; bounded by Khirthar range on E. and Hála Mts. on W.; area, 6357 sq. miles. Pop. (1910) 56,000. (2) capital of above; burial-place of Sir Robert Sandeman. Pop. *c.* 6000.

LAS CASAS, BARTOLOMÉ DE (1474–1566), Span. prelate; called 'The Apostle of the Indians'; endeavoured to secure better treatment of Indians by Spain; bp. of Chiapa (Mexico), 1544–47.

LAS CASES, EMMANUEL AUGUSTIN DIEUDONNÉ, COMTE DE (1766–1842), Fr. official; joined Napoleon, and accompanied him to St. Helena.

LAS PALMAS (28° N., 15° 41′ W.), capital, Grand Canary Island; episcopal see; seat of government cathedral. Pop. (1910) 53,824.

LAS VEGAS (35° 35′ N., 105° 20′ W.), town, New Mexico, U.S.A.; thermal springs in vicinity. Pop. (1910) 3179.

LASHIO (22° 54′ N., 97° 46′ E.), European station, Shan States, Burma, India. Pop. *c.* 3000.

LASKER, EDUARD (1829–84), Ger. politician and journalist; founded National Liberal party; successfully opposed Bismarck's autocratic measures; promoted judicial and economic reforms.

LASKI, HIERONYMUS (1496–1542), diplomat; entered John Zapolya's service, for whom he gained aid of Turks; established Zapolya's position on Hungarian throne.

LASKI, JAN (1456–1531), Polish abp. and politician; sent on diplomatic missions by Polish chancellor, Kurozwecki; sec. to King Alexander, 1501; Chancellor, 1503; abp. of Gnesen, 1511; excommunicated, 1531.

LASKI, JAN (1499–1560), nephew of preceding; bp. and reformer; embraced Augsburg Confession; wrote polemical works.

LASSALLE, FERDINAND (1825–64), Ger. socialist; b. Breslau; prosecuted Countess Hatzfeldt's suit against her husband; pub. work on Heraclitus, 1858; *System der erworbenen Rechte*, 1861; helped to found Social Democratic party in Germany, adopting career of agitator; chief aim was to improve conditions of working class; founded *Allgemeiner Deutscher Arbeiterverein*; wrote pamphlets and made speeches in large towns, attaining greatest success in Rhine country; involved in several state prosecutions; d. from result of duel. See Brandes, *Life* (1911).

LASSEN, CHRISTIAN (1800–76), Norweg. Orientalist; edited Sanskrit works, and wrote important books on Oriental languages and antiquities.

LASSOO, LARIAT, strip of plaited hide, used in America for purposes of capture; flung in noose over animal's head, end retained in hand.

LASSUS, ORLANDUS, ORLANDO DE LASSO (*c.* 1530–94), Belg. composer; b. Mons; chorister in the church of Nicholas; app. director of the choir of the Lateran, Rome, *c.* 1551; master of the court chapel, Munich, 1562–94; prolific composer (over 2000 works), and one of the greatest musicians of the XVI. cent.; masses, sacred motets, madrigals, chansons.

LASWARI, in Alwar, India; scene of Brit. victory over native forces, 1803.

LATACUNGA (0° 56′ S., 78° 26′ W.), town, Ecuador, S. America; subject to earthquakes. Pop. *c.* 10,000.

LATAKIA (35° 53′ N., 35° 46′ E.), port, Syria; produces tobacco of same name, which is extensively used in blending. Pop. *c.* 22,000. See also LAODICEA.

LATAX, Sea Otter, see WEASEL FAMILY.

LATEEN, triangular sail, used in Mediterranean.

LATERAN COUNCILS, held at Rome in the church of St. John Lateran. 1ST, in 1123, confirmed Concordat of Worms; 2ND, in 1139, settled papal schism; 3RD, in 1170, settled conflict between Empire and papacy; declared war against Cathari; 4TH, in 1215, formulated doctrine of transubstantiation. 5TH, in 1517, asserted superiority of pope over councils.

LATERITE, a red-brown earthy deposit occurring on various igneous and schistose rocks, caused by decomposition owing to exposure to natural forces. Most noticeable in tropics, probably owing to greater heat and tropical rains.

LATHE, contrivance by which various materials are 'turned' or polished; worked by means of foot-treadle or mechanical power.

LATIMER, HUGH (1490–1555), Eng. religious reformer; s. of Leicestershire yeoman; ed. at Cambridge; began to preach against ecclesiastical abuses; prohibited by bp. from preaching in diocese of Ely; made royal chaplain by Henry VIII.; became rector of West Kington, Wiltshire, 1531; tried for heresy and imprisoned, 1533, but on king's throwing off papal authority became his adviser; burned during Marian persecution.

LATIN LANGUAGE was the tongue spoken in Rome and in the plains watered by the Tiber in the VI. cent. B.C., but of whose previous existence we have no records. The Lat. language belongs to the so-called *Centum* group of the Indo-European languages. It has prominent features in common with Greek, and a still closer relationship with the Celtic group—viz. Gaelic (Irish and Scots), Manx, the language of ancient

Gaul, Welsh, Cornish, and Breton. Kindred dialects were spoken in the districts bordering on Latium, *e.g.* Umbrian, Oscan, and Sabellian. The Lat. language, like the other Indo-European languages, is synthetic and inflectional. The declensions of nouns in Lat. are 5 in number. There are 2 numbers—singular and plural. Unlike Greek, it has lost the dual, though *duo*, 'two,' and *ambo*,' both,' are relics of the dual number. The cases are nominative, vocative, accusative, genitive, dative, and ablative, with traces also of the old locative. There are 3 genders—masculine, feminine, and neuter. The verb has an active and a passive voice, but no middle, and thus is poorer than the Greek. In moods, too, Lat. is deficient, having no optative, though it retains the indicative, imperative, subjunctive, infinitive, and the participial (incomplete; in active, only present and future; in passive, only past). The present, future, perfect, imperfect, pluperfect, and future-perfect moods are preserved, but the aorist is wanting. Lat., however, has two unique developments of the verb, *i.e.* the gerund and gerundive.

The supremacy of Lat. over the other dialects of Italy was posterior by a considerable period in the supremacy of power. The remains at Pompeii show that the Oscan dialect was not dead there in 79 A.D., the date of the fatal eruption. The various dialects had great influence on the development of the language.

The development of Lat. is usually considered by dividing its history into 5 periods, viz.: (1) *c.* 500–240 B.C. To this period belong our earlier evidences of the written language—mainly inscriptions. Lat. has not yet taken literary form. (2) 240–70 B.C. The Lat. dialect is now becoming victorious over the neighbouring dialects. The Social War resulted in Lat. replacing many dialects. Gk. culture and learning has reached Rome, and its influence has re-shaped Lat. and made it a fit vehicle for literary expression. (3) 70 B.C.–14 A.D., **The Golden Age** of Lat. letters—the age in which prose reached its highest excellence in Cicero's writings, and verse its supreme beauty in Vergil. (4) 14 A.D.–180 A.D., **The Silver Age**, in which the language fast lost its purity. (5) 180 A.D. to the date of the disintegration of Lat. into the Romance languages. This period includes the development of ecclesiastical Lat.

Lat. possesses a lit. of high excellence. Its later development, ecclesiastical Lat., was a cosmopolitan medium in the Middle Ages. It became the parent of the languages of W. Europe. The relation between classical Lat. and the kindred dialects of Italy is important and must be kept in view, for the dialect forms appeared and reappeared in unexpected places. The point of divergence between the spoken form of the language and the literary form was the introduction of Greek models. When the Saturnian metre was superseded by the exotic hexameter the language underwent a corresponding change. Plautus's diction is nearer to the spoken idiom than the language of Ennius, as is natural in comedy. In Cicero the divergence is still more marked. Clause architecture has now reached a high degree of refinement, and the closing cadences have become subject to law. But the dialects and the spoken language counteracted on the literary language. Domestic life introduced words from the vulgar and servile vocabularies. As the area of spoken Lat. increased, the necessary accompaniments of colonisation, peregrine marriages, etc., had their influence. We find Vergil himself accused of making use of *peregrina verba*, and Livy of 'Patavinity.' But on the whole literary Lat. of the Classical Age maintained its independent course.

In the Silver Age the adulteration of the classical idiom by provincial influence is apparent. The percentage of non-classical words in the writings of Apuleius is alarmingly high. Still more apparent is the prevalence of provincial varieties in the writings of the Christian Fathers. But so long as the Empire held together, so long was the permanence of spoken Lat. secure. The fall of the Rom. Empire was accompanied by the disintegration of the language. The heralds of disintegration were the corruption of inflections, the usage of auxiliary verbs, and the appearance of definite and indefinite articles.

The replacement of spoken Lat. in the IX. cent. by Spanish, French, Italian, Rumanian, was almost complete. But though Lat. died as a spoken language, it long survived as a literary language. In the Middle Ages it was the universal language of scholars, and even Gk. thought and civilisation were only disseminated through a Lat. medium. The theology, philosophy, law, and science of the civilised world were expressed in Lat. Nor did the Renaissance with its revival of Gk. letters crush the marvellous vitality of the language. Till the reign of Louis XIV. it was the language of diplomacy, and Newton wrote his *Principia* in Lat. It still lingers in documents, mottoes, and inscriptions, and in the services of the Church of Rome.

Lat. cannot be compared in versatility with Greek. Its poverty in particles and verb forms makes it incapable of expressing the delicate shades of meaning so characteristic of the subtlety of Gk. thought. But it is a language of inimitable solemnity, lucidity, and precision, and, when its unpromising beginning is considered, its influence and development are marvellous.

LATIN LITERATURE developed on lines directly opposed to those along which the lit. of Greece evolved. Lat. lit. was shaped according to imported models; Gk. lit. was a spontaneous growth. The various species of Lat. composition arose according to no law; the various species of Gk. composition arose according to a natural order. The making of Lat. lit. was Gk. culture; the making of Gk. lit. was Gk. creative genius.

The capture of Tarentum (272 B.C.) is the great landmark in the history of Rom. letters. The imported Gk. slaves began to create a new lit. at Rome in imitation of the Gk. masterpieces. Previously, however, there had been the seeds of an indigenous lit. in the Lat. tongue. Inscriptions on busts and tombs were the beginnings of Lat. prose. The Songs of the Fratres Arvales and other land charms were a rude form of verse. Saturnian verse, a native metre, was employed in hymns to the gods and in the Fescennine verses sung at harvest festivals. Lastly, the dramatic *Saturæ*, a medley on all topics, with a strong vein of satire, were the origin of that purely Rom. product—Satire.

The history of Lat. lit. opens with the name of Livius Andronicus, a Gk. slave from Tarentum, brought to Rome, 275 B.C. He translated the *Odyssey* into Saturnian verse, and also translated some Gk. tragedies and comedies into Lat. But the father of native Rom. poetry was really Nævius. His *Bellum Punicum* paved the way for the great epics of Ennius and Vergil. The comedies of Plautus are vigorous performances based on the new comedy of Athens, but their originality in spirit and humour is undeniable. Ennius, the author of the epic called the *Annales*, took a great step in the history of Lat. prosodic development. His poem was written in Lat. hexameters and not in Saturnian metre, like the epic of Nævius. Vergil borrowed freely from the *Annales*. Cicero's poetry was Alexandrian in theme and treatment; it belongs to a school that preferred the recondite to the simple, the learned to the natural. The *De Rerum Natura* of Lucretius is difficult to classify. It is didactic and philosophical in theme, and shows the influence of the Alexandrian school, but it is fired by a genuine passion that lifts it far above all contemporary writing and places it among the masterpieces of the world.

Meantime Lat. prose has been advancing in the hands of Cæsar, Sallust, and Varro, but to Cicero belongs the crown of excellence. His prose is a model of style for all time and for writers in all languages. A poet contemporaneous with Lucretius, but of very different temperament, is Catullus. Catullus is essentially a lyric poet, and a lyric poet of the first order.

The influence of the Imperial policy of Augustus on Lat. letters is inestimable. As in the institutions of Rome so in other lit. the new era marked a complete

reversal of the old traditions. The imperial patronage fostered and directed the poet's talents. Thus the *Æneid* of Vergil set a halo upon the new administration and traced the new order to the inconvertible decrees of the gods. Horace did for Augustus in lyric what Vergil did in epic. The Augustan age is the golden age of Rom. lit., but in it lay the seeds of dissolution.

The age that followed produced great writers like Tibullus, Propertius, Ovid, and Livy, but style is becoming foremost and matter secondary—the age of rhetoric is at hand, the age that produced wooden poets like Statius, Lucan, and Seneca, and whose only possible greatness lay in satire such as Juvenal's and invective such as Tacitus's.

LATITUDE of a place is its angular distance from the equator, measured north or south along a meridian. It is found by an observation of altitude of sun at noon, and a reference to Nautical Almanac for sun's distance from celestial equator on that day. Length of degree of l. is a little greater at the poles than at equator; average value, nearly 69½ miles.

LATIUM, district round ancient Rome; bounded N. by Etruria, E. by Samnium, S. by the Liris, W. by the Tyrrhenian Sea; c. 370 B.C. 30 towns belonged to the LATIN LEAGUE, which was shortly afterwards dissolved by Rome (*q.v.*). The *Latini*, akin to the Romans racially, helped to form the *plebs* of Rome.

LATREILLE, PIERRE-ANDRÉ (1762–1833), Fr. zoologist; student, especially of Invertebrates.

LATS, see ARCHITECTURE, INDIAN.

LATTER-DAY SAINTS, see MORMONS.

LATUDE, JEAN HENRI (1725–1805), Fr. adventurer; imprisoned in Bastille on incurring disfavour of Mme de Pompadour.

LAUBAN (51° 7′ N., 15° 17′ E.), town, Pruss. Silesia, Germany; textiles, beer. Pop. 15,000.

LAUBE, HEINRICH (1806–84), Ger. dramatist; wrote *Das Neue Gahrhundert* (essays), *Das junge Europa* (novel), *Graf Essex* (drama), *Die Karlsschüler* (comedy), etc.

LAUCHSTÄDT (51° 24′ N., 11° 52′ E.), town, Pruss. Saxony, Germany. Pop. 3000.

LAUD, WILLIAM (1573–1645), Eng. abp.; ed. at Oxford; in 1611 made pres. of St. John's Coll. there, and dean of Gloucester, 1616, where he gave offence by removing the communion table to the east end; bp. of St. David's, 1621; and on accession of Charles I. did all in his power to crush the Puritan party; chancellor of Oxford Univ., 1629, where he did much good work for learning and discipline; abp. of Canterbury, 1633; supported absolutism of Charles I. in Church and State; impeached, 1640, and after being kept in prison executed. L. was a man with many good qualities, but narrow-minded and bent at all costs on maintaining outward uniformity (for pure theol. he cared not so much), and failed to understand the temper of his time.

Simpkinson, *Life and Times of Laud* (1894); Bell, *Laud and Priestly Government* (1907).

LAUDANUM (*Tinctura opii*), preparation of opium in equal parts of alcohol and water, the proportion of opium being 1 in 13½ or 1 gr. in 15 minims, the usual dose being 5 to 15 minims for repeated, 20 to 30 minims for single, dose; is a valuable method of giving OPIUM (*q.v.*).

LAUDER (55° 44′ N., 2° 46′ W.), town, Berwickshire, Scotland. James III.'s favourites executed here, 1483.

LAUDERDALE, JOHN MAITLAND, DUKE OF (1616–82); b. at Lethington; originally a Covenanter, subsequently became loyalist; taken prisoner at Worcester, 1651; app. Sec. of State by Charles II., 1660; maintained great influence over king; put down Covenanters; member of *Cabal* Ministry; duke, 1672; attacked by Commons and Scots, but retained position till 1680, when he resigned.

LAUENBURG (*c.* 53° 32′ N., 10° 40′ E.), duchy, Schleswig-Holstein, Germany. After various vicissitudes, L. was ceded to Prussia and Austria by Denmark in 1864, Prussia obtaining complete possession in 1865. Area, 455 sq. miles. Pop. *c.* 56,000.

LAUGHING GAS (N_2O), nitrous oxide; see NITROGEN.

LAUGHTER, complex bodily expression which generally accompanies joy, mirth, and consciousness of anything comic, but may accompany other emotions when there is a sudden release from severe tension, and may be produced by tickling.

LAUNCES, see SAND-EELS.

LAUNCESTON.—(1) (50° 48′ N., 4° 21′ W.) town, Cornwall, England; remains of old walls and Augustinian priory; ruined castle, scene of several sieges during Civil War; here George Fox was immured, 1656. Pop. (1911) 4117. (2) (41° 26′ S., 147° 7′ E.) town, Tasmania; commercial centre. Pop. 19,000.

LAUNDRY, place for washing and 'getting up' clothes; processes include washing, boiling, rinsing, blueing, drying by hydro-extractors and dry air, starching, and ironing.

LAURAHÜTTE (50° 18′ N., 19° E.), town, Pruss. Silesia, Germany. Pop. (1910) 16,118.

LAUREATE, a word used to signify eminent in one of the arts; the laurel in ancient times being associated with Apollo. Poet Laureate is the poet attached to the royal household.

LAUREL, or sweet bay (*Laurus nobilis*), an evergreen shrub indigenous to Mediterranean region, and commonly cultivated in Eng. gardens. The leaves, which are glossy, and leathery in texture, contain hydrocyanic acid, causing a characteristic smell of bitter almonds when crushed. The flowers are small and yellow, and produce purple berries which are used in veterinary med.

LAURENS, HENRY (1724–92), Amer. politician; pres. of Continental Congress, Philadelphia, 1777–78; imprisoned in England, 1780–81; peace commissioner, 1782.—JOHN L. (1754–82), his s.; on Washington's staff; distinguished at Germantown, Coosahatchie, Savannah, Charleston.

LAURENTIAN SYSTEM, ARCHÆAN SYSTEM; see GEOLOGY.

LAURIA, LORIA (40° 1′ N., 15° 48′ E.), walled town, Italy. Pop. 11,000.

LAURIA, ROGER DE, LURIA, or LORIA (d. 1305), Span. admiral; on outbreak of Sicilian Vespers went to Sicily with Peter III. of Aragon, who app. him commander of fleet; defeated Anjevines, 1283, 1284; gained brilliant victories off Catalonian coast, 1285, routing French near Hormigas and at Rosas.

LAURIER, SIR WILFRID (1841–), Canadian statesman of Fr. extraction; b. at St. Lin, Quebec; called to Bar, 1864; entered Quebec legislature, 1871; member of Dominion House of Commons, 1874; Inland Revenue Minister, 1877; represented Quebec from 1878; became leader of Liberal party, 1887; Prime Minister, 1896–1911. Administration marked by introduction of preferential tariff, 1897, in favour of Brit. goods; by Canadian support in South African War, 1899–1902; and by great advance in prosperity of Canada; opposed grant of three Dreadnoughts to Britain, 1913; fine bilingual orator. Willison, *Sir W. Laurier and the Liberal Party* (1903).

LAURIUM.—(1) (*c.* 37° 50′ N., 23° 50′ E.) town, Greece; silver mines. Pop. 10,500. (2) (47° 15′ N., 88° 8′ W.) town, Michigan, U.S.A.; copper mines. Pop. 7653.

LAURVIK (59° 4′ N., 10° 5′ E.), port, Norway; shipbuilding. Pop. (1910) 10,151.

LAUSANNE (46° 31′ N., 6° 38′ E.), town, Switzerland; capital of Vaud Canton, near Mont Jurat, 1690 ft. above sea-level, overlooking Lake of Geneva; fine cathedral (built 1235–75), library, art gallery, also supreme court of appeal for Swiss Federation; machinery, leather, chocolate; long the home of Gibbon; educational centre. Pop.—mostly French-speaking and Prot.—(1910) 63,926. Gribble, *Lausanne* (1909).

LAUSANNE, PEACE OF, see ITALY (HISTORY).

LAUZUN, DUC DE, ANTONIN NOMPAR DE CAU-

MONT, MARQUIS DE PUYGIULHEM (1632–1723), Fr. courtier and soldier; favourite of Louis XIV.; imprisoned, 1671–81; subsequently went to England; commanded Brest expedition, 1689.

LAVABO (Lat. 'I will wash'), used in Catholic Church of priest washing his hands at Mass.

LAVAGNA.—(1) (44° 18′ N., 9° 21′ E.) port, Liguria, Italy. Pop. 7400. (2) (45° 27′ N., 9° 26′ E.) town, Lombardy, Italy.

LAVAL (48° 4′ N., 0° 46′ W.), town, Mayenne, France; episcopal see; cathedral dates in part from XII. cent.; old ducal castle; formerly fortified. Manufactures textiles; marble quarries. Pop. (1911) 30,252.

LAVATER, JOHANN KASPAR (1741–1801), Ger. poet and writer on physiognomy; his great work on physiognomy (4 vols., 1775–78) occasioned much discussion, but was praised by Goethe.

LAVAUR (43° 43′ N., 1° 49′ E.), cathedral town, Tarn, France. Pop. 6500.

LAVELEYE, ÉMILE LOUIS VICTOR DE (1822–92), prof. of Political Economy at Liège, 1866; wrote works on economics and other subjects.

LAVENDER (*Lavandula vera*), a member of the Labiatæ; of shrubby habit, with pale, bluish flowers possessing a characteristic and exquisite odour, and prolific in honey; blooms, on distillation, yield oil of L., which is used in perfumery and in painting; often dried, and placed in packets for the linen press, or used in making potpourri.

LAVIGERIE, CHARLES MARTIAL ALLEMAND (1825–92), Catholic prelate; abp. of Algiers, 1866, devoting himself to work among Muhammadans; supported papal infallibility; latterly reconciled to Fr. Republic.

LAVINIUM (41° 40′ N., 12° 28′ E.), ancient town, Latium, Italy; traditionally founded by Æneas, near site of Laurentum, with which it was united as Lauro-Lavinium, under Trajan; remains include necropolis. On site is modern Pratica.

LAVISSE, ERNEST (1842–), Fr. historian; prof., Modern History, Sorbonne, 1888; Member of Academy; edit. and wrote part of *Histoire de France* (1901–); wrote *Trois Empereurs d'Allemagne.*

LAVOISIER, ANTOINE LAURENT (1743–94), Fr. chemist; laid the foundations of quantitative chem. by use of balance; proved indestructibility of matter, and that water is not turned into earth by heating, but that heated sulphur, phosphorus, and tin gain by absorption of air; employed Priestley's discovery of oxygen, and Cavendish's of the compound nature of water to overthrow phlogiston theory, and establish true theory of combustion; showed nature of diamond, introduced system of chemical classification and nomenclature; served Fr. State as *Fermier-général* (tax collector); commissioner for gunpowder, and for weights and measures, and on Committee of Agriculture; executed by Revolutionists.

Grimaux, *Life of L.* (1888).

LAW, see under ROME and various States.

LAW, JOHN (1671–1729), financier; b. Edinburgh; led a wild youth; imprisoned for slaying his antagonist in a duel; went to Holland, and became interested in finance; served in France under the Regent, 1715, and propounded a vast scheme to get the country out of financial difficulties. A bank was formed, of which L. became director, and company was formed to do trade with the Indies. A tremendous boom resulted, during which too many shares were issued, prices rose, and a crash came, 1720, when L., who had been popular, became detested. He left France, and d. in poverty. He had great financial ability, but one or two great mistakes brought about his failure.

Life, by Wiston-Glynn (1908).

LAW, WILLIAM (1686–1761), Eng. theologian; taught in Cambridge, but refused to take oath to George I., becoming a 'non-juror'; author of the *Serious Call,* and other works from High Church standpoint; a notable mystic. Whyte, *Characters and Characteristics of William Law* (1893).

LAWES, HENRY (1595–1662), Eng. musician; wrote music of Milton's *Comus.*

LAWES, SIR JOHN BENNET, Bart. (1814–1900); Eng. agriculturist; founder and endower of Rothamsted experimental farm.

LAWN-TENNIS, modern form of Tennis (*q.v.*), introduced *c.* 1875; played on grass or artificial courts, generally in open air, though play in winter is carried on in covered courts. Similar to tennis in mode of scoring, it is played with balls and racquets; balls must measure 2½ in. in diameter and weigh 1⅞ to 2 oz.; there are no standard measurements for racquets, which are oval in shape and vary from 13 to 17 oz. in weight according to wrist-strength of player. There are two varieties of the game, 'singles' for two, and 'doubles' for four players; in the first case the court is 78 ft. by 27 ft., with a serving-court 27 ft. in length on either side of the net; in the second the breadth is increased by 9 ft. while the serving-court remains the same. The net, which is stretched across the middle of the court, is 3 ft. 6 in. at supporting-posts, and 3 ft. at centre of court.

The 'server,' who opens play in each game, must deliver ball in opposite serving-court; two strokes are allowed; thereafter play within enclosing lines is open, and stroke is terminated when one side hits ball into net or outside the court. The service changes with every game. The fast overhand serve is nowadays the most popular form of service, and the higher the serve is, the faster the delivery. All England Champion, 1912, A. F. Wilding; Amer. Champion 1912, M. E. McLoughlin.

Vaile, *Modern Lawn-Tennis* (1907); Heathcote and others, *Tennis and Lawn-Tennis, etc.* (4th ed., 1897).

LAWRENCE.—(1) (39° N., 95° 14′ W.) town, Kansas, U.S.A.; site of state univ.; manufactures flour, machinery, furniture; an anti-slavery centre in Civil War. Pop. (1910) 12,374. (2) (42° 39′ N., 71° 10′ W.) town, Massachusetts, U.S.A.; manufactures cottons, woollens, paper, machinery, engines. Pop. (1910) 85,892.

LAWRENCE, ABBOTT (1792–1855), Amer. diplomatist; acquired great wealth in business with his bro. Amos; several years member of Congress; minister to England, 1849.

LAWRENCE, AMOS ADAMS (1814–86), Amer. financier; founder of L. Coll., Appleton, Wisconsin, and of L. City, Kansas; opposed revolt of South. His s., **William L.** (1850–), is Protestant Episcopal bp. of Massachusetts.

LAWRENCE, JOHN LAIRD MAIR, 1ST BARON L. (1811–79), Eng. administrator; younger s. of Lieut.-Col. Alexander L., who served in Mysore campaign, 1790, and capture of Seringapatam, 1799, and younger bro. of Sir Henry L. (*q.v.*), hero of Lucknow; on annexation of Punjab, 1849, became commissioner, and subsequently lieut.-gov., and won devotion of untamable Sikhs; loyalty of Punjab proved salvation of British at outbreak of Mutiny; troops sent by L. relieved important garrisons; received annual pension of £1000 as reward; baronet, 1858; P.C., 1859; Gov.-Gen. of India, 1863, and received annual pension of £2000 from East India Company; baron, 1869.

Life, by Smith (1883), Sir R. Temple (1889).

LAWRENCE, ST., river, see ST. LAWRENCE.

LAWRENCE, SIR HENRY MONTGOMERY (1806–57), Brit. soldier and politician; joined Bengal artillery, 1823; served in first Burmese War, 1824–26; first Afghan War, 1838; reduced Kaithal; established several military asylums in India; served in Sikh War, 1845–48; administrator in Punjab, 1849; fortified Lucknow in Mutiny; killed at beginning of siege.

Life, by Sir C. Aitchison (1892).

LAWRENCE, SIR THOMAS (1769–1830), Eng. painter; became famous in boyhood; succeeded Reynolds as limner to the king, and had a greater vogue than any portrait painter of his time; pres., Royal Academy, 1820; among his famous portraits is *Countess of Derby.*

LAWRENCE, STRINGER (1697–1775), Eng. general; served in India under Clive; called 'The father of the Indian Army.'

LAWRENCEBURG (39° 3′ N., 84° 52′ W.), town, Indiana, U.S.A. Pop. (1910) 3930.

LAWSON, SIR WILFRID, Bart. (1829–1906), Brit. politician; M.P., 1859; introduced Permissive Bill concerning sale of intoxicating liquors, 1864; opposed Boer War; pres. of United Kingdom Alliance; had reputation as wit.

G. W. E. Russell, *Memoir* (1909).

LAYAMON, Eng. poet of XII. cent., was a priest at Emley on the Severn. His *Brut* (British History), a work founded on the writings of Bede, 'St. Albin,' 'Austin,' and Wace, is of great importance prosodically as transition between O.E. and Eng. prosody; lines with O.E. alliteration and trochaic cadence alternate with iambic rhyming lines.

LAYARD, SIR AUSTEN HENRY (1817–94), Brit. archæologist and politician; b. Paris; conducted important excavations at Nimrud in 1845; pub. *Nineveh and its Remains* and *Monuments of Nineveh*. Became M.P. for Aylesbury (1852), and later Chief Commissioner of Works.

LAYMEN, HOUSES OF, Anglican assemblies in provinces of Canterbury and York.

LAZARISTS, VINCENTIANS, 'Congregation of Priests of the Mission,' R.C. Order, founded at St. Lazare, Paris, by St. Vincent de Paul for teaching of lower classes, 1624; now number *c.* 3000.

LAZARUS.—(1) In *John* 11^{12}, raised by Christ from the dead; (2) in *Luke* 16^{20}, in parable of Dives and Lazarus.

LAZARUS, MORITZ (1824–1903), Hebrew philosopher; prof., Berlin, 1873; emphasised importance of psychology and sociology.

LE BLANC (46° 38′ N., 1° 4′ E.), town, Indre, France. Pop. 5000.

LE BRUN, CHARLES (1619–90), Fr. painter; patronised by Louis XIV., who employed him for the decoration of the palace of Versailles.

LE CATEAU, CATEAU CAMBRÉSIS (50° 4′ N., 3° 22′ E.), town, Nord, France; peace concluded here between England, France, and Spain, 1559. Pop. 11,000.

LE CHAMBON, LE CHAMBON-FENGEROLLES (45° 23′ N., 4° 20′ E.), town, Loire, France; coal. Pop. 12,500.

LE CLERC, JEAN (1657–1736), Fr. Prot. theologian; preached at Saumur and London; prof. at Amsterdam, 1684–1712; wrote various works on Biblical criticism, in advance of his time.

LE CREUSOT (46° 48′ N., 4° 25′ E.), town, Saône-et-Loire, France; coal, iron. Pop. (1911) 35,587.

LE DAIM, OLIVIER, barber and confidant of Louis XI. of France; detested by populace; executed after Louis's death; appears in Sir W. Scott's *Quentin Durward*.

LE HAVRE, see HAVRE.

LE MANS (48° N., 0° 11′ E.), town, Sarthe, France; has remains of Rom. walls; episcopal see; fine cathedral dating in part from XI. cent., site of former abbey. Manufactures tobacco, machinery. Here Prussians defeated French in a two days' battle, 1871. Pop. (1911) 69,361.

LE MARCHANT, JOHN GASPARD (1766–1812), Eng. soldier; first lieut.-gov., Sandhurst; commanded cavalry brigade with distinction in Peninsular War; killed, Salamanca.

LE PELETIER, DE SAINT-FARGEAU LOUIS MICHEL (1760–93), Fr. revolutionary; murdered by a royalist for voting for execution of Louis XVI.

LE PUY, LE PUY EN VELAY (45° 2′ N., 3° 53′ E.), town, Haute-Loire, France; episcopal see; has XII.-cent. Romanesque cathedral and XI.-cent. baptistery; manufactures thread and guipure lace, textiles, chocolate, spirits; formerly fortified. Pop. 22,000.

LE SAGE, ALAIN RENÉ (1668–1747), Fr. author; b. in Brittany, and in youth employed on farm; for forty years fought against poverty, translating and doing other work, but, above all, making observations; published *Crispin rival de son maître*, a little play in prose, 1707; *Le Diable boiteux*, which won him fame, 1707; *Turcaret* (1709), a severe satire on financiers, who endeavoured to stop its production, but Le Sage was under protection of the Dauphin. His novel, *Gil Blas* (1715–35), great comic masterpiece, setting of which is in Spain, belongs to all times and all countries.

LE SUEUR, EUSTACHE (1617–55), one of the founders of the Fr. Academy of Painting; executed many religious and mythological pictures, of which the Louvre possesses 47 specimens.

LE TRÉPORT (50° 3′ N., 1° 22′ E.), town, Seine-Inférieure, N. France; shipbuilding, fisheries. Pop. 5000.

LEA, HENRY CHARLES (1825–1909), Amer. author; wrote several works on the history of the Inquisition and allied subjects.

LEAD (Pb=207), a metal of blue-grey colour having a strong metallic lustre when newly cut, which, however, soon dulls when exposed to the action of air; S.G. 11·38; M.P. 350° F. L. is one of the metals known in very early times; mention of it, for instance, is found in the *Book of Job* 19^{24}, while the Romans used it for water pipes, tanks, weights, and rings. L. is very soft—it can be scratched with the nail—flexible, ductile, and non-elastic. It is abundant and widely distributed, but is chiefly obtained from U.S.A. where the Colorado and Nevada l. mines find work for hundreds. Here it occurs in its virgin state. It is, however, often obtained from galena, or sulphide of l. found in veins on many parts of Europe. It is of great commercial value, being used for a variety of purposes, including gas and water pipes and roofing. Two parts l. and one part tin forms a soft solder, used by whitesmiths and others. Four parts tin and one part l. forms pewter, formerly used largely for making jugs, pint pots, etc. L. is also used for making type metal. L. has four oxides, viz. sub-oxide (Pb_2O), grey-blue colour; protoxide, or yellow oxide (PbO), also known as massicot; red oxide (Pb_3O_4), or red lead; dioxide (PbO_2), or brown oxide. Red l. and white l. are used by plumbers and painters, while sugar of l. is used medicinally and chemically. Protoxide is used for glazing earthenware and porcelain, and carbonate of l. is the foundation of white oil paint.

Lead-Poisoning, PLUMBISM, may be due to an occupation involving the handling of lead—white lead and red lead workers, lead smelters, painters, compositors, etc.—by drinking contaminated water or other beverages, or by women taking lead to procure abortion. There is anæmia, a dull tint of the skin, bad taste in the mouth with offensive breath and blue line on the gums, pains and tingling in the joints and muscles. *Lead colic* consists in sudden abdominal pain in the region of the umbilicus, slow pulse, and constipation. *Lead palsy* usually takes the form of *wrist-drop*, or there may be paralysis of the upper arm or leg, accompanied by wasting. The poisoning may produce brain disturbances, convulsions, delirium, and coma, death ensuing suddenly, or melancholia and delusions. The treatment is to remove the cause by removing the individual from his work, etc., and the various symptoms should be treated—morphia and fomentations for the colic, iron for anæmia, electricity and massage for the paralysis, and so on, and, on improvement, iodide of potassium to make the lead in the tissues soluble so that it may be gradually eliminated. Scrupulous cleanliness is the best preventive.

LEAD (44° 20′ N., 104° W.), town, S. Dakota, U.S.A.; gold mine. Pop. (1910) 8392.

LEADHILLS (55° 26′ N., 3° 45′ W.), village, Lanarkshire, Scotland; Allan Ramsay's birthplace. Mines yield *c.* 1000 tons of lead annually.

LEADVILLE (39° 12′ N., 106° 18′ W.), town, Colorado, U.S.A.; mining centre; smelting and refining

of lead and silver ore; gold, copper, manganese also found. Pop. (1910) 7508.

LEAF, typically a thin, green expanded structure, borne on the stem and performing three main functions, namely, transpiration, assimilation, and respiration. The first of these is the giving off as vapour of the surplus water absorbed by the roots, the second the absorption of carbon dioxide from the atmosphere, the oxygen being liberated and the carbon being utilised in the building up of organic materials (starch, oils, sugar), whilst the third is the absorption of oxygen and the liberation of carbon dioxide. The l. is bounded by an epidermis, usually cuticularised, and containing minute pores, or stomata, through which gaseous exchange with the atmosphere occurs. The internal tissues consist of a mass of green cells, the mesophyll, often differentiated into palisade and spongy parenchyma, the latter of which is provided with abundant air-spaces. This tissue is traversed and supported by veins, or conducting strands, which, in monocotyledons form a parallel, closed system, and in dicotyledons a reticulate open system. Although some leaves (*e.g.* grasses) are stalkless, the majority possess a definite petiole by means of which they are attached to the stem, the point of attachment being termed the node.

In many leaves the base of the petiole bears two expansions, the stipules, which may function as accessory leaves (hawthorn, viola, Leguminosæ), or be modified as spines (acacia, robinia), tendrils (smilax), or as bud-scales (lime, magnolia). Leaves are inserted on the stem in a definite and regular manner, some species possessing whorled leaves (balsam), others opposite (Labiatæ, sycamore), or alternate (lime, elm), and this arrangement is termed *phyllotaxy*. Where the leaves spring from a very short stem, forming a rosette, as in the daisy and plantain, they are said to be radical leaves. They are also grouped and folded in the leaf-bud in various characteristic ways, this being termed the *vernation* of the leaf. The shape of the blade in different plants is very variable as each may consist of a single coherent structure, when it is termed simple (oak, beech, lily), or may consist of two, three, or more separate leaflets arranged pinnately, as in the ash, or palmately, as in the horse-chestnut, when they are said to be *compound*. Although leaves have been given various names according to their shapes, they all conform ultimately to certain geometrical plans, a feature recognised as long ago as the XVII. cent., by Nehemiah Grew.

For modifications see under PITCHER-PLANTS, SUNDEW, VENUS' FLY-TRAP, etc. Lubbock's *Flowers, Fruits, and Leaves*.

LEAF-CUTTER BEES (*Megachile*), solitary bees which line their nests, in trees, walls, or in the ground, with discs cut from leaves, especially of rose bushes.

LEAF INSECTS AND STICK INSECTS (*Phasmidæ*), a family of Orthoptera, with about 600 species, which have bodies, limbs, and wing-covers (where present) resembling bare twigs or leaves. They subsist upon leaves and are nocturnal in habit. Tropical and subtropical, especially Australian, but four or five kinds have been found in Europe.

LEAF WORMS, see TURBELLARIAN WORMS.

LEAKE, WILLIAM MARTIN (1777–1860), Brit. antiquary; lieut.-colonel in the army; noted for topographical works on Greece and Levantine countries.

LEAMINGTON (52° 17′ N., 1° 31′ W.), town and health-resort, Warwickshire, England; mineral springs; manufactures cooking ranges. Pop. (1911) 26,717.

LEANDER, see HERO AND LEANDER.

LEAP YEAR, see CALENDAR.

LEAR, EDWARD (1812–88), Eng. artist and writer; exhibited at the Royal Academy from 1850 to 1873, and wrote several illustrated books; best known for his *Book of Nonsense*, 1846.

LEARNED SOCIETIES, see SOCIETIES, LEARNED.

LEATHER, tanned hides of animals. Skin is composed of two parts, the *epidermis* or upper skin (valueless in l. manufacture) and the *dermis* or *corium*, which is covered with gelatine. Hides are first scraped and then soaked for two weeks in lime-water; the loosened hair is removed by scraping. Hides for soft leathers are subsequently treated with fermented excrement of birds and dogs, or by 'erodin,' its chemical equivalent. **Tanning** is the next process. Tannin is a vegetable product, usually taken from oak bark or hemlock; in rough l. tanning oak bark, chestnut, and Valonia are used. The butts (hides with thin parts removed) are suspended in vats of weak solution, and progress gradually to vats containing stronger solutions. The butts are moved gently by machinery. After 8–10 days they are laid flat in 'handlers,' *i.e.* pits in which they are handled daily. In a few weeks they are 'dusted' with drying powder. Heavy l. is 'curried,' *i.e.* treated with fat and oil, and is used for belting, harness, etc. Sole l. is stretched and rolled. *Patent l.* is finished with linseed oil, umber, lamp-black, varnishing, and pumicing. Kid is made from lamb-skin, *chamois l.* from sheep-skin.

LEATHERHEAD (51° 18′ N., 0° 20′ W.), town, Surrey, England; beer, bricks. Pop. (1911) 5491.

LEATHER-JACKET, see TRIGGER-FISHES.

LEAVENWORTH (39° 24′ N., 95° W.), town, Kansas, U.S.A.; commercial and railway centre; manufactures machinery, iron goods, flour, furniture; has coal mines. R.C. episcopal see; has cathedral. To N. is Fort L., a military post constructed, 1827, by Col. Leavenworth. Pop. (1910) 19,363.

LEBANON (*c.* 33° 55′ N., 35° 50′ E.), two parallel mountain ranges in Syria, N. of Palestine; name is of Semitic derivation, and signifies white, in reference to the white rocks, of chalk and limestone formation, of which the mountains are principally composed. The two ranges are: Lebanon on the W., nearest the coast, which is the higher of the two, reaching an extreme elevation of 10,018 ft. in Zahr-el-Kazib; and Anti-Libanus on the E., of which the culminating point is Tal'at Musa (8720 ft.), unless the outlying Mt. Hermon (*q.v.*) be included, which reaches height of *c.* 9200 ft. Between the two ranges stretches the plain of Buka'a or Cœle-Syria, which is drained by the Litany and El-Asi (the ancient Leontes and Orontes) and other streams. The cedars of L., famous in Solomon's time, are now found only in certain districts. In alpine district are low bushes, junipers, etc.; forests of cypress, pine, oak occur on higher slopes, and rhododendrons abound; vines, olives, mulberries in lower regions. Produces cereals, tobacco, silk, honey, coal. Inhabitants include Maronites, Druses, Muhammadans, Christians. The vilayet of L. has area of 1190 sq. miles; administered by Christian governor, who is under protection of European powers and in service of Porte. Pop. *c.* 200,000.

LEBANON.—(1) (38° 35′ N., 89° 50′ W.) town, Illinois, U.S.A. Pop. (1910) 1907. (2) (40° 17′ N., 76° 30′ W.) town, Pennsylvania, U.S.A.; iron mines. Pop. (1910) 19,240.

LEBER, JEAN MICHEL CONSTANT (1780–1859), Fr. historian; wrote essays on economic history, and other treatises.

LEBRIJA, LEBRIXA (36° 55′ N., 6° 4′ W.), town, Seville, Spain; ruined castle. Pop. (1900) 10,500.

LECCE.—(1) (40° 22′ N., 18° 9′ E.) town, L. province, Apulia, Italy; seat of abp.; cathedral; formerly fortified. Pop. (1911) 36,310. (2) (41° 55′ N., 13° 41′ E.) town, Abruzzi, Italy.

LECCO (45° 51′ N., 9° 24′ E.), town, Lombardy, Italy; iron manufactures, copper and brass works. Pop. 10,500.

LECH (48° 10′ N., 10° 53′ E.), river, Bavaria, Germany; enters Danube.

LECKY, WILLIAM EDWARD HARTPOLE (1838–1903), Irish historical writer; b. near Dublin; M.P., 1895; P.C., 1897; wrote *A History of England in the Eighteenth Century*, *Democracy*, and other well-known hist. works.

LECONTE DE LISLE, CHARLES MARIE RENÉ (1823–93), Fr. poet; b. at St. Paul, Réunion; translated classical authors, and wrote poems in new style of the *Parnassiens*; fervour of generation of Victor Hugo replaced by great delicacy and effect of coldness of emotion.

LECOUVREUR, ADRIENNE (1692–1730), famous Fr. tragic actress.

LECTIONARY (Latin *lectio*, 'reading'), term applied to a volume, particularly of Scripture, arranged for reading selected passages; also to the list or system of passages to be read: thus the l. of Scripture for the Anglican Church is printed at the beginning of the Prayer Book.

LECTISTERNIUM, a very ancient ceremony of the Rom. people, and only celebrated at times of great danger, *e.g.* after the disaster at Cannæ couches were spread for the gods and goddesses in pairs, and near the couches feasts were spread.

LECTOURE (43° 56′ N., 0° 39′ E.), town, S.W. France; site of former monastery; interesting old church. Pop. 4500.

LEDBURY (52° 2′ N., 2° 25′ W.), town, Herefordshire, England; old hospital, established 1232. Pop. (1911) 3558.

LEDOCHOWSKI, MIECISLAUS JOHANN, COUNT (1822–1902), abp. of Gnesen, Posen, 1865; led anti-Pruss. movement, and imprisoned, 1874; left country, 1876; lived in Rome.

LEDRU-ROLLIN, ALEXANDRE AUGUSTE (1807–74), Fr. politician and writer; agitated for democratic revolution and became minister of Interior in provisional government, 1848; in exile, 1849–70; pub. *Décadence de l'Angleterre*, 1850.

LEDYARD, JOHN (1751–89), Amer. explorer; served under Captain Cook, 1776; walked across Europe and Asia, 1787.

LEE (42° 23′ N., 73° 16′ W.), town, Massachusetts, U.S.A.; manufactures paper; marble quarries. Pop. (1910) 4106.

LEE, ARTHUR (1740–92), Amer. diplomat; member of Commission to arrange treaty with France, 1776; Commissioner to Spain, 1777; opposed constitution.

LEE, FITZHUGH (1835–1905), Amer. Confederate general in Civil War; served in Virginia; gov. of Virginia, 1886; later served against Spain.

LEE, FRANCIS LIGHTFOOT (1734–97), Amer. politician; member of committee drafting Confederation Articles.

LEE, RICHARD HENRY (1732–94), Amer. politician; bro. of preceding; prominent in opposition to Britain; member of Congress, 1774–80, 1784–87; subsequently senator.

LEE, ROBERT EDWARD (1807–70), Amer. Confederate general in Civil War; commanded N. Virginian army, 1862; defeated Federals under Pope; invaded Maryland; won battles of Fredericksburg and Chancellorsville; defeated at Gettysburg; opposed to Grant, 1864; ultimately defeated.

Adam, *Life of General Robert E. Lee* (1905).

LEE, SIR SIDNEY (1859–), Eng. literary historian and critic; b. London; ed. Oxford; editor of *Dictionary of National Biography*, 1890–91; works include *Life of Shakespeare*, 1898; *Elizabethan Sonnets*, 1904; *Life of Queen Victoria*, 1902.

LEE, STEPHEN DILL (1833–1908), Amer. soldier and politician; fought for S. States in Civil War.

LEE, WILLIAM (1739–95), bro. of Richard Henry L.; planned commercial treaty with Netherlands.

LEECH, JOHN (1817–64), Eng. caricaturist; fellow-pupil with Thackeray at Charterhouse; studied med.; contributed to *Punch*, with which his name is inseparably connected.

Life, by Frith (2 vols., 1891), Brown (1882).

LEECHES, HIRUDINEA or DISCOPHORA, a class of segmented worms, with long flattened bodeis usually without setæ but bearing a sucker for adhesion at each end of the body. A few live in the sea, *e.g.* the Skate-Sucker or Rock-Leech (*Pontobdella*), but most in fresh water, as the Medicinal Leech (*Hirudo*) used in blood-letting, or on land, as the pestilent Land-Leeches (*Hæmadipsa*) of tropical countries.

LEEDS (53° 48′ N., 1° 32′ W.), town, Yorkshire, England; seat of univ. (founded, 1904); R.C. episcopal see; has annual musical festival; great centre of woollen manufacture in England, and probably greatest woollen cloth mart in world; other manufactures are leather, boots, engines, machinery, chemicals, paper, silk. Connected by canal with Liverpool. L. is parliamentary borough, returning five M.P.'s. In vicinity are remains of Kirkstall Abbey. Pop. (1911) 445,568.

LEEDS, THOMAS OSBORNE, 1ST DUKE OF (1631–1712), Brit. statesman; also known as EARL OF DANBY; M.P., 1665; supported Buckingham; became treasurer of navy, 1668; P.C. and Lord Treasurer, 1673; opposed to Roman Catholics, dissenters, and religious toleration; supported Test Act, 1673; cr. Earl of Danby, 1674; introduced Test Oath, 1675; ended war with Holland, 1674; arranged marriage of William of Orange and Mary, dau. of James II., 1677; opposed to Fr. influence in England; raised money for Fr. war, 1678; impeached, 1678, for intrigue and corruption; found guilty, but was pardoned; subsequently attainted, and imprisoned five years in Tower; released, 1684. Soon after accession of James II., joined opposition against king; was one of Revolution leaders; attached himself to William of Orange; became pres. of council, 1689; attained chief power when Halifax retired, 1690; again impeached for bribery, 1695, but proceedings fell through; subsequently retired, 1699.—*Life*, by Courtenay (1838).

LEEK (53° 7′ N., 2° 2′ W.), town, Staffordshire, England; remains of Cistercian abbey in neighbourhood. Manufactures silk. Pop. (1911) 16,665.

LEEK (*Allium porrum*), a bulbous, liliaceous plant with strap-shaped, strongly smelling leaves; used as flavouring in broth. The l., as the Welsh national emblem, is said to owe its origin to St. David, who caused the Britons to wear distinguishing l. leaves in their hats when fighting the Saxons; hence the custom of wearing l. on St. David's Day.

LEER (53° 13′ N., 7° 27′ E.), town, Hanover, Germany; textiles, paper, iron goods. Pop. (1910) 12,677.

LEEUWARDEN (53° 12′ N., 5° 47′ E.), town, Holland; commercial centre; shipbuilding, iron, copper and lead works; has royal palace and museum. Pop. (1910) 37,014.

LEEUWENHOEK, ANTON VAN, LEUWENHOEK (1632–1723), Dutch optician; at first a maker of lenses for microscopes, became microscopist and naturalist; discovered the capillary circulation of the blood, the finer structures of teeth, hair, and epidermis, and made many observations on the structures of insects, crustaceans, and plants.

LEEWARD ISLANDS (20° N., 75° W.), islands, W. Indies; Santa Cruz, St. John, and St. Thomas are Danish, the remaining islands British; they produce sugar, cotton, sulphur, cacao, lime citrate, and phosphates; area, 701 sq. miles. Pop. (1911) 127,189.

LEFEBVRE, PIERRE FRANÇOIS (1755–1820), Fr. marshal; fought in Revolutionary and Napoleonic Wars.

LEFEBVRE - DESNOËTTES, CHARLES, COMTE (1773–1822), Fr. soldier; served in Revolutionary and Napoleonic Wars.

LEG, the lower limb, or, more strictly anatomically, that part of the lower limb between the knee and the ankle. Its bony framework consists of two bones, the tibia and the fibula, the former of which may be felt immediately below the skin on the inner and anterior aspect of the l., while the latter is to the outer side of the tibia, articulating with it at its extremities. To the bones are attached numerous muscles, all of which are concerned in locomotion and the movements of the foot, the most prominent being those forming the projection of the calf. The anterior and posterior tibial arteries, the continuations of the

popliteal and femoral artery, nourish the anterior and posterior parts of the l., while the nerve supply comes from the branches of the great sciatic nerve. The common *Pott's fracture* consists of fracture of the fibula about 3 in. from the end, with outward displacement of the foot, while sometimes the tibia may also be broken, just above the ankle-joint. *Bow-leg*, with exaggeration of the curve of the tibia, is a condition due to rickets (*q.v.*). Ulceration of the l. is usually due to varicose veins diminishing the nutrition of the part.

Bow-Leg (*Genu varum*), a deformity in which there is bending outwards and somewhat forwards of the legs, so that the distance between the knees is abnormally great. Most frequently due to rickets, but may be owing to the bones bending in the direction in which they are habitually placed before the child is able to walk. Natural straightening often occurs in young growing children; otherwise the child should be kept off its feet and treated for rickets (*q.v.*). In older children an operation may be necessary to correct the deformity.

LEGACY, a personal gift by will, and as such it is not to be paid before the claims of creditors are satisfied. A legacy not exceeding £500 is recoverable in the county court if unpaid. In Rom. law a legacy was an injunction on the heir to disburse a certain sum to a third person.

LEGAS, a Galla folk settled in Abyssinia.

LEGATE (Lat. *legatus*, ambassador, etc.), name of representative of pope. Three ranks: (1) *legatus a latere* (*i.e.* from side of pope), usually cardinal; (2) *legatus natus*, whose position is inherent in archbishopric or other national ecclesiastical dignity; (3) *legatus missus* or apostolic *nuncio* or *internuncio*. *Ablegates* are sent abroad by pope on special missions. Power of local jurisdiction abolished by Council of Trent, 1545.

LEGENDRE, ADRIEN MARIE (1752–1833), Fr. mathematician; b. Paris; app. prof. of Math's at Paris Military School, 1774; helped to measure degree of latitude and introduce decimal system; made important researches on elliptic functions, and was first to suggest method of least squares for determination of orbits of comets, 1806; wrote *Exercices de Calcul Intégral*; *Théorie des Nombres*; *Eléments de Géométrie*; *Memoirs on Attractions of Ellipsoids*.

LEGGE, HENRY—afterwards Bilson L. (1708–64), Eng. politician; held various offices of state; three times Chancellor of Exchequer; dismissed, 1761.

LEGHORN (43° 33′ N., 10° 18′ E.), fortified seaport, Tuscany, Italy; fine harbour, extensive coasting and foreign trade; exports wine, oil, fruits, hides, straw hats. Episcopal see, fine cathedral. Owes importance to Medici family, under whom became free port, continuing such till 1868. Pop. (1910) 135,756.

LEGION, division of Rom. army; constitution under Republic; ten cohorts of infantry with 300 cavalry, comprising 4200 to 6000 men; cohorts arranged in two lines till time of Cæsar, who rearranged in three lines. See also Infantry.

LÉGION ÉTRANGÈRE, see Foreign Legion.

LEGION OF HONOUR, see Knighthood.

LEGITIMACY AND LEGITIMATION can only be acquired according to Eng. law by birth in lawful wedlock. It is presumed that the child of a married woman is legitimate unless rebutting evidence of fact is produced. In many countries the legitimation of a child born before wedlock is effected by subsequent marriage of parents, but Eng. law refuses to allow this.

LEGITIMISTS, party found in 1830 to further Bourbon cause; efforts hindered by the tactlessness of leader, Comte de Chambord (d. 1883); present head Duc d'Orleans.

LEGNAGO (45° 11′ N., 11° 27′ E.), fortified town, Venetia, Italy. Pop. (commune) 17,580.

LEGNANO (45° 36′ N., 8° 54′ E.), town, Lombardy, Italy. Pop. *c.* 19,000.

LEGOUVÉ, GABRIEL JEAN BAPTISTE ERNEST WILFRID (1807–1903), Fr. dramatist and social reformer; s. of poet Gabriel L. (1764–1812); assisted Scribe in compilation of *Adrienne Lecouvreur* (1849); obtained much success with *Médée* (1855).

LEGROS, ALPHONSE (1837–1911), Fr. painter and etcher; Slade prof. of Fine Arts at Univ. Coll., London, 1876–93; excelled in Fr. rural scenes and humble characters.

LEGUMINOSÆ, important family of dicotyledonous plants numbering over 12,000; has seed vessel of one carpel with seeds along one side and splitting open down the two edges; fruit known as *legume* is seen typically in common pea; has three suborders, two almost completely tropical, represented by Mimosa, Acacia, Tamarindus. The third sub-family is very common in Britain; includes Clover (*Trifolium*), Vetches (*Vicia*), Furzes (*Ulex*), Pea (*pisum*), Bean (*Vicia Faba*), Laburnum (*Cytisus laburnum*), and Broom (*Sarothamnus*).

LÈGYA (*c.* 21° N., 98° 10′ E.), one of Shan States, Burma, India. Pop. *c.* 27,500.

LEH (33° 52′ N., 77° 33′ E.), capital, Ladakh, Kashmir, India; trading centre. Pop. *c.* 4500.

LEHNIN (52° 19′ N., 12° 48′ E.), town, Brandenburg, Germany. Lehnin Prophesy, poem of 1690, professedly dating from *c.* 1300 and prophesying fate of Hohenzollerns; now considered a forgery.

LEIBNITZ, GOTTFRIED WILHELM (1646–1716), Ger. scholar and thinker; b. at Leipzig; entered univ. there, 1661. As a boy he had studied classics, as a student, philosophy, then math's and law, early showing his genius. He became acquainted with the Elector of Mainz and became interested in politics, suggesting a Fr. expedition to Egypt. Meanwhile he became busy with math's and mechanical science, and speculated in theol. and law. He invented a calculating machine and discovered the differential and integral calculus. In 1676 he entered the service of the Duke (afterwards Elector) of Hanover. L. formed schemes for uniting Catholicism and Protestantism, and this failing, tried to unite Lutherans and Calvinists. He continued his studies in many fields, especially economics, politics, and history. He collected hist. sources and began a history of Brunswick. Most of his philosophical work was done after 1690. In 1690 he pub. his *Essais de Theodicée sur la bonté de Dieu la liberté de l'homme et l'origine du mal*, the greatest of his philosophical works, and in 1714 *La Monadalogie* and *Principes de la nature et de la grâce*; latterly, he devoted much time to correspondence.

The central point of his philosophy is his doctrine of substance, which is not quite that of any other philosopher, though nearest Descartes. L. believed the Universe to be composed of centres of force (monads), without extension but with some of the attributes of spiritual being, such as feeling; space, matter, and motion have accordingly no ultimate existence. His theol. is theistic, and he believes in the goodness of God, who is the 'harmony' of all things; the problem of evil he strives in vain to solve. He influenced subsequent thinkers both in scientific method and the importance he attached to psychology.

Russell, *A Critical Exposition of the Philosophy of Leibnits* (1900).

LEICESTER (52° 39′ N., 1° 8′ W.), town, Leicestershire, England, on site of Rom. *Ratæ*, of which traces remain; castle dates from Norman times, Trinity and Wyggeston's Hospitals from 1330 and 1513 respectively; ruined abbey; several fine old churches. Returns two M.P's. Important hosiery, boot, and lace industries. Pop. (1911) 227,242.

LEICESTER, EARLDOM OF.—There was a Saxon earldom of Mercia, with which the connection of any post-Conquest earldom of L. is conjectural. Title was held by Beaumonts, 1130–1204, Montforts, 1207–65, Plantagenets from 1265 till 1399, when it was merged in Crown by accession of Henry IV.; it was granted to Dudley, courtier of Queen Elizabeth in 1564, but lapsed at his death without issue in 1588; held by Sydneys, 1618–1743, by Thomas Coke, 1744–59,

and by Townshends, 1784–1855. Another earldom, of L. of Holkham, has been held by Coke family since 1837.

LEICESTER, ROBERT DUDLEY, EARL OF (*c.* 1531–88), favourite of Queen Elizabeth. Early became courtier; Master of Horse on Elizabeth's accession; soon rose in her favour; m. Amy Robsart; suspected of compassing her death, 1560, so as to marry Elizabeth; cr. Earl of L., 1564; secretly m. Lady Essex; commanded expedition to Low Countries, 1585; became gov.; lieut.-gen. of forces to resist Spaniards, 1588. Bekker, *Elizabeth and Leicester* (1890).

LEICESTERSHIRE (52° 40′ N., 1° 10′ W.), inland county, England; area, *c.* 823 sq. miles. L. came under domination of the Danes in X. cent.; was held by Lancastrians during Wars of Roses; in Civil War of Charles I.'s reign most of county supported Roundheads; surface undulating, rising to *c.* 900 ft. in N.W.; drained by Soar, Wreak; produces coal, iron, limestone, fireclay, pipeclay; sheep and cattle raised; manufactures hosiery, boots, agricultural implements, Stilton cheese. Returns four M.P's. Pop. (1911) 481,115.

LEIDEN, LEYDEN (52° 10′ N., 4° 30′ E.), town, Holland; besieged by Spaniards, 1574; has famous univ., established 1575, and associated with Grotius, Descartes, Vossius, Arminius, Heinsius, and other scholars; magnificent library, museums of art, antiquities, natural history, and ethnography. Manufactures cloth, cotton; connected with Amsterdam and Rotterdam by canal. Pop. (1910) 59,114.

LEIDY, JOSEPH (1823–91), Amer. biologist and palæontologist.

LEIF ERICSSON, Greenland explorer; s. of Icelandic immigrant, Eric the Red; in return voyage from Norway to Greenland, in year 1000, cast on coast of N. America, which he named *Vinland* (q.v.).

LEIGH (53° 59′ N., 2° 31′ W.), town, Lancashire, England; silk, cotton. Pop. (1911) 44,109.

LEIGHTON, FREDERICK LEIGHTON, LORD (1830–96), Eng. painter; spent his early years in a series of extensive tours on the Continent, where he had instruction from some of the most distinguished artists. In 1855 he appeared at the Royal Academy with his famous picture, *Cimabue's Madonna carried in Procession through the Streets of Florence*, subsequently bought by Queen Victoria; elected Pres. of the Academy and knighted, 1878; sculptor also.

LEIGHTON, ROBERT (1611–84), Scot. scholar; studied at Edinburgh Univ.; spent some years abroad; principal of Edinburgh Univ., 1653; a learned, pious, and unworldly man, was chosen one of bp's by Charles II., 1661, and did all he could to check persecution and bring about religious union; app. abp. of Glasgow, 1670, but alienated extreme Episcopalians and Presbyterians alike, resigning in despair, 1674; lived happily in retirement until his death. Butler, *Life and Letters* (1903).

LEIGHTON BUZZARD (51° 56′ N., 0° 39′ W.), town, Bedfordshire, England; fine Early Eng. church. Pop. (1911) 6784.

LEININGEN, ancient Alsatian family dating certainly from XII. cent., still existing in several branches; Prince Emich of L. was the first husband of the Duchess of Kent, mother of Queen Victoria.

LEINSTER (*c.* 53° N., 7° W.), province, Ireland. Area, 7618 sq. miles. Pop. (1911) 1,160,328.

LEIPZIG (51° 20′ N., 12° 23′ E.), city, Saxony, Germany; on fertile plain at junction of Elster, Pleisse, and Parde. L. dates back to XI. cent.; Leipzig Conference, between Luther, Eck, and Carlstadt, 1519; suffered severely during Thirty and Seven Years Wars; at battle of L., 1631, Gustavus Adolphus defeated Tilly; Battle of the Nations, 1813, Allies defeated Napoleon; seat of Supreme Court of German Empire since 1879; birthplace of Wagner. The ancient town (now business section, with narrow crooked streets and quaint houses) is separated from extensive suburbs by fine promenades, built on site of old fortifications. Notable buildings include Nikolaikirche (1170), Thomaskirche (1213), celébrated univ. (founded 1409) with extensive library, splendid Imperial Supreme Court, museums, Municipal Theatre (1868), Auerbach's Keller (immortalised in Goethe's *Faust*), Gewandhaus (fine concert-hall), and famous Royal Conservatory of Music. L. ranks among first cities in the world in bookselling, publishing, type-founding, and music trades; seat of world-famous Teubner classical press; also metal and textile industries, chemicals, scientific instruments, leather, rubber, food-stuffs, etc.; famous fairs held Easter, Michaelmas, and New Year since Middle Ages. Pop. (1910) 587,635.

LEIRIA (39° 43′ N., 8° 47′ W.), cathedral town, Portugal; seat of bishopric. Pop. 5000. L. district has area of 1318 sq. miles. Pop. *c.* 240,000.

LEISLER, JACOB (*c.* 1635–91), Amer. political leader; led poorer classes, New York, during Eng. Revolution; lieut.-gov., New York, 1689–91; executed.

LEISNIG (51° 9′ N., 12° 55′ E.), town, Saxony, Germany. Pop. (1910) 7994.

LEITH (55° 58′ N., 3° 10′ W.), fortified port, Midlothian, Scotland; extensive harbour; important Baltic trade in grain and timber, large export trade in coal, cotton, iron; flour mills, shipbuilding yards, breweries, distilleries, engineering and chemical works. L. was pillaged by Eng. in 1544 and 1547. Citadel built by Cromwell, 1650, and taken by Jacobites, 1715. Pop. (1911) 80,489.

LEITMERITZ (50° 33′ N., 14° 9′ E.), town, Bohemia, Austria; seat of bishopric; bp.'s palace, cathedral; formerly fortified; breweries. Pop. (1911) 15,421.

LEITRIM.—(1) (54° 10′ N., 8° W.) county, Connaught, Ireland; area, *c.* 610 sq. miles; centre and N. wild and rugged; watered by Shannon; produces coal, linens, woollens; returns two M.P's. Pop. (1911) 63,557. (2) (53° 59′ N., 8° 4′ W.) village, L., Ireland.

LEIXOES (41° 9′ N., 8° 41′ W.), port, Portugal; exports wine.

LEJEUNE, LOUIS FRANÇOIS, BARON (1776–1848), Fr. soldier; fought in Napoleonic Wars, then became military artist.

LELAND, JOHN (*c.* 1506–52), Eng. antiquary; filled various church appointments, and is remembered for materials he collected, during a six years' tour, connected with the Eng. cathedrals, priories, and abbeys. Stow, Camden, and Dugdale benefited largely by his researches.

LELAND STANFORD JUNIOR UNIVERSITY, seat of learning at Palo Alto, California; founded in 1887 by Leland Stanford (1824–93), who endowed it; instruction in usual univ. subjects is given, but also, by condition of grant, business and technical training; opened, 1891.

LELEGES, name used by Greeks for ancient people of Caria; they became confounded with the Carians, and various regions of Greece were said to preserve traces of them.

LELEWEL, JOACHIM (1786–1861), Polish historian; History prof., Warsaw, 1818; prominent in revolution, 1829; banished.

LELY, SIR PETER (1617–80), Eng. artist of Dutch extraction; court-painter to Eng. Charles II.

LEMAÎTRE, FRÉDÉRICK (1800–76), Fr. actor; famous for character studies.

LEMAN LAKE, see GENEVA, LAKE OF.

LEMBERG.—(1) (49° 40′ N., 24° E.) town, Galicia, Austria; seat of R.C., Gk., and Armenian archbishoprics; has three cathedrals, univ., several monasteries; formerly fortified; commercial centre; machinery, beer. Pop. (1910) 206,113. (2) (46° 16′ N., 15° 34′ E.) town, Styria, Austria.

LEMERY (13° 50′ N., 120° 45′ E.), town, Luzon, Philippine Islands. Pop. *c.* 11,500.

LEMGO (52° 2′ N., 8° 55′ E.), town, Lippe, Germany. Pop. (1910) 9966.

LEMMING, a member of MOUSE FAMILY (*q.v.*).

LEMNISCATE, a curve of which the Cartesian equation is $(x^2+y^2)^2=a^2(x^2-y^2)$. From the polar equation $r^2=a^2\cos 2\theta$ it is easily seen that curve consists of two loops, and is symmetrical about x-axis.

LEMNOS (39° 53′ N., 25° 15′ E.), island in Ægean Sea, which, after belonging in turn to Greeks, Romans, and Venetians, was taken by Turks in 1657. Area, *c.* 160 sq. miles; surface generally hilly; chief town, Kastro, has good harbour and is fortified; produces cereals, fruit, tobacco; formerly celebrated for Lemnian earth, which has medicinal qualities. Pop. variously estimated at 15,000 to 30,000.

LEMON (*Citrus Medica*, var. *Limonum*), a member of the Rutaceæ, cultivated in Mediterranean countries for its fruit, which has a cool, acid flavour, due to presence of citric acid. The l. plant is a variety of the *citron*, which it resembles in general features, and is a large, freely branching shrub of thorny character, the thorns representing the modified leaves of auxiliary branches. The foliage leaves are oval in shape, and the inflorescence is corymbose, with pentamerous flowers. In addition to the juice obtained from the flesh, the fresh rind or peel is of economic importance, yielding on distillation an essential oil, termed 'essence' of l., which it stores in special superficial glands. The rind is also preserved as 'candied peel.'

LEMON, MARK (1809–70), Eng. writer; first editor of *Punch* (q.v.).

LEMONNIER, ANTOINE LOUIS CAMILLE (1844–), Belg. poet and novelist; his sympathies rest with the peasant classes and a life close to nature.

LEMONNIER, PIERRE CHARLES (1715–99), Fr. astronomer; contributed largely, by continued recommendation of Eng. methods and instruments, to reform of Fr. practical astronomy.

LEMUR or **TRUE LEMUR** (*Lemur*), a genus of Lemuroidea (*q.v.* under PRIMATES), long-tailed, non-web-footed, with long snouts and large ears; vegetarian and carnivorous; confined to Madagascar.

LEMUROIDEA, a sub-order of PRIMATES (*q.v.*).

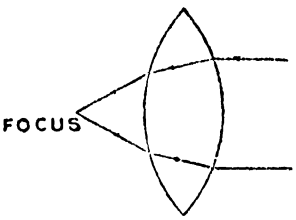
LEMUS, LEMMING, see MOUSE FAMILY.

LENA (73° 25′ N., 126° E.), river, Siberia; rises near Lake Baikal, flows to Arctic Ocean.

LENAU, NICOLAUS (1802–50), Hungarian poet; his short lyric pieces are the best of his many miscellaneous works.

LENKORAN (38° 44′ N., 48° 52′ E.), town, Transcaucasia, Russia. Pop. *c.* 9000. L. district has area of 2115 sq. miles. Pop. *c.* 133,000.

LENNEP (51° 7′ N., 7° 15′ E.), town, Rhenish Prussia, Germany. Pop. (1910) 13,125.

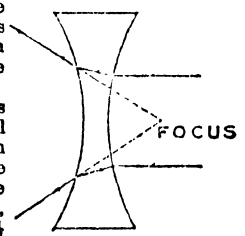


LENNOX (*c.* 56° N., 4° 30′ W.), region in Scotland, comprising Dumbartonshire, most of Stirlingshire, parts of Renfrewshire and Perthshire, which gave name at different periods to earldom and dukedom. First earl was one Alwyn, who received title from David I. *c.* 1192. Earldom eventually came to Stewarts of Darnley, Sir John Stewart, Lord Darnley, becoming Earl of L. in 1473, in right of his grandmother, Elizabeth, daughter of Duncan, 8th earl. Darnley's succession was unsuccessfully disputed by John of Haldane in right of his wife, a descendant of another daughter of Duncan. Henry, Lord Darnley, son of 4th Stewart earl, was second husband of Mary, Queen of Scots, and father of James VI. and I., with whom the title became an appanage of the Crown. It was granted to Charles Stuart, brother of Darnley, in 1572, and in 1579 to Esmé Stuart, who was afterwards raised to ducal rank. Dukedom was held by six of his descendants, and on death of Charles, 6th duke, in 1672, was merged in the Crown; and was granted three years later by Charles II. to Charles Lennox, Duke of Richmond, his natural son by Louise de Quérouaille, Duchess of Portsmouth. Of this line the 6th duke received additional title of Duke of Gordon, 1876.

LENNOX, MARGARET, COUNTESS OF (1515–78), was granddaughter of King Henry VII. and mother of Lord Darnley, husband of Mary, Queen of Scots.

LENOX (42° 26′ N., 73° 19′ W.), town, Massachusetts, U.S.A.; associated with Nathaniel Hawthorne and Henry Ward Beecher. Pop. (1910) 3060.

LENS (optics), a portion of a transparent substance which refracts light, having at least one surface curved.



Principal types of spherical lenses are: bi-convex (A), bi-concave (B), plano-convex (C), plano-concave (D), convexo-concave (E). If placed in the path of a beam of light, a lens will bend the rays towards its thicker part. Hence lenses A, C, and E will cause light rays from a distant source to converge (convergent lenses) towards a point on the side farther from the source, while B and D will cause the rays to diverge (divergent lenses), apparently from a point on the side facing the source. Such a point is called the *focus* of the lens.

CONVERGENT LENS.

The *focal distance* or *focal length* is the distance of the focus from the lens, and depends on the material of which the lens is made and on the curvature of its faces. A small correction must be made in the case of thick lenses.

The *power* of a lens is the reciprocal of its focal length and is measured in *dioptres*, the unit being the power of a lens of one metre focal length. Thus, if the focal distance is ½ metre, the power is 2 dioptres.

DIVERGENT LENS.

A lens (particularly a thick lens) will break up the light into the primary colours of which it is composed. This effect is termed *chromatic aberration* and is a source of great difficulty in the construction of accurate optical instruments. By cementing, with Canada balsam, a convergent lens of crown glass with a divergent lens of flint glass, a combination is obtained which will focus the bright rays of the spectrum at, approximately, one point. (The crown glass side is turned towards the source of light.) Such a combination is said to be *achromatic*.

Lenses are used in various combinations in optical instruments, and singly to correct defective vision. Myopia (short sight) is corrected by a bi-concave and hypermetropia (long sight) by a bi-convex lens. For astigmatism (inability to see with equal clearness in different planes) a lens having a cylindrical outer surface is used, while, if the person is also suffering from myopia or hypermetropia, the second face of the lens is suitably spherical (either concave or convex). See also SPECTACLES.

LENS (50° 24′ N., 2° 49′ E.), town, Pas-de-Calais, N. France. Pop. 27,800.

LENT (A.-S. *Lencten*, spring), name given to Church fast before Easter; at first short, but very strict, then three weeks, sometimes six weeks or longer; now in West forty days; in Middle Ages very rigorous.

LENTHALL, WILLIAM (1591–1662), Eng. politician; b. Henley-on-Thames; Speaker of Long Parliament, 1640; supported Parliament in Civil War; Master of Rolls, 1643; Commissioner of Great Seal, 1648; continued as Speaker till 1653; re-elected, 1654, 1659; temporary Keeper of Great Seal, 1659; helped to bring about Restoration; excluded from act of Indemnity, 1660.

LENTIL (*Lens esculenta*), a member of the Leguminosæ (*q.v.*) which grows in the E. Mediterranean region. The seeds, which were the 'pulse' of the ancients, when ground produce a very nutritious flour, often used in patent invalid foods.

LENTINI, see LEONTINI.

LENTOSPORA, see SPOROZOA.

LENTULUS, name of Rom. family of patrician *gens* Cornelia. Distinguished members: (1) P. CORNELIUS LENTULUS SURA, implicated in Catiline conspiracy, 63 B.C. (2) P. CORNELIUS LENTULUS SPINTHER, politician who supported recall of Cicero from banishment. Noted for haughtiness; Cicero uses *lentulitas* to express pride.

LEO, fifth sign of the Zodiac (*q.v.*).

LEO, name of thirteen popes: **Leo I.** (pope, 440–61), called *the Great*; succ. Sixtus III.; his letter to Flavian expounds the doctrine of the two natures of Christ, and was accepted by the Council of Chalcedon; met Attila outside Rome, Attila consenting not to attack Rome. His sermons and letters survive. He did much for the prestige of the Papacy. —**Leo II.** (pope, 682–83), sanctioned condemnation of his predecessor, Honorius, for heresy.—**Leo III.** (pope, 795–816), famous for his coronation of Charles the Great as Rom. emperor, 800.—**Leo VIII.** (pope, 963–65), elected while a layman.—**Leo IX.** (pope, 1049–54), a relation of Emperor Conrad II.; held synod, 1049, which decreed celibacy of clergy; led expedition against Normans of Sicily, 1053.

Leo X., GIOVANNI DE' MEDICI (pope, 1513–21), b. 1475; s. of Lorenzo de' Medici; cr. cardinal deacon, 1489; exercised full rights as cardinal, 1492; lived in Florence, 1492–94; devoted himself to art, etc., 1500, living in Rome. He was elected pope on the death of Julius II. The history of the Papacy during his reign is an intricate struggle in which L. strove to preserve the papal power by keeping foreign powers out of Italy. The Turks menaced W. Europe, but a projected crusade came to nothing. His reign was marked by Luther's revolt from the Papacy, the significance of which L. failed to realise. He was greatest as a patron of art and lit.; he encouraged Raphael and reorganised the Univ. of Rome. An astute politician and man of the world, he lacked spirituality and moral zeal when the Church sorely needed reform.—**Leo XII.**, ANNIBALE DELLA GENGA (pope, 1823–29), b. 1760; held various diplomatic appointments from 1794; during his reign a careful administrator, but reactionary.

Leo XIII., GIOACCHINO PECCI (pope, 1878–1903), b. 1810; ed. at Viterbo and Rome; app. nuncio to Brussels, 1843; abp. of Perugia, 1846–78; cardinal, 1853; elected pope on the death of Pius IX. His reign was one of great activity, political, social, and religious. He firmly upheld the necessity for the restoration of temporal power to the Papacy, but did not needlessly quarrel with the Ital. government. He was energetic as a statesman and entered into relations with many sovereigns in Europe and Asia, securing liberty for Roman Catholics in Russia. He encouraged learning, and his encyclicals showed some sympathy with socialism. His policy sometimes seemed liberal, sometimes reactionary. He re-established the Scot. hierarchy, and was generally respected in England. He was a man of culture and had perfect command of Latin, Italian, and French.

LEO, six Byzantine emperors: **Leo I.** (400–74), defeated Huns in Dacia; sent fleet against Vandals. —**Leo III.** (680–740), conquered Saracens, 719; introduced religious and civil reforms; forbade image-worship; began separation of Gk. from Rom. Church. —**Leo V.**, emperor, 813–20; fought against Arabs; defeated Bulgarians; repressed image-worship; assassinated.—**Leo VI.**, emperor, 886–911; lost Thessalonica to Muhammadan pirates.

LEO, HEINRICH (1799–1878), Ger. historian; prof. at Halle; from revolutionary became Hegelian and finally mediævalist, and, it was suspected, Catholic; high in court favour for conservative influence; Italian, Dutch, and German histories and autobiography.

LEO, JOHANNES (*c.* 1494–1552), Cordovan Moor; travelled in Africa and Asia Minor and wrote the *Africæ Descriptio*, long the standard authority on Muhammadan Africa.

LEOBEN (47° 24′ N., 15° 5′ E.), town, Styria, Austria. Pop. (1911) 11,504.

LEOBSCHÜTZ (50° 13′ N., 17° 50′ E.), town, Pruss. Silesia, Germany. Pop. (1910) 13,083.

LEOFRIC (d. 1057), Earl of Mercia from about 1030; ruled over the Welsh Marches.

LEOMINSTER.—(1) (52° 13′ N., 2° 45′ W.) town, Herefordshire, England; site of former monastery and priory. Pop. (1911) 5737. (2) (42° 28′ N., 71° 49′ W.) town, Massachusetts, U.S.A.; manufactures celluloid and horn articles, paper, woollens, etc. Pop. (1906) c. 14,700.

LEON.—(1) (42° 33′ N., 5° 40′ W.) N.W. province, Spain; area, *c.* 5986 sq. miles; crossed by Douro and Minho; agriculture is principal industry; formerly part of independent kingdom of L.; for sovereigns, see under FERDINAND. Pop. (1910) 393,888. (2) (42° 37′ N., 5° 37′ W.) capital, L., Spain; seat of bishopric; XIII.-cent. cathedral, bp.'s palace; manufactures machinery, linen, leather. Remains of Rom. walls. Pop. 17,000. (3) (12° 32′ N., 86° 54′ W.) town, Nicaragua; seat of bishopric; has cathedral, univ., bp's palaces. Pop. (1910) 62,569.

LEÓN, LEÓN DE LAS ALDAMAS (21° 1′ N., 101° 15′ W.), cathedral town, Mexico; manufactures leather, textiles. Pop. (1910) 63,263.

LEONARDO DA VINCI (1452–1519), Ital. painter, sculptor, architect, and engineer. Showing precocity in drawing, he was sent to study at Florence with Andrea del Verrochio, having Perugino for a fellow-pupil. He began his professional career about 1472, when he received the patronage of Lorenzo de' Medici, and about 1480 proceeded to the East as engineer to the sultan of Cairo. Two years later he settled in Milan, where he presently painted his famous *Last Supper*, a masterpiece which had the distinction of an elaborate criticism and description from Goethe's pen. After painting other pictures in Milan, and, as an engineer, devising a system of irrigation of the plains of Lombardy, he removed to Florence, and in 1502 became architect and engineer to Cæsar Borgia, then Duke of Romagna. The next outstanding incident in his career was the contest with his young rival Michael Angelo, when both were commissioned to decorate the Sala del Consiglio in the Palazzo della Signoria with historical scenes. About 1504 was completed the most celebrated of his easel pictures, a half-length portrait of Mona Lisa, third wife of Zanobi del Giocondo; this was stolen from the Louvre, 1911. Leonardo's later years were given to the service of France, Francis I. having, in 1516, assigned him an annual allowance of 700 scudi and given him the use of the Château Cloux, near Amboise, where he died, not, as often erroneously stated, in the royal arms. Collections of his pictures, all emphasising his supreme position as an artist, are preserved at Milan, Florence, Paris, Vienna, Venice, the British Museum, and the Royal Library, Windsor. He wrote a *Trattato della Pittura*, dealing with the details of his art, published in 1651, and in an Eng. translation, 1721. A portrait of Leonardo from his own hand is in the Royal Library at Turin.

LEONARDO OF PISA, Ital. mathematician of XIII. cent.; nicknamed 'Dunce.' Published *Liber Abaci* (deals chiefly with commercial arithmetic), *De Practica Geometriæ*, and scientific papers.

LEONCAVALLO, RUGGIERO (1858–), Ital. composer; influenced by Wagner; well-known operas, *I Pagliacci* (1892), *La Bohème* (1897).

LEONIDAS (fl. 491–480 B.C.), king of Sparta; held *Thermopylæ* against Persians till taken by treachery; pattern of bravery.

LEONTIASIS OSSEA, a rare disease in which there is an overgrowth of bone over the forehead, jaws, and bones of the skull, leading to much disfigurement, while painful symptoms and even death may ensue from the pressure on the brain. In some cases

treatment by chiselling away masses of bone is possible.

LEONTINI (37° 16′ N., 14° 59′ E.), ancient town, Sicily, to S.E. of L. lake; founded by Gk. colonists, 730 B.C.; ruined by Saracens, 848 A.D. Some bronzes have been excavated. Site of modern *Lentini*, which has trade in oil, wine, cereals. Pop. 17,500.

LEOPARD, see under CAT FAMILY.

LEOPARDI, GIACOMO, COUNT (1798–1837), Ital. poet; after several minor pieces, he wrote the *Apprassamento alla Morte*, 1819, a long poem upon Death after the manner of Petrarch; edited Cicero and Petrarch, 1825–26; pub. (1827) *Operette Morali*, a witty and ironic series of dialogues, modelled on Lucian and faultless in style. His chief claim to greatness is as classic and stylist; other important works are *La Ginestra, Song of the Wandering Shepherd.*

LEOPOLD I. (1790–1865), king of Belgians; fought against Napoleon; declined Gk. crown, 1830; elected first king of Belgians, 1831.

LEOPOLD II. (1835–1909), king of Belgians; succ., 1865; founded Congo Free State, for administration of which he was much criticised; acquired vast wealth; greatly developed Belgium; a strong ruler, but loose living.

LEOPOLD I. (1640–1705), Holy Rom. emperor; king of Hungary, 1655; Bohemia, 1657; emperor, 1658. Reign marked by wars against Sweden, Turks, France; concluded peace with Sweden, 1660; made truce with Turks after latter's defeat by Monticucculi, 1664; waged three wars against Louis XIV. of France, against whom he formed Grand Alliance, 1689; persecuted Protestants in Hungary; insurrection followed, in which rebels were aided by Turks, but ultimately defeated.

LEOPOLD II. (1747–92), Holy Rom. emperor; Grand-Duke of Tuscany, 1765; reformed administration; emperor, 1790; negotiated with England to check power of Russia and Prussia, crowned king of Hungary, 1790, promising to observe constitution; made truce with Turks, 1790; concluded peace at Sistova, 1791; combined with king of Prussia to declare readiness for intervention in France during Revolution, 1791; formed alliance with Prussia, 1792.

LEOPOLD II. (1797–1870), Grand-Duke of Tuscany; succ., 1824; reformed administration; granted constitution, 1848; sent troops against Austria on outbreak of War of Ital. Independence; revolutionary agitations subsequently arose; republic proclaimed, Feb. 1849; L. went to Gæta; accepted invitation to return, April; made treaty with Austria, 1850; revoked constitution, 1852; abdicated, 1859.

LEOPOLD I., PRINCE OF ANHALT-DESSAU (1676–1747), b. Dessau; succ. as Prince of A.-D., 1693; fought in Netherlands, 1695, and in war of 1697; distinguished himself in Span. Succession War, became a general field-marshal, 1712; defeated Charles XII., 1715, and after winning victory of *Kesselsdorf*, 1745, he retired from active service. A devout Lutheran, a brilliant soldier, a stern disciplinarian, he helped to make the Pruss. army a great force.

LEOPOLD, PRINCE, see ALBANY, DUKEDOM OF.

LEOPOLD II. (2° S., 18° 9′ E.), lake, Belgian Congo, Africa.

LEOVIGILD, Visigothic king in Spain, 568–86; an Arian; his s. HERMENEGILD executed for rebellion and adherence to orthodoxy.

LEPAGE, see BASTIEN-LEPAGE, JULES.

LEPANTO, BATTLE OF, action fought between allied fleets of Spain and Ital. States, under Don John of Austria, and Turk. fleet under Ali Pasha, Oct. 7, 1571; Turks utterly defeated.

LEPCHA, primitive race in Sikkim; now numbering *c.* 20,000.

L'EPÉE, see EPÉE, CHARLES-MICHEL, ABBÉ DE L'.

LEPIDODENDRACEÆ, see PTERIDOPHYTA.

LEPIDODENDRON, see PALÆOBOTANY.

LEPIDOPTERA, BUTTERFLIES AND MOTHS (Gk. *lepis*, a scale; *pteron*, a wing).—Owing to their size and beauty, Butterflies and Moths are amongst the best known of insects, *c.* 50,000 species being scattered over all the world, 2000 being found in Britain alone. The name 'Lepidoptera' signifies the presence of scales exceedingly minute and dust-like, but often brilliantly coloured, which cover the four large, moderately veined wings. To actual pigment in the scales, which, as in *Morpho*, may number a million and a half, or to close ribbing on their upper surface, are due the beautiful colours and metallic sheen so familiar in the group. But other features are very characteristic. Adult L. feed on vegetable matter, sucking the juices from plants and flowers, and for this purpose some of the mouth parts (first maxillæ) form a long 'tongue' or proboscis, which in the Hawk Moths may be 10 in. in length, but which can be coiled up like a watch-spring when not in use. With this is associated a pumping apparatus in the head.

The changes which pass in the history of the individual are great and abrupt. The eggs, marvellous in variety of shape and sculpturing in different species, are laid singly or in batches either on a chance object or on the particular plant on which the larvæ are to feed—a complete brood numbering from a few dozens to many thousands. In a few days or months, as the case may be, the larva or caterpillar appears and sets about its life-work, which is simply to feed ravenously, to grow, rest, and moult. In shape it is worm-like, often hairy, with a large head and biting mouth parts, three thoracic segments, each with a pair of clawed limbs—corresponding to those of the adult—and ten abdominal segments with usually four or five pairs of clasping pro-legs. When the caterpillar has collected much reserve food material in its 'fatty body' it enters a trance, the pupal stage, the chrysalis of Butterflies being suspended from a leaf or branch, often by a silken girdle, the pupa of Moths lying generally concealed in the ground or under bark, or hidden in a cocoon, such as those of the large Bombycid Moths, which furnish the world's silk-supply. Within the hard pupal skin great changes foreshadow the limbs, wings, and organs of the adult, and finally the imago bursts forth, and after resting a few moments to dry its wings, soars into the air.

The length of the life-history is very variable, some species having only one generation in three years, while others have as many as five generations a year.

L. afford wonderful examples of protective and defensive colouring, and 'mimicry.' Most larvæ agree in colour with their food plants, but the 'looper' or geometer caterpillars of the Geometrid Moths, so called on account of their looping mode of progression, resemble twigs when at rest, and the Puss Moth caterpillar, with sting-like appendages and startling colour, strikes 'terrifying attitudes.' Many Adult Moths exactly match the colour of the lichen-covered bark upon which they rest, or resemble leaves, twigs, or flakes of white bird-droppings. The brightly coloured Leaf-Butterfly (*Kallima*) alights on a branch, closes its wings, and is lost to sight, for the under-surfaces of the wings are indistinguishable from a withered leaf, stalk, midrib, veins, and all. Other Butterflies, supposed to be sought by birds for food, closely resemble noxious species, so that they may escape destruction, and many L. bear an extraordinary likeness to dangerous insects, such as Bees and Ichneumons. Some tropical Butterflies have different colour varieties for the 'wet' and 'dry' seasons, one Amer. *Papilio* having as many as three distinct and definite forms.

The economic bearing of the group is very limited. The only group of direct value to man, as they are almost the only insects domesticated by him, are the Silk-Worm Moths, but many Adults are of indirect value in fertilising flowers. On the other hand, much damage to plants, crops, and fruits is caused by caterpillars, a plague of which is capable of stripping a garden or even forest of leaves in a short time; and some destroy clothes.

L. have been divided into *Macrolepidoptera*, the larger forms, and *Microlepidoptera*, comprising only the 'Clothes-Moth' family, Tineidæ and Tortricidæ, but the more natural division is that of Butterflies and Moths, which are distinguished as follows :—

Butterflies, RHOPALOCERA, mostly day-fliers; antennæ with a club-like or swollen tip; hind-wings with a shoulder which edges under the fore-wing, but without a bristle or 'frenulum' (see below). Of the 68 Brit. Butterflies examples are: the Purple Emperor (*Apatura iris*), the Tortoiseshells and the Peacock (*Vanessa*), the Fritillaries (*Argynnis, Melitæa*), the Blues (*Lycænidæ*), and the Cabbage Butterfly (*Pieris brassicæ*), whose caterpillars are so destructive in the garden. But none of these compare in brilliancy of colouring or size with the gigantic *Morphos* of tropical Asia and America, sometimes with a wing-span of close on 10 inches.

Moths, HETEROCERA, mostly night-fliers; antennæ very seldom club-like at the tip. Hind-wing without distinct shoulder, but with a bristle ('frenulum') which engages with a projection or tuft of scales on the fore-wing, for purposes of support. In some cases a frenulum is absent, but never where the antennæ are butterfly-like. Familiar examples are: the Hawk Moths (*Sphingidæ*), including the Death's Head, the Clear Wings (*Sesiidæ*), resembling Hymenoptera, the Owl Moths (*Noctuidæ*), and the Clothes Moths (*Tineidæ*). But those which most concern man are the large Silk Spinners (*Bombycidæ*), of which the true Silk-Worm Moth (*Bombyx mori*) has been introduced to Europe, its larval cocoons supplying the finest silk of commerce.

LEPIDOSTEIDÆ, see GAR PIKES.

LEPIDOSTEUS, see GAR PIKES.

LEPIDUS, Rom. family of *gens* Æmilia; famous III. cent. B.C. to I. cent. A.D.; among its consuls, *pontifices maximi*, etc., was Marcus Æmilius (d. 13 B.C.), of proberbial inferiority as 'the Lepidus of the Triumvirate.'

LEPISMA, see SILVER FISH.

LEPROSY, chronic infectious disease caused by a specific bacillus, *Bacillus lepræ*, characterised by the development of nodules or more diffuse growths of granulation tissue in the skin and mucous membranes, or in nerves, the former type being termed *tubercular* L., and the latter *anæsthetic* L. The disease existed in China and India in very ancient times; it is dealt with somewhat fully in the Book of Leviticus, and it is supposed to have been brought to Europe from the East by the Crusaders. Although common in the Middle Ages, it is now gradually disappearing, in Europe occurring practically only in Norway, Russia, and parts of the Mediterranean coast, but it is more common in Asia, on the coast of Africa, in some of the Pacific Islands, and in Central and South America.

For a considerable time, perhaps years, before the appearance of definite symptoms, an individual affected by L. may suffer from feverish attacks, weakness, and constitutional disturbances, and then, in the tubercular variety, brownish nodular spots appear on the skin, which are tender, the affected area gradually increasing in extent, while in the anæsthetic variety the superficial nerves are first thickened, symptoms of nerve irritation appear, and then of destruction of the nerves with gangrene of extremities, etc. The disease usually runs a chronic course of ten, or, in the anæsthetic variety, as much as fifteen or twenty, years, but may disappear entirely at practically any time. The treatment is to segregate lepers so as to prevent infection, or to remove a person affected to a different climate, while appropriate surgical measures relieve unnecessary pain. Chaulmugra and Gurgun oils, internally and externally, are often of benefit. See PARASITIC DISEASES.

LEPSIUS, KARL RICHARD (1810–84), Ger. Egyptologist; wrote many works in his special branch of study, which he conducted on scientific lines.

LEPTIS MAGNA (32° 38′ N., 14° 4′ E.), ancient Phœnician town, N. Africa; was commercial centre; ruins of fortifications, theatre, etc., remain. Site of modern Lebda.

LEPTIS PARVA (*c.* 35° 35′ N., 10° 55′ E.), ancient Phœnician town, N. Africa; fortified; ruins remain. Site of modern Lamta.

LEPTOMEDUSÆ, see under HYDROMEDUSÆ.

LEPTOPLANA, a TURBELLARIAN WORM (*q.v.*).

LEPTOSPERMUM, genus of evergreen trees and shrubs, order Myrtaceæ; native to Australasia; leaves formerly used as substitute for tea.

LEPTOSTRACA, see under MALACOSTRACA.

LEPUS, see RABBIT.

LERICI (44° 4′ N., 9° 55′ E.), village, Liguria, Italy. Pop. 9500.

LÉRIDA.—(1) (41° 52′ N., 1° 10′ E.) N. province, Spain; area, 4690 sq. miles; drained by affluents of Ebro; wine, oil, live stock. Pop. (1910) 283,486. (2) (41° 34′ N., 0° 20′ E.) town, capital of above; XVIII.-cent. cathedral; episcopal palace; old cathedral now used as barracks; former convent now used as hospital. Pop. (1910) 24,531.

LERMA, DUKE OF, FRANCISCO DE SANDOVAL Y ROJAS (1552–1625), Span. minister under Philip III.; continued war against England; incompetent.

LERMONTOV, MIKHAIL YUREVICH (1814–41), Russ. poet; wrote great lyrics; *Ismail-Bey*, *Walerik*, *A Hero of our Time* (novel); killed in duel.

LERO DE TEJADA, SEBASTIAN (1825–89), pres. of Mexico, 1872–77.

LEROUX, PIERRE (1798–1871), Fr. economist of extreme socialistic views; his philosophy was a mystical eclecticism, and his theories quite unpractical.

LEROY-BEAULIEU, HENRY JEAN BAPTISTE ANATOLE (1843–), Fr. author and historian; has written several works on contemporary politics.

LERWICK (60° 9′ N., 1° 8′ W.), town, Shetland, Scotland; fishing centre. Pop. (1911) 4654.

LES ANDELYS (49° 14′ N., 1° 24′ E.), town, Eure, France; includes Grand and Petit Andely; site of former fortress. Pop. 4000.

LES BAUX (44° 50′ N., 4° 40′ E.), village, Bouches-du-Rhône, France; ruined castle; formerly fortified.

LES SABLES D'OLONNE (46° 29′ N., 1° 47′ W.), town, Vendée, France; oyster and sardine fisheries. Pop. *c.* 12,000.

LES SAINTES-MARIES (43° 27′ N., 4° 25′ E.), village, Bouches-du-Rhône, France.

LESBOS, MYTILINE (39° 14′ N., 26° 20′ E.), Turkish island, in Ægean Sea; early settled by Æolian Gks.; became famous as school of Gk. lyrical poetry; has associations with Sappho, Theophrastus, Alcæus, Terpander, Arion, Pittacus. Belonged in turn to Persia, Athens, Macedonia, Rome, Byzantium; Turkish since 1462. Area, 675 sq. miles; surface hilly, rising to over 3000 ft.; upper districts wooded; lower ground produces olives, grapes, figs. Chief town, Mytiline, on Kastro, has shallow harbour, cathedral; formerly fortified. Pop. *c.* 130,000.

LESCURE, LOUIS MARIE JOSEPH, MARQUIS DE (1766–93), Fr. royalist; fought against Republic in Revolutionary Wars.

LESDIGUIÈRES, FRANÇOIS DE BONNE, DUC DE (1543–1626), Constable of France; joined Huguenots in Dauphiné; became commandant-gen.; fought for Henry IV., 1585–1601; subdued Dauphiné; defeated Savoyards and Spaniards.

LESINA.—(1) (43° 8′ N., 16° 40′ E.) island, off coast of Dalmatia, Adriatic Sea; area, *c.* 120 sq. miles; produces wine, fruit. Pop. *c.* 19,000. (2) (43° 10′ N., 16° 26′ E.) capital of above, episcopal see.

LESION, injury or damage; in pathology, a morbid change in an organ; in Scots law, loss from the other party's failure in a contract.

LESKOVATZ (43° 7′ N., 21° 54′ E.), town, Servia; hemp. Pop. (1911) 14,266.

LESLEY, JOHN (1527–96), Scot. historian; studied at Aberdeen and in France; Catholic leader during Reformation; bp. of Ross, 1565; loyal friend of

Mary, Queen of Scots; imprisoned in London, then banished; bp. of Coutances, 1593; wrote history of Scotland.

LESLIE (56° 12′ N., 3° 12′ W.), town, Fifeshire, Scotland; paper, linen. Pop. (1911) 2142.

LESLIE, CHARLES (1650–1722), Irish prelate; supporter of Stewarts, though foe of Rom. Catholicism.

LESLIE, CHARLES ROBERT (1794–1859), Eng. artist, of Amer. parentage; painted Queen Victoria's Coronation; prof. of Painting, Royal Academy, 1848.

LESLIE, SIR JOHN (1766–1832), Scot. mathematician and physicist; s. of a cabinetmaker; studied at St. Andrews; invented hygrometer and differential thermometer.

LESLIE, THOMAS EDWARD CLIFFE (1827–82), Irish economist; took high honours at Trinity Coll., Dublin; called to the Bar; prof. of Political Economy and Jurisprudence at Belfast, 1853; often visited Continent to study social and economic conditions; wrote *Land Systems* and *Essays in Political and Moral Philosophy*; urged the need for reform, and said that all economic questions should be treated in relation to history and social conditions.

LESPINASSE, JULIE JEANNE ÉLÉONORE DE (1731–76), Fr. author; most distinguished hostess of her time; D'Alembert was habitué of her *salon*; victim of successive unfortunate *affaires du cœur* which give poignancy to her famous *Lettres*, pub. posthumously.

Marquis de Ségur, *Life* (Eng. trans., 1906).

LESSE (49° 59′ N., 5° 10′ E.), river, Belgium; joins Meuse.

LESSEPS, FERDINAND DE (1805–94), Fr. diplomat; b. at Versailles; ed. at Paris; employed in consular service at Lisbon, 1825–27; Tunis, 1828; Alexandria, 1832; conceived project of making Suez Canal; consul, Cairo, 1833; subsequently consul-gen., Alexandria; distinguished for zeal during plague, 1834–35; consul at Rotterdam, 1839; Malaga, 1840; Barcelona, 1842; minister at Madrid, 1848; retired from diplomatic service, 1849. Introduced Suez Canal scheme, 1854; obtaining concession from Said Pasha, company organised, 1858; work began, 1859; canal opened, 1869; received Grand Cross of Legion of Honour. Undertook Panama Canal, 1881, on insufficient money; charged with fraud; sentence of imprisonment not carried out.

Smith, *Life and Enterprises of F. de Lesseps.*

LESSING, GOTTHOLD EPHRAIM (1729–81), Ger. critic and dramatist; b. Kamenz (Saxony); studied theol., med., and philology at Leipzig, 1746–48, and wrote *Der Junge Gelehrte*, *Der Freigeist*, *Der Misogyn* (plays). L. spent most of the years 1748–55 in Berlin as journalist and critic; to this period belong his critical writings, *Das Neuste aus dem Reiche des Witzes*, *Rettungen*, and *Miss Sara Sampson* (tragedy); lived in Leipzig, 1755–58; returned to Berlin and wrote *Fabeln* and *Philotas* (tragedy), 1759, and his share of the *Briefe die neuste Literatur betreffend* (1759–65). In Breslau (1760–65) L. wrote parts of his great critical work, *Laokoon* (pub. 1766), and his fine comedy, *Minna von Barnhelm* (pub. 1767); app. director of National Theatre, Hamburg, 1767; became court librarian at Wolfenbüttel, 1770, until his death. Three of his best works belong to these years, viz. *Wie die Alten den Tod-gebildet*, 1769, *Emilia Galotti* (tragedy), 1772, and the great drama, *Nathan der Weise*, 1779. L. founded modern drama and crowned the *Aufklärung* movement in Germany.

Life, by Sime (1879), Rolleston (1889).

L'ESTRANGE, SIR ROGER (1616–1704), Eng. writer; royalist, imprisoned, 1648–53; licenser of Press under Charles II. and James II.; attempted to muzzle free expression of thought; fell into disfavour, 1688; translated several classics.

LETHAL, mortal or deadly: l. chamber, a receptacle or apartment in which animals are killed by poisonous gases.

LETHARGY, drowsiness; in med., a condition of profound sleep or unconsciousness from which a person can be awakened only with great difficulty.

LETHINGTON, see MAITLAND OF LETHINGTON.

LETO, see APOLLO.

LETTERKENNY (54° 57′ N., 7° 44′ W.), cathedral town, Donegal, Ireland. Pop. 2400.

LETTERS, see ALPHABET, EPISTLE.

LETTERS PATENT, or LETTERS OVERT, writings sealed with the Great Seal of England, declaring from the sovereign that a person or public company may do certain acts or enjoy certain privileges, which could not be done or enjoyed otherwise; so called because they are *open* and ready to be shown.

LETTRE DE CACHET, see CACHET, LETTRE DE.

LETTS, see LITHUANIA.

LETTUCE (*Lactuca sativa*), a member of the *Compositæ*, the tender leaves of which are used in salads. The flowers, which are small, are borne in panicles, resembling those of the hawkweed.

LEUCADIA (38° 43′ N., 20° 40′ E.), former name of Santa Maura, one of Ionian Islands.

LEUCITE (Gk. *leukos*, white), a rock forming mineral composed of potassium and aluminium, occurring in volcanic rocks. Colour, white and shades of grey; was formerly called white garnet, owing to colour and form of crystals, which are dull and opaque though sometimes transparent. Leucite rocks contain L., and are rare, though widely distributed. They are mostly lavas belonging to Tertiary period, and are unknown in England.

LEUCOCYTHÆMIA, see BLOOD.

LEUCTRA (38° 17′ N., 23° 14′ E.), small town, Bœotia, Greece, where Thebans defeated Spartans in 371 B.C.

LEUK (47° 19′ N., 7° 38′ E.), town, Valais, Switzerland; thermal mineral springs.

LEUTHEN (51° 5′ N., 16° 48′ E.), village, Pruss. Silesia, Germany; where Frederick the Great defeated Austrians, 1757.

LEVALLOIS-PERRET (48° 51′ N., 2° 20′ E.), suburb, Paris, France. Pop. (1911) 68,703.

LEVANT (*c.* 34° N., 34° E.), eastern end and shores of Mediterranean.—**Levanter**, prevailing summer wind (easterly) off N. African coast.

LEVELLERS, Eng. political party during Great Rebellion; came into prominence, 1647; opposed monarchical government; dissatisfied with parliamentary government after king's death, broke into open revolt, 1649; repressed by Cromwell and Fairfax; gradually lost importance.

LEVEN (56° 12′ N., 3° W.), town, Fifeshire, Scotland; manufactures linen, paper, etc. Pop. (1911) 6559.

LEVEN, EARLDOM OF, Scot. honour; bestowed in 1641 on Sir Alexander Lesley; David Melville, 2nd Earl of Melville, succ. as 3rd Earl of L., 1681, since when the titles have been united.

LEVEN, ALEXANDER LESLIE, 1ST EARL OF (*c.* 1580–1661), Scot. soldier; distinguished in service of Charles IX. and Gustavus Adolphus of Sweden; commanded Scots army against Charles I., 1640; took Edinburgh Castle, defeated king at *Newburn*; in Civil War commanded Scots army against king at *Marston Moor*; took Newcastle, 1644; served against Cromwell at *Dunbar*, 1650.

LEVEN, LOCH (56° 12′ N., 3° 22′ W.), lake, Kinross-shire, Scotland; has seven islands, including Castle Island, on which is castle associated with Mary, Queen of Scots, and St. Serf's, which has ruined priory. Loch is famous for pink trout.

LEVER, CHARLES JAMES (1806–72), Irish novelist; ed. Trinity Coll., Dublin, where he was noted for his lawlessness and ingenuity; became physician and entered Consular service; d. while consul at Trieste; had a European reputation for generosity, extravagance, and eccentricity. Novels include *Charles O'Malley*, *Harry Lorrequer*, which are full of excellent fun; later he took continental scenes and topics and wrote more didactically, but not with much success.

LEVERETS, the young of the hare (*q.v.*).

LEVERRIER, URBAIN JEAN JOSEPH (1811–77), Fr. astronomer; known chiefly for brilliant investigation of perturbations of orbit of *Uranus* (1846). Adams independently treated same problem (1845) with same conclusion, which led to discovery of planet *Neptune* by Galle of Berlin.

LEVIATHAN, Hebrew term for sea monster; also applied to other big creatures.

LEVIRATE, custom (of uncertain origin) whereby a man must marry his bro.'s widow; very common in primitive times, and still existing to-day amongst certain savage tribes; permitted under certain conditions amongst the Jews.

LÉVIS.—(1) (46° 47′ N., 71° 10′ W.) town, Quebec, Canada. Pop. *c.* 7500. (2) (46° 38′ N., 71° 15′ W.) county, Quebec. Pop. *c.* 26,000.

LEVITES, name given to the body of men in ancient Jerusalem who presided over the Temple services. Traditionally they were descendants of LEVI. The derivation of their name and their origin are really quite uncertain; some think it connected with the name of the priests of an Arabian deity. In the earliest times there seems to have been no priestly clan in Israel, and it is at least a plausible conjecture that the L's were a southern tribe, which became incorporated. Various stages of development can be traced in the Old Testament. In the older books, which reflect the conditions of things under the monarchy, all L's were or could be priests. In the second stage, on the suppression of local shrines and the establishment of the law of the one sanctuary, the priests had to come to Jerusalem, but could not serve at the altar. In the fully developed ritual of post-Exilic times, only the 'sons of Aaron' are true priests, the L's as a whole being servants. The exact process by which these changes came about is unknown.

W. R. Smith, *Old Test. in Jew. Church*; various commentaries on *Hexateuch*.

LEVITICUS, BOOK OF, fourth of so-called Mosaic books, part of the Priestly Code, the latest of the elements which make up the *Pentateuch*. Chapters 17–26 stand somewhat apart. Chapters 1–6 deal with the different sorts of sacrifices—burnt-offering, meal-offering, peace-offering, sin-offering, and guilt-offering; then follow ritual directions for the priests; 8–10 describe the ceremonies of admission to the priesthood; 11–16 give the regulations about clean and unclean meats, which animals may be used for food and which may not; 12–15 deal with personal purity; and 16 the ritual for the Day of Atonement. Chapters 17–26 are sometimes called the Law of Holiness. They resemble P rather than the other sources of the Pentateuch, but have peculiarities of style, and show close resemblances to the Book of *Ezekiel*. They form an originally separate body of laws, which have probably been modified and inserted into the book. They provide interesting points of agreement and contract with 'the book of the Covenant,' *Exodus* 20–23. The Law of Holiness, sometimes symbolised by H, is less detailed. It is possible that fragments from the same source as H exist elsewhere. H was perhaps compiled as the result of the Law of the One Sanctuary, *i.e.* sacrifice was to be offered only in Jerusalem. It is both ritual and moral in scope. Chapter 27 deals with vows and tithes.

Leviticus and Numbers, Kennedy (*Century Bible*).

LEVULOSE, see SUGAR.

LEWANIKA (c. 1860–), S. African chief, who through the influence of the missionary François Coillard, became civilised, and, in 1890, placed Barotse territory under Brit. protection.

LEWES (50° 52′ N., 0° 1′ E.), town, Sussex, England; ruined priory, dating from 1078; remains of ancient castle, built by William de Warenne, XI. cent. Here Simon de Montfort defeated Henry III., 1264. Pop. (1911) 10,972.

LEWES (38° 40′ N., 75° 7′ W.), town, Delaware, U.S.A.; fine harbour; fruit trade. Pop. 2158.

LEWES, GEORGE HENRY (1817–78), Eng. journalist and philosopher; abandoned medicine and the stage for encyclopædic study; pub. *Biographical History of Philosophy*, 1845–46; *Life of Goethe*, 1855; his best philosophical work was *Problems of Life and Mind*; although married, lived with George Eliot, 1854 till death; founded and edited *Fortnightly Review*, 1865–66. L. was influenced by Positivism, but did not give it entire acceptance; able, too, as a psychologist, but rather unsystematic.

LEWIS, SIR GEORGE CORNEWALL, Bart. (1806–63), Eng. politician and writer; Poor Law commissioner, 1839; sec., Board of Control, 1847; Under-Sec., Home Office, 1848; Financial Sec., Treasury, 1850; Chancellor of Exchequer, 1855; Home Sec., 1859; War Sec., 1861; among other works, wrote *Government of Dependencies*.

LEWIS, IDA (1841–1912), Amer. lighthouse-keeper, noted for her courage in saving life.

LEWIS, MATTHEW GREGORY (1775–1818), Brit. dramatist and general writer, known as MONK LEWIS from his romance, *Ambroso, or the Monk*. Most of his work is now forgotten.

LEWIS, MERIWETHER (1774–1809), Amer. army officer; commanded exploring expedition to Missouri, 1803; sailed up Missouri, and crossed Rockies to Pacific, 1804–6, discovering hitherto closed-up country and unknown native tribes; gov. of N. Louisiana, 1807.

LEWISBURG (40° 57′ N., 77° 1′ W.), town, Pennsylvania, U.S.A. Pop. 3081.

LEWISHAM (51° 31′ N., 0° 4′ W.), borough, London, England. Pop. (1911) 160,843.

LEWISTON (44° 4′ N., 70° 13′ E.) town, Maine, U.S.A.; manufactures cottons, woollens; site of Bates Coll. Pop. (1910) 26,247.

LEWIS-WITH-HARRIS (58° 10′ N., 6° 35′ W.), northernmost island, Outer Hebrides, Scotland; area, *c.* 770 sq. miles. Lewis, or N. part, is included in Ross-shire; Harris, or S. part, in Inverness-shire; coast deeply indented; produces barley, potatoes, fish, tweeds; has some stone circles and other interesting remains; chief town, Stornoway (*q.v.*). Pop. *c.* 32,000.

LEXICON, see DICTIONARY.

LEXINGTON.—(1) (38° N., 84° 31′ W.) town, Kentucky, U.S.A.; lies in midst of blue grass district; site of State and Transylvania Univ's; important horse market; manufactures whisky, carriages, tobacco, hemp, etc. Pop. (1910) 35,099. (2) (42° 30′ N., 71° 14′ W.) town, Massachusetts, U.S.A.; chiefly famous as site of first engagement in War of Amer. Independence, 1775; principal industries, agriculture and dairy-farming. Pop. (1910) 4918. (3) (39° 10′ N., 93° 50′ W.) town, Missouri, U.S.A.; manufactures hemp, woollens, bricks; large coal trade; scene of hostilities in Civil War. Pop. (1910) 5242. (4) (37° 42′ N., 79° 20′ W. town, Virginia, U.S.A.; site of Virginia Military Institute and Washington and Lee Univ. Pop. (1910 2931.

LEYDEN, see LEIDEN.

LEYDEN JAR or CONDENSER, electrical appliance for storing electricity, invented at Leiden; consists of glass jar coated inside and outside with tin foil, and a metal knob connected by conductor with the inner coating; it is charged through the knob, and discharged by connecting the knob with outer coating; used in study of 'spark discharges' and 'electrical waves.'

LEYTON (51° 34′ N., 0° 1′ E.), town, Essex, England; suburb of London. Pop. (1911) 124,736.

LHASA, LHASSA (29° 39′ N., 91° 6′ E.), capital, Tibet; name means 'Abode of the Gods'; sacred city of Buddhists; situated on fertile plain about 11,900 ft. above sea-level; encircled by mountains. L. was visited by several R.C. missionaries in XVII. and XVIII. cent's; after 1760, Europeans were forbidden to enter city, but in 1904 it was occupied by force of Ind. army under General Macdonald and Colonel Younghusband, when a treaty establishing

friendly relations was arranged. Town is laid out with comparative regularity, but is exceedingly dirty; principal building is the Potala, residence of Dalai Lama, a huge building with gilded roof, which stands on a hill to W. of city. The great temple or Jokhang stands in centre of town and contains many sacred shrines, one of which holds life-size image of Buddha. The Ramo-Chhe is also a celebrated temple, where sorcery and magic are practised and taught. L. has many monasteries, including those of Moru, Sera, Debung, and Galdan, last three of which were established by Tsonhava, XIV. and XV. cent's. L. has important transit trade by meeting of caravans from India, China, and Turkestan; trades in tea, silk, carpets, gold, lace, gums, porcelain, musk, rice, tobacco. Pop. 15,000 to 20,000. See TIBET, LAMAISM.

Landon, *Lhasa* (1905).

L'HÔPITAL, MICHEL DE (*c.* 1505–73), Fr. politician; Chancellor of France, 1560; approved edict of Romorantin, 1560; opposed persecution of Protestants; helped to procure edict reforming administration of justice; discharged, 1568.

LI HUNG CHANG (1823–1901), Chin. politician; associated with Gordon in suppressing Taiping rebellion, 1863; subsequently gov. of Kiang-su; viceroy of Hukwang, 1867; Chihli, 1870; two Kwangs, 1900; conducted Chin. foreign affairs for many years.

LIA FAIL, see INISFAIL.

LIABILITY, see EMPLOYERS' LIABILITY ACTS; COMPANIES' LIABILITY.

LIAKOURA, see PARNASSUS.

LIAO-YANG (41° 18′ N., 123° 23′ E.), town, Shengking, China. Pop. *c.* 100,000.

LIAS, LYAS, LAYERS, lowest division Jurassic system; divided into three groups—(1) *upper* l., (2) *marlstone* l., (3) *lower* l.; consists of thin layers limestone embedded in blue argillaceous clay; contains numerous fossils, including insects, crinoids, ammonites, gryphites, fish, and plants. Remains of the pterodactyl and great reptiles such as ichthyosaurus, plesiosaurus, and enaliosaurus are found also. L. is exposed at Lyme Regis (900 ft. thick) and runs along Cotswolds to Bath (280 ft.), and is seen at Redcar, Yorks (500 ft.), and in N. Scotland, Ireland, and other localities.

LIBAU (56° 30′ N., 21° 1′ E.), port, Courland, Russia; fine harbour; exports grain, flax, hemp, linseed, etc.; iron foundries, shipbuilding yards. Pop. (1910) 85,000.

LIBEL AND SLANDER, defamation of character; libel—by writing, printing, or otherwise publishing in more or less permanent form; slander—by spoken word. Generally in case of s. special damage to person defamed must be proved, but not necessarily in case of l. Publication, that is, the communication to some other person than the plaintiff, must be proved in either case. Every person has a legal right to earn the goodwill and respect of his fellows, and therefore if some one publishes a defamatory statement concerning him, so that he is shunned by others, his legal right is invaded, and there is cause for action. The plaintiff must prove that the l. or s. was aimed at him personally, and a defamatory statement concerning any considerable class of persons can be uttered without let or hindrance. Disguise or omission of a name does not save the libeller if the plaintiff can satisfy a jury he is the person defamed.

LIBELLATICI, those who, during Decian persecution in 250, procured certificate stating they had sacrificed to the gods, to escape martyrdom.

LIBELLULA, genus of dragon-fly (*q.v.*).

LIBER PONTIFICALIS, work containing lives of popes from St. Peter; of composite authorship, probably begun in VI. cent.

LIBERAL PARTY, political party in Gt. Britain; successors of Whigs; name definitely adopted in Gladstone's time; original motto, 'Peace, Retrenchment, and Reform'; aims at social progress and at bettering condition of lower classes; supports Free Trade, Irish Home Rule, and Welsh Disestablishment.

LIBERIA (*c.* 4° 20′ to 9° 45° N., 7° to 11° 30′ W.), negro republic, W. Africa, extending S.E. of Sierra Leone for 350 miles along coast to Fr. colony of Ivory Coast, and claiming country for about 200 miles inland. L. was established as a home for freed slaves in 1822 by a number of Amer. and European philanthropical societies. Boundaries were defined by treaties with England, 1885, and France, 1892 and 1907–10, by last of which a strip of territory was transferred to France; and in 1911 the Kanre-Lahun district was ceded to Sierra Leone. L. has area of *c.* 40,000 sq. miles, of which only the coastal strip is under effective government administration. Coast is low and swampy; interior rises, and has excellent timber; watered by Cavalla and other streams; soil very fertile; produces coffee, palm oil and kernels, rubber, cocoa, ivory, sugar, arrowroot, piassava, hides, kola nuts. Capital is Monrovia. Constitution resembles that of U.S.A.; executive power held by pres., assisted by vice-pres. and cabinet of six ministers; legislature consists of two houses, Senate and House of Representatives. Owing to unsatisfactory financial position of L. an international loan of £500,000 was agreed to, 1911, secured by Customs, rubber and head taxes, under administration of an Amer. controller and Brit., Fr., and Ger. sub-controllers. The inhabitants are all of negro race, and most of them profess Prot. religion. Pop. 1,500,000 to 2,000,000.

Johnston, *Liberia* (1906).

LIBERTAD, LA LIBERTAD (*c.* 8° S., 78° 30′ W.), maritime department, Peru, S. America; area, 10,206 sq. miles; produces cereals, cotton, coffee, fruits, cocoa. Pop. (1906) 188,000.

LIBERTARIANISM, theory that the will is 'free.'

LIBERTINES, term of opprobrium, used specially by Calvin in reference to the Genevan Anabaptists; for origin of term, see *Acts* 6⁹.

LIBERTY PARTY, first Amer. anti-slavery political organisation; founded chiefly by James Birney, whom party nominated for presidency, 1840; thorough organisation attempted after 1840; attained its greatest development, 1846; subsequently lost influence except in New England; held last national convention at Buffalo, 1847; joined Free Soil Party, 1848, thus losing identity.

LIBMANAN (*c.* 14° 5′ N., 123° E.), town, Luzon, Philippine Islands. Pop. *c.* 18,500.

LIBOURNE (44° 55′ N., 0° 11′ W.), town, Gironde, France; manufactures woollens; wine trade. Pop. 20,000.

LIBRARIES are almost as ancient an institution as the invention of writing. The accumulation of written records is the nucleus of a l. The earliest memoranda would fall roughly into two groups—the civic documents kept in the archives and the religious documents kept in the temples. But such papers are not collected in order to promulgate culture; l's containing works of general reference belong to a much later period of civilisation. The earliest l's of general reference were collected in Egypt and Assyria, and date from the remote period of 4000 B.C. Thus Sargon I. instituted a collection of works on all known subjects of learning in the year 3800 B.C. in the city of Accad. Throughout Babylonia at this time similar collections had been made. These were aggregated by Assurbanipal to replenish the great library of Nineveh—a library stocked with works on all known departments of learning, and thrown open to public use. We have little authentic information regarding the institution of l's in Greece. The small collections of private persons were kept in cylindrical boxes labelled and numbered.

We have relics of a large library at Herculaneum, in which the rolls were stored on the shelves of presses. Peisistratus is not only credited with editing a standard edition of Homer, but with collecting a larger and varied l. Aristotle had a great collection of heterogeneous works corresponding to the versatility of his own genius, and he is said thus to have set the example to the kings of Egypt.

Our knowledge of Egyptian libraries is more detailed. Diodorus Siculus relates that the l. of King Osymandyas (said to have been Rameses I.) had inscribed over the portal, 'Dispensary of the Soul.' There were two l's at Alexandria—the 'Great,' in the Museum, and the 'Daughter,' in the Serapeum. Callimachus is said to have constructed *pinakes* (catalogues) for the 'Great' library. These l's contained an immense store of knowledge. When Cæsar fired the fleet in Alexandria, the 'Great' l. was destroyed, and to compensate for the loss Antony sent to Alexandria the l. of Pergamum. The 'Daughter' l. now became the chief l. of Alexandria, but Theodosius partially destroyed it. Possibly its contents were less valuable than is generally supposed when it was demolished by the Arabs under Amru. On that occasion the Caliph Omar is said to have stated that if the books of the l. agreed in doctrine with the Koran, they were superfluous, if they did not they were baneful, and in both cases they should be destroyed.

The first Rom. l. of noteworthy extent was that transferred to Rome as spoils of war by Æmilius Paulus in 168 B.C., and which had belonged to the kings of Macedonia. From Cicero's correspondence we can form some idea of the interest taken by the writer and his friend Atticus in book-collecting. To Pollio belongs the credit of establishing the first public l. at Rome. Cæsar had projected the institution of a public reference l., but his project was left to Augustus to realise. Augustus founded two l's known as the Palatine and the Octavian. The Rom. emperors continued to found l's, of which the most famous is the Ulpian, instituted by Trajan. Constantine founded a l. of Christian authorities at the new Rom. capital of Byzantium.

In the Middle Ages pagan lit. was for the most part suppressed, and l's were almost exclusively the property of the monasteries. Of the various orders that of St. Benedict was the most famous with regard to book-collecting. The unrest on the Continent during the VI. and VII. cent's brought the treasures of the continental monasteries over to England. Thus the collections at Canterbury (founded by St. Augustine), York, Durham, and Whitby were at one time the finest European l's. (These were eventually destroyed by the coming of the Northmen.) Alcuin, Charlemagne's librarian, advised the king to send to Britain for books to stock his new l. Among the many famous monastic collections of Europe were those of St. Gall in Germany, Monte Cassino in Italy, and Fleury in France.

The conquest by the Arabians, when once their position was secured, was not inimical to learning. The l's of Bagdad and Cordova were universally famous, and the reinstitution of the l. at Constantinople during the Gk. revival of the IX. cent. seems to have been inspired by Arab. activity.

But it was the Renaissance that gave the great incentive to the making of l's. Italy took the lead. Niccolo Nicoli in 1436 left his l. as a legacy to the public. Following this precedent, Lorenzo de' Medici instituted his famous l. England, however, was slow to imitate the continental movement. Abp. Parker tried in vain to persuade Queen Elizabeth to follow the example set by Germany, Italy, and France. In the XVII. cent. many local l's were founded, but no national institution was formed. Sir Thomas Bodley founded the Bodleian library at Oxford, and at the same time Abp. Usher started that of Trinity Coll., Dublin. In 1627 Drummond of Hawthornden presented Edinburgh Univ. with a fine collection of books, and in 1682 the Faculty of Advocates of the same city appointed Sir George Mackenzie to superintend the collecting of books for their l. Though the l. of the University of Cambridge had been founded in the XV. cent., it was comparatively insignificant till George I. replenished it with a valuable contribution. Lambeth L. was founded in 1610, Sion Coll. (a guild of London clergymen) in 1629, and about this period public l's were founded in Leicester, Norwich, Bristol, and Manchester.

In 1610 Sir Thomas Bodley elicited from Stationers' Hall a grant for the Oxford L. of a copy of every book entered there. In the reign of Anne this grant was extended, and applied also to the Royal L. of St. James's, Cambridge L., Advocates' L., Edinburgh, and Sion Coll. L., London. Subsequently the privilege was extended to Trinity Coll. L., Dublin, and King's Inn L., Dublin. These rights were, however, commuted in 1835, and a compensatory yearly grant was made to those deprived of the benefit, viz. Edinburgh Univ., £575, Glasgow, £707, St. Andrews, £630, Aberdeen, £320, King's Inn, Dublin, £435, and Sion Coll., £363. It was not till mid. XIX. cent. that circulating l's were established generally in the larger cities of England, and the statistics of the period show that in this respect Britain fell far behind continental countries. William Ewart, M.P. for Dumfries, was indefatigable in his efforts to ameliorate matters. In 1849, in response to a motion of his, a Committee was formed to inquire into the best methods for founding a more adequate number of public l's. Subsequently a motion of Ewart's gave power of taxation of the inhabitants to certain districts for the purpose of maintaining public libraries.

The Brit. Museum, the national l. of Britain, is now the finest public l. in the world. In 1753 Sir Hans Sloane offered his valuable collection of books and MSS. to the nation for the sum of £20,000. The conditions of the offer also stipulated that they should be kept in a special museum. Parliament accepted the offer, and also purchased a collection belonging to Robert Harley, Earl of Oxford. To house the collections, Montague House, Bloomsbury, was purchased, and in 1759 opened as the Brit. Museum. To these collections were added the Cotton Collection, and the Royal L. of the Sovereigns of England (presented by George II.), along with which went the copyright privilege. In 1823 the splendid library of George III. was added. Other important collections added were the Hamilton (1772), the Cracherode (1799), the Antiquities from Alexandria (1867), the Towneley Marbles, etc. (1805–14), the Lansdowne MSS. (1807), the Phigalian Marbles (1815), the Elgin Marbles (1816), and the Burney L. (1818). Anthony Panizzi was mainly responsible for the marvellous growth of the library; he secured from the Government the annual grant of £10,000; he won the bequest of the priceless Grenville Collection, and planned the magnificent reading-room.

Of the continental l.'s the most famous is the Bibliothèque Nationale of Paris, which contains the collections of many Fr. monarchs, and was enriched with spoils so lavishly after the Revolution. Other notable Fr. l's are those of Bordeaux, Grenoble, Aix, Nantes, Besançon, Rouen, and Troyes. In 1862 an important edict enforced the establishment of a l. in connection with all the primary schools of France. The Royal National L. of Germany is eclipsed in interest by the Royal L. of Munich. Other important Ger. l's are those of Dresden, of Stuttgart, of Darmstadt, and the various univ's. In Austria-Hungary famous l's are those of Cracow, Gratz, Budapest, and the Imperial L. of Vienna. Italy is noted for its ancient l's—the finest are at Florence, Milan, Venice, Parma, and those of the univ's of Bologna, Genoa, Naples, Pisa, and Turin. But the Vatican L. of Rome, the oldest in Europe, is unique—so rich is it in priceless MSS. and antique volumes. In Spain the chief national l. is at Madrid. In Belgium there is a magnificent Bibliothèque Royale at Brussels. The chief l's of Holland are at Amsterdam and The Hague. In Denmark the Royal L. of Copenhagen is open to the public. The best equipped l. of Sweden is at Stockholm. The fine Imperial Library of St. Petersburg is also open to the public. In U.S.A. the establishment of public l's was late. The oldest collections were at Harvard Univ. and at Yale Coll., New Haven. The largest Amer. l. is the Library of Congress at Washington, the third largest in the world.

Savage, *The Story of L's*; Ogle, *The Free L.*; Clark,

Medieval and Renaissance L's; Fletcher, *Public L's in America*.

LIBRIS, EX, see BOOK (*Bookplates*).

LIBYA, ancient Gk. name for N. Africa.

LICATA (37° 4′ N., 13° 57′ E.), port, Sicily; large export trade in sulphur; excellent harbour. Pop. 23,000.

LICE (Order *Anopleura*), small, wingless, externally parasitic insects, which infest mammals, piercing the skin by means of a hooked tube and sucking the blood. *Pediculus capitis*—the Head Louse—is found on the human head.

LICENSING LAWS.—The profits of the sale of ale, England's native liquor, were often a regality in England in the Middle Ages. The lord of the manor frequently ran the brewery and alehouse over which his arms are still sometimes to be seen. It was long, however, before the state adopted the idea of making revenue from liquor. Its first interference was in the consumer's interest. The Statute of bread and ale (*panis et cervisiæ*), 51 Hen. III., enforced standard of quality on same principle as state controlled manufacture of cloth, weights, and measures. A new development—still without idea of revenue—took place in Tudor times when the drunken man became as important a problem as the sturdy rogue and vagabond. Justices of peace were given powers of suppression of taverns, 1495, and one of reforms of Somerset's protectorate was first licensing Act of 1551, by which license to keep alehouses had to be obtained from justices of the peace; alehouses were compelled to close at 9 p.m., and already in XVI. cent. restrictions were placed on Sunday opening. Growing strength of Puritanism caused severe regulations in early XVII. cent.; by Act, 1618, licences had to be taken out annually; both victualler and consumer were fined for drunkenness under Act, 1625.

Previous regulations seem to have applied to beer and wine only; wine, by Act of 1552, might not be consumed on premises; consumption of spirits was rare till second half of XVII. cent.; selling of spirituous liquors brought under same conditions as that of ale, 1700–1, and attempt was made to restrict grants of licences. XVIII. cent. was the great age of drunkenness in England, but high duties imposed on intoxicating liquors were due to device of exchequer as well as to social reform. First excise (*q.v.*) duties were imposed in England, 1643, on ale, beer, wine, cider, perry, tobacco; duties on licences not imposed until Act, 1784; Gin Act, 1736, roused great anger in country and led to illicit distilling. Two great difficulties have always prevented excessive interference with liquor traffic: so important a source of revenue cannot lightly be tampered with; high licensing has always produced fraud; add that state interference as social reformer has always been unpopular with a large section of population. A beneficial Act, 1753, made debts incurred by tippling irrecoverable at law. Liquor traffic is now controlled by Intoxicating Liquor Licensing Act (Alehouse Act), 1828, subsequently amended, by which, besides excise licence, justices' licence or certificate has to be obtained by alehouse-keeper; this Act was made applicable to all establishments selling intoxicating liquors by Wine and Beerhouse Act, 1869, Wine and Beerhouse Amendment Act, 1870, and Licensing Act, 1872.

By Act, 1828, 'off' licence was granted for sale of beer in quantity not less than 4½-gallon cask or 2 dozen quart bottles, and which, by Act, 1834, is not retail sale; spirits by above Acts could not be purchased in quantities less than 2 gallons; spirit dealer need not have justices' licence if he sells nothing but intoxicating liquors; by above Acts he might sell by retail not less than a quart bottle of wine. Theatres, etc., may receive licence under Act 5 and 6 Will. IV.; 'grocers' licences' granted to refreshment houses, 1860. XVI. cent. regulations as to Sunday closing remained only as far as hours of service were concerned; by Police Act, 1839, public-houses were closed from midnight, Saturday, till midday, Sunday; Forbes Mackenzie Act, 1853, made weekday closing hour 11 p.m., and forbade sale to any but lodgers and travellers on Sundays; public-houses may now open 6 a.m. to 11 p.m., weekdays, 12.30 p.m. to 3 p.m. and 6 to 10 p.m. Sundays, and in London, 5 a.m. to 12.30 at night, except Saturdays, when they close at 12 p.m., and Sundays 1 to 3 and 6 to 11 p.m. Travellers must have come not less than 3 miles to be excepted during prohibited hours on Sunday. Scotland and Wales close all day Sunday, as does Ireland, except in chief towns; publicans pay smaller licence duties for shorter hours; methylated spirits may not be sold from 10 p.m. Saturday to 8 a.m. Monday. Licensing system almost confined to British dominions and colonies; each state of U.S.A. acts independently in matter; local prohibition, also allowed in England, is common. Scot. Temperance Bill, dealing with reduction of licensed premises, etc., drastically amended by Lords; Commons determined to reintroduce Bill, 1913.

LICHEN (*lichen ruber*), skin disease characterised by slight rise of temperature, with appearance of small red points close together, more or less all over the body.

LICHENS are, in reality, dual organisms resulting from the symbiotic union of one, or (rarely) more, species of green or blue-green alga, and certain species of the higher fungi (*q.v.*), which with the exception of the tropical form, *Cora pavonia*, are Ascomycetes. Very characteristic growths are thus produced, which form encrustations or tangled shaggy patches on rocks, trees, and similar substrata, and are extremely resistant. The fungal constituent derives its nourishment from the assimilatory products of the alga, supplying inorganic and possibly certain organic matter in return. In simplest cases the lichen thallus consists of a filamentous or gelatinous mass, which includes both symbionts (*e.g.* Ephebe, Collema), but the majority are more highly specialised, and, in these, the algæ (or *Gonidia*) occupy a definite layer enclosed and protected by a highly resistant cortical layer of closely interwoven fungal filaments. Such l's are said to be heteromerous, and fall into three series: (*a*) *Crustaceous* forms, in which the thallus is closely adpressed to the substratum, to which it is normally intimately attached; (*b*) *Foliaceous* forms, in which the main body of the lichen is lobate and free, being attached to the substratum ventrally by a mass of root-like growths termed rhizines; (*c*) *Fruticose* forms, in which the thallus is attached by the base only, and often branches freely, and possesses a ribbon or tree-like form.

There are, however, a number of intermediate connecting forms. The reproduction of the Gonidia is by simple fission, but the l. as a whole is multiplied, either by fragmentation of the thallus, or by shedding of small, powdery masses, termed 'soredia,' each of which consists of a small group of actively dividing algæ, enclosed by fungal filaments. The familiar disc-shaped fruit-bodies, or apothecia, are the product of a multicellular carpogonium (the female sexual organ), which bears apically a club-shaped trichogyne to which the male elements adhere. In some species, however (*e.g.* Parmelia), the production of the apothecia appears to be purely apogamous. Among the best-known forms are the 'Beard lichen,' *Usnea barbata*, which is fruticose, and *Xanthoria parietina*, a foliaceous species which forms conspicuous orange patches on rocks and walls, especially at the seaside. Others of considerable interest are the Reindeer moss of the tundras, *Oladonia rangiferina*, utilised by the Lapps as winter fodder, and *Sphærothallia esculenta*, which grows on the rocks of the Asiatic steppes. The latter breaks up into small rounded fragments, which are distributed by the wind, and are utilised by the Tartars as a constituent of their earth bread. The Iceland moss (*Cetraria islandica*) is used medicinally as a demulcent, whilst *Roccella tinctoria* is also of

commercial importance, yielding the dyes litmus and orseille.

LICHFIELD (52° 42′ N., 1° 50′ W.), town, Staffordshire, England; episcopal see, founded by St. Chad, VII. cent.; cathedral dates from XIII. cent., and was restored after Civil War; episcopal palace, grammar school; birthplace of Dr. Johnson; chief industry, brewing. Pop. (1911) 8617.

LICHTENBERG, former principality, Rhenish Prussia, Germany.

LICHTENBERG, GEORG CHRISTOPH (1742–99), Ger. physicist; studied Göttingen Univ.; made investigations in electricity.

LICINIUS (250–324), Rom. emperor, 307, jointly with Galerius; jointly with Maximinus, against whom he rebelled, 313, becoming master of the East; conquered and deposed by Constantine, 323.

LICODEA EUBEA (37° 8′ N., 14° 44′ E.), town, Sicily. Pop. 7033.

LICORICE, see LIQUORICE.

LICTORS, see CONSUL, FASCES.

LIDDESDALE (55° 15′ N., 2° 45′ W.), district drained by Liddel, Roxburghshire, Scotland; contains Hermitage Castle, which has associations with Mary Stuart and Bothwell.

LIDDON, HENRY PARRY (1829–90), Eng. theologian; Ireland prof. of Exegesis at Oxford, 1870–82, and from 1870 Canon of St. Paul's, where his sermons drew enormous congregations; follower of Pusey, and vigorously opposed liberalising tendencies.

LIE, JONAS LAURITZ EDEMIL (1833–1908), famous Norweg. novelist. His works are descriptive of the lower classes, and the finest are *The Family at Gilje* (1883) and *Married Life.*

LIEBER, FRANCIS (1800–72), Amer. author and historian of Ger. birth; fought at Waterloo; settled in U.S.A., 1827.

LIEBIG, JUSTUS VON, BARON (1803–73), Ger. chemist; prof. of Chem. at Giessen, 1824–52; at Munich, 1852–73; laid the foundations of ultimate organic analysis; invented potash bulbs and a condenser; showed fulminic acid isomeric with cyanic acid, 1823; pub., with Wöhler, *Researches on the Radicle of Benzoic Acid,* 1832, and with Dumas, a memoir on polybasic acids, 1838; made valuable contributions to the chem. of agriculture and physiology, and established by analysis the nutritive values of foods; a well-known extract of beef is prepared from his prescription. See *Life,* by Shenstone.

LIEBKNECHT, WILHELM (1826–1900), Ger. Socialist; led Baden rebellion, 1848; imprisoned; subsequently escaped to France; returned to Germany, 1862; founded *Demokratisches Wochenblatt*; imprisoned, 1872–74; entered Reichstag, 1874; edited *Vorwärts,* Socialist paper.

LIECHTENSTEIN (47° 7′ N., 9° 33′ E.), small independent principality, between Vorarlberg, Austria, and Swiss cantons of Graubünden and St. Gallen; area, 65 sq. miles. Chief town, Vaduz; produces wine, fruit, timber, corn. Pop. 9900.

LIÈGE.—(1) (50° 32′ N., 5° 30′ E.) province, Belgium; area, 1117 sq. miles. Pop. (1910) 888,340. (2) (50° 38′ N., 5° 34′ E.) town, Belgium; capital of above; episcopal see; cathedral dating from X. cent.; seat of famous univ.; strongly fortified; important manufacturing town; coal, iron, zinc mined; manufactures small-arms, machinery, woollens, leather, sugar. L. was long the scene of hostilities between burghers and bishop-princes; taken by Charles the Bold, 1467; by Marlborough, 1702; by French, 1691 and 1792. Pop. (1910) 174,768.

LIEGNITZ (51° 12′ N., 16° 9′ E.), town, Prass. Silesia, Germany; old ducal palace; manufactures machinery, textiles, etc. Here Frederick II. defeated Austrians, 1760. Pop. (1910) 66,620.

LIEN, the right to retain property belonging to another until certain demands of the person in possession of the property have been satisfied. A *particular* l. arises out of the actual property retained, and is caused either by a definite contract, or by an implied contract. A *general* l. is given by indebtedness on other accounts. As a l. is only valid when the person through whom it is acquired has the absolute right of ownership, so it can only be enforced by the person to whom it is due in his own right, and not by an agent. It may be waived or lost by an act of agreement between the parties, by which it is surrendered, or made inapplicable; and it has been held that it may be lost by the temporary relinquishing of possession. But it is not lost when the demand in respect of which it was acquired can no longer be enforced by an action by reason of the Statute of Limitations; for the Statute does not end the debt, but only the legal recovery by action. A l. may be enforced simply by retention of property, and the courts have from time to time decreed a sale for the satisfaction of an unpaid l. Property subject to a l. may be disposed of by its owner, and the purchaser will have a perfectly valid title, but he must discharge the l. By the Judicature Act, 1873, the Chancery Divison of the High Court must deal with cases concerning the sale and distribution of property subject to lien.

LIERRE (51° 8′ N., 4° 34′ E.), town, Belgium. Pop. 24,611.

LIESTAL (47° 29′ N., 7° 44′ E.), town, near Basel, Switzerland. Pop. (1910) 5930.

LIEUTENANT (Fr., from Lat. *locum tenens,* holder of place, substitute), representative; especially applied to officer below captain in rank in army and navy; l. in navy has rank of army captain; l.-general and l.-colonel are deputies of general and colonel; lord l. of a county, Crown gov.; Lord L. of Ireland, viceroy.

LIFE, see ANIMALS.

LIFE ASSURANCE, see INSURANCE.

LIFEBOAT, see LIFE-SAVING APPARATUS.

LIFE-SAVING APPARATUS, term including all appliances for saving life, but generally applied to life-belts, life-jackets, and boats by which one may escape from a ship at sea. Life-jackets and buoys are made of cork, sewn in canvas, and enable wearer to float with ease. Cargo steamers generally carry sufficient boats for all on board; but in large passenger vessels this is almost impossible. In passenger vessels the Welin davit, by which the boats are carried outboard into the lowering position by turning a handle, is now used. Davits sometimes hold two boats side by side, or three in a tier. All the boats have inclosed buoyancy either in form of airtight, watertight copper cylinders, or externally fitting cork fenders, or with the buoyancy carried under a deck. Each boat must be fully equipped with oars, rudder, etc. (and in certain cases with mast and sail), and with fresh water, while provisions and self-igniting lights are sometimes carried. Cork mattresses which support three or four men are other life-saving appliances.

For life-saving from shore the *rocket apparatus* is almost invaluable. A rocket is fired carrying a line over the vessel, and this enables those on shore to send out a hawser and then to work backwards and forwards a sling buoy, sufficient to carry a person to the shore.

Lifeboats are boats of great strength, made very stable by a heavy keel, buoyant by a watertight deck and air-chambers, self-emptying, and self-righting. Institutions either State supported or by voluntary subscription provide and maintain lifeboats round the coasts of Britain, U.S.A., France, and Germany.

LIFFORD (54° 50′ N., 7° 29′ W.), town, County Donegal, Ireland. Pop. 446.

LIFTS, see ELEVATORS.

LIGAMENT, anything which ties one thing to another; in anat., a band of tissue connecting the bones forming a joint, or holding an organ in place, usually composed of parallel or interlacing fibres of flexible, dense, white, fibrous tissue.

LIGAN or **LAGAN,** see FLOTSAM.

LIGAO (13° N., 123° 50′ E.), town, Luzon, Philippine Islands. Pop. 18,000.

LIGHT is that branch of science which deals with the external cause of our visual sensations. It is also

known as Optics, and is frequently divided into such sections as Geometrical Optics, Physical Optics, and (although beyond the present scope) Physiological Optics. The first of these deals with the transmission, reflection, and refraction of light-rays, without inquiring into their physical nature. The second explains all phenomena relating to l. on the theory that it is due to a periodic displacement or wave motion in a luminiferous medium. The third includes the study of the anatomy of the human eye and the physiological factors relating to human vision.

Previous to the beginning of the XIX. cent., several theories had been propounded to account for the nature of l. and its propagation, but the two principal explanations offered were those known as the Corpuscular Theory, and the Undulatory or Ether Wave Theory. According to the former, the sensation of l. was excited by the impact on the retina of a large number of minute particles, or corpuscles, emitted in large numbers by the source of l. and travelling through transparent substances, as well as vacuous space, with great speed. Apart from inherent improbabilities, there were fatal objections to this theory, *e.g.* the speed of l. should, according to it, be greater in a denser medium, whereas Foucault showed experimentally that the reverse is the case. It also encountered serious difficulties in attempting to explain interference, diffraction, and polarisation.

The Undulatory Theory supposes that all space, including intra-molecular space, is filled with a medium capable of transmitting vibrations; that a ray of l. consists of a wave motion in this medium; and that the direction of vibration or periodic displacement in the wave is perpendicular to the direction of the ray. The medium thus proposed must therefore have qualities analogous to density and elasticity. This theory has been successful in explaining practically all the known facts regarding l. The real difficulty which it has to overcome is to explain the nature of the interaction between matter and ether. Substantial advances have been made in this direction during recent years.

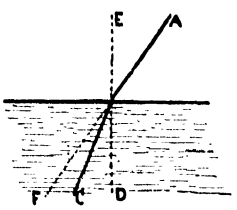
Accepting the undulatory theory, we may briefly summarise the leading points in the science by considering the essential characteristics of a ray of l., and, to begin with, we confine ourselves to monochromatic l. Any wave which is propagated in a medium has three principal features (see Wave). It must have (1) a certain *wave-length*, just as regular waves in the ocean have a length measured from crest to crest; (2) a certain *period*, i.e. the time taken by any portion of the medium affected by the wave to describe one complete vibration; (3) a certain *amplitude*, i.e. the distance on each side of the position of undisturbed rest through which the portion of the medium vibrates to and fro, and corresponding, in the case of ocean waves, to the height of the crest or the depth of the trough, measured from the ordinary undisturbed sea-level. Combining the first and second of these characteristics, it is seen that the velocity of propagation of the wave, as a whole, will be equal to the wave-length divided by the period. Applying these results to the case of a light wave, it is found that the wave length of light which is ordinarily appreciable by the human eye varies from $\frac{1}{2500}$ to $\frac{1}{1250}$ millimetre. The former (i.e. the shorter) waves give rise to violet-coloured light. As the wave-length increases we have, by indefinitely minute gradations, blue, green, and orange l., until for the longer wave-length mentioned we have red l. This range does not, however, exhaust all possible wave-lengths, for the existence of waves which are either too short or too long to affect the retina has been fully proved (see Photography, Radiation).

The different periods of l. waves can be deduced from the relation to the speed of l. The term *frequency* is used occasionally instead of period; it stands for the number of vibrations per second, and therefore is the reciprocal of the period. The amplitude of a l. wave is the factor which governs the intensity of the ray, for with light of a given wave-length the energy in the ray is proportional to the square of the amplitude. For the various methods of determining the intensity of a beam of l., see Photometry.

The speed of l. in air or a vacuum has been determined by different methods which show that its most probable value is about 300 million metres per second, and that it is the same for all wave-lengths. From the fact that l. consists of an undulatory motion in the ether, it is possible to explain the important phenomena which arise when rays from two separate sources meet at a point. Analogous cases are found in ocean waves and in the phenomena of the tides. If, owing to any cause, two series of waves from different sources affect the same water surface, there may occur the case where crests of waves in one series unite with crests of the other series. In this case the resultant wave has an amplitude equal to the sum of the component amplitudes. But in the case where the crests of one series meet the troughs of the other, the resultant amplitude is the difference of the component amplitudes, and if these are equal there is no disturbance of the sea-level. Similarly, it is possible to produce a combination of rays which will give either increased or diminished brightness. This is known as *interference* (see Interference and Diffraction below).

Another group of phenomena is due to the fact that the vibration of the ether, being perpendicular to the direction of the ray, may be confined to one particular plane. The l. is then said to be *polarised* in that plane. Further, since harmonic motions in directions inclined to each other can be combined so as to produce circular or elliptic motions, we can combine polarised rays in a similar manner (see Polarisation below). So long as a ray travels in the same homogeneous medium, it does so in a straight line. But when it arrives at the surface of separation between two media which are optically different, a change takes place. One portion of the ray may be thrown backwards into the medium in which it has been travelling, and is thereby *reflected* (see Reflection below). Another part may be reflected in a diffuse or irregular manner, and it is by this diffusive reflection that we see most objects which are not self-luminous. A third part may pass into the second medium, but in doing so its direction suffers an abrupt change, and is said to be *refracted* (see Refraction below). Lastly, a certain portion may be absorbed by the second medium and its energy transformed into heat. At present, the line of advance in physical optics is towards a satisfactory explanation as to how luminous matter transfers energy to the ether so as to produce vibratory motion. The most promising explanation is that, associated with each atom (or perhaps constituting each atom) there are electrically charged particles or electrons, whose mass is mostly, if not wholly, electromagnetic mass, and whose motions give rise to ether waves. In connection with this part of the subject the article on Matter should be studied for information on electrons, which are also discussed under Electricity.

See Achromatism, Eye, Fluorescence, Lens, Microscope, Mirror, Phosphorescence, Polarisation, Rainbow, Sextant, Shadow, Spectroscope, Telescope.



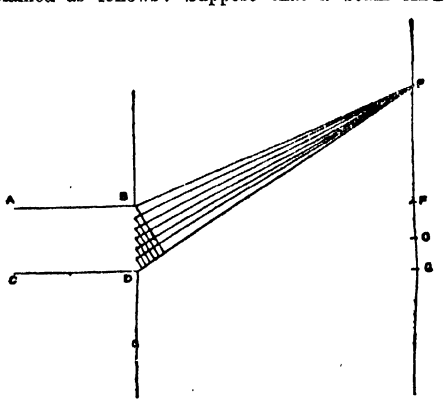
Interference.—The periodic displacements, due to light from two or more sources, may be compounded together into a resultant displacement. Suppose that light waves of equal wave-length arise from two sources, A and B, placed close together, and that they illumine a screen placed parallel to the line AB. Also let C be a point on the screen equidistant from A and B. At C, the ether is set into periodic vibration owing to the rays from A and B, and as the distances AC and BC are equal, the light waves arrive at C in the same phase (see Wave)—that is, at C the crest of a wave from A unites with the crest of a wave from B. The two effects reinforce one another, and hence at C there will be a bright band on the screen. Now take a line CP on the screen drawn parallel to AB, so that P is close to C, and consider the com-

bined effect at P of rays from A and B. The distances PA, PB are unequal. Let them differ by half a wave-length. Then the crest of a wave from A will, on arrival at P, unite with the trough of a wave from B; the two separate effects annul one another, the result is a zero displacement of the ether at P; and a dark band appears on the screen at that point. If the point P be now taken very slightly farther from C, so that the difference between PA and PB is equal to a whole wave-length, the waves from A and B meet each other at P in the same phase, and a bright band appears. Hence on either side of C there will be exhibited a series of alternating bright and dark bands. The former are due to the distances PA and PB differing by a whole wave-length or an integral multiple of whole wave-lengths, the latter being due to the difference being equal to a half wave-length or an integral multiple of half wave-lengths. These bands are said to be due to *interference*.

Phenomena due to this cause are noticed when a soap bubble, blown out until its film is extremely thin, is exposed to light from a large gas flame; also, when a few drops of paraffin oil are allowed to spread over the surface of a pool of water, and the light from a bright sky reflected by the thin film of oil is observed. They can be produced in a variety of other ways, but the general principle is that a ray of light from a single source is split up into two parts, one of which (by reflection at polished surfaces or by refraction through transparent substances) travels to a certain point by a path which differs in length from that of the other part of the ray. Such phenomena are of the greatest use in physical determinations, since by their means it is possible to measure distances so minute that no other method is practicable.

Reflection.—When a ray of l. falls obliquely on a plane polished surface, part of it is reflected back from the surface. The laws governing this phenomenon are: (i) The *incident* (or original) ray, the *normal* (or perpendicular) to the surface at the point of incidence, and the *reflected* ray, all lie in one plane; (ii) the incident and reflected rays are on opposite sides of the normal and are equally inclined to it. The best reflecting surface known is that of highly polished silver, which reflects about nine-tenths of the l. which falls upon it.

Refraction.—A ray of l. follows a rectilineal path so long as the medium through which it passes remains unchanged. But when it passes out of one medium into another, the path undergoes, at the surface of separation of the two, a sudden change in direction, and this change is known as *refraction*. For example, let AB represent a ray of l. travelling through air, and let it enter at B the surface of a mass of glass. Instead of continuing in the line BF, which is a continuation of AB, it takes the course BC. If we draw the normal DBE at the point of incidence, there ABE is termed the angle of incidence, and CBD the angle of refraction. The laws of refraction are as follows: (i) The incident ray (AB), the normal (DBE), and the refracted ray (BC) all lie in the same plane; (ii) the ratio of the sine of the angle of incidence to the sine of the angle of refraction is a constant ratio, which, if the ray be refracted from a vacuum (or air), is known as the *refractive index* of the refracting substance. It is obvious that if the direction of propagation of the ray be reversed, so that the l. travels in the second medium from C to B and then into a vacuum (or air) its subsequent path will be BA. This is usually stated in the form that the refractive index from one medium into a second is the reciprocal of the refractive index from the second into the first.



Hence a ray passing through a plate of glass, or other translucent material, whose faces are parallel, emerges with its direction unchanged, but with its path shifted parallel to its original path. The foregoing statements only apply to homogeneous l.—that is, to light of a single kind or wave-length. If we deal with composite l. (*e.g.* sunlight), it is found that there is a different refractive index for each wave-length. Hence a ray of sunlight in passing through a prism is refracted by different amounts, and is thus decomposed into its constituent colours. This phenomenon is known as the *dispersion of light*, and accounts for the formation of a spectrum. See SPECTROSCOPE.

Diffraction.—A sound can be perceived by the ear even when the source of the sound and the ear are not in an uninterrupted straight line—in short, sound can bend round a corner. Sound is propagated by a wave motion in air, hence it would appear probable in the analogous case of l., which is due to a wave motion in the luminiferous ether, that a ray of l. should be able to bend round a corner. But the fact that l. proceeds in straight lines appears to contradict this probability, and was held to be an objection to the undulatory theory of l. when it was first brought forward. The explanation depends on the circumstance that in the case of sound the wave-length is practically comparable with the dimensions of ordinary objects. For example, the sound wave which produces the middle C note on a pianoforte is about 4¼ ft. in length. On the other hand, the length of the l. wave which produces yellow (sodium) light is more than two million times smaller. It is difficult, therefore, to obtain a sound shadow, for the intervening object must be large compared with the length of the sound wave. It is, however, easy to obtain a l. shadow, for most objects placed in the path of a ray of l. are very much larger in dimension than the length of a l. wave. It follows that, in order to show any bending of a l. ray round a corner, the ray must pass through some aperture or round some object which is comparable in size with the wave-length of l.

Suppose that rays of homogeneous l. (*i.e.* l. which is all of one wave-length) from a distant source fall perpendicularly upon a screen—a thin metallic plate—in which there is a rectangular slit, and after passing through the slit be received on a second screen parallel to the first. If the breadth of the slit be considerable, its corresponding image on the second screen will be sharp and clear at its edges. But if the slit be narrow (such as might be produced by a cut with a sharp knife) the image is bordered by a series of alternately dark and bright bands, and these bands extend into the surrounding area, which, if the slit were wide, would ordinarily be unilluminated. This shows that l. has to some extent bent round the edge of the slit, and to this bending the term *diffraction* is applied.

The formation of these dark and bright bands is explained as follows: Suppose that a beam ABDC

of parallel rays of l. from a distant source fall perpendicularly upon a screen in which there is a slit

whose breadth is represented by the gap BD. Each l. wave, on arriving at BD, tends to initiate a secondary wave which spreads outwards in all directions towards the second screen. In ordinary circumstances, when the slit is wide, there is a 'geometrical' image between F and G, with its centre at O. Now consider all those secondary rays which travel to a point P on the second screen. BD is regarded as small compared with PB or PD, and we may therefore regard PB and PD as parallel to each other. Take P as centre and describe a circle whose radius is PB. It will pass through B. Again, with the same centre, describe a circle whose radius is PB+$\frac{l}{2}$, where l is the wave-length of the light. This second circle will cut BD in a point close to B. A third circle with radius PB+l, a fourth with radius PB+$\frac{3l}{2}$, a fifth with radius PB+2l, etc., may be drawn, and these will divide BD into a number of approximately equal lengths. Let these divisions be referred to as the 1st, 2nd, 3rd, etc., the last being the nth division. Taking a simple case, we may suppose that BD consists of an exact number of such divisions, *i.e.* that after the nth there are no fractional parts of a division. Now, the l. which reaches P from these different divisions has travelled different distances. For example, the l. from the second division has travelled a distance which is $\frac{l}{2}$ greater than that from the first division. Consequently, these two sets of waves will be in opposite phases; just as, when two waves in water meet each other so that the crest of the one coincides with the trough of the other. Hence, the effect at P of the first division will be annulled by the second; similarly, the effect of the third will be annulled by the fourth; and so on. If the number of divisions is an even number, there will be no illumination at P, but if there be an odd number of divisions, there will be some illumination at P due to the odd division. The same will be true for other positions of P, and it follows that as we travel outwards from O, the centre of the image, there will be a series of illuminated points. Between these there will be darkness. Hence the image on the screen will be bordered by alternating light and dark bands, and these are broader the narrower the slit. The foregoing explanation refers to homogeneous l. With composite l., such as sunlight or ordinary white l., the position of the dark lines will depend on the wave-length, and therefore the bands of l. will be variously coloured.

We may have diffraction bands at the edges of the shadow of a fine wire. A large number of such wires, parallel to each other, also produces similar phenomena, and such an arrangement is known as a *diffraction grating*. This effect can also be produced by ruling a large number of fine lines with a diamond point on a sheet of glass. L. reflected from such a grating ruled on a bright metallic surface also shows the effect, and such gratings are largely employed for the determinations of the wave-lengths of light. Diffraction effects can be seen on a large scale in the *coronæ* or coloured rings round the moon in hazy weather. These rings are produced by small water particles in the atmosphere, and it can be shown that when the particles are increasing in size the rings contract in diameter—a presage of rain to follow.

Preston, *The Theory of Light* (1912); Tait, *Light*; Edser, *Light*; Phillips, *Science of Light*.

Aberration of l.—In astron., the aberration of l., discovered by Bradley in 1729, is an apparent movement of every star arising from the earth's motion in its orbit and the velocity of l. The combined effect of these velocities is a displacement in the direction in which the earth is travelling at any moment, just as when rain falls vertically an umbrella has to be slanted in the direction of motion. The yearly displacement for a star 0° latitude is a straight line; for other latitudes up to 90° an ellipse, the greatest axis of which is constant and parallel to the plane of the ecliptic, the least axis varying from zero at 0° to a maximum at 90°. The half-major axis, the same for all stars, is the *aberration constant*, value 20″·445 (*Struve*). This figure is disputed. As the velocity of l. is known by experiment, this constant is used to determine the earth's velocity, and thence the sun's distance. On the corpuscular theory of l. the explanation of aberration is easy, but difficulties arise with the modern wave theory. There is also a daily aberration due to the earth's rotation, and planetary aberration due to the velocity of the planets themselves.

In optics, *spherical* aberration in mirrors and lenses is caused by the outer rays of l. coming to a focus nearer the mirror or lens than the central rays. The image is thus not completely in focus. In photography the defect is remedied by using only the central portion of the lens by insertion of a stop, or by a compound lens consisting of two lenses, a short distance apart. The intersection of reflected or refracted rays form *caustics*. *Chromatic* aberration is a more serious difficulty. The component colours of l. have different foci, and produce an image with coloured edges. For certain rays a correction can be made by combining two lenses of different curvatures—one of flint glass, the other of crown. The arrangement is called an *achromatic* lens. For optical instruments the blue and orange rays are thus corrected; for a photographic refracting telescope, on the other hand, the actinic rays.

LIGHTFOOT, JOHN (1602–75), Eng. theologian; ed. at Cambridge; member of Westminster Assembly, 1643–44; best known as a Hebrew and Rabbinical scholar; his greatest work was *Horæ Hebraicæ et Talmudicæ*.

LIGHTFOOT, JOSEPH BARBER (1828–89), Anglican divine; ed. at Cambridge, where he attained high honours; Hulsean prof. of Divinity, 1861; bp. of Durham, 1879; known best for his work on Early Christianity; a most scholarly critic.

LIGHTHOUSE, a building erected on some conspicuous part of the coast to warn and guide ships. The earliest form was a simple tower with a beacon fire. Amongst early l's the most famous was the Pharos of Alexandria, on the island of Pharos. It was erected by Sostratus of Cnidus in the reign of Ptolemy II., 283–247 B.C., and was destroyed in the XIII. cent. by an earthquake. The name Pharos came to be applied to all l's, and the term '*pharology*' has been used to describe the whole system of l. erection and maintenance.

L's may be situated on the land, or on rocks or shoals swept by the sea. Those on land are ordinary architectural buildings, and their construction does not call for special notice. There are various methods of constructing l's on rocks or shoals. If the rock affords a good foundation, a tower of masonry is usually the most convenient, such towers being constructed on the lines of Smeaton's Eddystone lighthouse, with certain modifications. The circular form is adopted as offering least resistance to wind and water, and the centre of gravity is kept low. The lowest parts of the structure, which have to withstand the full shock of the waves, are built with a vertical face. The height of the tower depends upon the work it has to do, but it always must be sufficient to keep the light unobscured by spray.

Where no solid foundation is available, as on sandbanks, shoals, or coral reefs, an open framework structure is frequently built upon piles driven well into the bottom. L's situated on land have buildings erected close to them for the accommodation of the keepers and the various stores and appliances, but where the lighthouse is on an isolated rock or shoal it is designed to provide this accommodation within itself. L's are fitted with lightning conductors carried down to an earth-plate buried in permanently moist ground, or to some point well below the lowest water level.

The lights may be divided into two classes, fixed and flashing. Fixed or continuous lights are falling into disuse, as they are very liable to be confused with shipping lights and various lights on shore. They are used for harbour lights, but seldom for other purposes. Flashing lights may show a single flash, or a group of two or more flashes, but in every case the periods of darkness are greater than those of the light. Fixed lights are often arranged so as to be entirely eclipsed at regular intervals, and they are then called occulting lights. Such lights may have groups of two or more occultations, and they are distinguished from flashing lights by having the light period greater than, or at least equal to, the period of darkness. There are also alternating lights, showing different colours with dark periods between, but these are not very satisfactory. White, green, and red are the colours generally used, and on account of the light absorption of coloured screens white is the most efficient.

Where a light is required to show the channel between sandbanks or other dangers, it is divided into sectors, white and coloured. White light is thrown on the fairway, and coloured light on the dangerous places. The apparatus employed in flashing and occulting lights is usually rotated by weight-driven clockwork mechanism, which automatically indicates when rewinding is required. Spring-driven clockwork is also used for occulting lights.

The earliest form of illuminant was a fire of wood or coal burning in some kind of brazier, and this was superseded by candles. Smeaton's Eddystone light consisted of twenty-four candles. Oil, coal or acetylene gas, and electricity are now used. The use of gas or electricity generally necessitates the construction of special generating plant, and on this account oil is much the simplest and most convenient illuminant, but its efficiency is lower than that of either electricity or gas.

The optical instruments used in l's may be divided into three classes—catoptric, dioptric, and catadioptric. In *catoptric* instruments the rays of light are reflected by plane, parabolic, spherical, or other mirrors. In the *dioptric* arrangement the rays are not reflected, but pass through the glass, being thus twice refracted. *Catadioptric* instruments combine both these methods. Besides the ordinary l. with keepers, there are numerous unattended lights and beacons. The source of light for these is often oil-gas, stored at a pressure of several atmospheres. Such beacons are capable of maintaining a light for periods of from two to three months, and they are frequently fitted with automatic occulting apparatus worked by the gas. Petroleum lamps burning ordinary l. oil are also used for beacons, and these will burn without attention for three or more months, and may be made flashing or occulting. Acetylene gas is also used to some extent.

Lightships are largely employed in places where it is not possible to construct a lighthouse. The lamps are carried upon the masts, and they may be fixed permanently or raised at night and lowered to the deck in the daytime. The lights may be fixed, flashing, or group-flashing, and the illuminant is usually oil, but oil-gas and electricity are also used. Lightships are provided with fog-signalling apparatus, in the shape of a siren worked by compressed air, or a steam whistle. There are also unattended lightships, using gas for the light and for working a fog-bell. Oil-gas is generally used for illuminated buoys, as it has proved more reliable than electricity, acetylene, or oil.

The English coast lights are under the control of the corporation of Trinity House, which has supervision over the various local lighting boards. The Northern Lighthouse Commissioners control the lights in Scotland and in the Isle of Man, and Irish lights are under the Irish Lights Commissioners. The Board of Trade has ruling powers over these three authorities in regard to financial and certain other matters. Amongst the more important local lighting authorities are the Mersey Docks and Harbour Board and the Clyde Lighthouse Trustees.

LIGHTING.—One of the earliest methods of obtaining artificial light was that of burning oil. The oils in use up to the mid.-XIX. cent. were principally of animal or vegetable origin, mineral oils being brought into use for lighting purposes about 1853. Early lamps, which consisted of a shallow containing-vessel and a short wick dipping into the oil, were very unsatisfactory, for they gave off unpleasant vapours, and the flame was smoky. The first real improvement in construction was made in 1784, when the *Argand lamp* was introduced. In this lamp a cylindrical wick was placed between two concentric metallic tubes, the combustion of the oil being made more complete by a constant stream of air passing through the inner tube to the flame, and by an additional draught, got by placing round the burner a glass chimney resting on a perforated base. The flame in this lamp varied with the level of the oil in the reservoir, and in the *Carcel* lamp, invented about 1800, this defect was remedied by a clockwork arrangement, which kept the burner supplied with an abundant supply of oil. The Carcel lamp is still used to a small extent in France. The *moderator lamp*, invented about 1836, is based upon the Carcel lamp, the oil being forced through a tube to the burner by the pressure of a spring upon a disc floating in the oil. In the tube is placed a tapering rod called the moderator, which regulates the flow of oil in accordance with the pressure of the spring. The above-mentioned lamps were only suitable for vegetable or animal oils, for the principle of forcing a superabundance of oil to the burner cannot be applied in the burning of petroleum, paraffin, or other mineral oils. In lamps intended for mineral oil, only as much oil as the wick is able to suck up reaches the burner, in order to prevent smoke, and a constant and abundant supply of air is provided. Petroleum may be burned in the ordinary way, or may be vaporised and used in conjunction with an incandescent mantle.

When *coal gas* was first tried as an illuminant it was burned as it issued from an open iron tube, but this was soon found to be unsatisfactory, as a large quantity of gas was consumed for a small amount of light. The end of the tube was then closed up, and three small holes bored in it, giving three small jets. Various arrangements of holes and saw-cuts followed, leading up to the fishtail burner, in which two holes are bored at such an angle as to give two jets impinging upon one another, and producing a flat flame. In the regenerative burner the heat of the flame is used to raise the temperature of the air supply.

Incandescent gas lighting rose from the fact that if certain incombustible substances were raised to a high temperature a brilliant light was produced. Platinum mantles were first tried, but their illuminating power decreased rapidly, owing to the erosive action of the gases in the flame. The discovery of the *Bunsen burner* about 1855, in which a non-luminous flame is obtained by mixing the coal gas, before combustion, with a certain proportion of air, paved the way to the modern incandescent burner. Welsbach hit upon the idea of a mantle consisting of a cotton fabric soaked in a solution of a metallic salt, and took out his first patent in 1805, but the *Welsbach mantle* was not perfected until 1893. Various methods of increasing the efficiency of the incandescent light have been introduced, such as supplying the gas or the air, or both, at a high pressure, or producing suction upon the gas and air by means of a special form of chimney used in combination with a burner adapted to utilise the augmented supply. The shape of the ordinary type of mantle is such that the light is given off at an angle above the horizontal, and this is a drawback for most domestic purposes, in which the light is required chiefly below the level of the mantle. This defect is remedied in the *inverted type* of mantle, which was introduced about 1900.

In 1801 Sir Humphry Davy discovered that if two carbon rods were connected with the terminals of a

powerful battery, and the points of these rods first brought into contact, and then slightly separated, the current did not cease, but continued to cross the gap, producing what is called the electric arc. This discovery led to the construction of the *arc lamp*, the first practical means of employing the electric current for purposes of illumination. The carbon points in the arc lamp become incandescent, and the intervening space is filled with incandescent particles of carbon. The temperature of the electric arc is very much higher than that of an ordinary flame, and therefore its light has a higher efficiency. The carbon points are gradually consumed, and there is also a transference of carbon from the positive rod to the negative rod, so that the positive rod wastes much the faster of the two. This wasting increases the length of the gap, and if the process were allowed to continue, the current would ultimately cease owing to the breaking of the arc. Arc lamps are therefore provided with an arrangement for automatically [illegible]g the rods closer together, in addition to a device for bringing them into contact and then separating them. The arc lamp may be open or enclosed, the consumption of the carbons in the enclosed type being about one-twentieth of that in the open arc.

When a conductor is traversed by an electric current it becomes heated, and if its resistance and its melting-point are sufficiently high it may be raised to a state of incandescence. This fact forms the principle of the *electric incandescent* or *glow lamp*. An incandescent lamp consists of the material to be heated, made in the form of a fine thread or filament, and enclosed in a glass globe from which the air is exhausted as far as possible, the current being led to and from the filament by wires fused into the glass. Carbon was first employed for the filament, and the carbon lamp was in general use until the desire for higher light efficiency led to the introduction of metallic filaments, which could be raised with safety to a higher temperature than the carbon filament. Metallic filament lamps are much more efficient than carbon lamps, and are more economical. Several metals are used for the filaments, amongst them being osmium, tungsten, zirconium, and tantalum. In the Osram lamp the filament is an alloy of osmium and tungsten. The incandescent lamp has a lower light efficiency than the arc lamp, but it gives a steadier and pleasanter light, and is much more suitable for interior lighting.

LIGHTNING, see METEOROLOGY (ATMOSPHERIC ELECTRICITY).

LIGHTNING CONDUCTOR, or LIGHTNING ROD, consists of a broad band of copper or iron, fixed to the outside of a building in the most direct manner possible. One end is buried in wet earth, and the other runs to a point (or set of points) projecting above the structure. Primarily it prevents accumulation of electricity in vicinity, but if this is very rapid, it offers an easy passage to the discharge, thus saving the building.

LIGHTS, CEREMONIAL USE OF, among Christians was partly taken over from Jewish and pagan antiquity, partly in the symbolism of light which inevitably grew up. Light has been sacred in many religions, but Christian services were often held at night, and lights were not used ceremonially till the III. cent. Tertullian and Lactantius denounce lights in the daytime as foolish. By the IV. cent., however, the custom was universal. But lights were not at first placed on or behind the high altar, but carried, as they are now in the Eastern Church. In the Rom. ritual, lights symbolise the presence of God, terrify the powers of darkness, or are votive offerings. The Sanctus candle symbolises the presence of Christ. In Passion Week 13 lights are gradually extinguished —the ceremony known as *Tenebræ*. New fire is made in Jerusalem at Easter Eve and also in the Rom. Church. Among Protestants lights have been abolished, except in Lutheran churches, where they are still retained. The Anglican Church has retained the use of lights intermittently; two candles on the altar were ordered by the First Prayer Book of Edward VI.; they were revived in the XVII. and again with the Oxford movement in the XVIII. cent.; the question of their legality is disputed.

LIGNE, CHARLES JOSEPH, PRINCE DE (1735–1814), Belg. soldier; fought in the Austrian interests at Kolin, Leuthen, etc.; favourite of Maria Theresa, and accompanied Catherine II. of Russia in the Crimea; his works on military affairs are numerous.

LIGONIER, JEAN LOUIS, EARL (1680–1770), Eng. field-marshal; distinguished at *Blenheim, Ramillies, Oudenarde, Malplaquet*; commanded at *Fontenoy*.

LIGONYI, see ELGON.

LIGUORI, ALFONSO MARIA DEI (1696–1787), Neapolitan R.C. theologian; founded order of Redemptorists; pub. *Glories of Mary*, 1750; *Homo Apostolicus*, 1755; of gentle and kindly disposition, he be- [illegible] referred to err on the side of leniency; canonised, 1839; declared 'Doctor of the Church,' 1871.

LIGURES BÆBIANI (c. 41° 20′ N., 14° 45′ E.), ancient town, central Italy; founded by Ligurians in II. cent. B.C.

LIGURIA (c. 43° 46′ to 44° 39′ N., 7° 30′ to 10° E.), division of N.W. Italy, bordering on Mediterranean; comprises Porto Maurizio and Genoa; area, 2037 sq. miles; surface generally mountainous; produces oranges, cereals, iron and copper pyrites, manganese; manufactures textiles, hardware. Largest towns are Genoa and Spezia. Coast is known as Riviera, famous winter resort. L. came under Rom. control in II. cent. B.C., and as Rom. province included much larger area than present division. Archæological remains are still matter of antiquarian dispute. Pop. (1911) 1,196,853.

LIGURIUS, greenfinch. See under FINCH FAMILY.

LILAC, common shrub of order *Oleaceæ*; flowers characterised by tubular corollas and bell-like calyxes; colours—pink, violet, blue, white.

LILBURNE, JOHN (c. 1614–57), Eng. agitator; pub. seditious pamphlets; frequently imprisoned under Charles I. and Cromwell; banished, 1652; on return, again engaged in agitation; imprisoned, 1653–55; afterwards became Quaker.

LILIACEÆ, monocotyledons, usually herbaceous, but containing two tree-like forms, *Dracæna* (the dragon tree) and *Yucca*. The plants are usually perennials, possessing either a rhizome (Solomon's seal), corm (autumn crocus), or bulb (tulip), and well-developed leaves. Ruscus and Asparagus are exceptional in having the leaves reduced to scales, in the axils of which the flattened assimilatory branches (cladodes) are borne. The flowers are perfectly trimerous, with six perianth leaves, six stamens, and a trilocular ovary.

LILLE (50° 38′ N., 3° 1′ E.), town, Nord, France; important centre of iron trade and of textile manufactures, which include linens, cottons, damask, tulle; also manufactures tobacco, spirits, sugar, machinery; seat of univ.; strongly fortified; contains Palais des Beaux Arts, law courts, several churches. L. was taken by Marlborough, 1708; unsuccessfully besieged by Austrians, 1792. Pop. (1911) 217,807.

LILLEBONNE (40° 30′ N., 0° 32′ E.), town, Seine-Inférieure, France; Rom. remains. Pop. 6220.

LILLO, GEORGE (1693–1739), Eng. dramatist; known chiefly by his frequently printed plays, *Fatal Curiosity* and *George Barnwell*.

LILLY, WILLIAM (1602–81), Eng. astrologer; issued almanacks and pub. *Merlinus Anglicus, Junior*, annually after 1644; generally set down as an impostor.

LILOAN (10° 20′ N., 124° E.), town, Cebu, Philippine Islands; fisheries. Pop. c. 16,000.

LILY (*Lilium*), genus of perennial, herbaceous monocotyledons, possessing a reserve of food stored in a scaly bulb; stem bears numerous decurrent, lanceolate leaves, and usually a racemose inflorescence; flowers are trimerous, with a petaloid perianth consisting of two whorls of three members, the edges of

the outer members dovetailing into the specially grooved midrib of the inner ones; fruit is a capsule.

LIMA, see under LAMELLIBRANCHIATA.

LIMA.—(1) (12°. 3′ S., 77° 8′ W.) capital, Peru, S. America; R.C. archiepiscopal see; cathedral was completely ruined by earthquake, 1746, but was afterwards rebuilt; seat of central univ., founded 1551; has school of mines and civil engineering, library, Mint, several convents; trading centre for W. coast of S. America; iron and copper works; manufactures gold lace, silver ware, stamped leather, glass, furniture. L. contains tomb of Francisco Pizarro, who founded city in 1535 and was murdered a few years later; held by Chileans, who sacked it thoroughly, 1881–83; frequently suffers from earthquakes. Pop. 140,884. (2) (12° 16′ S., 76° 30′ W.) maritime department, Peru, S. America; area, 13,310 sq. miles. Pop. 172,927. (3) (40° 46′ N., 84° 7′ W.) town, Ohio, U.S.A.; oil refineries. Pop. (1910) 30,508.

LIMASOL, LIMASSOL (34° 21′ N., 33° 4′ E.), port, Cyprus. Pop. (1911) 10,245.

LIMAX, Slug, see under GASTEROPODA.

LIMBACH (50° 53′ N., 12° 52′ E.), town, Saxony, Germany. Pop. (1905) 13,723.

LIMBURG (51° 15′ N., 5° 30′ E.), district now included in Dutch and Belg. provinces of L.; gave name to countship in IX. cent. and afterwards to duchy.

LIMBURG, LIMBOURG.—(1) (51° N., 5° 30′ E.) province, Belgium; area, *c.* 931 sq. miles. Pop. (1910) 275,691. (2) (51° 10′ N., 5° 55′ E.) province, Holland; area, 850 sq. miles. Pop. (1910) 340,053. (3) (50° 53′ N., 8° 3′ E.) cathedral town, on the Lahn, Hesse-Nassau, Germany; R.C. episcopal see. Pop. (1910) 10,965.

LIMBUS, LIMBO, the outskirts of hell, where infants dying unbaptized (*i.e.* in original, but without actual, sin) are believed by some sects to be; Old Testament saints, before Christ, were placed there (till liberated by Him) according to some theologians.

LIME, or LINDEN (*Tilia*), tree possessing horizontally spreading branches, and characterised by the inequality of the leaf lobes, which form a 'leaf mosaic.' The principal street in Berlin, *Unter den Linden*, is a magnificent avenue of l. trees. The wood is much used by carvers and turners—though soft it is tough. The fibre is used in making rope, etc. The sweet-smelling flowers yield much honey.

LIME, see CALCIUM.

LIMERICK.—(1) (52° 30′ N., 8° 45′ W.) county, Munster, Ireland; area, *c.* 1063 sq. miles; surface generally flat; hills on W. and S. borders; watered by Shannon; dairy-farming carried on, live stock raised; contains several ruined monasteries. Pop. (1911) 142,846. (2) (52° 39′ N., 8° 36′ W.) town, Ireland, on Shannon; R.C. and Anglican cathedrals; formerly fortified; important port; lace manufacture, bacon-curing, distilling. Pop. (1911) 46,725.

LIMES GERMANICUS, frontier lines which limited the Rom. provinces of Upper Germany and Rhætia; extended from Bonn to Regensburg.

LIMESTONE, a mineral of bluish-grey colour, existing in numerous varieties which differ in appearance, structure, and composition. L. may be composed of pure lime, carbonic acid, magnesia, alumina, silica, and iron. It is one of the most abundant of rocks, being commonest in the Secondary series; also found as the result of aqueous deposit. It has a granular structure. L. found in gneiss has large coarse grains; that found in mica-slate is fine-grained. The chief varieties of l. are Iceland spar, calcium spar, chalk, granular limestone, compact limestone, and oolite limestone.—CARBONIC l. is abundantly distributed, and stalactites (*q.v.*) and stalagmites (*q.v.*) are found in L. caverns. Petrifying wells, as at Knaresbro' (Yorks), cover objects placed under their dropping waters with l., and if left long enough will eventually solidify them. Marble (*q.v.*) possesses the same chemical composition as l., and is generally regarded as one of its varieties.

LIMITATION, STATUTES OF, Acts limiting right of action to fixed time after occurrence of events on which action is based. Most important Acts now in force are L. Act, 1623, and Real Property L. Act of 1874. Latter limits right of action for recovering property to 12 years; former limits actions for trespass, or debt, to 6 years; assault, battery, imprisonment, 4 years; slander, 2 years.

LIMITED LIABILITY, see COMPANIES.

LIMMAT, see LINTH.

LIMNÆA, Pond Snail, see under GASTEROPODA.

LIMNOCNIDA, see under HYDROMEDUSÆ.

LIMNOCODIUM, see under HYDROMEDUSÆ.

LIMOGES (45° 52′ N., 1° 17′ E.), town, Haute-Vienne, France; episcopal see; cathedral dates in part from XIII. cent.; manufactures fine china, textiles, paper; formerly fortified; various Rom. remains, including part of amphitheatre; captured by Black Prince, 1370; several times destroyed by fire. Pop. (1911) 92,181.

LIMON, PORT LIMON (10° N., 83° 15′ W.), seaport, Costa Rica, Central America; exports coffee, fruit. Pop. (1910) 5269.

LIMONENE, see TERPENES.

LIMONITE, important brown iron ore of fibrous structure, a natural hydrous ferric oxide, sometimes called brown hæmatite (*q.v.*); occurs in mammillated masses; found in England, Continent, and America.

LIMOUSIN (45° 30′ N., 1° 30′ E.), old province, France, now mainly included in Corrèze and Haute-Vienne; capital, Limoges.

LIMPET, see GASTEROPODA.

LIMPOPO, CROCODILE (25° 15′ S., 33° 28′ E.), river, S.E. Africa; rises in hills S.W. of Pretoria, and flows in semicircle between Transvaal and Rhodesia and then across Portug. E. Africa, discharging into Ind. Ocean.

LIMULUS, see KING-CRAB.

LINACRE, THOMAS, LYNAKER (*c.* 1460–1524), Eng. physician and scholar; studied in Italy; physician to Henry VII. and tutor to Prince Arthur; late in life entered the Church; one of the first to introduce the 'New Learning' into England; founder of the Royal Coll. of Physicians; trans. Galen, and was author of other scholarly works.

LINARES.—(1) (*c.* 35° 18′ S., 71° 48′ W.) province, Chile, S. America; area, 3941 sq. miles; vines, live stock. Pop. (1910) 111,864. (2) (38° 6′ N., 3° 42′ W.) town, S. Spain; silver-lead mining. Pop. (1910) 36,419.

LINCOLN.—(1) (53° 14′ N., 0° 33′ W.) county town, Lincolnshire, England, on Witham; important railway centre; has canal communication with Nottingham, the Humber, Boston, and the Wash; manufactures agricultural implements, flour; has trade in corn and wool; great horse fair annually in April. L. is an episcopal see; has magnificent cruciform cathedral, dating from Norman times, and episcopal palace; castle was built by William the Conqueror; formerly seat of various monastic establishments; L. was an important station of Romans, of whose occupation various traces remain, including parts of town wall, gateway (Newport Arch), and old road; scene of battle between Stephen and Matilda, 1141, and of another battle in 1218; besieged by Roundheads, 1644. Pop. (1911) 57,294. (2) (40° 6′ N., 89° 16′ W.) town, Illinois, U.S.A. Coal, grain. Pop. (1910) 10,892. (3) (40° 42′ N., 96° 40′ W.) town, Nebraska, U.S.A.; capital of state; R.C. episcopal see; three univ's; railway centre; salt works, meat-packing factories. Pop. (1910) 43,973

LINCOLN, ABRAHAM (1809–65), 16th pres. of U.S.A.; b. near Hodgenville, Kentucky; had little schooling; brought up on f.'s farm; journeyed to New Orleans as employé on flatboat, 1828; clerk of store at New Salem, 1831; went on with education in spare time; turned attention to law and politics; volunteered for service in Black Hawk Ind. War,

becoming militia captain, 1832; defeated in candidature for House of Representatives, Illinois, 1832; postmaster of New Salem, 1833; surveyor of Sangamon county, 1833. L. became member of Illinois legislature, 1834; re-elected, 1836, 1838, 1840; advocated internal improvements and convention system; admitted to Bar, 1836; member of Congress, 1846; introduced 'Spot Resolutions' concerning Mexican invasions, 1847; opposed slavery; retired from political affairs, 1852. On passing of Douglas's Kansas-Nebraska Act, 1854, when slavery question was reopened, L. again entered public life; became leader of opposition in Illinois; met Douglas in public discussions; nominated for presidency by Republicans, 1858; won fame by speeches during election campaign, but was not then elected; made famous speech against slavery in New York, 1860; elected pres., 1860.

Seven slave-owning states then seceded from Union, forming the Confederate States; civil war began by Confederate siege and capture of Fort Sumter, 1861. L. proclaimed blockade of southern ports; arranged for raising of large army and navy; approved passing of Act for emancipation of slaves in Columbia, 1862; but interfered to nullify Hunter's proclamation of freedom to slaves in Georgia, Florida, and South Carolina, 1862; proposed to give monetary compensation to states for gradual abolition of slavery, without result; saving of the Union, even more than destruction of slavery, was his aim. L. made introductory proclamation of emancipation, Sept. 1862; finally proclaimed freedom of slaves in rebel states, Jan. 1863; measure abolishing slavery in U.S.A. ultimately passed, 1865. During civil war L. preserved friendly relations with foreign states, thus preventing outside complications; made famous speech dedicating battlefield of Gettysburg as soldiers' cemetery, Nov. 1863; executed draft to enforce conscription, 1863; on suggestions regarding peace, announced willingness to stop war on submission of rebels to national authority of Union constitution. Re-elected president, 1864, L. held conference with Confederate Commissioners, Feb. 1865; adhered to conditions that national authority must be restored in all states, that government would not withdraw concerning slavery, that no truce was possible except as end of war; terms rejected; war ended, April 1865; entered Richmond after its surrender; shot at Washington, April 14; died next day. L. was simple and unaffected in manner; tolerant and honourable in character.

Nicolay and Hay, *Abraham Lincoln* (1890).

LINCOLN, EARLDOM OF.—Henry de Lacy, 3rd earl, fought for Edward I. in France, Scotland, Wales; title held by Clintons since 1572.

LINCOLN JUDGMENT, THE, ritual case, 1889. Dr. King, bp. of Lincoln, charged with ritual offences while administering Holy Communion; cited before Dr. Benson, abp. of Canterbury; charged with eight offences, of which three were pronounced illegal—mixing water with wine during service, performing manual acts of consecration unseen by congregation, making sign of cross during service; appeal against judgment failed.

LINCOLN'S INN, see INNS OF COURT.

LINCOLNSHIRE (*c.* 53° 15′ N., 0° 15′ W.), E. coast county, England; bounded N. by Humber, dividing it from Yorkshire; E. by North Sea, Wash, Norfolk; S. by Cambridgeshire, Northamptonshire, Rutland; W. by Leicestershire, Nottinghamshire, Yorkshire; area, 2646 sq. miles. Surface consists largely of low wolds and fens; drains to Trent, Witham, Welland; crossed by number of canals, largest of which, Foss-dyke and Car-dyke, have been attributed to Romans. County is divided for administrative purposes into three districts, called Parts of Holland, Parts of Kesteven, Parts of Lindsey. The county was occupied by the Romans, of whom traces remain; it was frequently invaded by Danes in VIII. and IX. cent's, and submitted to William the Conqueror in 1066; was scene of hostilities in Stephen's reign; rising known as Pilgrimage of Grace began here in 1536; supported Lancastrians in Wars of the Roses, Royalists in Civil Wars of Charles I.'s reign; was formerly the site of many monastic establishments, of some of which ruins remain. Soil is fertile, large area cultivated; produces barley, wheat, turnips, and other crops; horses, sheep, and cattle are raised in large numbers; iron ore occurs, as well as limestone, freestone, gypsum; there are important fisheries along coast; largest towns, Grimsby, Lincoln, (capital). Pop. (1911) 432,056.

LINCOLNSHIRE, 1ST MARQUIS OF (cr. 1912), CHARLES ROBERT WYNN-CARRINGTON (1843–), Eng. Liberal statesman; governor, New S. Wales, 1885–90; Pres. of Board of Agriculture, 1905–11; cr. Earl Carrington, 1895; Joint Hereditary Lord Great Chamberlain of England; advocate of small holdings.

LIND, JENNY (1820–87), Swed. singer (soprano); b. Stockholm; studied at Stockholm and Paris under Manuel Garcia; after great success on Continent, visited London, 1847; America, 1850; retired from operatic stage, and became concert singer, 1849; m. Otto Goldschmidt; teacher of singing, Royal Coll. of Music, London, 1883–86.

LINDAU (47° 34′ N., 9° 43′ E.), town, Bavaria, Germany, on islands in Lake Constance; good harbour, fisheries. Pop. (1910) 6620.

LINDAU, PAUL (1839–), Ger. dramatist and novelist; b. Magdeburg; wrote *Harmlose Briefe eines Deutschen Kleinstädters*, novels and plays.

LINDEN (52° 22′ N., 9° 42′ E.), town, Hanover, Germany. Pop. (1910) 73,352.

LINDEN, see LIME.

LINDISFARNE, see HOLY ISLAND.

LINDLEY, JOHN (1799–1865), Eng. botanist; voluminous writer on Brit. and general bot.

LINDLEY, WILLIAM (1808–1900), Eng. engineer; studied especially railway engineering; at Hamburg carried out various sewerage, waterworks and other engineering operations.

LINDSAY (40° 20′ N., 78° 50′ W.), port, Ontario, Canada. Pop. *c.* 7100.

LINDSEY, PARTS OF, see LINCOLNSHIRE.

LINDSEY, THEOPHILUS (1723–1808), Eng. theologian; took orders, but became Unitarian, one of first in England.

LINDUS (36° 23′ N., 28° 15′ E.), town, island of Rhodes, Gk. archipelago; now part of town of Rhodes.

LINE, may be straight or curved (see CURVE). Pieri defines the straight line joining two points as the class of points that are unchanged by a motion which leaves the two points fixed.

LINEN, cloth made from fibres of flax. Process of l. manufacture is shown on early Egyptian monuments; Jews took art to Canaan. L. was woven by Anglo-Saxons as early as VII. cent., and used in Europe for clothing in Middle Ages.

Fibres occurring in stem of flax are separated by soaking in water; next they are dried and combed into 'longs' and 'shorts.' Yarn is then spun and woven into cloth. Until comparatively recent times all spinning was done by spindle and distaff; in early machines spindle was rotated by hand; soon the treadle was introduced, and then the double spinning wheel, which was used until end of XVIII. cent. In modern l. manufacture the principal operations are *sorting* the fibres; *hackling*, combing, disentangling, and laying fibres parallel; *preparing*, drawing fibres into slivers, which is accomplished by series of operations similar to those described in cotton-spinning; *twisting* and winding on bobbins; *spinning*, of which there are two methods—the dry and the wet processes. Former is used for heavier yarns and the latter for fine yarns. Process resembles throstle-spinning as in cotton manufacture. Trade centres—*Heavy goods*: Dundee. *Damasks*: Belfast, Dunfermline, Perth. *Fine linen*: Belfast and N. Ireland. Centre of trade in England: Leeds and Barnsley.

LINEUS, see under NEMERTINE WORMS.

LING (*Molva molva*), a large, long-bodied, dark grey member of the Cod family, which may weigh 100 lb. and more. A common Brit. food-fish, found in deep water in the North Sea.

LING, see HEATH.

LING, PER HENRIK (1776–1839), Swed. inventor and instructor of gymnastic exercises without apparatus for the treatment of disease; founder and principal of the Royal Gymnastic Institute at Stockholm, 1813; his system, which is still taught and practised, is of great benefit under many conditions of ill-health.

LINGARD, JOHN (1771–1851), R.C. historian; wrote *History of England*, generally regarded as the ablest history written from the standpoint of his Church.

LINGAYEN (16° 3′ N., 119° 58′ E.), town, Luzon, Philippine Islands. Pop. c. 22,000.

LINGEN (52° 32′ N., 7° 19′ E.), town, Hanover, Germany; textiles, machinery, iron goods. Pop. (1905) 7004.

LINGEN, RALPH ROBERT WHEELER, BARON (1819–1905), brilliant Latin scholar at Oxford; permanent sec. at Education Office, 1849–69, and at Treasury, 1870–85; most efficient public servant. Cr. baron on retirement.

LINGUET, SIMON NICHOLAS HENRI (1739–94), Fr. journalist; admitted to the Bar, but subsequently interdicted from pleading; sent to the Bastille, 1780; released, exiled, but returned to Paris, 1791; guillotined, 1794; author of many hist. and satirical works.

LINGULA, see BRACHIOPODA.

LINGULA FLAGS, see CAMBRIAN SYSTEM.

LINKÖPING (58° 24′ N., 15° 35′ E.), town, Sweden; episcopal see; fine Romanesque cathedral. Pop. (1911) 23,020.

LINKS, see GOLF.

LINLEY, Eng. family of musicians; associated with Bath and Drury Lane Theatre. THOMAS (1732–95), composer; also a great teacher. Of his children, ELIZABETH (1754–92), beautiful singer, married R. B. Sheridan; son, THOMAS (1756–78), was friend of Mozart; early death cut short brilliant career; WILLIAM (1767–1837) composed songs.

LINLITHGOW (55° 58′ N., 3° 36′ W.), royal burgh, county town, Linlithgowshire, Scotland; ruined royal palace, birthplace of Mary, Queen of Scots; decorated parish church; famous for wells; manufactures paper, soap, spirits. Pop. (1901) 4279.

LINLITHGOW, 1ST MARQUESS OF, JOHN ADRIAN LOUIS HOPE (1860–1908), Brit. statesman; as Earl of Hopetoun, first Gov.-Gen. of Commonwealth of Australia, 1901; cr. Marquess of L., 1902; Sec. of State for Scotland, 1905.

LINLITHGOWSHIRE, WEST LOTHIAN (55° 55′ N., 3° 40′ W.), county, S.E. Scotland; area, 120 sq. miles; surface undulating, slopes downwards from hills in S. to Firth of Forth on N.; watered by Avon, Almond; chief industry, agriculture; cereals, dairy farming; coal, iron, paraffin-oil shale, fireclay; contains ruined preceptory of Knights Hospitallers at Torphichen. Pop. (1911) 79,456.

LINNÆUS, CARL (1707–78), Swed. botanist; b. Råshult; studied med., and acted as assistant in bot.; he travelled in Lapland, Holland, France, and England. After his return to Sweden he practised as a physician; became prof. of Med. and of Bot. at Upsala, where he died. His chief contribution to science was a remarkable artificial classification of plants founded on the characters of the stamens.

LINNET, see FINCH FAMILY.

LINOLEUM, see FLOORCLOTH.

LINSANG, a carnivore; see under CIVET FAMILY.

LINSEED (*Linum usitatissimum*), a plant introduced from Mediterranean, and extensively grown in Ireland for linen yielded by fibres; seed has a mucilaginous coat and yields l. oil, the refuse being utilised as oil cake for cattle.

LINTH, LIMMAT (46° 58′ N., 9° 2′ E.), river, Switzerland; unites with Aar.

LINTON, WILLIAM JAMES (1812–97), wood-engraver and author; long connected with the *Illustrated London News*. Mrs. Lynn L., the novelist, was his wife.

LINUS, ST., traditional first bp. of Rome and successor of St. Peter.

LINZ (48° 17′ N., 14° 18′ E.), town, Austria; capital of Upper Austria; episcopal see, two cathedrals; manufactures textiles, carpets, machinery, tobacco. Pop. (1910) 67,817.

LION, see under CAT FAMILY.

LIP, term applied to each of the two muscular folds, formed by the orbicularis oris muscle and covered with mucous membrane, surrounding the entrance to the mouth, and important in the production of certain sounds in speech.

LIPA (*c.* 13° 50′ N., 121° 15′ E.), town, Luzon, Philippine Islands. Pop. 37,934.

LIPARI ISLANDS, ÆOLIAN ISLANDS (38° 35′ N., 14° 50′ E.), volcanic islands, Sicily; most important are Lipari, Stromboli, Vulcano; chief town, Lipari; produce pumice stone, sulphur, wine, fruits, borax. Pop. 21,000.

LIPARITE, see RHYOLITE.

LIPETSK (52° 35′ N., 39° 37′ E.), town, Russia. Pop. 21,000.

LIPOCEPHALA, see LAMELLIBRANCHIATA.

LIPPE (52° N., 8° 50′ E.), principality, N.W. Germany, in basin of Weser; sometimes called LIPPE-DETMOLD; area, 469 sq. miles; surface generally mountainous; well wooded. Present dynasty was founded in XII. cent.; succession dispute was settled in favour of Lippe-Biesterfeld line by court at Leipzig, 1905. L. became member of N. German Confederation, 1866. Chief industry is agriculture; horses, cattle, and pigs reared; manufactures meerschaum pipes, tobacco; capital, Detmold. L. has Diet of 21 members, and is represented in Reichstag, as in Bundesrath, by one member. Pop. (1910) 150,937. See also SCHAUMBURG-LIPPE.

LIPPE (51° 40′ N., 6° 37′ E.), river, Germany; joins Rhine.

LIPPI, the name of two Florentine painters, father and son. The father, commonly known as **Lippo Lippi** (1412–69), painted chiefly religious subjects. His illustrations of the lives of Saints John the Baptist and Stephen on the choir walls of Prato Cathedral are regarded as his greatest work. He painted several Madonnas, and among his altar-pieces, one in the nunnery chapel of S. Ambrogio, Florence, is the subject of a poem by Browning. The son, **Filippino L.** (1460–1504), painted easel pictures, and executed some celebrated frescoes for churches in Florence and Rome.

LIPPSPRINGE (51° 47′ N., 8° 49′ E.), town, Westphalia, Prussia; saline springs. Pop. (1910) 4070.

LIPPSTADT (51° 40′ N., 8° 20′ E.), town, Westphalia, Prussia. Pop. (1910) 16,396.

LIPSIUS, JUSTUS (1547–1606), Belg. scholar; his *magnum opus* is his edition of Tacitus. He conformed to the Lutheran Church, but afterwards became reunited to the Catholic.

LIQUEFACTION OF GASES.—Just as steam can be condensed to water, so all known gases and vapours can be condensed to liquids. The condition necessary for the liquefaction of a gas is a low enough temperature accompanied by sufficient pressure. When the pressure on a gas is increased, the temperature of l. is raised, just as the b. p. of a liquid is raised under similar circumstances. The question, therefore, arises as to how far compression may take the place of cooling in the l. of gases and vapours. For a long time a distinction was drawn between gases, such as oxygen, which were regarded as permanent, and others, such as chlorine, which were condensible by compression when moderately cooled. In 1863, however, Andrews showed why some gases were 'permanent.' For every gas there exists a 'critical temperature,' above which it is im-

possible to liquefy it by compression; the pressure under which a gas is liquefied at its critical temperature is 'critical pressure.' When this principle was recognised, attempts were made to liquefy the 'permanent gases' under pressure by cooling them below their critical temperature. Thus, in 1877, Pictet and Cailletet independently liquefied oxygen in quite different ways. In Pictet's apparatus, carbon dioxide (critical temperature, 31·3° C.) was liquefied by compression, whilst it was cooled by being surrounded with liquid sulphur dioxide, boiling under reduced pressure at −65° C. This cooled liquefied carbon dioxide was conveyed to a cylinder surrounding a steel tube which contained oxygen compressed to 320 atmospheres; there it was made to evaporate so rapidly by pumping that its temperature fell to −140° C. Thus the oxygen was cooled below its critical temperature (−118·8° C.), and liquefied.

Cailletet liquefied oxygen by the further cooling caused by the sudden expansion of the compressed and already cooled gas. This cooling is due to the external work done by sudden expansion, the necessary mechanical energy being supplied from the heat energy of the gas itself.

Liquid Air.—Air is liquefied by the process known as 'self-intensive refrigeration.' When gases pass through a narrow orifice from a high to a lower pressure they are cooled in the process, not because of external work performed, but by reason of internal work done against cohesion, a certain amount of which exists between the molecules of all gases at high pressure. This cooling, called the Joule-Thomson effect, amounts for air to 0·2° to 0·25° C. per atmosphere.

The principle was applied by Linde and by Hampson in 1895. Air is compressed to 160–180 atmospheres in cylinders cooled by water, and, after being dried and freed from carbon dioxide, passes through a narrow spiral tube terminating at a regulated valve, through which it expands freely. The escaping air, cooled by its own expansion, passes over the coil through which the compressed air is being driven, cooling the latter before it expands. Thus the temperature of the issuing air is continuously lowered, until some of it liquefies as it escapes from the valve. Liquid air may drop from the orifice in about four minutes after the pumps have begun to work, and from 1 to 1½ litre of it be obtained per hour.

Liquid air, whose critical temperature is about −140° C. and critical pressure about 39 atmospheres, boils under 1 atmosphere at about 190° C. It generally contains more than twice as much oxygen as atmospheric air, because oxygen is more condensible than nitrogen. Oxygen is now obtained from liquid air by fractional evaporation of the more volatile nitrogen. The rare gases of the air—helium, neon, krypton, and xenon—are also separated from argon by fractional evaporation of the liquefied mixture. Liquid air evaporates rapidly in ordinary vessels, congealing the moisture in the adjacent air, which falls as heavy clouds. It possesses motive power analogous to that of boiling water, but an objection to its use is the formation of ice round the machinery containing it. Cotton wool, mixed with granulated charcoal, and soaked in liquid air, may be exploded by detonation, and has been used for blasting in coal mines. Liquefied gases are preserved in double-walled evacuated glass vessels, which may be silvered, and are known as Dewar flasks. Evacuation reduces thermal conduction to a minimum, and silvering hinders radiation. Thermos flasks are constructed on the same principle.

Liquefaction of Hydrogen.—Liquid hydrogen was first obtained in bulk by Dewar in 1898, by cooling the gas compressed to 150 atmospheres by means of liquid air boiling at −205° C., and then allowing it to expand. It is a clear, colourless liquid, having a density=0°·07, boiling under atmospheric pressure at −252·5° C., and becoming an ice-like solid at −257° C. Its critical temperature is about −238° C., and critical pressure about 15 atmospheres.

Liquefaction of Helium.—Helium was liquefied by Kamerlingh Onnes in 1908 by expansion from high pressure after cooling in liquid hydrogen. Its b. p. is −268·5° C., and density, 0·15.

LIQUEURS, strongly alcoholic beverages, flavoured aromatically and often sweetened. *Absinthe* is yellowish-green, contains over 50 % alcohol, and oil of wormwood, anise, cloves, angelica, and peppermint. Others are Chartreuse, Benedictine, Curaçoa, Ratafia, Vermuth.

LIQUOR LAWS, see Licensing Laws.

LIQUORICE, Licorice, root of European *Glycyrhiza glabra*; extract used medicinally as demulcent; also employed in confectionery.

LIRA (Lat. *libra*, pound), Ital. standard silver coin; equivalent (since 1862) of franc (*q.v.*); plural, *lire*; contains 100 *centesimi*. Turk. lira (or pound) is worth 18s.

LIRI (41° 51′ N., 13° 30′ E.), river, Italy; enters Tyrrhenian Sea.

LIRIOPE, see under Hydromedusæ.

LISBON, Lisboa (38° 41′ N., 9° 10′ W.), capital, Portugal, on Tagus. L. was an important city under Romans, from whom it passed to Visigoths early in V. cent.; held by Moors, VIII.–XII. cent's; taken by Portuguese, 1147; twice besieged by Castilians, 1373, 1384; captured by Spaniards under Alva, 1580; retaken by Duke of Braganza, 1640; almost entirely destroyed by earthquake, 1755, since when it has been practically rebuilt; scene of assassination of King Carlos, 1908; and Revolution, 1910. L. is an archiepiscopal see; has cathedral built originally *c.* 1150, but twice restored; several fine churches, two royal palaces, military arsenal, many educational and charitable institutions; fine aqueduct; near river is Hieronomyto monastery, containing tombs of Vasco da Gama, Camoens, Catharine of Braganza. City is strongly fortified; has one of finest harbours in Europe; centre of trade with Europe, W. and S. Africa, S. America; exports wines, fruits, corkwood, oil, salt, leather, wool, cattle, pit-props, tinned fish; imports cottons, woollens, silks, coal, iron, machinery, rubber, tea, coffee; manufactures gold and silver ware, tobacco, textiles, chemicals. Pop. 357,009. See Portugal.

LISBURN (54° 31′ N., 6° 3′ W.), town, Antrim, Ireland; XVII.-cent. cathedral; linen manufactures. Castle taken by Cromwell, 1650. Pop. (1911) 12,172.

LISIEUX (49° 8′ N., 0° 13′ E.), town, Calvados, France; has former cathedral, bp.'s palace; formerly fortified; textiles, dairy produce, machinery. Pop. (1906) 16,239.

LISKEARD (50° 27′ N., 4° 27′ W.), town, Cornwall, England; woollens, iron goods; formerly a stannary town. Pop. (1911) 4371.

LISMORE.—(1) (56° 30′ N., 5° 31′ W.) island, Loch Linnhe, Argyllshire, Scotland; choir of old cathedral remains; site of former monastery. Pop. 500. (2) (28° 47′ S., 153° 10′ E.) cathedral town, New South Wales, Australia; R.C. episcopal see. Pop. 5300. (3) (52° 8′ N., 7° 55′ W.) town, Waterford, Ireland; cathedral dates in part from XII. cent.; formerly seat of monastery and bishopric. Pop. 1600.

LISSA.—(1) (43° 4′ N., 16° 10′ E.) island, off coast of Dalmatia, Adriatic Sea; has belonged to Austria since 1815; area, 40 sq. miles; wine, sardines; chief town is fortified seaport of Lissa. Near here wore fought two naval engagements in XIX. cent.; British defeated Franco-Venetian force, 1811; Austrians defeated Italians, 1866. Pop. (1911) 10,110. (2) (51° 51′ N., 16° 33′ E.) town, Posen, Germany; formerly chief Polish settlement of Moravian Brethren; machinery, shoes, leather. Pop. (1910) 17,156.

LIST, FRIEDRICH (1789–1846), Ger. economist; prof. of Politics at Tübingen, 1817; owing to his reforming zeal compelled to resign; imprisoned and escaped; returned and released on condition he went to America; U.S. consul at Leipzig, 1832; known chiefly as economist; opposed free trade as universal rule; his principles largely followed in Germany.

LISTER, JOSEPH LISTER, BARON (1827–1912), Eng. surgeon; b. at Upton, Essex, April 5, 1827; s. of Joseph Jackson Lister, F.R.S., the scientist, and improver of the microscope; ed. at Quaker schools at Hitchin (Herts) and Tottenham, and at University Coll., London; B.A. (1847), M.B., and F.R.C.S. (1852). L. went to Edinburgh to become house-surgeon to Mr. Syme (whose dau. he married) (1856), then lectured on surgery in the Extra-Mural School. In 1860 he was appointed prof. of Surgery at Glasgow, and in 1869 prof. of Clinical Surgery at Edinburgh, at the same time carrying out important researches on blood coagulation, inflammation, etc. Following up the theories of Pasteur, to prevent suppuration in compound fractures he applied carbolic acid to the wounds with success, and revolutionised surgery by the introduction of carbolic acid as an antiseptic, purifying the surgeon's hands and instruments and the patient's skin with it, in addition to employing a spray of a watery solution of carbolic acid to destroy micro-organisms in the atmosphere and to irrigate the wound. L. also introduced carbolised catgut (a preparation of the intestine of the sheep steeped in carbolic acid), which is soon absorbed by the tissues, for sutures and ligatures, in place of silk, which caused irritation and suppuration. Eventually he discarded the spray and antiseptic washings of the wounds, and prevented the invasion of micro-organisms simply by aseptic measures. In 1877 he was appointed prof. of Clinical Surgery at King's Coll., London; was from 1895 to 1900 pres. of the Royal Soc., and retired from surgical practice in 1896. He was created a baronet in 1883, a baron in 1897, and nominated a member of the Order of Merit in 1902.

LISTON, ROBERT (1794–1847), Scot. surgeon; lectured in Edinburgh on surgery and anatomy; prof. of Clinical Surgery at University Coll., London (1835); a brilliant operator, and author of several works on surgery.

LISZT, FRANZ (1811–86), Hungarian composer and brilliant pianist; b. Raiding; studied with Czerny and Salieri, Vienna; settled in Paris as teacher, 1827; formed intimate relations with Countess D'Agoult, by whom he had three children; the youngest, Cosima, married von Bülow and afterwards Wagner. L. was greatly influenced by Chopin, Paganini, and Berlioz; app. conductor of Court Theatre, Weimar, 1847, and closed his career as virtuoso; took orders at Rome, 1865, and became Abbé; thereafter spent most of his time in Weimar, Rome, and Budapest. L. formed a deep and lasting friendship with Wagner, who owed much of his success to him during the Weimar period; a generous and fascinating nature; a remarkable teacher and original composer; an upholder of 'programme' music. Lyrical pianoforte pieces and songs are perhaps his best works. Orchestral compositions, *Dante* and *Faust* symphonies, *Les Préludes*, *Mazeppa*, etc.

A. C. Mackenzie, *Liszt*.

LITANY (Gk. *litaneia*), first denoted prayers of all kinds, then specially prayers of supplication and intercession. The R.C. Church has *Litaniæ majores* and *Litaniæ breves*; the Anglican l. follows the former, but without invocation of saints; in the Ambrosian rite the lesser l. appears in the Mass.

LITCHFIELD.—(1) (41° 44′ N., 73° 16′ W.) town, Connecticut, U.S.A.; dairy-farming. Harriet Beecher Stowe's birthplace. Pop. 3005. (2) (39° 12′ N., 89° 40′ W.) town, Illinois, U.S.A. Pop. (1910) 5971.

LITERATURE is the body of writings of a people preserved on account of its beauty of thought and style; lit. falls into two great classes—prose and poetry, and each of these is divisible into many species, according as the basis of division is form or matter. Gk. lit. developed spontaneously and without external influence; it perfected all the principal types, except prose fiction.

LITERNUM (c. 41° 55′ N., 14° E.), former town, Campania, Italy; no remains visible.

LITHGOW (33° 30′ S., 150° 14′ E.), town, New South Wales, Australia; government small arms factory; iron smelting, rolling-mills. Pop. 8700.

LITHIUM (Gk. *lithos*, 'a stone'), metallic base of alkali lithia, of silvery lustre; used in making of fireworks, causing beautiful red colour; carbonate dissolves uric acid and accordingly is used medicinally in treatment of gout and rheumatism.

LITHODOMUS, see under LAMELLIBRANCHIATA.

LITHO-FRACTEUR, see BLASTING.

LITHOGRAPHY, see PRINTING.

LITHOLOPAXY, see BLADDER.

LITHOTOMY, see BLADDER.

LITHUANIA, the name of a former grand-duchy, bounded on the S. by the Dniester, including the basin of the Dnieper, and reaching almost to the Black Sea and the Baltic. L. secured its independence from Russia in the XII. cent., became Christian under Grand-Duke Mindog, and became united to Poland in 1386. It was divided between Russia and Prussia in 1772 and 1797. The Lithuanian group includes the Old Prussians, whose language is extinct, *the Letts*, and the Lithuanians. The two last now inhabit the north-eastern parts of Poland and Prussia and certain western provinces of Russia, on the Baltic coast, and on the Niemen and the Duna; total population about 3,500,000, in addition to large colonies of emigrants in America. Both peoples still retain their own characteristics distinct from Russians and Poles. Agriculture is the chief industry; but the Letts also trade in the towns. In Courland the Letts are Lutheran in religion—only 50,000 being members of the Gk. Church. In Poland both races are chiefly Catholic. The language is akin to the Slavonic (the Lithuanians, however, speaking a tongue which has a closer affinity with Sanskrit), but is a recognised and separate tongue, known as the *Baltic*.

LITMUS, extract of lichens *Lecanora tartarea* or *Rocella tinctoria*, used for testing in acidimetry; acids turn l.-paper red, alkalies blue; prepared by adding potassium carbonate to lichen and mixing with gypsum.

LITOPTHERNA, sub-order of ungulate mammals from S. Amer. Tertiary; two families, *Proterotheriidæ* and *Macrauchenidæ*; typified by macrauchenia (*q.v.*).

LITTLE AUK, see GUILLEMOT AND AUK FAMILY.

LITTLE FALLS.—(1) (45° 58′ N., 94° 11′ W.) town, Minnesota, U.S.A. Pop. (1910) 6078. (2) (43° N., 74° 45′ W.) town, New York, U.S.A. Pop. (1910) 12,273.

LITTLE ROCK (34° 45′ N., 92° 13′ W.), capital, Arkansas, U.S.A.; R.C. and Anglican episcopal see; Univ.; manufactures machinery, cotton-seed cakes, and oil. Pop. (1910) 45,941.

LITTLEHAMPTON (50° 48′ N., 0° 32′ W.), town, Sussex, England. Pop. (1911) 8351.

LITTLETON, SIR THOMAS DE (c. 1402–81), Eng. jurist; student of the Inner Temple; sheriff of Worcestershire, 1447; serjeant-at-law, 1453; king's serjeant, 1455; justice of the Common Pleas, 1466; knighted, 1475; author of a legal treatise on 'Tenures' (written in Law-French), which, edit. by Sir Edward Coke (1628), was for long the standard and authoritative text-book on the law of Real Property in England; first pub. 1481; 90 editions subsequently issued. Throughout the Wars of the Roses L. was recognised equally by Henry VI. and Edward IV.

LITTORINA, a Mollusc. See under GASTEROPODA.

LITTRÉ, MAXIMILIEN PAUL ÉMILE (1801–81), Fr. philosopher and philologist; studied languages and med., then devoted himself to literary work; became follower of Comte, though he did not follow him entirely; his elaborate Fr. dictionary appeared, 1873, after many years' work; pub. *Auguste Comte et la philosophie positive*, 1863; edit. Hippocrates and Pliny; a convinced materialist.

LITURGY.—In ancient Athens a *Leitourgia* was a service rendered to the state; word came to be used in Christian Church of service rendered to God in public worship, and particularly of the Eucharist, which it signifies in the East. In present Eng. usage it means

any written or prescribed form of prayer or worship, as distinct from that which is extempore. The different forms of the Eucharist, specially called l's, are of considerable importance in the history of Christian worship. The main division is that into Eastern and Western The Rom. Rite is now used almost universally in the R.C. Church in the West, though it only gradually superseded various local rites, *e.g.* the Mozarabic in Spain and the Gallican in France; the Ambrosian is still used in Milan. The main Eastern Rites are the Syrian, Egyptian, Persian, and Byzantine, which exist both in obsolete and in still current forms.

In Britain there were various l's used in the ancient Celtic Church. In Norman times certain features were introduced from the Gallican l., and the *Sarum Missal* became regularly used in England. *The Book of Common Prayer* was composed of various elements. The Scot., Irish, and Amer. Churches use the Anglican l. with certain modifications. L's are used by Calvinists and Lutherans, but not by Presbyterians nor the majority of Eng. Nonconformists.

Brightman, *Liturgies Eastern and Western*; Warren, *Liturgy and Ritual of the Celtic Church.*

LIVE OAK (30° 23′ N., 83° W.), town, Florida, U.S.A. Pop. (1910) 3450.

LIVER, large vascular gland, of a reddish brown colour, situated in the upper right part of the cavity of the abdomen, behind the ribs, the largest gland in the human body, weighing about 3 lb. The upper and anterior surface is in contact with the diaphragm and the anterior abdominal wall, while the lower and posterior surface, to which the gall bladder is bound down by peritoneum, is divided into several lobes by fissures, and is in contact with the stomach, duodenum, colon, right kidney and suprarenal body, and other neighbouring structures, and is grooved by the œsophagus and vena cava. In regard to its minute structure, the l. is composed of a great number of lobules of distinctive polygonal hepatic cells, and the portal vein divides into minute branches which again ramify round each lobule, from which other venous capillaries run to a central vein in the middle of the lobule, which joins other similar veins, becomes the hepatic vein, and eventually enters the vena cava.

The functions of the l. include the breaking down of worn-out blood corpuscles, and the secretion and excretion of bile, which is a digestive fluid acting on fats and making them more easily absorbed, while the l. is also a great storehouse of nutriment for the body, carbohydrates and proteids absorbed after a meal in a soluble form in the blood being held up in liver-cells in the form of *glycogen*, which is set loose when the body requires it.

Congestion of the l. may occur as a result of backward pressure of the blood through heart or lung disease interfering with its return, or through inflammation, while *jaundice* (*q.v.*) may arise from congestion, from tumours of the liver or in its neighbourhood pressing on the bile ducts, or from poisons (in fevers, blood-poisoning, chloroform, phosphorus, and other poisoning) circulating in the blood and interfering with the normal secretion of bile. *Hepatic colic* (see COLIC) is due to gall-stones in the bile passages of the l. *Acute hepatitis* (inflammation of liver) and *abscess* of l. may ensue as a result of blood-poisoning, dysentery, and conditions with similar general effects, the symptoms being a rise of temperature, pain, and perhaps bulging of the organ. *Hydatids* (see PARASITIC DISEASES) are most frequently situated in the l. *Acute yellow atrophy* usually affects women, and is due to obscure toxins producing such an effect on the l. that it diminishes greatly in size, the secreting cells degenerating; *cirrhosis* of the l. is a chronic inflammatory condition, usually due to alcoholism, producing a great increase in fibrous tissue of the liver, and at first enlargement and, later, diminution in size. The l. is liable to *fatty* or *waxy degeneration*, the former due usually to general obesity or phthisis, the latter to chronic suppuration, *e.g.* syphilis or tuberculosis. Cancer, characterised by pain, jaundice, and continuous emaciation, may be either primary or secondary in the l. See also DIGESTION.

LIVER FLUKES, a kind of TREMATODE WORMS (*q.v.*).

LIVERMORE, MARY ASHTON, *née* RICE (1821–1905), Amer. temperance and woman's suffrage worker.

LIVERPOOL (53° 25′ N., 2° 59′ W.), town, Lancashire, England, on Mersey; greatest seaport on W. coast, with 19 public graving docks; served by 7 railway systems; a railway tunnel and ferry steamers cross Mersey to Birkenhead (*q.v.*); connected with Manchester by Ship Canal, with E. coast by Leeds and L. Canal; accounts for one-fourth of imports and two-fifths of exports of U.K., the total net tonnage of arriving and departing vessels, apart from coasting trade, totalling over 21,000,000 in 1910. Chief imports are raw cotton, wheat, live stock, wool, food stuffs; chief exports, iron and steel manufactures, textiles, chemicals, machinery, silk, woollen and linen yards. Principal industries are shipbuilding, with associated iron and brass industries, flour and rice milling, sugar-refining, manufacture of tobacco, glass, chemicals, chain cables, and anchors.

L. is episcopal see of R.C. and Anglican churches; foundation-stone of Prot. cathedral was laid in 1904 by Edward VII.; univ., formerly affiliated to Victoria Univ., Manchester, was incorporated in 1903. Public buildings include St. George's Hall, good example of XIX.-cent. Renaissance style, which contains assize court and great hall; Walker Art Gallery, built 1877, which has fine collection, including several old paintings by Dutch and Italian masters; Town Hall, Exchange, Public Library, Museums, many charitable establishments. L. received its first charter from King John in 1207, and obtained subsequent charters at various dates; was Parliamentary stronghold in Civil War; taken by Prince Rupert, 1644; corporation acquired Crown rights of manor of L. in 1672; centre of slave trade in XVIII. cent.; owes much of its importance to opening up of S. Lancashire coal-field and rise of cotton industry in XVIII. cent. Pop. (1911) 746,566.

LIVERPOOL, EARLDOM OF. — CHARLES JENKINSON, 1ST EARL (1729–1808), Sec. of Treasury, 1763; War Sec., 1778; Pres., Board of Trade, 1786. —ROBERT, 2ND EARL (1770–1828), Foreign Sec., 1801; Home Sec., 1804; War Sec., 1808; Premier, 1812.—ARTHUR FOLJAMBE, 5TH EARL (1870–), was cr. Earl of L., 1905; app. Gov. of New Zealand, 1912.

LIVERSEDGE (53° 45′ N., 1° 45′ W.), town, W. Yorkshire, England. Pop. (1911) 14,660.

LIVERWORTS, see BRYOPHYTA.

LIVERY, term descriptive of uniform worn in mediæval times by retainers of noblemen; custom abolished by Henry VII.

LIVERY COMPANIES, of which there are seventy-eight in London, consisted originally of the members of the various trades practised within the City of London. Formerly each trade had its distinctive dress or 'livery'— hence the term liveryman, meaning a member of one of the city trade guilds or companies. Admission to these companies is now a matter of inheritance or of payment, and all connection with actual trading has long ceased; but the Livery Companies own considerable property and administer many charities; and the liverymen are freemen of the city, with exclusive power to elect the lord mayor and sheriffs.

LIVIA DRUSILLA (55 B.C.–29 A.D.), wife of Emperor Augustus and mother (by former marriage) of Emperor Tiberius and of Drusus, father of Emperor Claudius.

LIVINGSTON, EDWARD (1764–1836), Amer. politician; entered Congress, 1795; opposed Jay's Treaty, Alien and Sedition Laws; district attorney, New York State, 1801; removed to Louisiana, 1804; drew up code of criminal law; member of commission

to draft civil code; senator, 1829; Sec. of State, 1831–33; ambassador to France, 1833–35.

LIVINGSTON, ROBERT R. (1746–1813), Amer. politician; Chancellor, New York state, 1777–1801; ambassador to France, 1801; negotiated Louisiana purchase.

LIVINGSTON, WILLIAM (1723–90), Amer. politician; attended first and second Continental Congresses, 1774, 1776; Gov., New Jersey, 1776. Bro's, Peter and Philip, Whig leaders; s., Henry Brockholst, officer, War of Independence.

LIVINGSTONE, DAVID (1813–73), Scot. missionary and African explorer; b. Blantyre, Lanarkshire; at ten years of age worked fourteen hours daily in factory, studying at night; took courses of med. and theol. at Glasgow Univ.; medical missionary to Africa, 1840–56; discovered Lake Ngami, 1849; traversed Africa from Zambesi to Congo, 1853–54, returning 1855–56; pub. *Missionary Travels and Researches in S. Africa*, 1857; Brit. consul to Portug. possessions in S. Africa, 1858; discovered Lakes Shirwa and Nyassa, 1859; commenced search for source of Nile, 1866; after terrible journey reached Zambesi, Jan. 1867; during 1867 discovered watershed between Loanga tributary of Zambesi and other rivers (the Chambeze most important) flowing N., and believed Chambeze to be source of Nile; explored until finally, broken down, took refuge at Ujiji; many search expeditions failed; found by Stanley, 1871; continued exploration of Chambeze till death at Itala; valuable journals; wonderful endurance, patient observer, and ardent, pious missionary.

LIVIUS ANDRONICUS (*c.* 284–204 B.C.), the founder of Rom. epic poetry and drama; translated the *Odyssey* into Lat. Saturnian verse.

LIVNO (43° 44′ N., 17° 7′ E.), fortified town, on Bistritza, Bosnia. Pop. 5400.

LIVONIA, province of Russia; named from early inhabitants, *Livs*; situated on shores of Baltic; area, over 18,000 sq. miles; first hist. mention XI. cent.; Christianised, XII. cent., and received bishopric; divided between Russia and Poland, 1561; completely annexed by Poland, 1582; seized by Sweden, 1621, in order to obtain access to ocean; acquired by Peter the Great, 1721.

LIVORNO, Ital. name for Leghorn (*q.v.*).

LIVY, TITUS LIVIUS (59 B.C. to 17 A.D.), Rom. historian; b. at Patavium (Padua), Italy; lived chiefly in Rome; well versed in Gk. lit., rhetoric, and philosophy; sympathised with Pompey in Civil War; visited Campania; befriended by Augustus, although republican in politics; gained fame by his great work, *History of Rome*, probably written, 27–20 B.C. On Tiberius becoming emperor, withdrew to Padua, where he died; had one s., one dau.

His great work, properly called *Ab urbe condita libri*, deals with history of Rome from landing of Æneas and founding of city to death of Drusus, 9 B.C.; written in 142 parts or *libri*, of which 35 are still extant, while epitomes of most of others also exist. First 15 *libri* narrate history down to beginning of war with Carthage; next 15 describe two Punic wars, conquest of Macedonia, Gracchus' administration, Sulla's dictatorship, death of Cæsar, civil wars, battles of *Philippi* and *Actium*, and twenty years of Augustus' reign are all subsequently described. L.'s object in writing it, as told in his preface, was to create monument to greatness of Rome, to show his readers how this was attained by virtues of Rom. citizens, and to point out the decline following their decay; not a critical study, but excellent as lit.; deals with foreign nations very slightly, and only as far as they are concerned with Rome. Enthusiasm for his country often leads L. to one-sided view of affairs; but he shows impartiality in recognising good qualities of such enemies of Rome as Hasdrubal and Hannibal; does not apply philosophy to history; adheres to old Rom. religion. Chief defect is his want of original research; took materials from traditions of earlier writers and from family legends, rather than from such original sources as inscriptions and monuments, although such are known to have existed; or, for later history, from laws, Senate's decrees, and official registers, which probably reached back several centuries.

Teuffel-Schwabe, *History of Roman Literature*.

LIZARD POINT, THE LIZARD (49° 57′ N., 5° 12′ W.), most southerly point in England, on S. Cornish coast.

LIZARDS (*Lacertilia*), one of the orders of the Reptilia, containing about 1700 species; usually four-limbed; either or both pairs of limbs may be absent, *e.g.* Glass Snake, Slow Worm, etc., but vestiges of the shoulder and hip girdles are always present. Unlike that of snakes, the lower jaw is rigid, the eyelids are generally movable, and external ear-openings are present. Regeneration of a lost limb or of the often very brittle tail is common. Though many bite severely, poison glands occur only in the Amer. Heloderms. The diet is usually of worms and insects, but the larger forms eat frogs, mice, and small birds; while other lizards are vegetarian. From 20 to 30 soft-shelled eggs are laid usually, but some forms are viviparous. The majority are terrestrial, though some are arboreal, and others semi-aquatic; one only is marine, the Galapagos Sea Lizard.

Hibernation occurs in the colder regions, in Europe lasting from 6 to 8 months, but many species in warmer regions pass the hottest season in a torpid state. These usually active, graceful and beautifully coloured animals are of world-wide distribution. They are most abundant in the tropics, but are absent from the polar regions.

According to Gadow there are three sub-orders: (1) Geckones (Geckos); (2) Lacertæ (typical Lizards); (3) Chamæleones (Chamæleons).

The GECKONES is the genus *Gecko*, with adhesive disc toes for climbing; though harmless, legend has it that venom is ejected from the toes. In LACERTÆ we note the following: Draco (Flying Dragon or Lizard of Malay), with a membrane extended on prolongations of the ribs, which acts as a parachute while the creature takes flying leaps; Moloch or Thorny Devil of Australia (*Moloch horridus*), which, though harmless, is protectively covered with conical spines and curved horns; Iguana, a genus of the *Iguanidæ* of S. America and the West Indies, active on land and in water, with much elongated tail and large throat appendage; Blind or Slow Worms (*Anguidæ*), limbless lizards of Europe and W. Asia, the Brit. species, *Anguis fragilis*, being neither blind nor poisonous; Monitor or Alligator Lizard (*Varanus niloticus* of Africa), 5 to 6 ft. long, which feeds on the eggs and young of crocodiles; Lacerta, a genus of 20 species, mostly in the Old World, distinguished by a collar of enlarged scales and more or less developed pads on the under side of the digits; Amphisbænidæ, a family with subterranean and usually limbless members, having degenerate eyes and ears, living like worms in galleried burrows.

LLAMA, see CAMEL FAMILY.

LLANBERIS (53° 6′ N., 4° 5′ W.), town, Carnarvonshire, N. Wales; slate quarries. Pop. 3015.

LLANDAFF (51° 29′ N., 3° 14′ W.), town, Glamorganshire, Wales; episcopal see; cathedral, ruined episcopal palace; practically a suburb of Cardiff. Pop. 6000.

LLANDILO, LLANDEILO (51° 53′ N., 3° 59′ W.), town, Carmarthenshire, Wales; in neighbourhood are ruins of Dynevor Castle. Pop. (1911) 1932.

LLANDOVERY (51° 59′ N., 3° 48′ W.), town, Carmarthenshire, Wales; ruined castle; manufactures beer. Pop. (1911) 1993.

LLANDOVERY GROUP, the lowest division of Silurian system in Britain; divided into Lower and Upper L. g.; formed of conglomerates, sandstones, etc. At Llandovery (*q.v.*) they rest unconformably in the ordovician rocks. The Lower group has many fossils, including graptolites, trilobites, brachiopods. L.

rocks used for building and flag-stones and slate-pencils.

LLANDRINDOD, Llandrindod Wells (52° 15′ N., 3° 22′ W.), town, Radnor, Wales; mineral springs. Pop. (1911) 2779.

LLANDUDNO (53° 20′ N., 3° 52′ W.), town, Carnarvonshire, N. Wales; summer resort. Pop. (1911) 10,469.

LLANELLY (51° 42′ N., 4° 9′ W.), port, Carmarthenshire, Wales; tinplate and copper works. Pop. (1911) 32,077.

LLANES (43° 26′ N., 4° 46′ W.), port, N. Spain. Pop. (1910) 21,779.

LLANGOLLEN (52° 58′ N., 3° 11′ W.), town, Denbighshire, Wales; has ruined fortress; bridge over Dee dates from 1345. Pop. (1911) 3250.

LLANQUIHUE (41° S., 72° 50′ W.), S. province, Chile, S. America; area, 45,513 sq. miles; contains Lake L.; surface mountainous, well forested; produces lumber, cereals. Pop. 113,300.

LLANTRISANT (51° 32′ N., 3° 23′ W.), town, Glamorganshire, Wales; ruined castle. Pop. *c.* 11,000.

LLANTWIT MAJOR (51° 24′ N., 3° 29′ W.), town, Glamorganshire, Wales; formerly site of monastic coll., founded VI. cent.; in neighbourhood are Rom. remains. Pop. 1200.

LLANWRTYD WELLS (52° 6′ N., 3° 40′ W.), town, Breconshire, Wales; mineral springs. Pop. (1911) 753.

LLORENTE, JUAN ANTONIO (1756–1823), Span. ecclesiastic; wrote history of Inquisition.

LLOYD GEORGE, DAVID (1863–), Brit. Liberal statesman; b. Manchester, of Welsh descent; solicitor, 1884; M.P. for Carnarvon district since 1890; led Welsh agitation against Education Act; in opposition and in office proved himself a brilliant speaker and bold fighter; Pres. of Board of Trade, 1905–8; Chancellor of Exchequer since 1908; the rejection of his Budget of 1909 by House of Lords led to General Election (1910) and passing of *Parliament Act*; mainly responsible for *Old Age Pensions Act* (1908) and *National Insurance Act* (1911); P.C., 1905.

LLOYD'S, an association of persons engaged in marine insurance. Took its name from the fact that the members formerly met at Lloyd's Coffee-House in Lombard Street, London; incorporated, 1871, with the object of marine insurance. Members are required to deposit securities for £5000.

LLYWARCH HEN, see Celts (*Welsh Lit.*).

LOACH, see under Carps.

LOAD-LINE, see Plimsoll.

LOAN, see Banks.

LOANDA, ST. PAUL DE (8° 49′ S., 13° 6′ E.), port, Angola, Portuguese W. Africa; exports rubber, ivory, palm oil, coffee; has observatory and episcopal palace. Pop. *c.* 20,000.

LOANGO (4° 30′ S., 12° E.), port and coast region, W. Africa; formerly centre of slave trade; exports rubber, palm oil.

LOBANOV-ROSTOVSKI, ALEXIS BORISOVICH, PRINCE (1824–96), Russ. politician; entered diplomatic service, 1844; ambassador to Constantinople, 1878, France, 1879, Vienna, 1882; foreign minister, 1895; revived Russian influence in Balkans.

LÖBAU.—(1) (51° 6′ N., 14° 40′ E.) town, Saxony, Germany; textiles, buttons. Pop. (1910) 11,256. (2) (53° 41′ N., 19° 45′ E.) town, Prussia, Germany. Pop. 5500.

LOBE, a rounded projection; in anatomy, a rounded division, marked off by fissures, of the liver or brain, also the lower part of the external ear; in botany, rounded division of a leaf, also the pod of a leguminous plant.

LOBELIA, a commonly cultivated genus of the Campanulaceæ, which differs from the majority in possession of a zygomorphic flower. One species, *L. dortmanna*, grows submerged in lakes (*e.g.* Windermere), only the flowering shoot appearing above water.

LOBENSTEIN (50° 27′ N., 11° 37′ E.), town, Reuss, Germany. Pop. 3000.

LOBO, JERONIMO (1593–1678), Portug. missionary in India.

LOBOSA, a group of Amœboid Rhizopods—minute Protozoa with a clear external coat of protoplasm and with body processes (*pseudopodia*) which do not branch, *e.g.* the naked Amœba, and freshwater Pelomyxa, and Difflugia, protected by a shell built up of foreign particles.

LOBSTERS, the true Lobsters and Crayfishes (*Nephropsidea*) are distinguished by their large pincer claws from their relations, the Rock or Spiny Lobsters (*Scyllaridea*). The Common L. frequents rocky portions of the coast, and is much esteemed as food, extensive 'fisheries' being prosecuted where it occurs in abundance.

LOCARNO (46° 10′ N., 8° 48′ E.), town, Switzerland. Pop. *c.* 4000.

LOCH, HENRY BROUGHAM, 1st Baron L. (1827–1900), Brit. administrator; served in Crimea, 1854; sec. of embassy to China, 1860; imprisoned for time in China; gov. of Isle of Man, 1863, Victoria, 1884, Cape, 1889.

LOCHABER (56° 57′ N., 4° 45′ W.), mountainous region, Inverness-shire, Scotland.

LOCHES (47° 7′ N., 0° 59′ E.), town, Indre-et-Loire, France; contains noted castle, in donjon of which Ludovico Sforza, Duke of Milan, was imprisoned in XVI. cent. Pop. 5150.

LOCHGELLY (56° 8′ N., 3° 18′ W.), town, Fifeshire, Scotland; coal, iron. Pop. (1911) 9076.

LOCHGILPHEAD (56° 2′ N., 5° 25′ W.), town, Argyll, Scotland; herring fisheries. Pop. (1911) 921.

LOCHMABEN (55° 8′ N., 3° 27′ W.), town, Dumfriesshire, Scotland; in neighbourhood are ruins of L. Castle. Pop. (1911) 1056.

LOCK, a construction whereby vessels can be transferred from one reach of a river or canal to another at a different level. It consists of a small dock connecting the two reaches by gates, each containing a sluice by means of which the water in the l. can be levelled to that of either reach. A boat, supposed in reach A, wishes to enter reach B, which is at a higher level. The water in the l. is first levelled to that of reach A and the communicating gate opened; the vessel enters and the gate is closed. Through the sluice in the second gate, the l. is now filled to the higher level, and the second gate opened; the boat can then pass into the upper reach. L's enable vessels to navigate far inland to parts considerably above sea-level.

LOCK HAVEN (41° 6′ N., 77° 34′ W.), town, Pennsylvania, U.S.A.; timber. Pop. (1910) 7772.

LOCKE, JOHN (1632–1704), Eng. philosopher; s. of a Puritan who fought in Civil War; ed. at Westminster School and Christ Church, Oxford, becoming tutor there, 1660. He was influenced by the philosophy of Descartes, became interested in theol., and then studied med. and politics. In 1666 he became sec. to Lord Ashley (later Earl of Shaftesbury), and remained so till Shaftesbury's imprisonment, 1681. He was in France, 1675–79. Suspected by the government, he fled to Holland, and returned to England in 1689. His *Essay Concerning Human Understanding*, which appeared in 1690, had been in his mind for years. His *Epistola de Tolerantia* was pub., 1689, likewise *Two Treatises on Government*. In 1691 he pub. *The Reasonableness of Christianity as Delivered in the Scriptures*. He was a commissioner on the Board of Trade, 1696–1700. In his later years he mostly studied theol., and wrote theological and other works.

L.'s writings cover a wide range of subjects, including Philosophy, Theol., Politics, Economics, Education, and Science. L.'s views may be described as 'liberal' in the widest sense; unlike most of his contemporaries, he believed in toleration, and preferred something simpler than ecclesiastical Christianity. His *Essay on Human Understanding* became famous during his lifetime, and by it he is mostly remembered. His main idea was that the human mind should be free to criticise everything, and that no limits should be

set to this process by arbitrary authority. This idea of liberty, which on its intellectual side is elaborated in the *Essay*, is illustrated in the sphere of religion in the *Essay on Toleration*, and of politics in the *Treatises on Government*.

He argues against the doctrine of innateness of our ideas, for we must go back to experience for everything. All things can be traced back to the senses, and reflection on what we have experienced through them. He continues the discussion into metaphysics, and shows that even ideas of space and time, infinity and personality, have their roots in experience. Despite this he does not entirely deny the existence of intuitive knowledge, where, unless we give way to utter scepticism, it is inevitable, in pure math's and religion. We must have here some fundamental ideas to which to appeal. In many things, therefore, we must remain quite uncertain, and in L.'s view, it has been said, probability is the guide of life. He has been described as typically English in his love of truth and reason, his distrust of mysticism and abstractions, and his love of religion and his moderation. In the history of thought he prepared the way for the rationalism of the XVIII. cent.

Lives, by Fowler, Fraser.

LOCKERBIE (55° 7′ N., 3° 21′ W.), town, Dumfriesshire, Scotland; annual lamb fair. Pop. (1911) 2455.

LOCKHART, GEORGE (1673–1731), Scot. politician and author; of distinguished Lanarkshire family; arrested for part in rising of 1715, but liberated; continued to intrigue with Pretender till death; *Memoirs*, etc., important sources of Scot. history.

LOCKHART, JOHN GIBSON (1794–1854), Scot. writer; b. Cambusnethan, near Wishaw; studied for the Bar; became one of the chief contributors to *Blackwood*. His *Lives* of Burns, Napoleon, and Scott are masterpieces.

A. Lang, *Life* (1897).

LOCKHART, SIR WILLIAM STEPHEN ALEXANDER (1841–1900), Brit. soldier; fought in Indian Mutiny, Burma, etc.

LOCKJAW, see PARASITIC DISEASES (*Tetanus*).

LOCKPORT.—(1) (41° 36′ N., 88° 2′ W.) town, Illinois, U.S.A.; grain. Pop. 2555. (2) (43° 7′ N., 78° 46′ W.) town, New York, U.S.A.; fruit, chalk, sandstone. Pop. (1910) 17,970.

LOCKROY, ÉDOUARD (1838–), Fr. journalist and politician; deputy, 1871; Minister of Commerce, 1886; Education, 1888; Marine, 1895–96, 1898–99.

LOCLE, LE (47° 4′ N., 6° 45′ E.), town, Switzerland; watch manufacture. Pop. (1910) 12,690.

LOCMARIAQUER (47° 35′ N., 2° 58′ W.), village, W. France, on Gulf of Morbihan. Pop. 770.

LOCOMOTIVE, see ENGINE.

LOCOMOTOR ATAXIA, TABES DORSALIS, disease associated with progressive degeneration of the posterior columns and nerve roots of the spinal cord. There are three stages: at first lightning pains in the legs, constricting pains round the body, loss of sensibility in the legs, etc.; then unsteadiness, loss of muscular tone, a distinctive stamping gait, eye disturbances, and derangements of internal organs; while in the most advanced stage there is paralysis, the patient being unable to walk. The causes are syphilis (most generally), and injury or exposure to extreme temperatures. The progress of the disease may be arrested at an early stage, even advanced cases may improve, but complete recovery is practically impossible. The treatment is to avoid over-exertion of every kind; antisyphilitic treatments, arsenic, strychnine, and silver nitrate are all of value, while severe symptoms as they arise are treated by appropriate remedies.

LÖCSE (49° 1′ N., 20° 35′ E.), town, Hungary; Gothic church. Pop. 8000.

LOCUST (*Pachytylus cinerascens, P. migratorius*, etc.), members of the Acridiidæ (*Orthoptera*) allied to the Grasshoppers (*Grillidæ—Locustidæ*), which are migratory in character, and voracious vegetable feeders. They migrate in vast numbers, removing every particle of plant tissue they encounter, with the result that they often produce famine, and, on the putrefaction of their bodies, disease. Various species are found in N. America, the Antipodes, S. Africa, and other regions of the world—the locust of the Biblical 'plagues' probably being *Schistocerca peregrina*, which ranges from N. Africa to Southern India.

LOCUSTIDÆ, see GRASSHOPPERS.

LODÈVE (43° 44′ N., 3° 11′ E.), town, Hérault, France; XIII.-cent. cathedral; episcopal see till 1790. Pop. 7500.

LODGE, HENRY CABOT (1850–), Amer. Republican politician; author of hist. and other works. His s. was GEORGE CABOT L. (1873–1909), the poet.

LODGE, SIR OLIVER JOSEPH (1851–), Eng. scientist; principal, Birmingham Univ.; has written much on pure science and psychical phenomena.

LODGE, THOMAS (*c.* 1558–1625), Eng. dramatist; a noted reprobate and wit at Lincoln's Inn; romance *Rosalynde* furnished Shakespeare with the plot for *As You Like It*; his dramas, *The Wounds of Civil War* and *A Looking-Glass for London and England*, are poor.

LODI (45° 18′ N., 9° 29′ E.), town, Piedmont, Italy; seat of bishopric; has Romanesque cathedral dating from 1158; dairy produce. Here Napoleon defeated Austrians, 1796. Pop. *c.* 28,000.

LODZ (51° 46′ N., 19° 33′ E.), town, Russ. Poland; cottons. Pop. (1910) 395,670.

LOESS, in geology, loamy deposit of fine sand occurring in alluvial deposits of Pleistocene system; found in valleys of Danube, Rhone, Rhine, and Missouri. Fossils found in it are land and fresh-water shells; Pleistocene mammals comprise mammoth, rhinoceros, and reindeer, and man.

LOFOTEN AND VESTERAALEN (*c.* 68° 40′ N., 15° 20′ E.), chain of islands belonging to Norway, stretching along N.W. coast; mountainous; sheep raised; great cod-fisheries; exports cod, cod-liver oil, roe, herring. Pop. *c.* 43,000.

LOFTUS, ADAM (*c.* 1533–1605), Irish prelate; went to Ireland, 1560; abp. of Armagh, 1563; of Dublin, 1567.

LOG, instrument for measuring a ship's speed; modern l., towed from stern, registers by means of fly-wheel. **Log-Book**, journal of occurrences on board ship; kept by navigating officer.

LOGAN (41° 38′ N., 112° W.), town, Utah, U.S.A.; Mormon temple; manufactures sugar. Pop. (1910) 7522.

LOGAN, JOHN (1748–88), Scot. minor poet; wrote, among other things, the beautiful lyric, *The Braes of Yarrow*. His claim to the *Ode to the Cuckoo*, as against that of Michael Bruce, is controverted.

LOGAN, JOHN ALEXANDER (1826–86), Amer. soldier and politician; fought for Union in Civil War; senator, 1871–77, 1879–86.

LOGAN-BERRY, a hybrid between raspberry and bramble, first produced by Judge Logan, an American, in 1881.

LOGANSPORT (40° 46′ N., 86° 17′ W.), town, Indiana, U.S.A.; iron foundries, automobile manufactures; grain trade. Pop. (1910) 19,050.

LOGAR (33° 55′ N., 68° 26′ E.), river, Afghanistan, tributary of Kabul R.

LOGARITHM.—If $a^a = N$, x is called the *logarithm* of N to the base a. This is written $x = \log_a N$. Hence, as logarithms are indices, they obey the laws of indices.

(i.) If $\log_a A = \alpha$, $\log_a B = \beta$, $\log_a C = \gamma$, . . then $A = a^\alpha$, $B = a^\beta$, $C = a^\gamma$, . . . and $\therefore ABC \ldots = a^{\alpha+\beta+\gamma+\ldots}$

$$\therefore \log_a (ABC \ldots) = \alpha + \beta + \gamma + \ldots = \log_a A + \log_a B + \log_a C + \ldots$$

i.e. *Log. of a product is sum of logs. of factors.*

(ii.) $\frac{A}{B} = a^{\alpha-\beta}$; $\therefore \log_a (A \div B) = \alpha - \beta = \log_a A - \log_a B$

i.e. *Log. of a quotient is log. dividend – log. divisor.*

(iii.) $\frac{A}{A} = a^{\alpha-\alpha} = a^0 = 1$; $\therefore$ *log.* $1 = 0$ *to any base.*

(iv.) $A^n = a^{n \log_a A}$; $\therefore \log_a(A^n) = n.a = n \times \log_a A$, where n may have any value whatever.

(v.) If $\log_a N = \alpha$, $\log_b N = \beta$, then $N = a^\alpha = b^\beta$; $\therefore a = b^{\frac{\beta}{\alpha}}$ and $a^{\frac{\alpha}{\beta}} = b$; whence $\frac{\beta}{\alpha} = \log_b a$, $\frac{\alpha}{\beta} = \log_a b$, and we have $\log_a b \times \log_b a = 1$. Also $\beta = \alpha \cdot \log_b a$; *i.e.* $\log_b N = \log_a N \times \log_b a$.

(vi.) Logarithms may be calculated from the *Logarithmic Series*—

$$\log_e(1+y) = y - \frac{y^2}{2} + \frac{y^3}{3} - \ldots + (-1)^{r-1}\frac{y^r}{r} + \ldots \quad (1)$$

where $e = 1 + 1 + \frac{1}{2!} + \frac{1}{3!} + \frac{1}{4!} + \ldots = 2{\cdot}71828\ldots$;

but in practice more rapidly converging series are used. Changing the sign of y in the above, and subtracting, we get

$$\log_e \frac{1+y}{1-y} = 2\left(y + \frac{y^3}{3} + \frac{y^5}{5} + \ldots\right) \quad (2)$$

and further, substituting $\frac{p-q}{p+q}$ for y, we obtain

$$\log_e \frac{p}{q} = 2\left\{\frac{p-q}{p+q} + \frac{1}{3}\left(\frac{p-q}{p+q}\right)^3 + \frac{1}{5}\left(\frac{p-q}{p+q}\right)^5 + \ldots\right\} \quad (3)$$

a series which converges rapidly, and from which logs. to the base e can be easily obtained.

Thus, putting $p=2$, $q=1$, we get

$$\log_e 2 = 2\left\{\frac{1}{3} + \frac{1}{3}\cdot\frac{1}{3^3} + \frac{1}{5}\cdot\frac{1}{3^5} + \ldots\right\} = {\cdot}693147\ldots$$

Hence, from (3),

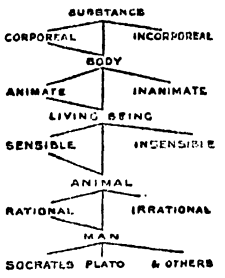
$$\log_e 3 - \log_e 2 = 2\left\{\frac{1}{5} + \frac{1}{3}\cdot\frac{1}{5^3} + \frac{1}{5}\cdot\frac{1}{5^5} + \ldots\right\} = {\cdot}405465\ldots$$

$$\therefore \log_e 3 = 1{\cdot}098612.$$

Others may easily be obtained. These logarithms are known as *Napierian* or *natural logarithms*, and are used in all theoretical investigations. For purposes of computation, we require logs. to the base 10, which are known as *common logarithms*. Since we have $\log_{10} N = \log_e N \times \log_{10} e$ we can easily obtain common from natural logs. $\log_{10} e = {\cdot}43429\ldots$ It is usual to omit the base 10 in writing. In common logarithms it is convenient to keep the *decimal part always positive*. Thus log. 0·3 is written $\bar{1}{\cdot}4771213$ and not $-0{\cdot}5228787$. In this way the decimal part of the logarithms of all numbers consisting of the same digits in the same order is the same, and the logs. only differ in the integral part. When so written, the decimal part is called the *mantissa*, and may be obtained from tables; the integral part is called the *characteristic*, and may be written down by inspection by means of the following rules, decimal notation being used: (1) *The characteristic of the log. of any number greater than unity is one less than the number of figures to the left of the decimal point.* (2) *The characteristic of the log. of any number less than unity is negative and is one more than the number of ciphers immediately to the right of the decimal point.* Thus, the logs. of 1060, 1·060, 0·1060, 0·0001060 are respectively $3{\cdot}0253\ldots$, $0{\cdot}0253$, $\bar{1}{\cdot}0253$, $\bar{4}{\cdot}0253$, the minus sign in the latter two cases being placed over the characteristic to show that it alone is negative. The reason for the above rules is obvious, for (1) a number with n figures to the left of the decimal point is $< 10^n$ and not $< 10^{n-1}$. Its log. is therefore $(n-1)+$ a decimal. (2) A number with n ciphers just to the right of the decimal point is $> 10^{-n-1}$ and $< 10^{-n}$. Its log. is therefore $-(n+1)+$a decimal.

Log. tables are published giving to 7 or more places of decimals the mantissæ of the logarithms of all numbers from 1 to 99,999. For numbers of more than 5 significant figures interpolation (*q.v.*) is necessary, but for practical purposes it is sufficient to employ *simple proportion* in determining intermediate logarithms to those given in the tables.

LOGIA, name given to 'sayings' of Jesus unearthed at Oxyrhynchus in Egypt by Grenfell and Hunt. In 1897 a fragment was found, containing eight sayings; in 1903 some more were found, more mutilated, and in 1907 a fragment of a hitherto unknown Gospel, containing an account of a conversation on purification between Christ and a Pharisee in the Temple. The papyri are III. cent. and the sayings themselves probably II. cent.; most critics think they are not entirely dependent on the canonical gospels, but represent separate traditions; the 'sayings' are quite possibly genuine.



Grenfell and Hunt, *Oxyrhynchus Sayings of Jesus, New Sayings of Jesus and Fragment of a Lost Gospel.*

LOGIC, the science of reasoning, or of the necessary forms of thought as systematising the principles of correct thinking, has been regarded as an art for framing rules for detecting fallacious reasoning. The Laws of Thought, which regulate all valid thinking, are (1) Principle of Identity, 'Everything is what it is,' requiring the unvarying meaning of any term in the same argument, and implying the expression of identity amidst diversity; (2) Principle of Contradiction, 'Nothing can both be and not be,' denying the possession of contradictory attributes at the same time and place; (3) Principle of Excluded Middle, 'Everything must either be or not be,' denying any alternative between contradictories. Besides these is sometimes affirmed the Principle of Sufficient Reason, 'Whatever exists must have a reason for being as it is and not otherwise.'

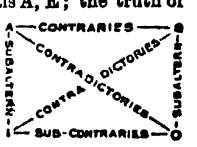
Any simple argument, such as, Socrates is a man, all men are mortal beings, therefore Socrates is a mortal being, consists of three statements ('propositions'), each made up of two substantives ('terms') joined by the verb 'is.' Hence we may describe in order, terms, propositions, and arguments or syllogisms as a whole; these three parts of logic corresponding to the mental acts of apprehension, judgment, reasoning. We may distinguish between the matter of thought, the things thought about, the form, the manner in which the mind thinks of them; the former variable, while the latter remains the same. The validity of formal reasoning depends only on the form, whence terms may be expressed symbolically.

Terms may be 'subject' or 'predicate' of a logical proposition, *i.e.* may stand for what is thought of, or for the predication made of it. Terms are singular, denoting only one object, general, applicable to many, or collective, regarding a group as a unity; concrete, the name of a thing, or abstract, referring to a quality thought of apart from the object to which it belongs; positive or negative, implying the presence or absence of a certain attribute; absolute or relative, carrying or not carrying a reference to another object. A distinction is made between Connotation, qualities necessarily implied by a term, and Denotation, objects to which the term is applied. Only those terms implying attributes have connotation; proper names, which suggest attributes, are non-connotative. By adding to the connotation of any term, its denotation is decreased; not a mathematical variation, for the addition of an attribute common to a class, *e.g.* 'mortal' to 'man,' does not affect the denotation. The Predicables are a classification of the possible relations of the predicate to the subject of a proposition. Porphyry divided them into Genus, Species, Differentia, Proprium, and Accidens. A Genus is a wider class made up of narrower classes (species); any genus may be a species of a higher class, whence a series from a Summum Genus down to an Infima Species, divisible only into Individuals. According to Aristotle, there were ten Summa Genera ('Categories' or 'Predicaments') under which every term capable of use as a predicate is included. A species is wider in connotation than its genus; the additional attributes form the Differentia of the Species. A Proprium is an attribute not included in, but following from, the connotation, and therefore common to every member

of the class. An Accident has no known connection with the connotation; it is 'Separable' or 'Inseparable,' according as sometimes or never absent from the class. Of these Predicables, the Tree of Porphyry is an example.

Substance is Summum Genus, Man, infima species; Body, Living Being, Animal, genera in relation to those following, species of the preceding; the attributes Corporeal, Animate, etc., are the Differentiæ of each successive species.

Logical division is the process of distinguishing the species of a genus, in reference to a quality (*Fundamentum Divisionis*) common to some individuals, absent from others. Division must have only one basis, to avoid cross-division, must be exhaustive, and step by step. These conditions are ensured by Division by Dichotomy (*dicha*, in two, *temno*, to cut), at every step into corresponding positive and negative terms, as in the Tree of Porphyry. A cumbrous method, giving at each step a sub-class undefined in extent. Logical Division is to be distinguished from Metaphysical Analysis of the attributes of an object, and from Physical Partition of the whole into its parts; in neither of these can the whole be predicated of each of its members. A development on the material sides gives Material Division, or Classification. A Definition is a statement of the Connotation of a term; to contain only the essential attributes expressed clearly and not to be tautologous or negative. Definition *per genus et differentiam* shortly expresses the connotation by stating the next higher genus, and the species.



A Proposition is the statement of a truth or falsity; hence not every grammatical sentence is a logical proposition. Propositions are Categorical if the statement is unconditional; Hypothetical, conditional; or Disjunctive, expressing alternatives; in quality are affirmative or negative, expressing agreement and difference respectively between subject and predicate; or universal or particular, affirming the predicate of the whole or of part of the subject. These kinds may be shown with symbols and examples—

Universal	Affirmative	A. S a P.	All birds are feathered.
	Negative	E. S e P.	No reptiles are feathered.
Particular	Affirmative	I. S i P.	Some knowledge is useful.
	Negative	O. S o P.	Some knowledge is not useful.

A, I are the first two vowels of *affirmo*, I affirm; E, O, of *nego*, I deny; whence the two methods of symbolising propositions. The negation may be joined to the copula or placed before the subject. Many forms of expression are ambiguous. 'All the metals are not heavier than water,' is an O proposition, not an E, meaning 'Some metals are not heavier than water'; 'some' is perfectly indefinite, ranging from more than one up to all; 'any' = every; 'a few' = some.

Universal propositions, as asserting something of the whole of the subject, are said to distribute the subjects. Negative propositions distribute the predicate, the whole of which is cut off from the subject. Hence E distributes subject and predicate, A distributes subject only, O distributes predicate only, I distributes neither. From this follows the 'Opposition' of propositions, the relations between propositions differing in quality or quantity, but having identically the same subject and predicate; shown diagrammatically in the 'Square of opposition.'

Contradictories differ both in quality and quantity; no third alternative is possible, whence one must be true and the other false. Contraries are both universals, the extreme poles of divergence, allowing of intermediate alternatives; both may be false, but both cannot be true. Subalternates are the particulars corresponding to the universals A, E; the truth of the particulars follows from that of the universals, the falsity of the universals from that of the particulars. Subcontraries are perfectly compatible with each other; both may be true, both cannot be false.

From the proposition, 'All crows are black,' we may, by interchanging subject and predicate, infer that 'Some black (birds) are crows'—not a universal, but only a particular. This process is Conversion; the quality must remain unaltered, and no term undistributed in the original proposition can be distributed in the 'converse.' Applying these rules, it may be shown that A gives I, I gives I, and E gives E. These last two cases are 'Simple Conversion,' the first, where a universal has given a particular, conversion *per accidens*. An O proposition, before conversion is possible, must be changed into an equivalent affirmative proposition. Thus 'Some existing things are not material' = 'Some existing things are immaterial,' whence 'Some immaterial (things) are existing.' This is 'Conversion by Negation.'

Opposition of propositions and conversion of propositions are kinds of Immediate Inference, since the derivation of the second proposition from the first is direct. Mediate Inference, of which the Syllogism is the type, makes use of a middle term; by this two propositions or premises are so combined that we may reach a third proposition, the 'conclusion,' whose truth necessarily follows from that of the premises. One of the premises must be universal, and syllogistic reasoning is therefore deductive, arguing from the more general to the less. As propositions may be Categorical, Hypothetical, or Disjunctive, so syllogisms are of different kinds. The Categorical Syllogism must contain three terms (major, minor, middle) and three propositions (major and minor premises, conclusion); its middle term must be distributed at least once; no term can be distributed in the conclusion if undistributed in the premises; from two negatives nothing can be inferred; a negative premise necessitates a negative conclusion, and *vice versa*. The major term occurs in the major premise and as predicate of the conclusion; the minor, in the minor premise and as subject of the conclusion; the middle term occurs in each premise but not in the conclusion. From the position of the middle term are derived four forms or Figures of the syllogism, thus—

Fig. I.	Fig. II.	Fig. III.	Fig. IV.
M – P	P – M	M – P	P – M
S – M	S – M	M – S	M – S
∴ S – P	∴ S – P	∴ S – P	∴ S – P

Symbolising major, minor, and middle terms by P, S, M. Of these figures, the scholastics regarded the first as the perfect type, and tested the others by reduction to it. To it applies the dictum, *de Omni et Nullo*, 'Whatever is distributively affirmed or denied of any class may be affirmed or denied of everything included in the class,'—a rule itself based on the three Laws of Thought. In each figure, each proposition may be A, E, I, or O, whence sixty-four possible combinations; of these all but nineteen break one of the rules of the syllogism. These nineteen valid 'Moods' may be memorised by the old mnemonic lines—

Barbara, Celarent, Darii, Ferio-que, prioris;
Cesare, Camestres, Festino, Baroco, secundæ;
Tertia, *Darapti, Disamis, Datisi, Felapton,*
Bocardo, Ferison, habet; Quarta insuper addit
Bramantip, Camenes, Dimaris, Fesapo, Fresison.

The words in ordinary type are real Latin words, indicating the figure; the rest are artificial, showing by their vowels the nature of their propositions

Thus, *Celarent*, a mood of the first figure, major premise E, minor A, conclusion E. The lines also give directions for the 'reduction' of the other figures to the form of the first; thus *s* = convert preceding proposition simply, *p* = convert *per accidens*, *m* = transpose (*mutare*) premises; B, C, D, F indicate the mood of the first figure produced by reduction. *Baroco* and *Bocardo* cannot be reduced as above; their conclusion is proved by showing the falsity of its contradictory (*c* = indirect reduction).

In daily life, one of the propositions of an argument is often omitted; such a syllogism is an Enthymeme. Syllogisms may be connected with one another, the conclusion of the first (Prosyllogism) being a premise of the following (Episyllogism). A Sorites is a chain of enthymemes, omitting the conclusion of each prosyllogism. Thus, all A's are B's, all B's are C's, all C's are D's, all D's are E's; therefore all A's are E's. An Epicheirema omits a premise of each prosyllogism.

Syllogisms may contain hypothetical or disjunctive propositions. A Dilemma contains a hypothetical major, offering more than one alternative, and a disjunctive minor. Thus, if either A or B, then C; either A or B; ∴ C.

Induction is the process of the detection of general laws in particular facts. On an empirical view, it consists in the enumeration of instances, aiming at the 'Perfect' induction which has examined all possible cases, but most frequently reaching only the varying degree of probability of the 'Imperfect' induction. On the opposing view, true knowledge implies a connection of content of different elements of reality, which is not given even by a complete enumeration; every particular an expression of the universal, which is to be disentangled from irrelevant details by an analysis of the given; plurality of instances is valuable in sorting out unessential elements. The method of induction is to frame hypotheses to explain the given phenomena, to deduce from these hypotheses consequences which are to be carefully tested from experience. Hypotheses are frequently suggested by analogy, *e.g.* presence of striated rocks indicates glacial action; they are to be based on facts, and to be determined as accurately as possible, till at length they can be accepted as demonstrated theories, which alone explain the facts. A theory is established by analysis of phenomena, the isolation of the essential. Observation is difficult, requiring abundant knowledge, is liable to bias and non-observation, and cannot control all the operative conditions. In Experiment the conditions are determined by the observer, and unessential elements more easily eliminated. Both observation and experiment employ scientific instruments, the use of which does not constitute an experiment unless the observed object is modified.

Fallacies, violations of logical principles, may be divided into logical fallacies, occurring in the mere form of the statement, and material, the detection of which requires acquaintance with the subject. Logical are further subdivided into purely logical and semi-logicals. The first includes breaches of syllogistic rules, the use of four terms, undistributed middle, distribution in conclusion of term undistributed in premises (Illicit Process), inference from two negative premises. Semi-logical fallacies arise from ambiguity of grammatical construction (Amphiboly), of emphasis (Accent), of meaning of a term (Equivocation), and from confusion between the collective and distributive uses of a term (Composition and Division). Material fallacies include those of Accident, where accidental circumstances render a general rule inapplicable; Irrelevant Conclusion (*Ignoratio Elenchi*), proving the wrong point; *Petitio Principii*, assuming the proposition to be proved; False Cause, assuming a cause without sufficient grounds; Many Questions, so combined that a single true answer is impossible.

Jevons, *Lessons in Logic*.

LOGOGRAPHERS, Gr. historians who preceded Herodotus; works may be regarded as prose counterparts of epic poems, as sacred histories or pious myths.

LOGOS (Gk. *logos*, 'word,' 'reason'), a philosophical and theological term, found in Hellenic speculation from the time of Heraclitus, who postulated a divine 'logos' corresponding to the human reason, though somewhat material; it appears in Plato, Aristotle, and Stoicism. A similar concept had evolved in Judaism, where an increasing reverence had separated God from the world and an intermediate being was required; His was the divine Word (*Mêmra*). The greatest exponent of the idea of the L. was Philo, who combined Hellenic and Hebraic elements. In Christian theol. the L. doctrine appears in the Fourth Gospel (the parallel with Philo is important, but must not be pressed too close). Further developments came with Gnosticism.

Harnack, *History of Dogma*; Drummond, '*Philo Judæus*,' *a Fourth Gospel*.

LOGROÑO.—(1) (42° 15′ N., 2° 40′ W.) N. province, Spain; area, 1946 sq. miles; produces wine, oil, fruit, cereals. Pop. (1910) 188,235. (2) (42° 28′ N., 2° 33′ W.) capital of above; surrounded by walls; produces wine. Pop. (1910) 23,926.

LOGWOOD, heart-wood of l. tree (*Hæmatoxylon campechianum*) of Central America; cut in chips and fermented in heaps, it yields hæmatoxylin, the red colouring matter used in dyes and inks.

LOHARU.—(1) (28° 30′ N., 75° 45′ E.) native state, Punjab, India. Pop. *c.* 17,000. (2) (28° 23′ N., 75° 50′ E.) capital of state. Pop. 2700.

LOHENGRIN, the hero of an old Ger. poem of XIII. cent.; son of Parsifal, and a knight of the Grail; he was carried by a swan to Elsa of Mainz, and the revelation to her of his origin resulted in their separation; story is theme of Wagner's opera *Lohengrin*.

LOIRE (45° 50′ N., 4° E.), department, S.E. central France; area, 1852 sq. miles; mountainous; drained by Loire, Rhône; large deposits of coal; manufactures iron, steel, machinery, textiles, glass, paper. Pop. (1911) 640,549.

LOIRE (47° 13′ N., 2° 12′ W.), longest river of France; rises in Cevennes, and after flowing some distance N., bends to W. and enters Bay of Biscay; chief tributaries, Allier, Vienne, Sarthe; largest towns on banks, Orleans, Tours, Angers, Nantes.

LOIRE-INFÉRIEURE (47° 20′ N., 1° 45′ W.), coast department, W. France; area, 2693 sq. miles; surface generally low and flat; drained by Loire; produces flax, wine, cider; fishing; coal, iron, copper, machinery, shipbuilding. Dairy-farming and stock-raising carried on. Pop. (1911) 669,920.

LOIRET (48° N., 2° 20′ E.), inland department, France; area, 2629 sq. miles; surface rises from N.E. to S.E.; drained by Loire and tributaries of Seine; forests; produces great quantities of wheat and oats; live stock raised; manufactures woollens, leather, sugar, flour. Pop. (1911) 364,061.

LOIR-ET-CHER (47° 40′ N., 1° 20′ E.), inland department, France; area, 2478 sq. miles; watered by Loir, Cher; produces cereals, fruit, vegetables, timber, wine; horses and sheep bred; manufactures textiles, leather. Pop. (1911) 271,231.

LOISY, ALFRED FIRMIN (1857–), Fr. R.C. theologian; ordained priest, 1879; prof. of Oriental Languages and Biblical Exegesis at Catholic Institute of Paris, 1881–93; became influenced by modern critical views; lecturer at l'École des Hautes Études Pratiques, 1900; became famous on publication of *L'Évangile et l'Église*, 1902, in answer to Harnack's *What is Christianity?*; pub. *Autour d'un petit livre*, *Le Quatrième Évangile*, 1903; *Les Évangiles synoptiques*, 1908; after which he was excommunicated; prof. of History of Religions at Collège de France, 1909.

Lacey, *Harnack and Loisy*; and Loisy's works.

LOJA.—(1) (37° 11′ N., 4° 12′ W.), town, Spain; ruined Moorish castle; damaged by earthquake, 1885. Pop. 20,000. (2) (4° 10′ S., 79° 15′ W.) province, Ecuador, S. America. Pop. c. 66,000. (3) (4° S., 79° 16′ W.) town, Ecuador, S. America. Pop. *c.* 10,000.

LOKEREN (51° 6′ N., 3° 59′ E.), town, Belgium. Pop. 22,000.

LOKOJA (7° 50′ N., 6° 34′ E.), town, Nigeria, W. Africa.

LOLLARDS, a term used to describe the mediæval heretics of the XIV. cent., whose greatest leader was Wycliffe. Till then there had been little heresy in England, but grave abuses in the Church had brought about not only a widespread feeling that reform was needed, but a distrust of the entire sacerdotal and sacramental system of Catholic Christianity. The Act *De heretico comburendo* was passed by Parliament in 1401, and William Sawtre was burnt that year. Ineffectual efforts were made to put down Lollardy under Henry IV., and more stringently under Henry V., when Sir John Oldcastle (Lord Cobham) was burnt. Nevertheless Lollardy lingered on, and was finally absorbed into Protestantism, which was partially its offshoot.

Poole, *Wiclif and Movements for Reform*; Trevelyan, *England in the Age of Wycliffe*; Gairdner, *Lollardy and the Reformation.*

LOMBARDY (*c.* 45° 30′ N., 9° 30′ E.), division, N. Italy; area, *c.* 9297 sq. miles; includes provinces of Bergamo, Brescia, Como, Cremona, Mantova, Milano, Pavia, Sondrio; contains most of Ital. lakes; crossed by Po and its affluents; produces silk, cereals, wine; manufactures textiles, automobiles, paper; iron, zinc, marble worked. Pop. (1911) 4,786,907.

Lombard League, league of L. towns, especially that of 1167, when Cremona, Mantua, Brescia, Bergamo united against Emperor Frederick I., defeating him at Legnano.

Lombards, LONGOBARDI, in V. cent. a Teutonic tribe on the Danube; settled in the N. of Italy, A.D. 568, and became an independent kingdom; overthrown by Charles, the Frank king, 774 A.D., and annexed. By the XI. cent. Milan and other Lombard cities were self-governing 'communes'; they suffered the usual vicissitudes of Ital. cities, and in the XIX. cent. Lombardy was released from Austria to become part of the new united Italy of King Victor Emmanuel. In the XIII. and XIV. cent's the Lombard merchants were great bankers and moneylenders, and, though attacked for 'usury,' were safe under the protection of nobles and of Rome itself; since many Lombards acted as agents for the Papal Court. They did a very considerable business with English kings—Henry III., Edwards I., II., and III.—and with the Earls of Derby, Nottingham, Salisbury, and Suffolk. Then in 1345 the two great Lombard houses of the Bardi and Peruzzi became bankrupt—Edward III. owing the former 900,000 gold florins and the latter 600,000—and the Lombards ceased to be the principal bankers.

LOMBOK (8° 30′ S., 116° 25′ E.), one of Sunda Islands, Dutch E. Indies; area, *c.* 4000 sq. miles; mountainous, but fertile; produces cotton, indigo, tobacco, maize, sugar, coffee. Pop. *c.* 41,000 or, with Bali, *c.* 523,530.

LOMBROSO, CESARE (1836–1909), Ital. criminologist; prof. of Psychiatry at Pavia; head of lunatic asylum at Pesaro; prof. of Forensic Medicine and Psychiatry, and afterwards of Criminal Anthropology at Turin; propounded, after much research, the theories that the criminal was a special type of the human race, and also that the genius was a degenerate with a close relation to the insane, theories not altogether accepted. See CRIMINOLOGY.

LOMÉNIE DE BRIENNE, ÉTIENNE CHARLES DE (1727–94), Fr. ecclesiastic and politician; abp. of Toulouse, 1763; pres., Assembly of Notables, 1787; treasurer, 1787.

LOMOND, LOCH (56° 5′ N., 4° 35′ W.), lake, Dumbartonshire and Stirlingshire, Scotland; area, 27 sq. miles; many islands.

LOMZA, LOMZHA.—(1) (53° 5′ N., 22° 8′ E.) government, Russ. Poland; area, *c.* 4070 sq. miles; produces cereals, vegetables, flax, honey. Pop. (1910) 683,600. (2) (53° 9′ N., 22° 10′ E.) capital of above. Pop. 27,343.

LONAULI (18° 45′ N., 73° 28′ E.), town, Bombay, India. Pop. 7000.

LONDON (51° 32′ N., 0° 5′ W.), capital of United Kingdom, and largest city in the world. Modern city may be said to have been founded by Alfred on site of a place fortified by the Romans and destroyed successively by Saxons and Danes; strength of Alfred's fortifications is attested by the long and stout resistance offered by city to Canute's besieging force in 1016. Burghers received excellent terms from William the Conqueror, who built the Tower in 1078; and they obtained from Henry I., *c.* 1101, a charter which in later times was regarded as the foundation of their most important privileges; by this, L. was recognised as a corporation, and the citizens received the farm of Middlesex and the right to appoint their own portreeve. During struggles between Stephen and Matilda the latter alienated the citizens by depriving them of their ancient privileges and placing the city in demesne for first and only time; this resulted in their support of Stephen and his ultimate success. In 1136 greater part of city was destroyed by fire.

During Norman period guilds began to attain importance, and several monasteries were founded. Mayoralty was established before 1193, first mayor being Henry Fitz Ailwin, who held office till his death in 1212. During John's reign a number of foreign merchants settled in city; and the rebuilding of London Bridge, begun under Henry II., was completed in 1209. In Henry III.'s reign religious houses were established by Dominicans, Franciscans, Carmelites, and Friars Eremite; certain privileges were granted to Hanse traders in 1259; and the city fell into a defiant and lawless state, while trade suffered considerable decrease. In the following reign six members for L., including the mayor, sat for first time in Parliament in 1284; in 1285 Kirkeby, the treasurer, by a ruse took the mayoralty into hands of the king, Edward I., who eventually restored city to state of order. In this reign Jews were badly treated; many were hanged in 1279, and a decree of banishment was issued in 1290. In following reign, city supported the queen, Isabella, in deposing Edward II.

The XIII. and XIV. cent's were marked by number of processions, which occurred on occasions of national rejoicing, as on the triumphant return of king or prince after victories against the French. Richard II.'s reign was marked by Wat Tyler's rebellion here in 1381; that of Henry IV. by a visitation of plague in 1407; Jack Cade's rebellion occurred in 1450 when Henry VI. was king; and under Edward IV. the first printing-press was established by Caxton. Principal event affecting the city in Henry VII.'s reign was Perkin Warbeck's insurrection in 1497; under his successor, Henry VIII., the Act of Supremacy was followed by the Dissolution of the Monasteries, of which St. Thomas's and St. Bartholomew's afterwards became hospitals, in 1539, and the confiscation of Church property; this was succeeded in Edward VI.'s reign by the suppression of guilds, which for so long had been intimately bound up with the social life of the city. Mary's persecution of Protestants tended to strengthen cause of Reformed faith, which was firmly established under Elizabeth, in whose time there was a great increase of trade and prosperity, while lit. flourished and theatres became important.

During the Civil Wars of XVII. cent. L. espoused the cause of Parliament; but under the Commonwealth the city suffered considerably at the hands of Cromwell and was glad to welcome Charles II. at Restoration. In 1665 occurred the Great Plague, in 1666 the Great Fire, when, it is said, 13,200 houses, as well as St. Paul's and great number of churches, were burnt; after this the city was rebuilt chiefly in brick or stone, and St. Paul's and many other churches were constructed under direction of Wren. Charles II. ruined

great number of bankers and merchants by closing the Exchequer in 1672; and towards end of his reign he further alienated the citizens by taking away their charter and himself appointing a Lord Mayor. This policy was continued by James II. until landing of William of Orange, when too late he restored the charter; the citizens rejected his overtures and sent a formal petition begging William to mount the throne. In William's reign the court was removed to Kensington; and the bank of England was established in 1694.

In 1709 occurred the Sacheverell riots, and in 1720 the bursting of the South Sea Bubble involved countless families in ruin. The Bank of England was built in 1732–34, and in 1753 the British Museum was founded. The old wall and eight gates were taken down in 1760. In 1805 the docks were opened, and in 1807 gas was first used as means of lighting streets. Cabs came into use from 1823 onwards, omnibuses from 1829. Rebuilding of L. Bridge was completed in 1831; and in 1838 the Royal Exchange was burnt, a new building being opened in 1844, in which year also the old debtors' prison of the Fleet was destroyed.

Since middle of XIX. cent. L. has greatly increased in all directions, and great number of suburbs have sprung up. First underground railway was opened in 1863, since when subterranean means of communication have been greatly extended. Temple Bar was removed in 1878. Changes in administration resulted from the Local Government Acts of 1888 (when County of L. was formed) and 1894, and in 1900 the administrative county was divided into 28 municipal boroughs. Tower Bridge, of which the foundation stone was laid in 1886, was opened in 1894.

L. occupies parts of Middlesex, Surrey, and Kent, while the outer ring of suburban districts extend also over parts of Essex and Hertfordshire. Districts N. of Thames, next river, from W. to E., are Hammersmith, Fulham, Chelsea, Westminster, Strand, City, and Tower Hamlets; outside these, Kensington, Paddington, Marylebone, Hampstead, St. Pancras, Finsbury, Islington, Hackney, West Ham; and between Finsbury and the City and West Ham, partly through Tower Hamlets, the sub-districts of Whitechapel, Stepney, Limehouse, Poplar touching the river, and to N. of these Shoreditch, Bethnal Green, Mile-End. On S. side, next river, are Wandsworth, Battersea, Lambeth, Deptford, Greenwich, Woolwich; outside these, Clapham, Camberwell, Lewisham; across Lambeth and Southwark are minor sub-districts of Brixton, Kennington, Newington, Bermondsey. Leaving out Strand, Tower Hamlets, West Ham, Whitechapel, Limehouse, Mile-End, Clapham, Brixton, Kennington, and Newington, and adding Holborn (part of Finsbury) and Stoke Newington (N. Hackney), we have list of metropolitan boroughs making up administrative county.

City of L. has area 672 acres; administrative county, *c.* 117 sq. miles; Greater L., or Metropolitan Police area, *c.* 602 sq. miles. The Bank of England may be called the central point of the city, and from this streets radiate in all directions; of these one, as Poultry and Cheapside, leads westward to St. Paul's, whence two great roads lead towards the W.; of these the northern thoroughfare, known successively as Holborn Viaduct, Holborn, Oxford Street, and Bayswater Road, leads past Marble Arch and northern side of Hyde Park, and so to Hammersmith; while the southern, as Ludgate Hill, Fleet Street (where the Fleet once flowed to join Thames), and Strand (formerly the river bank), leads to Trafalgar Square, and as Pall Mall to Green Park. N.W. of Trafalgar Square is Piccadilly Circus, whence Regent Street curves northwestward to meet Oxford Street at Oxford Circus, while Piccadilly runs westward to Hyde Park Corner, and continues, as Knightsbridge, Kensington Gate, and Kensington High Street, past the S. side of Hyde Park and Kensington Gardens to the royal borough of Kensington, and W. to Hammersmith. Other important thoroughfares are the Edgeware Road, which represents the Rom. Watling Street and leads from Marble Arch towards N.W.; Victoria Embankment, on N. side of river, between Westminster and Blackfriars Bridges; Tottenham Court Road, continuing as Hampstead Road and leading from Oxford Street to N. Hampstead.

Among well-known squares are Belgrave, Eaton, Leicester, Parliament, Russell, and Soho Squares; Trafalgar Square and Charing Cross are western business centre; and finest shops are in Piccadilly, Regent Street, Oxford Street, Bond Street, and Kensington High Street. There is traffic across Thames by nineteen bridges as well as by steamers and five tunnels. Principal bridges, W. from Tower Bridge, are London Bridge, Blackfriars, Waterloo, Charing Cross, Westminster, Vauxhall, Chelsea, and Battersea Bridges; Waterloo is oldest of existing bridges, and was constructed, 1811–17, by John Rennie.

L. is full of interesting buildings. Most important churches are Westminster Abbey, oldest part of which dates from 1245, while greater part was built in 1483–1509, in Gothic style; St. Paul's Cathedral, built by Sir Christopher Wren in Classic style in 1675–97, is the third cathedral church on this site—the first was established in Saxon times, and was burnt towards close of XI. cent.; second was built between *c.* 1087 and 1283, and was destroyed by Great Fire of 1666, being replaced by present building. Examples of Norman architecture are St. Bartholomew's Church, in Smithfield, built in XII. cent., used for a long time as smithy; St. John's, in the Tower; the Temple Church, built by the Knights Templars *c.* 1185, in the churchyard of which is Oliver Goldsmith's tomb. The Church of St. Mary le Bow, or Bow Church, in Cheapside, has a Norman crypt, and was first London church built on stone arches, which were used by Wren as foundation for his own building. Other interesting churches are St. Saviour's Cathedral Church, at Southwark, where the poet Gower is buried, built in XIII. cent.; Church of Austin Friars, built *c.* 1354; All Hallows Church, Barking, which has a remarkable collection of brasses; St. Giles', Cripplegate, built 1545, which contains tomb of John Milton, and was the scene of Cromwell's marriage; St. Helen's, Bishopsgate, which dates from XIII. cent., and has many interesting monuments; St. Ethelreda, Ely Place, is a R.C. church containing ancient crypt and Saxon font; St. Katharine Cree, in Leadenhall Street, which is ascribed to Inigo Jones, and dates from 1631; St. Margaret's, close to Westminster Abbey; St. Andrew Undershaft, built XVI. cent., and containing Stow's monument; Ely Chapel, in Holborn. More modern churches are St. Martin's-in-the-Fields, Trafalgar Square, built in 1726; St. Pancras, in Euston Road, built 1822; and the new R.C. cathedral at Westminster, of Byzantine architecture, which is magnificently decorated inside.

Among important public buildings are: the Tower (covering about 13 acres) of London, which was built by William the Conqueror, was long used as a State prison, now an arsenal, and has museum with interesting collection of mediæval armour and weapons, and a room in which the Crown jewels and regalia are kept; the Houses of Parliament at Westminster, which were built of the sandstone of Aislaby in Whitby, by Barry, and are neo-Perpendicular in style; Guildhall, Mansion-House, Royal Exchange, and Bank of England, in the City; Somerset House and law courts, in the Strand; British Museum, in Bloomsbury, built 1828–52; Victoria and Albert and Natural History Museums, in South Kensington, and the Albert Hall close by; Soane's Museum, in Lincoln's Inn Fields, which contains Wren's plans for rebuilding of L. after Great Fire of 1666; the National Gallery and National Portrait Gallery, in Trafalgar Square and St. Martin's Lane. There are also fine art collections at Hertford House, where the Wallace Collection remains, and in the Tate Gallery, Vauxhall; and at Burlington House, in Piccadilly, is held the annual exhibition of the

Royal Academy. Royal palaces include Buckingham Palace, originally built in XVIII. cent.; Westminster Palace, used as royal residence until *c.* 1512; St. James's Palace, which was constructed as such under Henry VIII.; Marlborough House, built by Wren, 1709–10; Kensington Palace, first used as residence by William III., and now open to the public. The palace of the Archbishop of Canterbury at Lambeth is mainly modern. There are many beautiful parks, including Hyde Park and Kensington Gardens, between Bayswater Road on N. and Knightsbridge and Kensington on S.; Green Park, bordering on Piccadilly, and St. James's Park, adjoining it; Regent's Park, in Marylebone, which contains Zoological and Botanical Gardens; Battersea Park, in S.W. Hampstead Heath, in the N.W., is a favourite Bank Holiday resort.

L. is seat of University, which has eight faculties, and was organised in its present form in 1900; public schools include Westminster and St. Paul's. Charitable institutions include the London Hospital in Whitechapel, St. Bartholomew's Hospital in Smithfield, Guy's in Southwark, St. Thomas's in Lambeth, St. George's at Hyde Park Corner, and Queen Charlotte Hospital. There are numerous theatres, situated chiefly in the west end.

L. returns 61 members to the House of Commons. For municipal purposes it is divided into 27 boroughs, in addition to the Cities of London and Westminster. Affairs of City of London are managed by the City Corporation, and general local authority for the remainder of L. is the County Council. The Lord Mayor is elected by the former body. The L. County Council owns the tramways and passenger steamers, directs education (by Education Act, 1903), maintains bridges, tunnels, drainage, parks, etc., and supervises all building and sanitary arrangements.

The port of L. extends from London Bridge to Blackwall, and is one of largest and busiest in the world, having 30 % of total trade of United Kingdom; value of imports nearly double that of exports, owing to distance from coal and enormous population. L. is important distributing centre, and is meeting-place of all the great railway systems of kingdom, and has water communications inland up Thames valley. Has enormous amount of dock accommodation—London Docks, St. Katharine Dock, East and West India, Royal Victoria, Royal Albert, Millwall, Tilbury, and other docks; warehouses and stores for all kinds of goods, great cold storage buildings, enormous vaults for wines, oils, etc. Centre for great bulk of commerce with East Indies, China, and France. Industries include those connected with food supply, clothing, shipping appliances, house fittings and furnishings, textiles, etc. Total tonnage of arriving and departing vessels, apart from coasting trade, in 1910 was 24,596,746. There are many markets, most of which are under authority of City Corporation; these include Billingsgate fish market, Leadenhall meat market, the London Central Markets, in Smithfield, for fruit, meat, provisions, etc., the Metropolitan Cattle Market, in Islington. Covent Garden is a private market held by Dukes of Bedford. Pop. (1911) of City, 19,657; of 'Outer Ring,' 2,730,002; of Greater London, 7,252,963.

Besant, *Survey of London* (1902–8); Wheatley, *Story of London* (1904); Loftie, *London* (Historic Towns, 1887); Douglas-Irving, *History of London* (1912); Jesse, *Literary and Historical Memorials of London* (1847); publications of London Topographical Society.

LONDON (43° N., 81° 16′ W.), town, Ontario, Canada. Pop. (1911) 46,300.

LONDON CLAY, in geology, an important member of the Lower Eocene formations of Great Britain, best developed in Thames valley; colour, bluish and brownish; numerous fossil remains include fish, reptiles, birds, and plants.

LONDON PRIDE, see SAXIFRAGACEÆ.

LONDONDERRY.—(1) (54° 55′ N., 6° 55′ W.) coast county, Ulster, N. Ireland; area, *c.* 816 sq. miles; surface hilly in centre and S., elsewhere flat; drained by Foyle, Bann, Roe; linen manufactures, agricultural produce, fisheries. Formerly belonged to O'Neills. Pop. (1911) 140,621. (2) (55° N., 7° 20′ W.) town, L. County, Ireland, on Foyle; encircled by walls; R.C. and Anglican cathedrals; episcopal palace on site of former monastery; excellent harbour; salmon-fisheries, shipbuilding yards, linen manufactures, distilleries. Besieged by James II., 1688–89. Pop. (1911) 40,799.

LONDONDERRY, CHARLES WILLIAM STEWART VANE, 3RD MARQUESS OF (1778–1854), Brit. nobleman; fought in Napoleonic Wars; succ. to title, 1822; grandfather of present (1913) marquess.

LONDONDERRY, ROBERT STEWART, 2ND MARQUESS OF (1769–1822), Brit. statesman; member of Irish Parliament, 1790; Viscount Castlereagh, 1795; Keeper of Privy Seal, Ireland, and Chief Sec., 1797; put down Fitzgerald's conspiracy, and rebellion of 1798; after Union, 1800, M.P. for Down; pres., Board of Control, 1802; supported Wellesley's policy in India; advocated Catholic relief in Ireland; War and Colonial Sec., 1805; again War Minister, 1807. Took measures against Napoleon; succeeded in appointing Wellesley commander-in-chief in Portugal, 1809; quarrelled with Canning; planned Walcheren expedition, 1809; after failure of which found Canning and his colleagues had resolved on his removal from office. After duel with Canning, both resigned; Foreign Sec. and leader of House, 1812; for twelve years exercised great power and controlled Lower House; skilled in diplomacy; tried to keep together Grand Alliance: concluded treaty of Chaumont, 1814; represented United Kingdom at Congress at Vienna, 1814; concluded secret treaty between Britain, Austria, and France against Russ. and Pruss. projects in Poland and Saxony respectively; this was pub. after Napoleon's escape from Elba. On Napoleon's final defeat, arranged terms of peace; Home Sec., 1821; protested against Grand Alliance policy of intervention; should have represented Britain at Congress at Verona, 1822, but before this took place, committed suicide. A. Alison, *Biography*.

LONG BEACH, watering-place near Los Angeles, California. Pop. (1910) 17,809.

LONG BRANCH (40° 17′ N., 74° 2′ W.), town, New Jersey, U.S.A.; seaside resort; annual horse show. Pop. (1910) 13,298.

LONG EATON (52° 55′ N., 1° 17′ W.), town, Derbyshire, England; lace. Pop. (1911) 19,215.

LONG ISLAND (40° 50′ N., 73° W.), island of New York State, E. of New York Bay, and separated from New York by East River, across which are famous suspension bridges; to the N. is L. I. Sound, an important channel leading to Atlantic, area, 1681 sq. miles; surface undulating; considerable area is woodland and sandy waste, and there are a number of lakes; at W. end of island are Queens Borough (with Long Island City) and Brooklyn, now parts of New York City; Coney Island is popular resort. Game is abundant and there are excellent fisheries and oyster beds; market-gardening, oil-refining, carpet-weaving, and piano manufacture carried on; scene of battle in 1776, when Americans under Washington were defeated by English under Howe and Clinton. Pop. (1905) 1,718,056.

LONG ISLAND CITY (40° 45′ N., 74° W.), former city, now included in borough of Queens, New York City, U.S.A. Pop. (1900) 48,272.

LONG PARLIAMENT (1640–60), see ENGLAND (*History*); CROMWELL, OLIVER.

LONGCHAMP, WILLIAM (d. 1197), Eng. chancellor and bp. of Ely under Richard I.; opposed John; banished, 1191; undertook diplomatic missions for Richard.

LONGFELLOW, HENRY WADSWORTH (1807–

82), Amer. poet; b. Portland, Maine; ed. Bowdoin Coll., Brunswick; became prof. of Modern Languages at Bowdoin, 1829, after three years' travelling in Europe; prof. of Modern Languages at Harvard, 1835; was married twice—in 1831 to Miss Potter, who died in 1835, and in 1843 to Miss Appleton. He travelled to Europe several times, and was particularly popular in England. After his death a bust was placed in the 'Poets' Corner' of Westminster Abbey.

His earlier poems, before he became saturated with European mediævalism and mysticism, are treated naturalistically and with freshness. All through his works the religious element bulks large, but there is lacking that deep psychology which is to be found in Browning; as a translator he was faithful and spirited.

Chief works: *Voices of the Night*, a book of original poems (1839), *The Spanish Student*, a drama (1843), *The Poets and Poesy of Europe* (a collection containing many of his translations) (1845), *Evangeline* (1847), *The Golden Legend* (1851), *Tales of a Wayside Inn* (1863–74), translation of Dante's *Divina Comedia* (1867–70).

LONGFORD.—(1) (53° 40′ N., 7° 52′ W.) county, Leinster, Ireland; area, c. 421 sq. miles; surface generally flat; produces potatoes, oats; live stock raised; manufactures linen. Pop. (1911). (2) (53° 44′ N., 7° 43′ W.) county town of above; R.C. cathedral. Pop. 3747.

LONGINUS, CASSIUS (c. 213–73 A.D.), Gk. rhetorician and philosopher, taught for many years at Athens, where he had Porphyry for a pupil. Later he became adviser of Zenobia at Palmyra, whom he encouraged to resist Aurelian; the latter, when victorious, put him to death. Of his writings little has survived. The treatise, *On the Sublime*, formerly ascribed to him, probably belongs to the I. cent. A.D. Saintsbury, *History of Criticism* (1900–4).

LONGMANS, firm of London publishers of high standing; founder of firm was Thomas L. (1699–1755). In 1726 he bought a business in Paternoster Row, the present site of the firm.

LONGOBARDI, see LOMBARDS.

LONGSTREET, JAMES (1821–1904), Amer. general; served in Mexican War; distinguished on Confederate side in Civil War, especially at battle of Chickamauga.

LONGTON (52° 59′ N., 2° 8′ W.), town, Staffordshire, England; pottery. Pop. (1911) 37,481.

LONGUEVILLE, ANNE GENEVIÈVE, DUCHESSE DE (1619–79), dau. of Henri, Prince of Condé; m. Duc de Longueville, 1642; played important part in Fronde wars; subsequently embraced Jansenist opinions; renowned for piety.

LONGWY (47° 32′ N., 5° 45′ E.), town, Meurthe-et-Moselle, France; fortified; ironworks. Pop. 10,000.

LÖNNROT, ELIAS (1802–84), see FINLAND (*Language and Lit.*).

LONSDALE, EARLS OF.—JAMES LOWTHER, 1st earl (1736–1802), Eng. politician; M.P., 1757–84. WILLIAM, 3rd earl (1787–1872), held various minor offices of state; Pres. of Council, 1852.

LONS-LE-SAUNIER (46° 41′ N., 5° 33′ E.), town, Jura, France; salt springs; produces wine. Pop. 13,200.

LOO, card game; three cards dealt; trumps determined by turning up first card after dealing. An extra hand, 'missy,' or 'widow,' is dealt; may be exchanged for dealt hand.

LOOE (50° 22′ N., 4° 27′ W.), port, Cornwall, England; fisheries; exports grain, granite. Pop. (1911) 2718.

LOOKING-GLASS, see MIRROR.

LOOM, see WEAVING.

LOÓN (9° 50′ N., 123° 50′ E.), town, Bohol, Philippine Islands. Pop. c. 19,000.

LOPES, FERNÃO (c. 1380–1459), Portug. chronicler and archivist; keeper of royal archives, 1418; studied early records and produced first history of kings of Portugal; graphic style.

LOPEZ, CARLOS ANTONIO (1790–1862), Paraguayan despot; b. Asuncion. During the dictatorship of Francia he was obliged to live in concealment, but after his death he developed the resources of the country and expanded its powers.

LOP-NOR, LOB-NOR (39° 50′ N., 90° E.), lake, Desert of Gobi, Chinese Turkistan, Central Asia.

LORAIN (41° 24′ N., 82° 10′ W.), town, Ohio, U.S.A.; shipbuilding, coal trade. Pop. (1910) 28,883.

LORALAI (30° 22′ N., 68° 35′ W.), town and district, Baluchistan, India. Pop. of district, 67,864; town, 3561.

LORCA (37° 44′ N., 1° 43′ W.), town, E. Spain; wine, lead, textiles; scene of hostilities during wars with Moors. Pop. (1910) 72,795.

LORCH.—(1) (50° 2′ N., 7° 47′ E.) town, Hesse-Nassau, Germany; wine. Pop. 2269. (2) (48° 47′ N., 9° 42′ E.) town, Württemburg, Germany; cement. Pop. 3100.

LORD (O.E. 'bread-winner'), Brit. title; peers are lords temporal, bishops are lords spiritual; younger sons of dukes and marquises have courtesy title 'Lord'; as official title it is held by Lord Chancellor, Lord High Steward, etc., and by Scot. Court of Session judges. Cf. 'Lord Mayor,' 'Lord Provost.'

LORD ADVOCATE, see ADVOCATE.

LORD CHAMBERLAIN, see CHAMBERLAIN.

LORD CHIEF JUSTICE, Pres. of High Court (app. by the Crown) in absence of Lord Chancellor; ex-officio judge of Court of Appeal; presides at the King's Bench Division of the High Court. Salary, £8000.

LORD GREAT CHAMBERLAIN, see CHAMBERLAIN.

LORD HIGH CHANCELLOR, speaker or proloctor of House of Lords; not necessarily a peer, but, by established custom, on attainment of office he is raised to peerage. The Lord Chancellor is custodian of the Great Seal, and Presiding Lord of Appeal in cases before House of Lords; highest judicial officer in kingdom; appoints all County Court judges and J.P's; must be a member of Established Church; salary, £10,000 a year. See CHANCELLOR.

LORD HIGH STEWARD, Eng. chief state official; originally presided over Court of Claims; now only app. for special occasions, *e.g.* coronation or trial of peer.

LORD HOWE ISLANDS (31° 30′ S., 159° E.), Brit. group of islands, S. Pacific; 450 miles N.E. of Sydney; administered by New South Wales. Pop. c. 100.

LORD, JOHN (1810–94), Amer. historian; wrote *Beacon Lights of History*, etc.

LORD KEEPER OF THE GREAT SEAL, office important in mediæval England, which existed till XVIII. cent.; the Lord Keeper was often made Lord Chancellor.

LORD MAYOR'S DAY, Nov. 9, when the Lord Mayor's Show has been held in London since 1215.

LORD OF THE ISLES, title of chiefs of Scot. Western Isles; Somerled received a grant of Bute and Arran from David I., 1135; a descendant, after Haco of Norway's defeat, ceded Western Isles to Scotland, and henceforth Lords of the Isles were vassals. Notable Lords were Donald (d. c. 1420), who sought Eng. help to make Isles independent; John (d. c. 1498), last Lord, had his lands confiscated, but retained title.

LORD STEWARD, chief officer of Royal Household; a member of the Government and almost invariably a peer of the realm; presides over the *Board of Green Cloth*, which deals with accounts of the Household, appoints royal tradesmen, and selects officers and servants of the Household.

LORDS OF THE ADMIRALTY and TREASURY, see ADMIRALTY, TREASURY.

LORD'S SUPPER, see EUCHARIST.

LORELEI, Lurlei (50° 8′ N., 7° 45′ E.), rock, some 430 ft. high, on right bank of Rhine, a few miles below Bingen; legendary haunt of a siren. *Die L.* is a celebrated poem by Heine.

LORENZO MARQUES, see Lourenço Marques.

LORETO (3° 49′ S., 70° 9′ W.), department, N.E. Peru; a vast plain; thickly wooded; traversed by the Ucayali and Huallaga; chief export, rubber; capital, Iquitos. Pop. *c.* 110,000.

LORETO, Loretto (43° 27′ N., 13° 35′ E.), town, Ancona, Italy, on Musone. Its Santa Casa, reputed to have been the house of the Virgin Mary in Nazareth, has long been a famous pilgrimage shrine; rosaries, crucifixes manufactured.

LORIENT (47° 47′ N., 3° 21′ W.), fortified seaport and naval arsenal, Morbihan, France, at confluence of Scorff and Blavet; extensive docks and shipbuilding yards; iron-founding, engineering, and fishing industries; founded by Fr. East India Co., 1664; Brit. naval victory over French off L., June 1795. Pop. (1911) 49,039.

LORIES, see under Parrot Tribe.

LORIIDÆ, see under Parrot Tribe.

LORIQUETS, see under Parrot Tribe.

LORIS or Slow Lemurs (*Nycticebus* and *Loris*), two genera of Lemuroidea (*q.v.* under Primates); with short tail or none, index finger small and nailless, bases of toes webbed; nocturnal; vegetarian and carnivorous; found in tropical Asia.

LORIS-MELIKOV, MICHAEL TARIELOVICH, COUNT (*c.* 1825–88), Russ. politician; distinguished in Russo-Turk. War, 1877–78; Minister of Interior, 1880.

LORRACH (47° 36′ N., 7° 41′ E.), town, grand-duchy of Baden, Germany, on Wiese; textile industries.

LORRAINE, Lothringen, ancient province of France, situated between Champagne on W., Franche-Comté on S., Alsace on E., Germany and Netherlands on N.; formed from realm given by Emperor Lothair to his second s., Lothair, 855. Under Rom. occupation Trèves was capital of *Belgica Prima*, and Metz, Toul, and Verdun were important cities; Christianised in III. cent.; became centre of Frankish kingdom of Austrasia in V. cent. and scene of great monastic activity, especially at Metz; became in 916 a duchy over which both France and Germany claimed overlordship; declared independent of empire, 1542; henceforth under Fr. influence; Richelieu made pretext for governing the duchy in XVII. cent.; in 1662 Duke Charles was forced to bequeath it to France, but in 1670 Louis XIV. occupied it and retained it until forced to restitution by Treaty of Ryswick, 1697; on death of Duke Stanislas, 1766, France annexed the duchy; Prussia took small portion, 1815; Germany annexed entire northern portion, 1871. See Alsace-Lorraine.

LORRIS, GUILLAUME DE (d. *c.* 1230), Fr. poet; wrote first section of *Roman de la Rose*.

LOS ANDES (8° 40′ N., 71° W.), former state of Venezuela, now included in states Tachira, Trujillo, and Mérida.

LOS ANGELES (34° 3′ N., 118° 11′ W.), town, S. California, U.S.A.; business centre for S. California, Arizona, and New Mexico, with very large trade; crops and manufactured goods dealt with estimated at annual value of over £50,000,000; centre of fruit-producing district; industries include fruit-canning, meat-packing, lumbering, manufacture of flour, steel, cottons. L. A. is regularly laid out, and has beautiful parks and botanic gardens; seat of R.C. cathedral, Methodist-Episcopal Univ., observatory; has fine public buildings and many churches. Pop. (1910) 319,198.

LOS ISLANDS (9° 20′ N., 13° 40′ W.), group of volcanic islands, off coast of Fr. Guinea, W. Africa.

LOSSIEMOUTH (57° 43′ N., 3° 18′ W.), town, Elginshire, Scotland.

LÖSSNITZ (50° 37′ N., 12° 43′ E.), town, Saxony, Germany.

LOST PROPERTY.—Should be handed over to the police; if owner does not claim it within three months, it belongs to finder.

LOSTWITHIEL (50° 24′ N., 4° 41′ W.), market town, on Fowey, Cornwall, England.

LOT, in *Genesis*, traditional progenitor of Ammon and Moab.

LOT (44° 40′ N., 1° 40′ E.), department, S.W. France, formed chiefly from ancient province Quercy, in Guienne; hilly; chief rivers, Lot and Dordogne; principal products, wine, tobacco, cereals; capital, Cahors. Pop. (1911) 205,760.

LOT (44° 30′ N., 1° 4′ E.), river, S. France, joins Garonne near Aiguillon; length, 300 miles; 194 miles navigable; ancient *Oltis*.

LOT-ET-GARONNE (44° 20′ N., 0° 30′ E.), department, France, formed from part old provinces of Guienne and Gascony; watered by Garonne and affluents; chief occupation, agriculture; capital, Agen. Pop. (1911) 268,083.

LOTHAIR (825–69), king of Lorraine (Lotharingia); chiefly remarkable for attempts to divorce wife, Teutberga; supported by Louis the German.

LOTHAIR I. (795–855), Holy Rom. emperor; succ., 840; defeated by bro's at *Fontenoy*, 841; by Treaty of Verdun obtained imperial title and Italy.

LOTHAIR II. or **III.** (*c.* 1070–1137), Holy Rom. emperor; duke of Saxony, 1104; elected Ger. king, 1125; defeated Conrad of Hohenstaufen, his rival for imperial crown, 1129; captured Nuremberg and Spires; supported Innocent II. against Anacletus II., rival pope; reduced Bavaria to order; defeated Hohenstaufen; extended imperial power over S. Italy.

LOTHIAN, the three counties of Haddington, Edinburgh, and Linlithgow, in Scotland, are called the L's. For some cent's the whole district from Tweed to Forth was called L., and formed part of Anglian kingdom of Northumberland; but in 1018 it was taken by the Scots, and the name came to be restricted to the counties above mentioned.

LOTHIAN, EARLDOM AND MARQUESSATE OF, titles of Kerr family. Robert, 1st marquess, supported William III. William, 3rd marquess, present at *Culloden*.

LOTHIAN, EAST, see Haddingtonshire.

LOTHRINGEN, see Lorraine.

LOTI, PIERRE, pseudonym of Louis Marie Julien Viaud (1850–), Fr. naval officer and author; landscape painter or poet *manqué* rather than novelist; emotional, exotic, picturesque; principal stories include *Mon Frère Yves* (1883), *Pêcheur d'Islande* (1886), *Madame Chrysanthème* (1887), *Fantômes d'Orient* (1892), *Ramuntcho* (1897).

LÖTSCHEN PASS, Lötschberg (46° 28′ N., 7° 48′ E.), glacier pass, between Kandersteg, Bernese Oberland, and Lötschen valley, canton Valais, Switzerland.

LOTTERIES.—By Lotteries Act, 1823, selling of tickets or chances in a lottery (including Foreign State Lotteries) is illegal, and involves penalty of £50 and punishment as a rogue and vagabond. Raffles at bazaars are lotteries, and are consequently illegal; the fact that they are on behalf of charity makes no difference as far as law is concerned. Certain lotteries, however, are authorised by Act of Parliament, notably those carried on by Art Unions. A prize drawing, where every ticket carries a prize, is not a lottery.

Ashton, *History of English Lotteries*.

LOTTO, LORENZO (*c.* 1480–1556), Ital. painter; dealt chiefly with religious and allegorical subjects.

LOTUS, name applied to various plants, *e.g.* Water-Lily of Africa; root of *Nymphæa* L. of the Nile is edible; *Lotophagi*, a N. African people, according to Homer, gave Ulysses the fruit of the lotus-tree, and its influence made him forget his home and people. See Tennyson's *The Lotus-Eaters*.

LOTZE, RUDOLF HERMANN (1817–81), Ger. philosopher; ed. Leipzig univ.; as a boy studied classics; then devoted himself to science, philosophy, and med.; felt strongly the need of applying proper scientific methods to study of philosophical problems; had keen appreciation of art, and æsthetic apprecia-

tion of beauty united with strong ethical instincts. For some years he devoted himself to working out the relation of psychology and biology, and aimed at showing the reign of law here as elsewhere. In his *Metaphysik* he arrives at the conclusion that everything of which we are cognisant is under the realm of facts, laws, or ethical standards, though these are in essence one; there is a personal God, without whom the Universe would be incomprehensible. His place in history of philosophy is, as regards his method, in opposition to the idealism of Hegel, and on its constructive side akin to Leibnitz.

Jones, *Account of the Philosophy of Lotze.*

LOUBET, ÉMILE FRANÇOIS (1838–), Fr. pres.; deputy, 1876; Minister of Public Works, 1887; Premier, 1892; Pres. of Senate, 1896; Pres. of Republic, 1899–1906; administration marked by disestablishment of Church, and *entente cordiale* with Britain.

LOUDON, ERNST GIDEON, BARON VON, LAUDON (1717–90), field-marshal of Ger. empire; distinguished himself in Wars of Austrian Succession and Seven Years War, winning several brilliant victories over armies of Frederick the Great; ended Turk. peril by capture of Belgrade, 1789. His nephew, JOHANN LUDWIG ALEXIUS, BARON VON LOUDON (1762–1822), was imperial lieut.-field-marshal, and noted, like himself, for intrepidity and absence of self-seeking.

LOUDOUN, JOHN CAMPBELL, 1ST EARL OF (1598–1663), Scot. Covenanter; cr. earl, 1633; Lord Chancellor of Scotland, 1641; 'principal manager of the rebellion;' fought for Charles II. at *Dunbar*, etc.

LOUDUN (47° N., 0° 5′ E.), town, Vienne, France; lace.

LOUGHBOROUGH (52° 47′ N., 1° 12′ W.), town, Leicestershire, England; hosiery.

LOUGHREA (53° 12′ N., 8° 45′ W.), market-town, on Loughrea, Galway, Ireland.

LOUGHTON (51° 39′ N., 0° 4′ E.), town, Essex, England.

LOUHANS (46° 40′ N., 5° 15′ E.), town, Saône-et-Loire, France.

LOUIS I. and II., kings of Bavaria, see LUDWIG.

LOUIS, LUDWIG, Holy Rom. emperors: **Louis I., THE PIOUS,** *Le Débonnaire* (778–840), king of France; s. of Charlemagne; emperor, 814; reign marked by various revolts of his sons, who deposed him, 833; restored, 834.—**Louis II.** (825–75), succ., 855; reign marked by wars against Saracens whom L. defeated and expelled from Capua.—**Louis III.** (*c.* 880–928), succ., 901; called *The Blind*, because blinded by enemies, 905.—**Louis IV., THE BAVARIAN** (*c.* 1287–1347), king of Germany, 1314; defeated Frederick of Austria, rival claimant, at *Mühldorf*, 1322; subsequently warred against Pope John XXII., who refused to recognise him; took Pisa, 1327; crowned Rom. emperor, 1328; deposed pope; formed alliance with Edward III. of England; election as emperor declared valid by council of electors at Rheuse, 1338, although not recognised by pope.

LOUIS, kings of France: **Louis I.,** see LOUIS I., Rom. emperor.—**Louis II.** (846–79), succ., 877; called *Le Bègue* (stammerer).—**Louis III.** (*c.* 863–82), became joint-king with bro. Carloman (*q.v.*), 879; defeated invading Northmen, 881.—**Louis IV.** (921–54), crowned, 936; called *d'Outremer* because he spent childhood in England with his Eng. mother, wife of Charles the Simple.—**Louis V.** (967–87), succ., 986; called *Le Fainéant.*—**Louis VI., THE FAT** (1081–1137), succ., 1108; suppressed barons' depredations; warred against Henry I. of England 25 years, in Normandy; rallied France against threatened invasion of Emperor Henry V.; strengthened crown and encouraged emancipation of Communes.—**Louis VII.** (*c.* 1121–80), called *Le Jeune*; succ., 1137; defeated Theobald of Champagne, 1144; undertook Second Crusade, 1147, with humiliating results; warred against Henry II. of England, who m. L.'s divorced wife, Eleanor of Aquitaine, thus acquiring S.W. France.—**Louis VIII.** (1187–1226), succ., 1223; at behest of rebellious Eng. barons invaded England, 1216; defeated at *Fair of Lincoln*, 1217; recovered Poitou from Henry III. of England, 1224; led crusade against Albigenses, 1226; called *Le Lion.* See FRANCE (History).

LOUIS IX., ST. LOUIS (1214–70), king of France; succ., 1226; put down rising of nobles, 1242; vowed to undertake crusade, 1244; sailed for Egypt, 1248; defeated and taken at *Mansura*, 1250; four years captive in Syria; on return concluded treaties of Paris, 1259, and Corbeil, 1258, in which made settlements with England and Aragon respectively; sailed on Second Crusade, 1270; d. from plague in Tunis; canonised, 1297; a wise and just ruler; founded Sorbonne and introduced many administrative and judicial reforms.—**Louis X.** (1289–1316), succ., 1314; called *Le Querelleur.*

Life of Louis IX. in Joinville's contemporary *Memoirs*; Perry, *St. Louis* (1901).

LOUIS XI. (1423–83), king of France; twice rebelled against his f., Charles VII.; m. Margaret of Scotland; succ., 1461; tried to curb power of barons, who formed league with Charles the Bold, Duke of Burgundy, and declared war, 1465; yielded to nobles' demands; subdued Normandy, 1467; taken prisoner by Charles of Burgundy at Péronne, 1468; subsequently allied himself with Lancastrians against Edward IV. of England and Charles of Burgundy; made truce, 1471; Charles the Bold defeated and killed at *Nancy*, 1477. L. then warred against Maximilian of Austria, who m. Charles' dau.; by treaty of Arras, 1482, obtained Burgundy, Picardy, and other provinces; acquired Bar and Anjou, 1480, Maine and Provence, 1481; interference in Spain unsuccessful; attained great influence in Italy; united France and increased power of Fr. crown, by masterly but unscrupulous diplomacy.

C. Hare, *Life of Louis XI.* (1907).

LOUIS XII. (1462–1515), king of France; called *Le Père du Peuple*; succ., 1498; conducted wars in Italy, resisted Holy League, defeated at *Guinegatte*; m. (1514) Henry VIII.'s sister Mary. See FRANCE (History).

LOUIS XIII. (1601–43), king of France; s. of Henry IV.; succ. 1610. Queen-mother, Marie de' Medici, governed during minority; superseded by Richelieu, who became minister, 1624, henceforth ruling France. L. took little part in public affairs; supported Richelieu's policy. Reign marked by civil war, plots, struggle with Protestants. See FRANCE (History).

LOUIS XIV., LE GRAND (1638–1715), king of France; succ., 1643; Fronde War and Thirty Years War ended during minority; after Mazarin's death, 1661, L. assumed government; encouraged Colbert's financial schemes; gained prestige in War of Devolution, 1667–68; Dutch war, 1672–78; later years marked by influence of Mme de Maintenon, whom he secretly married; revocation of Edict of Nantes; Wars of Grand Alliance, 1688–70, and Span. Succession, 1670–1713. L. was a profound believer in divine right of kings, declaring *L'Etat, c'est moi*; his ostentatious despotism finally led to universal opprobrium. L.'s reign was Augustan age of Fr. lit. and fine arts. See FRANCE (History, Literature).

Hassall, *Louis XIV.*; Voltaire, *Siècle de Louis XIV.*; Saint-Simon, *Mémoires.*

LOUIS XV. (1710–74), king of France; succ. great-grandfather, Louis XIV., Duke of Orleans regent, 1714; Fleury subsequently became minister, ruling till 1743. Reign was marked by War of Austrian Succession (1741–48) and Seven Years War (1756–63); French defeated in latter, lost India and Canada. L. was infatuated by Mme de Pompadour and others. His reign weakened France at home and abroad, and, helped by the *philosophes* and *encyclopédistes*, prepared way for Fr. Revolution. See FRANCE (History, Literature).

LOUIS XVI. (1754–93), king of France; grandson of Louis XV.; succ., 1765; encouraged Turgot's reforms; later influenced by wife, Marie Antoinette (*q.v.*); Fr. Revolution of 1789 precipitated by extravagance of court and ministry; imprisoned by revolutionaries; deposed and executed (Jan. 21); well-intentioned, but weak, he reaped what others had sown. See FRANCE (History), FRENCH REVOLUTION.

LOUIS XVII. (1785–95 ?), titular king of France; s. of Louis XVI. and Marie Antoinette; never reigned; imprisoned in Temple, 1792; recognised as L. XVI.'s successor by Royalist party, 1793; formation of plots began for his release; under guardianship of cobbler named Simon and his wife, who left Temple, 1794; was subsequently kept in dark room like cage; said to have died, 1795. Ere long it was rumoured he had escaped; whether he died or escaped is still conjectural, probability seeming to point to latter alternative. At Restoration many pretenders, notably Naumdorff, appeared in his name.

C. Welch, *Little Dauphin* (1908).

LOUIS XVIII. (1755–1824), king of France; younger bro. of Louis XVI.; fled from France during Revolution, 1791; established headquarters at Coblenz, becoming leader of anti-revolutionary party; declared himself regent, 1793, king, 1795; life marked by travels and plots; served with Condé, 1796; subsequently lived at Blanckenberg, Mittau, Warsaw, and in England; refused to abdicate in Napoleon's favour. After latter's defeat, 1814, Bourbons were restored to throne of France, and L. returned to Paris as king; promised to grant constitution; fled on Napoleon's return; again restored, 1815; soon dismissed Talleyrand and Fouché; confided affairs to Decazes and Richelieu. See FRANCE (History).

E. Daudet, *Histoire de la restauration* (1882).

LOUIS I. (1326–82), king of Hungary and Poland; succ. to Hungarian throne, 1342; waged three wars against Venice, 1346, 1357–58, 1378–81; defeated in first, successful in others; succ. uncle as king of Poland, 1370; defeated Turks, 1372.

LOUIS II. (1506–26), king of Hungary and Bohemia, 1511; drowned after defeat at Mohács.

LOUIS I. (1339–84).—**Louis II.** (1377–1417).—**Louis III.** (1403–34), Dukes of Anjou; titular kings of Naples.

LOUIS, LUDWIG, Ger. kings of East Franks. **Louis the German** (804–76), succ. to kingdom of Bavaria, 817; after defeat of Lothair at *Fontenoy*, 841, received Carolingian territories east of Rhine; suppressed Saxon rising, 842; subdued Abotrites; failed to acquire Acquitaine; supported Lothair of Lorraine.—**Louis the Younger** (d. 882), succ., 876.—**Louis the Child** (893–911), succ., 899; last of Carolingian line in Germany; reckoned by some as Emperor Louis IV.

LOUIS OF NASSAU, LUDWIG (1538–74), s. of Count of Nassau; raised troops in aid of Dutch revolt against Spain; defeated Spaniards at *Heiligerlee*, 1568; defeated at *Jemmingen*, 1568; killed at *Mookerheide*.

LOUIS PHILIPPE I. (1773–1850) king of the French; s. of Philippe 'Egalité'; cousin of Louis XVI.; fought as Duc de Chartres in revolutionary army; left France, 1793; returned, 1814; became associated with Liberal party; lieut.-gen., 1830. On deposition of Charles X., L. P. was proclaimed 'king of the French,' 1830; crushed insurrections in Lyons and Paris, 1834; put down Louis Napoleon's rising at Boulogne, 1840; strengthened *entente* with England, 1843; subsequently broke it by transactions concerning the 'Span. marriages,' seeking to re-establish his family's influence in Spain. Extension of franchise was demanded by people, 1847; followed by revolution, 1848, when L. P. had to abdicate and flee to England. See FRANCE (History).

Guizot, *France under Louis Philippe* (1865).

61

LOUISBURG (45° 56′ N., 60° W.), town and ruined fortress, Cape Breton, Nova Scotia, Canada; formerly important seaport.

LOUISE OF SAVOY (1476–1531), mother of Francis I.; ruled France from his accession (1515) till her death; greedy, passionate, corrupt; exercised fatal influence on France.

LOUISIADE ARCHIPELAGO (11° S., 152° 30′ E.), archipelago of small islands, Pacific Ocean, belonging to Britain.

LOUISIANA (29° to 33° N., 89° 5′ to 94′ W.), one of southern states of U.S.A.; bounded N. by Arkansas, E. by Mississippi and Gulf of Mexico, S. by Gulf of Mexico, W. by Texas; area, 48,720 sq. miles. Surface flat and marshy, especially towards the sea; L. has coast-line of over 1200 miles along Gulf of Mexico, and is drained by Mississippi, Red R., and Sabine; capital, Baton Rougo; largest towns, New Orleans, Shreveport.

History.—L. is said to have been visited by Ferdinand de Soto in 1541; partially explored in 1682 by de la Salle, who annexed it to France and named it after Louis XIV.; acquired in 1717 by John Law's Mississippi Co., which eventually came to grief, and in 1731 was again in hands of Crown; ceded to Spain in 1762, but restored to France in 1800. Three years later L. was acquired from Napoleon by U.S.A. by *Lousiana Purchase* (*q.v.*); admitted as state of Union, 1812; took part in war against British in 1812–15, during which battle of *New Orleans*, 1815, resulted in Brit. defeat; seceded from Union in 1861; during Civil War great number of engagements took place within its bounds, and New Orleans was in 1862 taken by Federals. After close of war L. was restored to Union, 1865; in 1868 franchise was extended to blacks, and for some time the state suffered from political disturbances, which in 1873 amounted to civil war. During last thirty-five years prosperity has greatly increased.

Government.—Executive power is vested in gov., who is assisted by various officers of state and holds office four years; legislative authority vested in Senate of 41 members and House of Representatives of 115 members, both elected for four years by popular vote. Supremacy of white population in political matters is secured by clauses requiring voter either to have certain property qualification, to be able to read and write, or to prove that his father or grandfather had vote on Jan. 1, 1867. State sends two Senators and seven Representatives to Federal Congress.

Resources.—L. is thickly wooded in parts, producing yellow pine, cypress, cotton-wood, oak, etc.; a great cotton, sugar-cane, and rice-producing region, these being grown in large quantities along coast and Mississippi valley; also produces corn, oats, potatoes, tobacco, fruits. Horses, cattle, sheep, and pigs are raised, and there are important fisheries. Industries include lumbering, sugar-refining, preparation of rice, manufactures of machinery, cotton-seed oil, tobacco, beer, confectionery. Minerals include rock-salt, sulphur, petroleum. Railway mileage in 1910 was 6521.

Population.—Principal religion is R.C.; other creeds in order of numerical importance are Baptist, Methodist, Episcopalian, Presbyterian. Education is free and is greatly improving; there is a univ. at Baton Rouge, and New Orleans is seat of Tulane Univ. and also of a univ. for negroes, and several colleges. Inhabitants include whites, negroes, Asiatics, Indians; whites of foreign birth include Italians, Germans, French, British. Pop. (1910) 1,656,388.

Phelps, *Louisiana* (Amer. Commonwealth Series, Boston, 1905); Louisiana Historical Society's Publications.

LOUISIANA (39° 25′ N., 91° 5′ W.), city, Missouri, U.S.A., on Mississippi; grain and fruit region; flour and lumber-mills; foundries. Pop. (1910) 4454.

LOUISIANA PURCHASE, large tract of country

in N. America, bought by U.S.A. Government from Napoleon in 1803; included whole of present states of Arkansas, Iowa, Louisiana, Missouri, Nebraska, N. Dakota, Oklahoma, S. Dakota, and most of Colorado, Kansas, Minnesota, Montana, Wyoming (*qq.v.*). All the Fr. territory W. of Mississippi R. had been transferred to Spain by treaty in 1762, the arrangement being kept secret until 1764, while Spaniards did not completely establish themselves until after 1769; their control ended in 1800, when country was retroceded to France; importance of subsequent purchase by U.S.A. can hardly be overestimated.

LOUISVILLE (38° 13′ N., 85° 41′ W.), town, Kentucky, U.S.A.; named after Louis XVI. of France, 1780; damaged by cyclone in 1890, by fires in 1891; chief trading city in state, and largest tobacco mart in world; other industries, leather, pork-packing, distilling, manufacture of ploughs, machinery, furniture, metal pipes, flour; great railway centre; important port on Ohio R., rapids of which are avoided by canal, opened 1830. L. has R.C. cathedral, univ., many educational and charitable establishments, and fine parks. Pop. (1910) 223,928.

LOULÉ (37° 4′ N., 7° 54′ W.), town, Faro, Portugal; basket-making; leather manufactures. Pop. 23,000.

LOURDES (43° 6′ N., 0° 1′ W.), town, Hautes-Pyrénées, France, on river Pau; contains an ancient castle; famous place of pilgrimage, on account of sacred spring, whose waters are credited with many wonderful cures of cripples and other invalids; marble quarries.

LOURENÇO MARQUES, Lorenzo Marques (25° 56′ S., 32° 27′ E.), capital, Portug. E. Africa, on Delagoa Bay; first founded as Portug. trading post in 1544; terminus of railway to Pretoria, by which large percentage of Rand imports and exports pass; has excellent harbour; coaling port. Pop. *c.* 10,000.

LOURIS, see Turacos.

LOUSE, see Lice.

LOUTH (53° 55′ N., 6° 30′ W.), county, Leinster, Ireland; extends from Carlingford Lough in N. to River Boyne in S.; smallest county in Ireland; hilly in N., flat elsewhere; rivers Dee and Glyde enter Dundalk Bay. Chief towns: Dundalk (county town), Louth, Drogheda, Ardee; chiefly agricultural; oysters are found in Carlingford Lough. Area, 316 sq. miles. Pop. (1911) 63,402.

LOUTH (53° 22′ N., 0°), town, Lincolnshire, England, on Lud; agricultural centre; iron foundries. Pop. (1911) 9883.

LOUVAIN (50° 53′ N., 4° 41′ E.), town, Brabant, Belgium, on Dyle; breweries, distilleries; seat of univ. (founded 1426). Chief buildings are the beautiful Gothic hôtel-de-ville and Church of St. Pierre. Pop. (1910) 42,123.

LOUVER, Louvre, Luffer, turret on roof; originally outlet for smoke from fire in centre of room; now an ornamental ventilator.

LOUVET DE COUVRAI, JEAN-BAPTISTE (1760–97), Fr. author and politician; achieved sudden fame (1787) by *risqué* book, *Aventures du chevalier de Faublas*; became Jacobin and subsequently Girondist; made famous Ciceronian attack on Robespierre; forced into exile by the Mountain; persecuted by mob as terrorist on return; wrote graphic *Mémoirs*.

LOUVIERS (49° 12′ N., 1° 11′ E.), town, Eure, France, on Eure; cloth manufactures. Pop. 10,400.

LOUVOIS, FRANÇOIS MICHEL LE TELLIER, MARQUIS DE (1639–91), Fr. statesman; app. Sec. of State for War, 1666; said to have restored to troops order and discipline that Colbert had given to finances.

LOVAT, SIMON FRASER, 12TH BARON (*c.* 1667–1747), Scot. intriguer; compelled Dowager Lady L. to marry him, for which was outlawed, 1701; went to France; planned Jacobite rising; suspected of treachery, imprisoned in Aquitaine for some years; escaped to England, 1714; engaged in Jacobite intrigue, playing traitor on various occasions; supported rising of 1745; taken prisoner after *Culloden*; executed for treason.

LOVE FEASTS, see Agape.

LOVE-BIRDS, see under Parrot Tribe.

LOVEDALE (32° 40′ S., 27° 2′ E.), educational and mission station, Cape Colony; founded by Scot. missionaries, 1841.

LOVELACE, RICHARD (1618–58), Eng. cavalier lyrist; b. at Woolwich; his lected poems were pub. in 1659 under the title of *Lucasta: Posthume Poems. To Althea from Prison* and *To Lucasta on going to the Wars* are among the best lyrics in the language.

LOVE-LIES-BLEEDING, see Amaranth.

LOVER, SAMUEL (1797–1868), Irish novelist; famous for *Rory O'More*, *Handy Andy*; wrote songs and plays; painter also.

LOVERE (45° 50′ N., 10° 4′ E.), town, on Lake Iseo, N. Italy; ironworks.

LOVETCH, Lovatz (43° 11′ N., 24° 34′ E.), town, Bulgaria. Pop. 7000.

LOW ARCHIPELAGO, see Paumotu Islands.

LOW CHURCHMAN, a member of the Anglican Church who adheres to definitely Prot. principles.

LOW COUNTRIES, see Netherlands, Belgium.

LOW, SETH (1850–), pres. (1890–1901) of Columbia Univ., New York, which he reorganised.

LOWE, SIR HUDSON (1769–1844), Brit. general; served against France, 1793; defended Capri, which he had to evacuate, 1808; distinguished in campaigns of 1813–14; gov. of St. Helena, 1815–21, during Napoleon's captivity; commanded in Ceylon, 1825–30.

LÖWE, JOHANN KARL GOTTFRIED (1796–1869), Ger. composer; many beautiful ballads and art-songs. See Song.

LOWE, ROBERT, see Sherbrooke.

LOWELL (42° 34′ N., 71° 23′ W.), town, Massachusetts, U.S.A., on Merrimac River, 25 miles N. of Boston; has great cotton factories, and also manufactures of woollens (carpets, hosiery, etc.), iron goods, machinery, chemicals, paper, leather. Native place of Whistler. Pop. (1910) 106,294.

LOWELL, CHARLES RUSSELL (1835–64), Amer. soldier; killed in Amer. Civil War, fighting for the North.

LOWELL, JAMES RUSSELL (1819–91), Amer. poet, journalist, essayist, diplomatist; s. of Unitarian minister of Boston, of Scot. descent; m. Maria White, 1844, and adopted her abolitionist and other political and social enthusiasms; pub. vol. of verse, 1841; joint-publisher of new magazine, *The Pioneer*, 1843; 1848 saw third vol. of poems, *Fable for Critics*, *Biglow Papers*, *Vision of Sir Launfal*, all showing combination of wit and sentiment which was his characteristic. Reforming zeal was the inspiration of much of his verse, which, however, contains some purely pastoral efforts. L. succeeded Longfellow at Harvard Coll., 1855, and subsequently wrote much criticism, his *My Study Windows* and *Among my Books* giving him high rank as literary essayist; editor of *Atlantic*, 1857; joint-editor of *North American Review*, 1863; pub. *Under the Willows*, 1869; *The Cathedral*, 1870; *Heartsease and Rue*, 1888; ambassador to Spain, 1877; to England, 1880–85.

E. E. Hale, *James Russell Lowell and His Friends* (Boston, 1899).

LOWELL, JOHN (1799–1836), member of noted Massachusetts family; founder of Lowell Institute at Boston, a public establishment for the provision of free lectures; endowment, 237,000 dollars. His s., **Francis Cabot**, (1775–1817), founded Lowell city, and introduced cotton manufacture into U.S.A.

LÖWENBERG (51° 6′ N., 15° 35′ E.), town, Silesia, Prussia, on Bober; textile industries. Pop. 9500.

LÖWENSTEIN (49° 5′ N., 9° 20′ E.), town, Württemberg, Germany; ancient ruined castle.

LOWESTOFT (52° 29′ N., 1° 44′ E.), seaport and seaside resort, Suffolk, England, on North Sea; old town stands on cliff forming part of Lowestoft Ness, most easterly cape in England. Pop. (1911) 33,780.

LOXIA, Crossbills, see under Finch Family.

LOYALISTS (in Amer. Revolution), colonists who remained in their allegiance to England during War of Independence; favourite subject of Amer. history and biography; formed about one-third of total population and probably represented element which had not inherited spirit of religious and political revolt. Their elimination by war, confiscation, and exile gave unity to heterogeneous Amer. character. Great Britain secured terms for them by treaty, 1815.

LOYALTY ISLANDS (21° 20′ S., 167° 25′ E.), group of islands in S. Pacific, belonging to France; dependency of New Caledonia.

LOYOLA, ST. IGNATIUS OF (1491–1556).—Inigo Lopez de Recalde, founder of the Society of Jesus, was of noble Span. birth, and went as a page-boy to the Span. court; and being courageous and energetic, became a soldier. While fighting in Navarre in 1521, he was injured at the siege of Pampeluna, and while recovering began to repent of his worldly ways. Entering the Abbey of Montserrat in 1522, he led a life of devotion; afterwards went to Rome, and then on pilgrimage to Jerusalem; coming back to Italy, was viewed as a heretic by the Inquisition; continued his wanderings in Spain and then in Paris and Italy; ordained priest, 1538. While in Rome in 1537 he saw vision of Christ which led him to found the Society of Jesus, which was sanctioned by Pope Pius III. in 1540, and of which he himself was elected general in 1541. L. drew up the *Constitutions* of the Order, and finished his *Spiritual Exercises*; devoted the rest of his life to the Society. He was beatified in 1609; canonized, 1629. A man of strong character who had had difficulty in conquering himself, and of intense spiritual fervour, he was, if sometimes stern, a born ruler of men. See JESUITS.

Joli, *St. Ignace de Loyola.*

LOZÈRE (44° 40′ N., 3° 30′ E.), department, S.E. France, formed from ancient Gevaudan in Languedoc; mountainous; rich in minerals; cattle and sheep rearing, silkworm breeding; manufactures cheese; capital, Mende. Pop. (1911) 122,738.

LUANG-PRABANG (19° 54′ N., 102° 10′ E.), chief town, Laos, Fr. Indo-China, on Mekong. Pop. *c.* 13,000.

LUBAO (15° N., 120° 30′ E.), town, Luzon, Philippine Islands. Pop. 20,000.

LÜBBEN (51° 56′ N., 13° 53′ E.), town, Brandenburg, Prussia, on Spree; sawmills. Pop. (1910) 7802.

LUBBOCK, JOHN, see AVEBURY.

LÜBECK (53° 51′ N., 10° 41′ E.), free city, capital of L. state, Germany, on Trave, about 12 miles from Baltic; once head of Hanseatic League; now prominent fort, trading chiefly with Baltic countries. L. was founded XII. cent.; became free city of the Empire, 1226; conquered by French, 1806; recovered independence, 1815. L. is a picturesque old town, with quaint gables and late Gothic and Renaissance architecture. Among striking buildings are Marienkirche, 1276–1310 (with fine paintings and sculptures), Domkirche (founded by Henry the Lion; XII.-XIV. cent. altarpiece by Memling); churches of St. Catherine and St. James (XIV. cent.); Rathaus (XIII.-XV. cent.), Gothic Holstentor (XV.-cent. gateway). Chief industries are shipbuilding, machinery, chemicals, breweries, brushes, soap, cigars, food-stuffs, etc. The STATE OF LÜBECK (area, 115 sq. miles) is a republic, governed by Senate and House of Burgesses; sends one member to Bundesrat, and one to Imperial Reichstag. The PRINCIPALITY OF LÜBECK (pop. 41,000), lying N. of L. State, forms part of Oldenburg (*q.v.*). Pop. (1910) city, 98,620; state, 116,500.

LÜBEN (51° 23′ N., 16° 11′ E.), town, Silesia, Prussia. Pop. (1910) 7818.

LUBLIN.—(1) (51° N., 23° E.) government, S.E. of Russian Poland, bordering Galicia. Pop. 1,437,000. (2) (51° 20′ N., 22° 35′ E.) capital of above; XIII.-cent. cathedral; linen and woollen manufactures. Pop. 62,000.

LUBRICATION, the science of correctly applying lubricants. When two working surfaces run in contact, friction is set up, the amount varying according to the surfaces and the material. In 1803 Beauchamp Tower discovered that, when a lubricant was applied, its effect was to separate the surfaces which were working against each other, by a thin film, and so hold them apart.

Light spindles, as in textile machinery, require a thin oil, while the heavy bearings of a steam engine require an oil which is about as viscous as treacle. As a rule, the greater the load the thicker the lubricant. Water- and air-cooled engines require different oils.

Lubricants may be solid, semi-solid, or liquid, and consist of animal or vegetable greases or oils and mineral oils. The chief l's are: *Solids*, soapstone, plumbago, and graphite. *Semi-solids*, tallow, lard, and other animal fats. *Liquid* (oils)—Animal—Sperm oil. Vegetable—Olive and rape oils. Mineral—Oils distilled from Russ. and Amer. petroleums. Mineral oils may be used simple or compounded. Plumbago and graphite are frequently mixed with oils or grease.

For heavy loads, vegetable and animal oils are better than mineral oils.

LUCA DELLA ROBBIA, see DELLA ROBBIA.

LUCAN, MARCUS ANNÆUS LUCANUS (A.D. 39–65), Rom. poet; b. Corduba, Spain. His success roused Nero's jealousy, and he was forbidden to recite in public; indignation prompted L. to join the Pisonian conspiracy; on the discovery of the plot he was compelled to end his life; great work is the *Pharsalia*, a rhetorical poem dealing with the conflict between Cæsar and Pompey.

LUCANIA, former name of region between Gulf of Tarentum and Tyrrhenian Sea, S. Italy; now included in provinces of Basilicata, Cosenza, and Salerno; surface mountainous; inhabited by Lucani from V. cent. B.C.; subdued by Rome in 272 B.C.; supported Carthage in Hannibalic War.

LUCARIS, CYRILLOS (1572–1637), patriarch of Constantinople; tried to make Eastern Church Calvinistic.

LUCAS, SIR CHARLES (d. 1648), Royalist soldier in Civil War; shot by Parliamentarians for breaking parole, 1648.

LUCAS, CHARLES (1713–71), Irish physician and politician; at first an apothecary in Dublin; compelled to flee abroad on account of his political opinions; studied med. in Paris and Leiden, and commenced practice as physician in London; pardoned and elected to Irish Parliament as member for Dublin; noted for defence of independence of Irish Parliament; wrote many political pamphlets.

LUCAS, JOHN SEYMOUR (1849–), Eng. artist; painted *The Armada in Sight, After Culloden.*

LUCAS, VAN LEYDEN (*c.* 1494–1533), Dutch painter and engraver; an intimate of Mabuse and Albrecht Dürer; dealt successfully with sacred history and contemporary manners and portraits.

LUCCA (43° 51′ N., 10° 31′ E.), town, Tuscany, Italy; was free city in XIV. cent.; became principality in 1805, when Napoleon gave it to his sister, Princess Bacciochi; afterwards became duchy, and was incorporated with Tuscany, 1847; annexed to Italy, 1860. L. is seat of archbishopric; has cathedral dating in part from XI. cent., and containing fine pictures; many old churches, palaces, educational establishments; old fortifications remain; manufactures silk. Pop. (1911) of town, 31,000; of commune, *c.* 76,037.

LUCCA, BAGNI DI (43° 51′ N., 10° 31′ E.), watering-place, on Lima, Lucca province, Italy.

LUCCHESINI, GIROLAMO (1751–1825), Prussian diplomat; ambassador to Poland, 1789; arranged Prusso-Polish alliance, 1790; ambassador to Vienna, 1793; Paris, 1802; tried to maintain friendly relations between France and Prussia.

LUCENA (37° 35′ N., 4° 32′ W.), town, Cordova, Spain, on Casajar; earthenware. Pop. (1910) 21,020.

LUCERA (41° 30′ N., 15° 21′ E.), town, Foggia, Italy; cathedral and castle; silk. Pop. 17,500.

LUCERNE, LUZERN.—(1) (47° 10′ N., 8° 10′ E.) canton, Switzerland; hilly and mountainous; chief stream, the Reuss; agriculture and dairy-farming; joined Swiss confederation, 1332. (2) (47° 3′ N., 8° 18′ E.) town, capital of above; beautifully situated on Lake of L.; popular tourist resort; old walls and watch-towers (erected, 1385), ancient town hall, Hofkirche, museum, arsenal (old armour), *Lion of Lucerne* monument, glacier garden, etc. Pop. (1912) 40,900.

LUCERNE, PURPLE MEDICK, or ALFALFA (*Medicago sativa*), a member of the *Leguminosæ* cultivated as a fodder crop. The fruits usually form a coiled mass.

LUCERNE, LAKE OF, VIERWALDSTÄTTERSEE (47° N., 8° 30′ E.), 'Lake of the Four Forest Cantons,' Switzerland; surrounded by cantons of Lucerne, Unterwalden, Schwyz, and Uri; area, 44 sq. miles; overlooked by Mount Pilatus and Rigi; traversed by the Reuss; beautiful scenery; associated with William Tell.

LUCHAIRE, DENIS JEAN ACHILLE (1846–1908), Fr. historian; prof. of History at the Sorbonne; wrote several works, particularly on Pope Innocent III.

LUCHU ISLANDS (24° to 30° N., 122° 30′ to 130° E.), group of some 50 volcanic and coralline islands belonging to Japan, half-way between Kiushiu and Formosa; total area, 930 sq. miles; largest islands, Okinawa and Amami; chief towns, Shuri (capital) and Nafa, most important seaport and trading centre; annexed by Japan despite China's threatening attitude in 1879; produce sugar, sago, dyewoods, aromatic oranges. Pop. 457,000.

LUCIAN (d. *c.* 200 A.D.), Silver-Age Gk. writer; b. Samosata, Syria; after unsuccessful apprenticeship to his uncle, a sculptor, turned his hand to oratory; seems to have prospered; eventually obtained a well-paid post in Egypt as recorder of legal actions and keeper of State documents. L. wrote a very large number of treatises and dialogues (in the Platonic style), mostly satires on current abuses and on philosophers. He believed little of what was taught either in philosophy or religion. His style is elegant and correct, although it naturally contains a few Silver-Age words and constructions (notably his use of *Kan*). Best-known work is his *True History*, a classical Baron Munchausen describing the exciting adventures of some voyagers to the moon; written to ridicule hist. poets and historians from Homer downwards. In *De morte peregrini* L. shows knowledge of Christianity, which he treats with scant respect. Other well-known dialogues include the *Piscator*, a conversation between Socrates, Plato, and others; *Hermotimus*, between a Stoic and Lycinus (Lucian).

Collins, *Lucian.*

LUCIFER ('Light-Bringer'), *Venus* (*q.v.*) as Morning Star; (myth.) son of Aurora (dawn); Satan, supposed to have fallen from heaven (cf. *Isaiah* 14^{12}; *Luke* 10^{18}; *Revelation* 9^{1} *sqq.*); friction match containing phosphorus, dating from *c.* 1830.

LUCIFER (d. *c.* 370), bp. of Cagliari; orthodox protagonist in Arian controversy.

LUCILIA, see under HOUSE FLY.

LUCILIUS, GAIUS (*c.* 180–103 B.C.), Rom. satirist; b. Suessa; served in the Numantine War under Scipio, and despite his humble origin lived on terms of the closest familiarity with Scipio and Lælius; regarded as the first great Rom. satirist. He wrote with great ease and variety, but his work lacks polish and finish. In his satire he is more personal than Horace.

LUCKENWALDE (52° 7′ N., 13° 9′ E.), town, Brandenburg, Prussia, on Nuthe; cloth. Pop. (1910) 23,475.

LUCKNOW (26° 52′ N., 80° 58′ E.), city, India, on Gumti; formerly capital of independent state of Oudh; chief building, the mausoleum Imambara; seat of Canning Coll. and La Martinière Coll.; noted for heroic defence and relief in Indian Mutiny, 1857–58; muslins, embroidery, brass-ware, pottery. See INDIA (*History*). Pop. (1911) 259,798.

LUÇON (46° 27′ N., 1° 9′ W.), town, Vendée, France; cathedral; bp.'s see. Pop. 6900.

LUCRETILIS (42° 10′ N., 12° 50′ E.), mountain, in the Sabine country, ancient Italy.

LUCRETIUS, TITUS CARUS (*c.* 98–55 B.C.), Rom. poet; according to tradition, was poisoned by love-potion, and wrote during intervals of sanity. His poem, *De Rerum Natura*, in six books of hexameters, treats of Epicurean philosophy, but is interspersed with many remarkably clever conjectures and theories regarding the atomic origin of the world, mankind, etc. He bears no great love to the Rom. pantheon, and condemns superstition as one of man's burdens. L. is one of the most characteristically Roman of all Lat. writers.

Mason, *Atomic Theory of Lucretius* (1884); Santayana, *Three Philosophical Poets* (1911).

LUCRINE LAKE, LUCRINUS LACUS (40° 51′ N., 14° 5′ E.), small lake, on coast of Campania, ancient Italy; oyster-beds.

LUCULLUS, LUCIUS LICINIUS (*c.* 109–56 B.C.), one of greatest orators, gov's, and generals of Rome; subject of one of Plutarch's *Lives*; consul, 74, and by death of pro-consul became leader of forces against Mithridates; rescued Rom. gov. of Bithynia and conquered Pontus, 74–2; overran large part of Armenia; recalled by enemies at home, abandoned ambition, and became famous as art amateur and voluptuary.

LUCY, SIR THOMAS (1532–1600), Lord of Charlecote, Warwickshire, England, in Shakespeare's early days; model for Justice Shallow; according to legend Shakespeare stole his deer.

LUDDITES, bands of workmen who smashed machinery in Eng. Midlands, 1812–18; named after Ned Lud, a Leicestershire lunatic, who, 30 years previous, smashed some stocking-frames.

LÜDENSCHEID (51° 13′ N., 7° 46′ E.), town, Westphalia, Prussia; metal goods. Pop. (1910) 32,297.

LUDHIANA (30° 52′ N., 75° 55′ E.), town and district, Jalundhar division, Punjab, India; shawls; trade in grain. Pop. *c.* 49,000.

LUDINGTON (39° N., 86° 30′ W.), city, summer resort, Michigan, U.S.A., on Lake Michigan; trade in grain. Pop. (1910) 9132.

LUDLOW (52° 22′ N., 2° 44′ W.), market town, Shropshire, England; at confluence of Corve and Teme; has a fine old church and grammar school, and remains of a XII.-cent. castle, formerly residence of the Lords Presidents of Wales. Pop. (1911) 5926.

LUDLOW, EDMUND (*c.* 1617–92), Eng. regicide; held commands for Parliament in Civil War; signed warrant for king's execution; brought to a close Cromwellian subjugation of Ireland, 1651–52; opposed protectorate; sentenced, 1660, but fled abroad.

LUDLOW GROUP, LUDLOVIAN ROCKS, part of Upper Silurian rocks in Great Britain; well developed at Ludlow (Salop); consists of shales at the top, which get more sandy in descent until the Old Red Sandstone is reached.

LUDWIG, see LOUIS.

LUDWIG I. (1786–1868), king of Bavaria; b. at Strassburg; led Bavarian opposition to France; had share in forming Bavarian constitution; succ., 1825; opposed Jesuits; improved financial affairs; encouraged learning and art; furthered economic improvements; promoted founding of Zoll-Verein, 1833; aided Greece in struggle for independence against Turkey, his son becoming king of Greece, 1832; gave largely to charitable objects; influenced in political matters by dancer, Lola Montez, which led to revolution, 1848, when L. had to abdicate; retired to private life.

LUDWIG II. (1845–86), king of Bavaria; succ.,

1864; opposed Prussia in Schleswig-Holstein affair; joined Austria against Prussia, 1866; defeated; subsequently reformed army; aided Prussia against France, 1870–71; offered imperial crown to William of Prussia, 1871. His friendship with Richard Wagner roused opposition in country; interested in art, lit., and philosophy; built many magnificent castles and Bayreuth theatre; suffered from mental weakness, which ultimately developed into incurable insanity; deposed, 1886; drowned himself in Starnberger See a week later.

LUDWIG, KARL FRIEDRICH WILHELM (1816–95), Ger. physiologist; prof. of Anat. and Physiology at Zürich, 1849, at the military medical school in Vienna, 1855; prof. of Physiology at Leipzig, 1865; investigated gland secretions and secretory nerves, blood pressure, the blood and lymph, and numerous other physiological subjects; greatly influenced modern development of physiology, introducing valuable new methods, in addition to making many important discoveries; author of *Textbook of Physiology*.

LUDWIGSBURG (38° 53′ N., 9° 12′ E.), town, Württemberg, Germany; important military dépôt. Pop. (1910) 24,926.

LUDWIGSHAFEN (49° 28′ N., 8° 27′ E.), town, Bavarian Palatinate, on Rhine; chemical works. Pop. (1910) 83,307.

LUDWIGSLUST (53° 19′ N., 11° 30′ E.), town, Mecklenburg-Schwerin, Germany; contains a grand-ducal residence. Pop. (1910) 6926.

LUGANO (46° N., 8° 56′ E.), chief town, Swiss canton of Ticino, on Lake Lugano; tourist centre. Pop. 13,000.

LUGANO, LAKE OF (46° N., 9° E.), lake of Switzerland and N. Italy; ancient *Ceresius Lacus*.

LUGANSK (48° 35′ N., 39° 10′ E.), town, Ekaterinoslav, Russia, on Lugan; coal-mining centre; iron manufactures. Pop. (1910) 32,260.

LUGARD, SIR FREDERICK DEALTRY (1858–), Eng. colonial gov.; served with distinction in Afghan War (1879–80), and in Sudan and Burma campaigns; administrator of Uganda (1889–92); high commissioner of N. Nigeria (1900–6); gov. of Hong-Kong (1907–11); app. gov. of both N. and S. Nigeria (1912) with a view to federating the Protectorates; author of *Our East African Empire* (1893). His wife, LADY LUGARD (*née* Flora Louise Shaw), is well known as traveller and writer.

LUGDUNUM, see LYONS.

LUGDUNUM BATAVORUM, Rom. name for Leiden (*q.v.*).

LUGGER, boat with one to three masts with square sail ('lugsail') on each.

LUGO.—(1) (43° N., 7° 30′ W.) maritime province, Galicia, Spain; mountainous. Pop. (1910) 477,239. (2) (43° N., 7° 31′ W.) capital of above, on Minho; textile industries; sulphur baths in vicinity. Pop. (1910) 28,174.

LUGOS (45° 41′ N., 21° 53′ E.), town, Hungary, on Temes; wine. Pop. 16,500.

LUG-WORM, see under CHÆTOPODA.

LUIK, Flemish name for Liége (*q.v.*).

LUINI, BERNARDINO (*c.* 1465–1540), Ital. painter, and pupil of Leonardo da Vinci (*q.v.*); executed frescoes at Milan and Lugano, and painted several easel works, including *The Daughter of Herodias*, now in the Louvre. Ruskin praises him.

Mason, *Luini* (Masterpieces in Colour).

LUKE, ST., a Gk. physician, friend and companion of St. Paul; probably wrote Third Gospel and *Acts*; said to have died in Bithynia, aged 74; probably collected traditions in Palestine and Asia Minor for his writings, into which he infused something of his own personality.

Luke, Gospel of St., third and longest of three Synoptic Gospels, based largely on *Mark* (*q.v.*), and, like *Matthew* (q.v.), on collection of sayings of Jesus, and material peculiar to itself (specially in chapters 1–3 and some of parables); traditionally work of St. Luke, physician and companion of St. Paul, and recent criticism has done much to support this; forms with *Acts* continuous hist. work; differs in several points from *Matthew* and *Mark*—*e.g.* in Passion narrative; tone of L.'s Gospel is Gentile, and shows special sympathy with women, sufferers and sinners; used by Justin Martyr (and in mutilated edition by Marcion, *c.* 150).

Adeney, *Luke* (Century Bible); Plummer, *St. Luke* (in Internat. Crit. Com.); Harnack, *Luke the Physician, Acts of the Apostles, Date of Gospels and Acts*.

LULEÅ (65° 35′ N., 22° 10′ E.), seaport, Sweden, on Gulf of Bothnia; trade in timber. Pop. (1911) 8960.

LULLY, RAIMON, RAYMOND LULL (*c.* 1235–1315), mediæval philosopher, known as 'the enlightened doctor'; b. Majorca; becoming a Christian, endeavoured to convert Moslems by appeal to their higher reason; founded college of missionaries in 1276; failed to interest the pope in his plans; martyred in Tunis.

LUMBAGO, rheumatism of muscles of the small of the back, probably an inflammation of the fibrous tissue of the muscles also affecting the nerves, characterised by intense pain on movement; treatment is rest, fomentations on affected part, and a saline laxative, while sodium salicylate, aspirin, counter-irritants, or electricity may be beneficial. See RHEUMATISM.

LUMBER, see TIMBER.

LUMBINI, a garden near Bhagwanpur, Nepal, India, the traditional birth-site of the Buddha. A pillar with an inscription was put up by the Emperor Asoka, 248 B.C. This was found in 1895.

LUMP-SUCKERS and **SEA-SNAILS** (*Cyclopteridæ*), carnivorous fishes with clumsy bodies and slow movements. The ventral fins are united to form a sucking disc by which they attach themselves to rocks. They occur in Antarctic, but chiefly in northern seas, being found sometimes at a depth of 1800 fathoms. The Brit. forms are 3 in number—the ugly, globular Lump-Sucker or Cock-Paidle (*Cyclopterus lumpus*), the Sea Snail, and Montagu's Sucker (*Liparis*), common coastal species.

LUNA (44° 5′ N., 10° E.), ancient city, Etruria, modern Luni, Italy, on Macra.

LUNA, ÁLVARO DE (d. 1453), courtier and friend of John II. of Castile; opposed to noble faction at court; Constable of Castile, 1423; executed owing to queen's influence.

LUNA, PEDRO DI (d. 1422 ?), Span. antipope, BENEDICT XIII.; supported Clement VII., and was himself elected pope by Fr. party at Avignon, 1394; refused to accept deposition by Council of Constance, 1417.

LUNACY, see INSANITY.

LUNARDI, VINCENZO (1759–1806), see under BALLOON.

LUNAWADA, LUNAWARA (22° N., 73° E.), native state, Gujarat division, Bombay, India. Pop. 10,000.

LUND (55° 39′ N., 13° 11′ E.), city, Swedon, on Höjea; bp.'s see; seat of univ. (founded, 1866). Pop. (1911) 20,139.

LUNDY (51° 11′ N., 4° 40′ W.), small island at entrance of Bristol Channel; interesting antiquities. Pop. 100.

LUNDY, ROBERT, gov. of Londonderry; declared for William III. and was besieged by Jacobite army, 1689; intrigues with assailants discovered; forced to fly from Londonderry, covered with ignominy.

LÜNEBURG (53° 15′ N., 10° 25′ E.), town, Hanover, Prussia, on Ilmenau; one of the ancient Hanse towns; has several old Gothic churches and some interesting mediæval buildings; manufactures cement and salt. Pop. (1910) 27,797. **Lüneburger Heide** (53° 3′ N., 10° 10′ E.), moorland district, Hanover, Prussia, between Aller and Elbe.

LUNETTE, see FORTIFICATION.

LUNÉVILLE (48° 35′ N., 6° 30′ E.), town, Meurthe-et-Moselle, France cotton and woollen industries; noted riding-school; birthplace of Emperor Francis I. Pop. 24,500.

LUNG-CHAU (22° 24′ N., 106° 42′ E.), treaty town, Kwangsi, China. Pop. *c.* 14,000.

LUNG-FISHES, see under FISHES.

LUNGS, the main organs of respiration, two in number, situated in cavity of the thorax, above, behind, on each side of, and, to a slight extent, in front of the heart. Each lung is cone-shaped, the apex reaching to root of the neck and the base resting on the diaphragm, while right lung, which is the larger, is composed of three lobes, and left of two lobes. See RESPIRATORY SYSTEM.

LUPERCALIA, an ancient Rom. festival, held on Feb. 15, in honour of Lupercus, god of fertility, and one of the oldest pastoral deities of Italy.

LUPUS, tuberculosis of the skin, running a prolonged and chronic course; most commonly affects persons under twenty, and generally attacks the nose and neighbouring part of the cheek, ulceration taking place; treatment is the injection of new tuberculin, or application of X-rays or Finsen light rays, and application of salicylic acid to destroy diseased tissue, along with plenty of fresh air and cod-liver oil. See TUBERCULOSIS.

LURAY CAVERN (38° 33′ N., 78° 22′ W.), cave near Luray village, Virginia, U.S.A.; discovered 1878, and noted for its remarkable stalactites and stalagmites; these include a number of columns over 50 ft. in height, the colours ranging from white to red, yellow, brown, and blue. There are many different chambers, which are lit by electricity. Traces of wild animals remain, and a human skeleton has been found.

LURCHERS, see DOG FAMILY.

LURGAN (54° 28′ N., 6° 20′ W.), market town, Armagh, Ireland; linens. Pop. (1911) 12,135.

LURIA, ISAAC BEN SOLOMON (1534–72), Jewish hermit; b. Jerusalem; led a hermit's life on the banks of the Nile, where he had visions and dreams; he transformed Judaism, but the chief beauty of his doctrine was his interpretation of the Sabbath.

LURISTAN (33° N., 48° E.), mountainous province, W. Persia, bordering on Turkey.

LURLEI, see LORELEI.

LUSATIA, district, Germany, between Oder and Elbe, N. of Bohemia; comprised Upper and Lower Lusatia; belonged to Saxony from 1635–1815, when Lower Lusatia and part of Upper Lusatia were ceded to Prussia.

LUSHAI HILLS (23° 20′ N., 93° E.), mountainous district, India, on frontier of Assam, Bengal, and Burma.

LUSIADS, THE, see under CAMOENS, LUIS DE.

LUSIGNAN (46° 27′ N., 0° 8′ E.), town, Vienne, France; XI.-cent. church.

LUSSIN, LOSSINI (44° 35′ N., 14° 25′ E.), island in Adriatic, belonging to crownland of Istria, Austria; ancient *Apsorus*. Pop. (1911) 12,947. Capital, LUSSINPICCOLO. Pop. 8340.

LUSTRATION (Lat. *lustro*, purify), ceremonial washing which occurs in many religions: thus contact with a corpse involves uncleanness which has to be washed away; at first there is no clear distinction between ritual and moral uncleanness.

LUTE (Arabic *Al'ud*, 'the wood'), an ancient stringed instrument, plucked by the fingers, similar to the guitar, mandoline, etc. L. has a pear-shaped body with neck attached to it; strings of catgut, but after XVII. cent. silver-spun bass strings were used. L. with large double-neck and two sets of tuning pegs was known as *Theorbo*. L. is of Oriental origin; in vogue between XV. and XVII. cent.

LUTETIA (PARISIORUM), ancient name of Paris (*q.v.*).

LUTHER LEAGUE, Amer. soc. for young Lutherans, founded 1888.

LUTHER, MARTIN (1483–1546), the greatest leader of the Prot. Reformation, was the s. of a miner and b. at Eisleben in Thuringia; he went to school at Mansfeld and Magdeburg, and entered Erfurt Univ. in 1501, studying scholastic philosophy and theol. In 1505, to the surprise of his friends, he entered the monastic life. His reasons for this he never fully explained, but it seems that from this time onwards he was tortured by the sense of sin, and the fear of Christ as Judge had haunted his childish mind. It was some time before L. could win the sense of pardon and forgiveness. At last he did, and was ordained. He went to Wittenberg and gave lectures in theol., which soon attracted attention for his power of reaching the hearts of his hearers. He began at length to mistrust the scholastic theol., and his feelings were particularly roused by the sale of Indulgences.

These, originally intended at first merely to remit the temporal penalty of sin, had been abused, and were now utilised as a source of revenue by the Papacy. In November 1517, L. nailed 95 *theses* to the church door at Wittenberg, following a regular precedent in academic disputes. L. engaged in controversy with John Maiyr of Eck, a Catholic controversialist, and soon had popular sympathies on his side. Meanwhile, Miltitz, a papal envoy, came to Germany and tried to win over L., but the Papacy would not compromise at all. In June 1519, L. engaged in public dispute with Eck, and saw that his breach with the Church was wider than he himself had at first imagined.

In 1520 he pub. his famous *Address to the Christian Nobility of the German Nation*, and when the papal bull directed against him arrived, burnt it. Rome then appealed to the Emperor to outlaw L. At length L. was summoned to appear at a diet at Worms, and in April 1521 given a safe conduct to last three weeks. L. hid in the Castle of Wartburg. But a national movement was now growing up in his favour. From 1521–25 L. led popular feeling, when the course of events was modified by the Peasants' Revolt. After this the cleavage between Protestants and Catholics became marked, and a third revolutionary party, the Anabaptists and kindred sects, came into being. A diet was held at Speyer, 1526, but the Catholic party refused to recognise Prot. liberty. L. became engaged in controversy about the Lord's Supper with the more radical Zwingli.

L. devoted the rest of his life to elaborating theological and Church reform, being less revolutionary than the rest of the reformers, and died worn out with his labours; many works (prose and hymns) in Latin and German.

Beard, *Martin Luther* (Lond., 1889), only up to 1522; Janssen, *History of the German People*, vol. ii.–iii. (St. Louis, 1896–); Lindsay, *Luther and the German Reformation*, should be read with Döllinger's *Die Reformation*.

LUTHERANS, body of Ger. Protestants founded by Luther (*q.v.*), called sometimes EVANGELICAL, as opposed to Reformed or Calvinistic Churches. Lutheranism is less rigid than Calvinism, various controversies showing that it was not always easy to discover Luther's belief on various points, and in ritual less break was made with the mediæval Church. The L. theory of consubstantiation approaches the Roman of transubstantiation. Ger. Protestantism would have been stronger but for the split between Calvinist and Lutheran. In the XIX. cent. some Ger. governments forced a union, and many Lutherans seceded, forming the Old L. Church. L. pastors are appointed by the State or local authorities. The Scandinavian Lutheran Church retains episcopal government. The funds are partly from the State, partly from endowments and subscriptions. Various liturgies are used.

Schaff, *History of the Creeds of Christendom*.

LUTON (51° 52′ N., 0° 26′ W.), town, Bedfordshire, England; chief seat of Eng. straw-plait manufacture. Pop. (1911) 50,000.

LUTRA, Otter, see WEASEL FAMILY.

LUTSK (50° 44′ N., 25° 22′ E.), town, Volhynia government, S. Russia. Pop. 17,500.

LUTTERWORTH (52° 28′ N., 1° 12′ W.), small town, Leicestershire, England.

LÜTTICH, Ger. name for Liège (*q.v.*).

LÜTTRINGHAUSEN (51° 7′ N., 7° 16′ E.), town, Rhine province, Prussia; textiles, iron goods. Pop. (1910) 13,559.

LÜTZEN (51° 16′ N., 12° 8′ E.), town, Prussian province of Saxony; here the imperialist forces under Wallenstein were defeated by Gustavus Adolphus of Sweden, who was killed in action, Nov. 16, 1632; and on May 2, 1813, the allied forces of Prussia and Russia under Wittgenstein were defeated by Napoleon. Pop. (1910) 4082.

LUXEMBURG.—(1) (49° 45′ N., 6° 8′ E.) grand-duchy, Europe, bordering on Belgium, Prussia, and France; area, 998 sq. miles; surface generally table-land; capital, L.; produces iron ore; manufactures hardware, leather, beer, paper. Declared neutral territory in 1867. Pop. (1910) 259,891. (2) (50° N., 5° 30′ E.) province, S.E. Belgium; area, 1706 sq. miles; produces marble, fruit, timber; capital, Arlon. Pop. (1910) 231,215. The Belgian province was included in grand-duchy till 1839.

LUXEMBURG, formerly LÜTZELBURG (49° 37′ N., 6° 7′ E.), capital, grand-duchy of Luxemburg, on Alzette; formerly strongly fortified; dismantled after the treaty of 1867. Pop. of state (1910), 259,891; of capital (1910), 20,848.

LUXEMBURG, FRANÇOIS HENRI DE MONTMORENCY-BOUTEVILLE, DUC DE (1628–95), Maréchal of France; distinguished himself under Condé and Turenne; famous retreat from Holland, 1672; brought France to height of military success, 1691–92, in war of League of Augsburg, twice defeating William III.; considered general of genius, but poor strategist.

LUXEUIL-LES-BAINS (47° 49′ N., 6° 23′ E.), town, Haute-Saône, France; mineral springs. Pop. 5500.

LUXOR (25° 39′ N., 32° 39′ E.), town, Upper Egypt, on Nile; contains magnificent ruins of Thebes (*q.v.*), occupying part of its site. Pop. *c.* 13,000.

LUYNES, name of Fr. family Albert (Alberti); of Florentine origin; acquired L. Important members are HONORÉ (*c.* 1540–92), his son CHARLES (1578–1621), Marquis d'Albert, Duc de L., and his descendants, distinguished generals.

LUZ (42° 50′ N., 0° 1′ W.), town, Hautes-Pyrénées, France; noted fortified church; thermal springs.

LUZERN, LUCERNE (*q.v.*).

LUZZATTI, LUIGI (1841–), Ital. economist and politician; prof. at Milan and Padua, then held various positions in Ital. government.

LYCÆUS (37° 22′ N., 21° 58′ E.), mountain, Arcadia; sacred to Zeus, surnamed Lycæus.

LYCANTHROPY, word used to express widespread primitive credence in metamorphosis of man, voluntarily or otherwise, into a lower animal; still believed among ignorant peasantry. Classical legends depict gods assuming animal shape for various purposes, or changing men into animals either as punishment (cf. Lycaon (*q.v.*)) or as means of protection (cf. Io (*q.v.*)). Mediæval lit. presents numerous accounts of such metamorphosis for beneficent or more frequently for evil ends. Trials for l. were common in France till beginning of XVII. cent.; l. is connected with totemism, *e.g.* a god was generally venerated in animal form, the tribal totem, in the district where the legend arose; and is distinct from metempsychosis. European legends associate the wolf with l.; Eng. *were-wolf*, Fr. *loup-garou*.

LYCAON (classical myth.), infamous king of Arcadia, who offered Zeus a feast of human flesh in order to test his divinity. Zeus slew L. and his 50 sons with a thunderbolt, or, according to another version, changed them into wolves.

LYCAON, see DOG FAMILY.

LYCAONIA, now part of Konia; ancient district, Asia Minor; capital was Iconium.

LYCIA, ancient region, S. Asia Minor; bounded N. by Phrygia and Pisidia, E. by Pamphylia, S. by Mediterranean Sea, W. by Caria; surface mountainous, crossed by Taurus ranges; drained by Limyrus, Xanthus, and other streams; among most important towns were Xanthus (capital), Myra, Olympus, Patara. There are interesting ruins of temples, and some fine rock tombs have been discovered. The country was conquered in turn by Persians, Syrians, and Romans.

LYCK, LYK (53° 50′ N., 22° 22′ E.), town, E. Prussia, Germany, on river and lake Lyck; iron manufactures. Pop. (1910) 13,427.

LYCOPODIACEÆ, see PTERIDOPHYTA.

LYCOPODIALES, see PALÆOBOTANY.

LYCOSURA (37° 20′ N., 22° E.), ancient city, Arcadia; said to have been founded by Lycaon, son of Pelasgus.

LYCURGUS (*c.* 396–325 B.C.), Attic orator; b. Athens; warm supporter of Demosthenes; only one of his speeches is extant.

LYCURGUS, Spartan lawgiver; nothing certain known concerning him; according to tradition, flourished in IX. cent.; was son of royal house; sometime regent for nephew; said to have travelled, and on returning, introduced reforms in constitution which raised Sparta from condition of anarchy to strong united state; also credited with important military and educational reforms.

LYDD (50° 57′ N., 0° 55′ E.), market town, Kent, England.

LYDENBURG (25° 10′ S., 30° 40′ E.), town and district, Transvaal, S. Africa; goldfields.

LYDFORD (51° 6′ N., 2° 37′ W.), village, on Lyd, Devonshire, England.

LYDGATE, JOHN (*c.* 1370–*c.* 1451), Eng. poet of Chaucerian school; chief works are the *Storie of Thebes*, drawn from Statius and Boccaccio, the *Troy Book*, *Temple of Glass*, *Fall of Princes*. Versification is bad; poems are an example of XV.-cent. vain attempts to follow Chaucer.

LYDIA, ancient region, Asia Minor; bounded N. by Mysia, E. by Phrygia, S. by Caria, W. by Ionia; surface generally consists of two fertile plains separated by the Tmolus Mountains; plains produced cereals, and gold was mined in the hills, while the inhabitants manufactured textiles and carried on considerable trade. L. was a powerful kingdom under Gyges in early VII. cent. B.C., and reached its apogee under one of his successors, Crœsus, whose name has become a synonym for wealth; Crœsus was defeated and killed by Cyrus in 546 B.C., when L. became Persian province; it subsequently belonged to Athenians, Macedonians, and Romans in turn.

LYELL, SIR CHARLES (1797–1875), Brit. geologist; b. Forfar; s. of Chas. Lyell, noted botanist. In his early days L. had a leaning to natural history; entered Exeter Coll., Oxford; B.A., 1819; M.A., 1821; called to Bar, 1825; commenced to study geol. as hobby; specialised in marine remains, Tertiary Period; pub. greatest work, *Principles of Geology* (3 vol's), 1830–33; became strong upholder of Darwin's theories; buried at Westminster; sometimes called 'father of modern geology.'

Bonney's *Charles Lyell and Modern Geology* (1895).

LYLY, JOHN, LILLY, LYLIE (1553–1606), Eng. writer; b. Kent; ed. Oxford. L. is famous as the inventor of EUPHUISM, a flowery, aureate, stilted prose diction receiving its name from his novels *Euphues, the Anatomy of Wit* (1579), and *Euphues and his England* (1580). The style is marked by peculiar similes drawn from the natural history of the day, excessive alliteration, vernacular touches, and classical references.

L.'s plays are important more for their fine lyrics and brilliant wit than for their stories; best known are *Endymion*, *Midas*, *Love's Metamorphosis*. He wrote for the court and his plays are related to the Masque. He undoubtedly had much influence on Shakespeare (cf. *As You Like It*, the dialogue of Beatrice and

Benedick in *Much Ado*). L. wrote in prose, and only in his later plays does blank verse appear.

Wilson, *John Lyly* (1905).

LYME REGIS (50° 43′ N., 2° 56′ W.), seaport, watering-place, Dorsetshire, England, on English Channel; stone quarries; landing-place of Monmouth in 1685. Pop. (1911) 2772.

LYMINGTON (50° 46′ N., 1° 33′ W.), seaport, watering-place, Hampshire, England, on English Channel. Pop. (1911) 4329.

LYMPH, a colourless, watery fluid, alkaline, but less so than blood plasma, and coagulable, but clotting less firmly than blood plasma; it contains white corpuscles, lymphocytes, which are derived mainly from the lymph glands, and after digestion fat globules and dissolved substances from the digested food are present in the l. coming from the intestines, giving it a milky appearance. It exudes from the blood in the various tissues and organs, and after laving and nourishing the tissue cells it is taken up by the lymphatic vessels, carrying with it any waste products of the tissues, and eventually is poured into the great veins of the neck by the *thoracic* and *right lymphatic ducts*, the two main lymphatic vessels. The flow of l. from the tissues depends partly on the amount of the tissue fluids and partly upon the power of the cells lining the l. capillaries to determine the amount of l. entering the capillaries, a power which is influenced by the activity of the tissues.

LYMPHATIC SYSTEM includes the *lymph capillaries* which lie in the intercellular spaces of the tissues, and receive the lymph after it has exuded from the blood capillaries and laved the tissue cells; these capillaries join together to form the *lymphatic vessels*, which are furnished with valves, and have an inner lining of endothelial cells, an outer coat of fibrous tissue, and, in the larger vessels, a middle coat of muscular tissue. The *lacteals* are those lymphatic vessels which convey the *chyle*, or digested food, from the intestine, and they converge to join the sac termed the *receptaculum chyli*, to which go also all the abdominal lymphatics. From the receptaculum chyli goes the largest lymphatic vessel, the *thoracic duct*, which runs up close to the aorta, and on its right side, is joined by the lymphatics of the left side of the neck and the left arm, and opens into the commencement of the left innominate vein. The *right lymphatic duct* is a short vessel which is joined by the lymphatics of the right side of the neck and thorax and the right arm, and opens into the right innominate vein. There are certain *lymph spaces* in communication with the lymph capillaries, some of them being merely spaces in the connective tissue with no special lining; others, such as the capsule of Tenon in the orbit, or the sub-epicranial space in the scalp, lined with endothelium; others, larger and more important serous cavities, such as the pleural and the peritoneal cavities. The *lymphatic glands* have fibrous capsules from which fibrous bands go into the substance of the gland, which is composed of lymphoid tissue; the glands are situated in different positions in the courses of the lymphatic vessels, and act as filters, while from their cells are to a large extent derived the white corpuscles of the lymph and of the blood.

The lymphatic glands, owing to their properties as filters, are particularly liable to attack in toxic conditions and infectious diseases. *Scrofula* (*q.v.*) is due to infection of the lymph glands of the neck by the tubercle bacillus, and is treated by improving the general health with plenty of fresh air and nourishing food, cod-liver oil, and tonics; the injection of tuberculin has proved beneficial, and, in more advanced cases, removal of the affected glands by operation is necessary. *Tabes mesenterica* is a condition, usually occurring in children, in which the lymph glands of the abdomen are infected by the tubercle bacillus, and is treated by making an incision into the abdomen, which, of itself, has a beneficial effect, or by more advanced surgical measures. *Lymphadenoma*, or *Hodgkin's Disease*, is a condition in which the lymph glands of the body, beginning usually with the glands of the neck, progressively become enlarged, followed by extreme general emaciation. The condition is treated by application of X-rays; arsenic is a drug which has proved of benefit; and removal of the enlarged glands by surgical operation has also been successful. *Status lymphaticus* is an obscure condition, occurring more commonly in children, in which the thymus gland and the lymphoid tissues all through the body are much enlarged; persons in this condition are very liable to sudden death through slight causes, *e.g.* an anæsthetic or a cold water spray; no treatment has yet proved of benefit.

LYNCH LAW (formerly 'Lynch's Law'), punishment in America without observance of legal forms. Origin of term is not certain; theories are—(1) That it is named after Charles Lynch, J.P., of Virginia, said to have dealt out irregular justice; (2) derived from Lynches' Creek, South Carolina, rendezvous of 'regulators,' *i.e.* self-constituted police of mid-XVIII. cent.; in common use when ordinary codes proved insufficient after liberation of negroes.

LYNCH, PATRICIO (1825–86), naval officer, at first in Brit. navy, then in that of Chile.

LYNCHBURG (37° 18′ N., 79° 1′ W.), city, Virginia, U.S.A., on James River; tobacco. Pop. (1910) 29,494.

LYNDHURST, JOHN SINGLETON COPLEY, BARON (1772–1863), Lord Chancellor of England; Solicitor-General, 1819–24; one of counsel at trial of Queen Caroline; Attorney-General, 1824–26; Master of Rolls, 1826–27; Lord Chancellor, 1827, 1834, 1841–46 (under Tory governments); noted for probity, ability, and polish.

LYNDSAY, SIR DAVID, OF THE MOUNT (*c.* 1490–*c.* 1555), Scot. poet; b. Cupar, Fife; Lyon King-of-arms; famous for *Satire of the Three Estates*, a 'morality' play satirising Church and State; other works—*History of Squire Meldrum*, a biography in verse; *Dialogue between Experience and a Courtier*, a history of the world; the *Dream*, a tiresome allegory; *Tragedy of the Cardinal*, an attack on Beaton.

LYNEDOCH OF BALGOWAN, THOMAS GRAHAM, 1ST BARON (1748–1843), Brit. soldier; lieut.-colonel of Perthshire volunteers, 1794; assisted in capturing Minorca, 1798; in retreat to Corunna, 1809; won battle of *Barossa*, 1811; eulogised by Napier; general, 1821.

LYNN (42° 25′ N., 71° 1′ W.), city, Essex County, Massachusetts, U.S.A., on Massachusetts Bay; boots and shoes; leather. Pop. (1910) 89,336.

LYNN REGIS, see KING'S LYNN.

LYNTON AND LYNMOUTH (51° 17′ N., 3° 50′ W.), two summer resorts, Devonshire, England, on Bristol Channel. Lynton stands on a cliff, 430 ft. high, with Lynmouth below.

LYNX, see under CAT FAMILY.

LYON, NATHANIEL (1818–61), Amer. soldier; fought in Mexican War, and in Civil War for North.

LYONS, LYON (45° 45′ N., 4° 49′ E.), third city of France; at confluence of Rhône and Saône; great commercial and industrial town—centre of silk-trade; first-class fortress; overlooked by two hills—Fourvières (*Forum Vetus*), crowned by sumptuous modern church, and Croix-Rousse, covered with silk-workers' houses; many fine bridges and quays. Other notable features are Rom. remains (aqueducts, etc.); mediæval churches, especially Cathedral of St. Jean (began *c.* 1110), Église d'Ainay (rebuilt X.-XI. cent.), St. Nizier, with ancient crypt; XVII.-cent. Hôtel-de-ville, Palais des Arts, Bourse, unique Musée des Tissus; Palais de Justice, Prefecture; Univ.; Hôtel-Dieu and Hospice de la Charité, first of their kind in France; beautiful Parc de la Tête d'Or, Place Bellecour, Rue de la République. L. (*Lugdunum*) was the chief town of ancient Gaul, and was a great ecclesiastical and commercial centre in Middle Ages; annexed to France, XIII. cent.; long a hotbed of religious, political, and industrial unrest;

Carnot (*q.v.*) assassinated here, 1894; birthplace of Germanicus, Claudius, Caracalla, Ampère, Puvis de Chavannes, etc.; silk fabrics, chemicals; printing, engineering, motor-cars, etc.; great banking centre (*Crédit Lyonnais*). Pop. (1911) 523,796.

Charléty, *Petite Histoire de Lyon* (1903).

LYONS, COUNCILS OF.—First Council, 1245, met to consider quarrel between pope and Emperor Frederick II.; resulted in excommunication and deposition of emperor. Second Council, 1274, passed regulations governing election of popes.

LYRE, an ancient Gk. stringed musical instrument of various patterns and sizes. The strings, at different periods numbering 4, 7, or 10, were stretched across a hollow body or sound chest, and played with a plectrum. The modern Gk. lyra is of the violin type, played with a bow; and several bowed instruments of this kind, differing greatly as to number of strings, were known as l's about the XIX. cent. Haydn alone among the classical composers wrote for the lyra.

LYRE-BIRDS (*Menura*), a genus of 3 large birds characterised by the peculiar lyre shape of the tail in the males. They form by themselves a family and order (*Menuriformes*) of birds. Lyre-birds live in the thick bush country of south-eastern Australia, where they feed upon insects. Their nests are large and tunnel-like, with the entrance in the side, and each bird seems to have a reserved beat of its own in the neighbourhood. They are excellent mimics of the songs of other birds.

LYRICAL POETRY, a species of verse originally accompanied by a lyre; in Gk. it is represented by such names as Sappho, Alcæus, and Mimnermus, and in Lat. by Catullus and Horace. A lyric is normally personal, passionate, brief, and usually commences abruptly, and has no fixed form or metre; sonnets are often lyrics. In English the great lyrical outbursts were those of the Elizabethan dramatists, the Caroline poets, and the song writers of the XIX.-cent. romanticists.

LYSANDER (d. 395 B.C.), Spartan general; ended Peloponnesian War, after defeating Athenian fleet at *Ægospotami*, by capture of Athens, 405; slain in attack on Thebes; despotic and wily.

LYSIAS (c. 380 B.C.), Attic orator; s. of Cephalus, wealthy Syracusan, friend of Socrates; went to Thurii from Athens when fifteen; was driven out after failure of Athenian expedition against Syracuse, 413; settled in Athens as shield-manufacturer; narrowly escaped death at the hands of the Thirty, 404; fled from Athens with loss of property; returned, 403; lived by writing speeches for litigants. Greatest exponent of 'plain' type of rhetoric as opposed to 'grand'; style is graceful and simple with homely illustrations. The most celebrated of his 34 extant speeches is *Against Eratosthenes*.

LYSIMACHUS (c. 355–281 B.C.), king of Thrace; on partition of realms of Alexander the Great, 323, received Thrace; helped to defeat Antigonus, 301: conquered Macedonia; slain by Seleucus at battle of *Cyropedion*.

LYTE, HENRY FRANCIS (1793–1847), Anglican clergyman and hymnologist.

LYTHAM (53° 44′ N., 2° 58′ W.), watering-place, Lancashire, England, on Irish Sea. Pop. (1911) 9464.

LYTHE, see Pollack.

LYTTELTON (43° 39′ S., 172° 32′ E.), seaport town, on inlet of Port Lyttelton, South Island, New Zealand; fine artificial harbour; extensive export trade.

LYTTELTON, GEORGE LYTTELTON, 1ST BARON (1709–73), Lord of Treasury, 1744–54; Chancellor of Exchequer, 1755–56; acceptance of office led to split with Pitt, and he was generally considered unequal to finance; praised by contemporaries for writings and character.

LYTTON, EDWARD GEORGE EARLE LYTTON, BULWER-LYTTON, 1ST BARON (1803–73), Eng. writer; youngest s. of General Bulwer; played prominent part in society; early writings in verse; *Pelham*, 1828, established his popularity as novelist; series of brilliant novels followed, of which taint is often emotional falsity, or exaggeration; three chief plays, *Lady of Lyons*, *Richelieu*, *Money*, had unprecedented success; command over motive of terror shown in short story, *The Haunted and the Haunters*. Prominent Liberal politician as well as writer; Sec. of State for Colonies, 1858–59; cr. baron, 1866.

LYTTON, EDWARD ROBERT BULWER-LYTTON, 1ST EARL OF (1831–91), Eng. poet and statesman; s. of 1st Baron L. of Knebworth; literary pseudonym, Owen Meredith; minor poet of considerable merit; held various posts as ambassador; Viceroy and Gov.-Gen. of India, 1876–80; started system of 'famine insurance'; satisfactorily conducted Afghan War, 1878–79, and pressed for annexation of Kandahar; introduced reforms in taxation and administration; severely criticised at time, but justified by results; cr. earl, 1880.

M, 13th letter of alphabet; originally picture of an owl; has affinity for letter *b*, hence numerous words in *mb*, e.g. *climb, dumb*.

MAAS, MEUSE (*q.v.*).

MAASIN (10° 15′ N., 125° E.), town, S. coast of Leyte, Philippine Islands. Pop. *c.* 18,000.

MAASLIUS (51° 55′ N., 4° 16′ E.), fishing town, Netherlands, on Maas. Pop. (1910) 9175.

MAASTRICHT, MAESTRICHT (50° 51′ N., 5° 42′ E.), town, Netherlands, on Maas; capital of province Limburg; ancient *Trajectum Superius*; taken by the French in 1673, 1748, and 1794; formerly important fortress; chief objects of interest are ancient Church of St. Servatius; St. Pietersburg sandstone quarries, first worked in Roman times; manufactures earthenware, glass, carpets. Pop. (1910) 37,483.

MAAT, see EGYPT (ANCIENT RELIGION).

MABUSE, JAN (*c.* 1470–1532), Flemish painter; studied at Antwerp, and began his professional career there with several altar-pieces; painted subjects religious and from Gk. mythology and portraits.

MACABEBE (15° N., 120° 40′ E.), town, Luzon, Philippine Islands. Pop. *c.* 15,000.

MACABRE, a species of composition where death and its accompaniments are treated with eerie humour. In English, John Webster and E. A. Poe are outstanding writers of this class. The origin of Macabre seems to be the mediæval representations of the *Dance of Death*.

MACACUS, see under CERCOPITHECIDÆ.

MACADAM, JOHN LOUDON (1756–1836), Scot. inventor of 'macadamised roads,' *i.e.* roads covered with crushed metal.

M'ALESTER (34° 55′ N., 95° 45′ W.), city, Oklahoma, U.S.A.; coal-fields. Pop. (1910) 12,954.

MACAO (22° 11′ N., 113° 30′ E.), Portug. settlement and city, on island of Hang-Shang, at mouth of Canton River, China; formerly an important seat of commerce; bp.'s see; chief export, tea; settled by Portug. in 1557. Pop. (1910) 74,866.

MACAQUE MONKEYS, see under CERCOPITHECIDÆ.

MACARONI, an Ital. foodstuff prepared from hard wheat, worked into a thick paste with water and moulded in various forms.

MACARONICS, a species of burlesque verse, in which, along with Lat., words from other languages are used with Lat. inflections and construction. The name was derived from the mixture of ingredients in the dish macaroni.

MACARSCA (43° 18′ N., 17° 1′ E.), seaport, Dalmatia, Austria, on Adriatic; wine. Pop. (1911) 12,155.

MACASSAR (5° 8′ S., 119° 21′ E.), seaport town, Celebes, Dutch East Indies; flourishing trade; exports coffee, spices, oil, timber. Pop. 18,500.

MACAULAY, THOMAS BABINGTON, BARON MACAULAY OF ROTHLEY (1800–59), Eng. historian and statesman; b. Rothley Temple, Leicestershire; s. of Zachary M., Whig and leader of slavery abolitionists; mother a Quaker; noted as precocious child; retained wonderful memory through life; twice won Chancellor's medal for poems at Cambridge; called to Bar, 1826; commenced connection with *Edinburgh Review*, 1825; sec. to Board of Control, 1832; legal adviser to Supreme Council in India, 1834–38; P.C., 1830; Sec. of War, 1839–41; *Lays of Ancient Rome* appeared, 1842, *Essays*, 1843; member of cabinet as paymaster-general of forces, 1846–48, after which he retired from active political life and devoted himself to compilation of well-known *History of England from the Accession of James II.*, never completed. The sale of M.'s writings was unique in annals of hist. lit. He had great power of giving personality to hist. characters, but lacked appreciation of shades and care for fairness. His power of felicitous epigram was marred by love of heavy rhetoric and trick of antithesis, which became a mannerism. The ardent Whig, whose eloquent speeches were of utmost use to his party, carried his principles back into history, and wrote as an avowed partisan. M. lived a steady life, had an amiable character and an unending flow of good conversation. In person he was short, stout, plain, ungraceful, fond of dress; he was a great reader and walker.

The Life and Letters of Lord Macaulay, Trevelyan (1876).

MACAW, see under PARROT TRIBE.

MACCABEES, Jewish family, who led patriotic revolt against Antiochus Epiphanes and his successors. Chief member, JUDAS (d. 160 B.C.), s. of the priest Mattathias, who slew an apostate Jew. Followers of Judas called themselves *Maccabeans*. He won great victories over Apollonius near Samaria, over Seron at *Bethoron*, and over Ptolemy, Nicanor, and Gorgias; entered Jerusalem, purified temple and restored religion, 164. His bro. JONATHAN, high priest, continued contest, expelling Syrians from Palestine, till death, 144. Remaining bro. SIMON, also high priest, with aid of his sons and Roman alliance, freed Judæa from Syria.

Maccabees, Books of.—*I. Maccabees* contains Jewish history, 175–135 B.C., *i.e.* from reign of Antiochus Epiphanes to death of Simon, main source for this period—the life and death struggle of Jewish nationalism against Hellenising tendencies; dates probably from 100–80 B.C. (possibly earlier), and is the work of a Palestinian Jew; original language Hebrew or Aramaic. *II. Maccabees* gives history from 176–161 B.C., thus covering some of the ground of *I. Maccabees*, but with additional matter. It is fuller of the supernatural and generally less hist. and more didactic; written probably I. cent. B.C. The name M. is also given to other apocryphal books not in our regular Apocrypha. *III. Maccabees*, an hist. remains of Jewish persecution dealing with III. cent. B.C., written I. cent. B.C. or 1 A.D. *IV. Maccabees*, religious work of no hist. value, written about time of Christ. *V. Maccabees*, an Arabic compilation.

Fairweather and Black in *Cambridge Bible*.

M'CARTHY, JUSTIN (1830–1912), Irish novelist and journalist; chief work, *A History of Our Own Times*.

MACCHIAVELLI, see MACHIAVELLI.

M'CLELLAN, GEORGE BRINTON (1826–85), Amer. general; b. in Philadelphia; distinguished in Mexican War; sent to study Crimean War, 1855; wrote *Armies of Europe*, 1861; commanded Union army early in Civil War; founded army of the Potomac; defeated Confederates at *Fair Oaks*; won battle of *Antietam*, 1862; delayed to pursue Confederates across Potomac; was relieved of chief command; resigned, 1864.

M'CLERNAND, JOHN ALEXANDER (1812–1900), Amer. general and politician; commanded in Federal army, 1861–64; blamed for conduct at *Champion's Hill*; forced to resign for disregard of orders. His s., EDWARD JOHN M'CLERNAND (b. 1848–), is distinguished army officer.

MACCLESFIELD (53° 16′ N., 2° 8′ W.), market town, Cheshire, England; chief buildings are old

church of St. Michael and town hall; silk manufactures; stone and slate quarries in vicinity. Pop. (1911) 34,804.

MACCLESFIELD, CHARLES GERARD, 1ST EARL OF (*c.* 1618–94), commander-in-chief for Charles I. in South Wales, 1644, and made royal cause supreme; baron, 1645; rode at head of Life Guards at Restoration, 1660; intrigued with Monmouth, and was forced to fly country on accession of James II.; cr. earl, 1679; returned at head of bodyguard of Prince of Orange, 1688.

M'CLINTOCK, JOHN (1814–70), Methodist divine; prof. at Pennsylvania University; worked in New York, Paris, and London; did much for education.

M'CLINTOCK, SIR FRANCIS LEOPOLD (1819–1907), Brit. sailor and Arctic explorer; discovered traces of Franklin, 1850; relieved M'Clure, 1852; found record of Franklin's death, 1857.

MACCOLL, MALCOLM (1838–1907), Anglican divine and controversialist; High Churchman and Liberal.

M'COOK, modern Amer. family known as 'the fighting M'Cooks.' Daniel (1798–1863), a major, served with his eight sons in Civil War; three of them were generals; nephew, Henry Christopher M'C. (b. 1837), noted etymologist.

MACCORMAC, SIR WILLIAM, Bart. (1836–1901), Irish surgeon; practised in Belfast and later in London; was through Franco-Prussian War of 1870 as head of Anglo-Amer. ambulance; surgeon to St. Thomas's Hospital, London; pres., Royal College of Surgeons (1896–1900); consulting surgeon to forces in S. African War (1899–1900); author of surgical works.

M'COSH, JAMES (1811–94), Scot. philosopher; President Princeton University, 1868–88.

M'CRIE, THOMAS (1772–1835), Scot. Presbyterian theologian; wrote *Life of John Knox.*

MACCULLOCH, JOHN (1773–1835), Scot. geologist; b. Guernsey; studied med. and practised, 1807–11; commenced to study geol., especially the structure of Channel Islands; wrote several books; accidentally killed in Cornwall.

M'CULLOCH, JOHN RAMSAY (1789–1864), Brit. economist; author of *Principles of Political Economy,* 1825; prof., London Univ., 1828–32; compiled large number of statistical and economic works.

M'CULLOCH, SIR JAMES (1819–93), Australian politician; b. in Glasgow; went to Melbourne, Australia; entered Legislative Council, Victoria, 1854; Premier, 1862; passed Land Bill; inaugurated system of Protection; again Premier, 1868, 1870, 1875; Agent-Gen. for Victoria, 1871; defeated at election, 1877; retired; returned to England.

MACCUNN, HAMISH (1868–), Scot. composer; Scot. songs, overtures, operas, etc.

MACDONALD, FLORA (1722–90), Scot. heroine of Jacobite revolt; aided Prince Charles Edward to escape from island in Hebrides after *Culloden,* taking him with her in guise of spinning maid.

MACDONALD, JACQUES ÉTIENNE JOSEPH ALEXANDRE (1765–1840), Duke of Taranto; Fr. marshal; captured Dutch fleet, 1794–95; served in Italy; opposed Suvarov at Trebbia; commanded in Switzerland, 1800–1; crossed Splügen Pass; commanded column at Wagram, 1809; defeated at Katzbach by Blücher, 1814.

MACDONALD, SIR JOHN ALEXANDER (1815–91), Canadian statesman; first premier of dominion of Canada; b. in Glasgow; family went to Canada, 1820; called to Bar, 1836; member of Canadian Assembly, 1844; Receiver-Gen., 1847; subsequently commissioner of Crown lands. Advocated federation of Brit. colonies in N. America; became leader of Liberal-Conservative party; Prime Minister, 1857; took chief part in carrying out Brit.-Amer. confederation scheme, resulting in creation of dominion of Canada, of which he became first premier, 1867; organised Dominion; established supreme court; again became premier, 1878; established system of protection; carried out construction of Canadian-Pacific Railway. Joseph Pope, *Life* (1894).

MACDONALD, SIR JOHN HAY ATHOLE, LORD KINGSBURGH (1836–), Lord Justice-Clerk of Scotland; inventor; author of military text-books.

MACDONNELL, ALASTAIR RUADH (1725–61), Highland chief; acted for Brit. Government as spy on Jacobites.

MACDONNELL, SORLEY BOY (*c.* 1505–90), Scots-Irish chieftain, constable of Dunluce Castle, and lord of the Route; waged war with the MacQuillim, Shane O'Neill, and the government of Elizabeth; finally submitted to Elizabeth, 1586, and received official recognition and grant of lands in Ulster.

MACDONOUGH, THOMAS (1786–1825), Amer. naval commander; fought in war of 1812 against Britain.

MACDUFF (57° 40′ N., 2° 30′ W.), seaport, Banffshire, Scotland, at mouth of Deveron; herring fishery.

MACE, official staff, usually of silver or gold, and richly ornamented. It is placed in legislative and municipal chambers and carried before certain public officers as an emblem of authority by an official m.-bearer. Originally a weapon of offence, about 5 ft. long, with a metal head heavily studded with spikes; it was adopted for the defence of princes and persons of authority against assassins, and retained as a symbol when the need had passed.

MACEDONIA (*c.* 41° 10′ N., 22° 55′ E.), part of Turk. province of Rumelia, to N. of Greece. After being controlled in turn by Athens, Thebes, and Sparta, M. became a powerful kingdom under Philip II. and attained its zenith under Alexander the Great, *c.* 330 B.C. (see MACEDONIAN EMPIRE). It was invaded by Gauls in III. cent. B.C.; conquered by Romans in 168 B.C., and became province of Rome; invaded by Goths in IV. cent. A.D., and overrun by Theodoric in 482; settled by hordes of Slavs between III. and VII. cent's; seized by Bulgars, 978; was under Byzantine control in XI. cent.; formed part of kingdom of Thessalonica in 1204, and was under sway of Servia, 1330–55; taken by Turks in 1430.

Turk. oppression of Christian inhabitants resulted in open rebellion in 1902 and 1903, and this was put down with terrible cruelty. In 1903 Austria and Russia intervened, suggesting various reforms, but without much result. Constant massacres took place, and the province, owing partly to religious differences, partly to Turk. misrule and Bulgarian intrigue, long remained on verge of revolt. During the Turko-Balkan War (*q.v.*) of 1912–13, M. formed the main Servian objective, while a Bulgarian force invaded it from N.E. Many towns fell to the Allies, including Kumanovo, Usküb, Kuprulu, Monastir, and Salonica. In the proposed partition of Jan. 1913, Servia and Bulgaria claimed the greater part of M.

M. is a mountainous district for most part, though there are several fertile plains; in N.W. are Shar Mountains, culminating in Mt. Liubotrn, which is variously estimated at from 8300 to over 10,000 ft. in height; in N.E. are Rhodope Mountains, and in the S. Mt. Olympus reaches height of nearly 9800 ft. Principal rivers are the Axius or Vardar, Haliacmon or Bistritza, Strymon or Struma, and Mesta, and there are many smaller streams. There are many lakes, of which Okhrida and Presba are most important. Province is divided into the vilayets of Kossovo, Monastir, and Salonica, and the largest towns are Salonica, Monastir, and Usküb. Climate subject to extremes of cold in winter. Inhabitants include Turks, Slavs, Greeks, Bulgars, Jews, Albanians, Gipsies, Vlachs, Circassians. Chief religions are Gk. Orthodox, Muhammadan, Jewish. M. was in ancient times famed for gold and silver mines, and produced quantities of oil and wine. Chief products at present time are tobacco, rice, fruits. Pop. *c.* 3,000,000. See BALKAN PENINSULA, TURKO-BALKAN WAR.

Brailsford, *M., its Races and their Future* (1906).

MACEDONIAN EMPIRE.—Macedonians were Pelasgians of same stock as Greeks, Thracians, and Illyrians, and their kings claimed descent from Heracles; monarchy dates from about 700 B.C. Perdiccas I. and shadowy successors ruled, 700–498. Amyntas I. was succ. by s., Alexander I. (489–54), who took part in Olympic Games of Greece; his s. Perdiccas II. (436–13) made war against Athens, which was extending its territory northwards and had founded Amphipolis; Archelaus (413–399) civilised his people, built up army, and established fortresses and military roads; civil strife ensued on his death until accession, 360, of Philip, who completed his work; he developed famous Macedonian phalanx, improving the form evolved by Epaminondas of Thebes, and established Macedonian supremacy over all surrounding states, including those of Greece; decisive battle of *Chæronea*, 338; his s., Alexander the Great (336–23), conquered Persian empire.

Alexander ruled at his death Macedonia and Thrace in Europe; Phrygia, Lydia, Caria, Lycia and Pamphylia, Great Phrygia, Paphlagonia, and Cappadocia in Asia Minor; Cilicia, Syria, Mesopotamia, Babylonia, Susiana, Persis, Media, Parthia, Hyrcania, Bactria, Arcia and Drangiana, Carmania, Sogdiana, Arachosia and Gedrosia, the Kabul valley and province on Indus in Asia; and Egypt. In conquered realms of Persia system of government by lieutenants called *satraps* was retained, though Macedonians were generally app. On Alexander's death the empire was partitioned; a series of murders exterminated royal family; Antipater, gov. of Macedonia, seized the crown of the kingdom, but his descendants were unable to retain it. It fell into hands of Demetrius, ruler of Thessaly, 294, was seized by Pyrrhus, king of Epirus, 287, and by Lysimachus, king of Thrace, 286.

Seleucus, ruler of Babylonia, displaced Lysimachus, 281, but was murdered by Ptolemy Ceraunos, 280; Ptolemy made himself master of Macedonia, but Babylonia was occupied by Antigonus, s. of Seleucus; Meleager, Ptolemy's bro., Sosthenus, Ptolemy II., and Pyrrhus enjoyed brief and troubled rule, till finally power fell into hands of s. of Demetrius, Antigonus Gonatas, 276. He drove back Gauls, whose incursions had become serious danger, and made Macedonia again a strong kingdom, but Asia, separated finally, had definitely become eastern empire under Seleucids, and Egypt formed brilliant kingdom of Ptolemies.

Antigonids resumed old Macedonian position of chief Gk. power, but future history hung on relations with new imperial power, Rome. Philip III. (220–179) was forced to make treaty, after defeat by Romans at *Cynoscephalæ*, 197, agreeing to confine his activity to Macedonia and make no war without permission of Rome; after battle of *Pydna*, 168, Macedonia was divided into four provinces with local autonomy, but dependent on Rome; revolt crushed by Metellus at second battle of *Pydna*, 148, after which Macedonia was formed into Rom. province, 146, with Illyria; ultimately proconsul resided at Thessalonica. Macedonian Seleucid empire gradually broke up; ended with Rom. annexation of Syria, 64. Egypt was conquered by Rome, 30.

MACEIO (9° 40′ S., 35° 51′ W.), seaport town, capital, Alagoas, Brazil; exports cotton, rum, sugar. Pop. 33,000.

MACERATA (43° 18′ N., 13° 26′ E.), town, capital, Macerata, Italy; has univ. and cathedral; various industries. Pop. (1911), town, 23,000; province, 25,091.

M'GEE, THOMAS D'ARCY (1825–68), Irish-Canadian politician and poet; emigrated, 1842, but returned and became associate of O'Connell in Young Ireland movement; edited *Amer. Celt*, 1850–57; retired to Montreal and became prominent member of Canadian Parliament; assassinated for denunciation of Fenians.

M'GIFFERT, ARTHUR CUSHMAN (1861–), Amer. Biblical scholar; prof. in Union Theological Seminary.

MACGILLIVRAY, WILLIAM (1796–1852), Scot. naturalist; especially devoted to zool., and author of a classic *History of British Birds*. His s. **John**, also a naturalist, was author of the account of the *Voyage Round the world of H.M.S. Rattlesnake*.

MACGREGOR, JOHN (1825–92), Scot. adventurer; travelled widely; called 'Rob Roy' from his canoe.

M'GREGOR, ROBERT, see ROB ROY.

MACHÆRODUS, see under CAT FAMILY.

MACHAULT D'ARNOUVILLE, JEAN BAPTISTE DE (1701–94), Fr. politician who endeavoured to introduce financial reforms before Revolution; his s., **Machault D'Arnouville, Louis Charles,** was bp. of Amiens.

MACHAUT, GUILLAUME DE (fl. 1350), Fr. poet and musician; wrote motets, chansons, ballads, etc.; besides poems.

MACHIAVELLI, NICCOLÒ (1469–1527), Florentine statesman and author; s. of a lawyer; became clerk in chancery of Florentine republic, 1494; second chancellor and sec., 1498–1512; his political experience among the subtle, worldly people who then led civilisation in Renaissance period, and the frequent opportunities afforded by foreign embassies, account for urbanity, cynicism, and wide knowledge of M.'s books; mind of widest scope which found its expression in political theorising; besides direct hist. value, his works are of greatest interest as interpretation of life by a son of the humanist movement. The Christian standard was entirely abandoned; hence *Machiavellianism* was synonymous in XVI. cent. with everything that was evil. Throughout his career, however, he showed himself a patriot; to impress on Florence the need for militia he wrote address to Gonfalonier Soderini, 1506, entitled *Discorso sulla provisione del danaro*, a scheme, subsequently adopted, for financing citizen army. He fell from office with return of Medici, 1512, when his reforms were undone and he was exiled; racked and imprisoned on suspicion of having conspired with Boscoli, 1513; released and wrote, in retirement at his country villa, works of political wisdom intended for his native city; *Il Principe*, finished 1513, and widely read in MS., was not pub. till after his death; it was dedicated to Lorenzo dei Medici, in whom M. hoped to find saviour of Florence; gained favour of Medici; commissioned to write the *Historie Fiorentine*, 1520, but never finished it; his famous comedy, the *Mandragola*, was pub., 1524; unsparing picture of life as he found it.

Macaulay, *Essay on M.*; Lord Morley, *Machiavelli* (Romanes Lecture, 1897).

MACHINE GUN, a piece of ordnance loaded and fired mechanically; delivers a large number of bullets or shells either simultaneously or in quick succession. The origin of the m. g. is to be found in the early custom of grouping together a number of guns in order to concentrate the fire. Two or more small guns or culverins were frequently mounted upon a waggon with blades fixed to the wheels, and used to break the enemy's ranks. In the XVI. cent. m. g's called 'organs,' from the fact that they contained several tubes, were used to a considerable extent, but they gradually fell into disuse on account of their lack of power and mobility. During the XVII. and XVIII. cent's many m. g's were invented, but they were mostly unsatisfactory, and comparatively little attention was given to them owing to the great improvement in infantry weapons. The French *canon à balles*, introduced about 1866, proved a disappointment, although it was capable of good work within a certain range. Its failure was partly due to the way in which it was handled, for authorities disagreed about its correct use, and it was employed sometimes as an infantry weapon and sometimes in place of artillery. The Gatling gun, used in the Amer. Civil War, was hand operated, and had ten barrels which were rotated round an axis and fired successively. It was fairly successful, and even as late as 1898 it was used in the

Span.-Amer. War. Another important hand-operated gun was the Nordenfelt, intended chiefly for naval use, to repel attack by torpedo boats. The barrels did not move, but were fixed horizontally and fired in rapid succession by moving the firing handle backward and forward. Modern m. g's perform automatically the operations of loading, firing, and ejecting. The first to make a really practical m. g. was Sir Hiram Maxim. The Maxim gun has a single barrel with an outer case round it, the intervening space containing water for cooling the barrel. The first shot is fired by hand, after which the gun goes on working by power obtained from the recoil at the explosion of the successive cartridges. The cartridges are attached to a broad belt, and the gun continues to fire as long as any remain. The gun is sighted to 2500 yards, weighs from 50 to 60 lb., and is capable of firing 450 rounds per minute. The Hotchkiss gun is actuated by a portion of the explosion gases. It weighs about 53 lb., is sighted to 2000 yards, and delivers 500 to 600 rounds a minute. Another gun utilising the explosion gases is the Colt automatic. It is sighted to 2000 yards or more, weighs about 40 lb., and fires 400 or more rounds a minute. Other m. g's worked by the gases of explosion are the Austrian Schwarzlose gun and the Skoda gun; while the Ital. Perino gun is recoil operated. One of the defects of single-barrel m. g's is overheating. The 7½ pints of water contained in the water-jacket of a Maxim are raised to boiling-point in about 1½ minutes of rapid firing, and of course the water-jacket has to be replenished frequently. The Schwarzlose gun has a large water-jacket, which does not require refilling until 3000 rounds have been fired. The disadvantage of guns cooled by water-jacket is the difficulty of always ensuring an adequate supply of water. In the Hotchkiss gun a radiator is used instead of a water-jacket, and in the Colt gun heating is guarded against by making the barrel exceptionally heavy. In the Maxim, Perino, and other guns of the same type the utilisation of the recoil obviates straining the gun or its mounting, but the construction is more complicated than that of most guns using the explosion gases. Besides rapid automatic firing, m. g's are capable of slow single shots, but slow firing is difficult to control. M. g's are painted a neutral colour, and almost always mounted upon a tripod, wheeled vehicles being used only for transport. Protecting shields were in use until fairly recently, but are now abandoned, as they afford the enemy an excellent target.

MACK, VON LEIBERICH, KARL, BARON (1752–1828), Austrian lieut. field-marshal; distinguished in Turk. War, 1788-91, and won glory in recapture of Belgium, 1790–91; commanded Neapolitan army, 1798, and was captured by Napoleon; quartermaster-gen. at headquarters, 1805, and imprisoned for disasters.

MACKAY (21° 10′ S., 149° 5′ E.), seaport, Queensland, Australia, on Pioneer River; outlet of several copper- and gold-fields. Pop. 4500.

MACKAY, HUGH (c. 1640–92), Scot. general; important influence in securing Scotland for William of Orange, 1688; defeated at *Killiecrankie*, 1689, but put down Highland revolt; not brilliant, but trustworthy.

M'KEES ROCKS (40° 30′ N., 80° 20′ W.), town, Allegheny County, Pennsylvania, U.S.A., on Ohio; iron and steel manufactures. Pop. (1910) 14,702.

M'KEESPORT (41° 19′ N., 79° 41′ W.), city, Allegheny County, Pennsylvania, U.S.A., at junction of Youghiogheny and Monongahela; iron and steel manufactures; bituminous coal and natural gas region. Pop. (1910) 42,694.

MACKENNEL, ALEXANDER (1835–1904), Eng. Congregationalist theologian; pastor at Bowdon, Cheshire; one of leaders of his denomination; wrote theological works.

MACKENZIE (65° N., 125° W.), river, N.W. Canada: falls into Arctic Ocean after a course of about 2500 miles.

MACKENZIE, HENRY (1745–1831), Scot. novelist; a leading figure in old Edinburgh literary life; one of the first to appreciate Burns in print. His *Man of Feeling*, pub. 1771, was popular.

MACKENZIE, SIR ALEXANDER (1755–1820), Canadian explorer; Mackenzie River is named after him.

MACKENZIE, SIR ALEXANDER CAMPBELL (1847–), composer; b. Edinburgh, where he first practised his profession; has written operas, oratorios, cantatas, and many orchestral and other works. Principal of the Royal Academy of Music since 1888.

MACKENZIE, SIR GEORGE (1636–91), Scot. lawyer; for prosecuting Covenanters earned title 'Bluidy Mackenzie.'

M'KENZIE, SIR JOHN (1838–1901), New Zealand statesman; Minister of Lands, Immigration, and Agriculture, 1891, and did much to develop resources of New Zealand and amend laws as to taking up land.

MACKENZIE, SIR MORELL (1837–92), Eng. physician; distinguished throat specialist, physician to Throat Hospital (London) and London Hospital; attended the Crown Prince (afterwards Frederick III.) of Germany (1887), diagnosing and treating an affection of his throat as a simple growth, in opposition to the Ger. physicians, who considered it to be malignant, which it proved later to be; M.'s diagnosis was of considerable political importance in regard to the succession to the Ger. throne, and after the death of Frederick III. (in 1888) he pub. account of the case, and was censured by the College of Surgeons.

MACKENZIE, WILLIAM LYON (1795–1861), Canadian politician and journalist; edit. of *Colonial Advocate*, 1824–33, and became leading demagogue; government attempted in vain to suppress paper; M.P. for York, 1828; several times expelled but re-elected until writ was suspended; organised rebellion of Upper Canada, 1837–38; wrote in exile for *New York Tribune* and edit. *Mackenzie's Magazine*.

MACKEREL (*Scombridæ*), a widely distributed family with fifty species, some of which are important food fishes. All are rapid swimmers and seek their food near the surface of the sea. The best-known form, the beautiful blue and silvery M. (*Scomber scombrus*), is an abundant food fish even more common on Amer. than on Brit. coasts. The Bonito (*Sarda*), a graceful blue-banded fish found throughout the Atlantic and Mediterranean, is also a fair food fish; largest of the M. family is important Mediterranean species, the Tunny.

MACKINAC, MACKINAW (45° 58′ N., 84° 35′ W.), city, summer resort, on M. island, at entrance of Straits of M., Michigan; near it is Fort Mackinac.

M'KINLEY, MOUNT (63° 30′ N., 151° W.), mountain, Alaska, highest in N. America (20,500 ft.); first scaled by Hudson Stuck, 1913.

M'KINLEY, WILLIAM (1843–1901), 25th Pres., U.S.A.; b. at Niles, Ohio; served in Civil War as volunteer; called to Bar, 1867; elected member of Congress, 1877; favoured protection; leader of Republican party in House of Representatives, 1889; introduced M'K. Bill, 1890, protective measure providing for higher duties on various imports, and treaties of reciprocity with European countries; gov. of Ohio, 1891, 1892–95; pres. of National Republican Convention at Minneapolis, 1892. As Republican he defeated Bryan of the Democrats in presidential election, 1896; declared war against Spain on Cuban question, 1898; crushed Filipinos' insurrection in Manila; annexed Hawaii, 1898; some of Samoan isles, 1899; and sent troops to join Powers' march on Pekin, 1900. Re-elected Pres., 1900; reorganised army and navy; shot at Buffalo by anarchist, Leon Czolgosz. *Life*, by Halstead and Manson (1902), Fallows (1902).

M'KINNEY (33° 10′ N., 96° 30′ W.), city, capital, Collin County, Texas, U.S.A.; cotton industries. Pop. (1910) 4714.

MACKINTOSH, SIR JAMES, Kt. (1765–1832), Scot. philosopher, historian, politician, and lawyer; wrote against Burke's *Reflections on the French Revolution*, *Vindiciæ Gallicæ*, best radical vindication of

Revolution, which M. ultimately came to condemn; eloquent, earnest reformer, centre of literary circle.

MACLAURIN, COLIN (1698–1746), Scot. mathematician; b. Kilmodan; ed. Glasgow Univ.; wrote *Geometrica Organica, A Treatise of Fluxions*; papers on the form of the earth, tides, action of wind on windmills and sails of ships, etc.

M'LENNAN, JOHN FERGUSON (1827–81), Scot. ethnologist; upheld matriarchal as against patriarchal theory of primitive society.

MACLEOD, NORMAN (1812–72), Presbyterian divine; upholder of Scot. establishment; liberal in theology; admired by Queen and Royal Family; opposed strict Sabbatarianism.

MACLISE, DANIEL (1806–70), Irish painter; made himself famous by his *All-Hallow Eve*, 1833. His best pictures are familiar by engravings.

MACMAHON, MARIE EDMÉ PATRICE MAURICE DE, DUKE OF MAGENTA (1808–93), Fr. Pres. and soldier; b. at Sully, near Autun; served repeatedly in Algeria, c. 1828–55; in Crimean War, 1855, he captured Malakoff works; crushed Kabyles in Algeria; won battle of Magenta, 1859; gov.-gen., Algeria, 1864–70; commanded in Alsace, 1870; capitulated at Sedan; Pres., 1873–79.

MACOMB (40° 27′ N., 90° 44′ W.), city, Illinois, U.S.A.; bricks, pottery. Pop. (1910) 5774.

MACOMER (40° 15′ N., 8° 45′ E.), village, Cagliari, Sardinia.

MACON (33° 46′ N., 83° 36′ W.) city, Georgia, U.S.A., on Ocmulgee River; important railway centre; seat of various educational institutions; iron foundries; manufactures machinery, cottons, woollens. Pop. (1910) 40,665.

MÂCON (46° 19′ N., 4° 50′ E.) town, Saône-et-Loire, France, on Saône; ancient *Matisco*; remains of ancient cathedral; brass foundries; wine. Pop. 19,500.

MACON, NATHANIEL (1758–1837), Amer. statesman; fought in War of Independence; strong democrat and upholder of states' rights; pres. of South Carolina State Convention, 1835.

MACPHERSON, JAMES (1736–96), Scot. 'translator' of Ossian; b. Ruthven, Inverness-shire. After travelling through the Highlands in search of Gaelic MSS. he pub. *Fingal* and *Temora*, supposed translations from original Gaelic of Ossian; generally considered a literary forger.

MACPHERSON, JAMES BIRDSEYE (1828–64), Amer. soldier; fought for North in Civil War.

MACQUARIE (53° 30′ S., 159° 30′ E.), island group, S. Pacific; dependency of New Zealand.

MACRAUCHENIA ('long-necked'), genus of extinct, long-necked, three-toed ungulates from later Tertiary of S. America, typifying sub-order Litopterna.

MACREADY, WILLIAM CHARLES (1793–1873), Eng. actor; first appearance was at Birmingham as Romeo; first London success was as Rob Roy; interpretations of Shakespeare's heroes were good.

MACROBIUS, AMBROSIUS THEODOSIUS, Rom. writer of early V. cent.; wrote *Saturnalia*, containing much information about history, myths, philosophy, science.

MACROCHEIRA, see under MALACOSTRACA.

MACROLEPIDOPTERA, see LEPIDOPTERA.

MACRONUCLEUS, see under NUCLEUS.

MACROOM (51° 54′ N., 8° 57′ W.), market town, Cork, on Sullane; corn-mills; leather-work. Pop. 3820.

MACRORHINUS, see under CARNIVORA.

MACROSOMATIA, see under TERATOLOGY.

MACTRA, Clams, see under LAMELLIBRANCHIATA.

MACUGNAGA (45° 57′ N., 7° 58′ E.), village, Novara, Piedmont, Italy.

MACVEAGH, WAYNE (1833–), Amer. Republican politician.

MACWHIRTER, JOHN (1839–1911), Scot. painter of Highland landscapes; celebrated for his 'Silver Birches.'

MADAGASCAR (12° to 25° 30′ S., 43° 12′ to 50° 30′ E.), large island off S.E. coast of Africa; is separated from Africa by the Mozambique Channel on the W.; area, c. 228,000 sq. miles; eastern part is of Archæan, western of Secondary formation; interior rugged with mountains and mountain chains rising to 3000–5000 ft., sloping down on both sides to low ground about 600 ft. above sea-level; between ranges are plateaux, and highest part of island is near centre, where Ankaratra, probably an extinct volcano, reaches height of 9000 ft.; drained by Onilahy, Mangoky, Tsiribihina, Betsiboka, and other streams; largest lake, Alaotra. Capital, Antananarivo; important towns are Diego Saurez, Fianarantsoa, Tamatave. Climate hot and unhealthy on coasts, more temperate and healthy in interior.

Modern European knowledge of M. dates from 1500, when it was sighted by Diogo Diaz and named São Laurenço; it is said to have been visited by Almeida in 1506. Early Portuguese and Dutch attempts at colonisation proved unsuccessful, and the first Portuguese settlement, established in 1548, was destroyed in following cent. by French, who for long time continued their attempts at establishing themselves here, and were constantly engaged in hostilities with native inhabitants. Their settlement at Fort Dauphin was seized by English in 1810–11, and the territory was in 1818 ceded to King Radama on his abolishing slave trade. Under Radama Christianity was introduced; but on his death power was seized by Queen Ranavalona I., who was opposed to Christianity, expelled missionaries, and persecuted native Christians. Under her successors, Radama II., Rasohérina, and Ranavalona II., Christianity was again encouraged, treaties were made with England, France, and America, and considerable progress was made.

In 1883 war with France broke out, and in this year also Ranavalona II. d. and was succ. by Ranavalona III. War continued for two years, and ended in 1885, when treaty was made whereby France obtained Diego Saurez and the right partially to control foreign affairs of island, while a Fr. Resident was to be sent to the capital. French increased their demands in 1894, and on these being rejected sent force against island in 1895. Fr. protectorate was established in same year, the queen being allowed to remain on throne; but in 1896 rebellion occurred, and M. was annexed to France, Ranavalona III. being banished to Algeria. After this several insurrections broke out, but by 1901 whole island had submitted to Fr. control. Trade and education have made rapid progress in recent years; and in 1907 a large number of gold-mining concessions were granted.

M. is administered by a gov.-gen., assisted by a consultative council; it is in part under military and in part under civil control. The Christian inhabitants belong to both R.C. and Prot. religions, but many tribes are still pagans, practising forms of fetishism. Education is free and obligatory, and the children are obliged to learn Fr. language. Inhabitants include Fr. and other Europeans, Asiatics, Africans; native inhabitants are Hovas, Betsileos, Betsimisarakas, and other Malagasy tribes, the Hovas being the most advanced and intelligent.

M. has luxuriant vegetation, most valuable trees being bananas, cocoa-nuts, orange and mulberry trees, areca palms, pandunas, acacias, ebony; also produces rubber, cotton, hemp, rice, manioc, coffee, cacao, vanilla, tobacco, sugar-cane. Maize, sweet potatoes, and other crops grown; cattle and sheep raised. Minerals include gold, copper, iron, lead, silver, antimony, sulphur, lignite, salt. Railway mileage, c. 190. Pop. (1911) 3,054,658.

Sibree, *M. and its People* (1870); Gravier, *Madagascar* (1904).

MADDALONI (41° 1′ N., 14° 23′ E.), town, Caserta, Italy. Pop. 21,000.

MADDER (*Rubia*), genus of plants, order Rubiaceæ: used in dyeing until superseded by alizarin (*q.v.*).

MADEIRA, THE MADEIRAS (c. 33° N., 16° 45′ W.), islands, Atlantic Ocean, about 700 miles W. of Lisbon,

M. was visited by Portug. explorers in 1820, when it was annexed to Portugal, remaining in possession of Portug. government almost without interruption until present time; first permanently settled, *c.* 1431; taken and held by British for short time in 1801 and in 1807–14. The group comprises M., Porto Santo, and three uninhabited Desertas; total area, 314 sq. miles. M. is an irregular oval in shape; area, *c.* 270 sq. miles; surface mountainous, rising to over 6000 ft. in Pico Ruivo; has fine climate and is favourite health-resort, especially for consumptive patients; chief town, Funchal, is port of call for Atlantic steamers; exports fruits, wines, vegetables, sugar, tobacco; Madeira wine is well known, and is made from mixed white and black grapes. Porto Santo is a hilly island, with practically no products; it was visited by Columbus. Whole group is part of submarine range of volcanic mountains. Flora includes large variety of flowering plants. M. is administered as a district of Portugal; education is nominally obligatory; chief religion, Rom. Catholicism. Inhabitants are of Portug. nationality with slight admixture of Moorish and negro blood. Pop. (1910) 176,500.

Biddle, *The M. Islands* (1891); Koebel, *M.: Old and New* (1909).

MADELENIAN, *La Madeleine,* name given to a period of prehistoric age characterised by use of bone implements.

MADELEY (53° N., 2° 21′ W.), town, Shropshire, England; ironworks; coal and iron mines.

MADISON.—(1) (43° 3′ N., 89° 18′ W.) capital, Wisconsin, U.S.A.; site of state univ. and state capitol; has important libraries, observatory, opera-house, various schools; fine system of parks. Manufactures flour, machinery; trades in tobacco, dairy produce. Pop. (1910) 25,531. (2) (45° 40′ N., 74° 25′ W.) town, New Jersey, U.S.A.; residential suburb of New York and Newark. Pop. (1910) 4658. (3) (38° 46′ N., 85° 20′ W.) city, Indiana, U.S.A., on Ohio; centre of fine grain and fruit region. Pop. (1910) 6934.

MADISON, JAMES (1751–1836), 4th Pres., U.S.A.; b. Port Conway, Virginia; prominent in Virginian affairs till 1779, when entered Congress; tried to establish right of Congress to tax imports; M. was member of House of Delegates, Virginia, 1784; had considerable share in drafting Virginian constitution and in inducing its acceptance by nation; in this connection he wrote *The Federalist,* with Hamilton and Jay. Again member of Congress, 1789; supported Jefferson, and opposed Hamilton's financial policy; advocated Amer. intervention in aid of France against Britain, 1793; retired from Congress, 1797. Sec. of State, 1801; Pres., 1808; tried to coerce Britain and France by commercial restrictions; subsequently declared war, 1812, ended by *Peace of Ghent,* 1814; retired, 1817.

Gaillard Hunt, *Life* (1902).

MADNESS, see INSANITY.

MADRAS (*c.* 8° 4′ to 20° 18′ N., 74° 30′ to 85° 30′ E.), presidency and administrative division of India. M. was colonised by English in 1639, when the East India Company established themselves there; held by French, 1746–48, when Brit. regained possession; further hostilities with French ended about 1761; war against Hyder Ali and Tippoo Sahib of Mysore ended in 1799, since when Brit. possession has been undisturbed except by occasional native risings. M. occupies whole width of Indian peninsula S. of river Kistna and its tributary Tungabhadra, and extends northward along E. coast as far as Lake Chilka; area, 141,726 sq. miles; low coastal strip on each side rises by E. and W. Ghats to great central tableland, sloping up from 1000 to 3000 ft.; drained by Godavery, Kistna, Cauvery, and other streams; chief towns, Madras, Malabar, Travancore, Kanara. Climate very variable.

M. is administered by governor, who is assisted by executive and legislative councils. There is univ. at M., and there are other educational establishments. Chief religions, Hindu, Muhammadan, Christian, Animist. Produces large crops of cotton and tobacco, also rice, millet, pulse, ground-nuts, oil seeds, sugar-cane, spices, indigo, cocoa-nuts, areca-nuts, dates; on hills, tea, coffee, cinchona, cardamoms are grown; valuable teak forests. Minerals include gold and iron, but await development. Exports raw cotton, seeds, rice, indigo. Pop. (1911) 41,405,404.

Ayyangar, *Forty Years' Progress in M.* (1893).

MADRAS (13° 4′ N., 80° 17′ E.), capital, M. Presidency; 9 miles long; as port M. is handicapped by surf; commercial part, the 'Black Town,' is on shore; Europeans live farthest inland; chief buildings: Government House, Senate House, St. George's Cathedral. Original settlement was Fort St. George. Chief exports: tea, coffee, cotton, sugar, dye-stuff, grain, hides, indigo. Pop. (1911) 518,660.

MADREPORARIA, see CORAL.

MADRID (40° 30′ N., 3° 40′ W.), province, New Castile, Spain; belongs to basin of Tagus; capital, Madrid (*q.v.*). Pop. (1910) 877,819.

MADRID (40° 25′ N., 3° 43′ W.), capital of Spain, on Manzanares, in centre of great sandy plateau over 2100 ft. above sea-level. Originally belonged to Moors, from whom it finally passed to Alphonso VI. of Castile, 1083; capital of Spain under Philip II., 1560; taken by French, 1808; occupied by Wellington, 1812; Ferdinand VII. restored, 1814; important recent event was marriage of King Alphonso with Princess Ena of Battenberg, 1906, when a bomb outrage occurred.

M. is archiepiscopal see, has cathedral and many churches and monasteries. Principal street, Calle de Alcala, is one of finest in Europe. Site of univ., founded 1590, with observatory and magnificent library; numerous educational and charitable establishments. Contains royal palace, CORTES, royal picture gallery with splendid collection of paintings by Velazquez, Titian, and other masters, museums, libraries. Manufactures leather goods, tobacco, furniture, tapestry, glass, porcelain, gold and silver work. Pop. (1910) 571,539.

A. F. Calvert, *Madrid* (1909).

MADRIGAL.—(1) a brief lyrical poem, usually amorous, irregular in construction, and of no specified formula, but normally about ten lines long and having the iambic foot dominant. Eng. madrigal writers are Drummond, Lodge, Carew, and Suckling. (2) in music usually a pastoral song sung by four or more voices and without musical accompaniment. Glee singing superseded madrigal singing in the XVIII. cent.

MADURA.—(1) (7° S., 113° 30′ E.) island, Dutch East Indies, N.E. of Java, from which it is separated by the Strait of Madura. Pop. 1,750,000. (2) (9° 55′ N., 78° 9′ E.) district, Madras, India; mountainous in N. and W., elsewhere level and fertile; capital, Madura, on Vaigai, is of great historic interest; it contains palace of the former rajahs, and one of the most remarkable temples in India; coffee industries. Pop. (town) 134,130; (district) 2,900,000.

MADURA FOOT, see PARASITIC DISEASES.

MÆCENAS, GAIUS CILNIUS (*c.* 73 B.C.–8 B.C.), Rom. patron of letters; chief administrator at Rome during the conflict between Octavian and Antony. About the year 16 B.C. he fell into disfavour with Augustus and retired from public life. To him both Horace and Vergil largely owed their fame and the privilege of imperial favour, hence M. has become name for patron.

MAETERLINCK, MAURICE (1862–), Belg. poet and writer; b. Ghent; writings are deeply imbued with symbolism and mysticism. *Pelléas et Mélisande* was his first great drama. Other notable works are *Le Trésor des humbles, Douze Chansons, La Vie des Abeilles, L'Oiseau bleu* (*The Blue Bird*).

MAFEKING (25° 52′ S., 25° 41′ E.), town, British Bechuanaland, S. Africa; noted for its spirited defence (Oct. 1899 to May 1900) by Baden-Powell (*q.v.*) in Boer War.

MAFIA, MAFFIA, supposed Sicilian secret society. Love of vendetta and scorn for those who have recourse to legal punishment is mark of Sicilian *mafiosi*; violence

and assassination common; no proof of existence of organised secret society.

MAFRA (38° 54′ N., 9° 20′ W.), town, Estremadura, Portugal, on Lisandra; has magnificent royal palace erected by John V., 1717. Pop. 4850.

MAGADHA, ancient kingdom, India; capital, Pataliputra, on Ganges; corresponded generally to modern Behar and Oudh.

MAGALLANES (50° S., 75° W.), territory, S. Chile, including the area S. of lat. 47° S., the W. portion of Tierra del Fuego, and the islands of the Straits of Magellan. Pop. (1910) 23,650.

MAGDALA (11° 15′ N., 39° 22′ E.), fortified town, Abyssinia; captured by the British under Napier, 1868.

MAGDEBURG (52° 9′ N., 11° 38′ E.), town, Prussian Saxony; strongly fortified; strategic importance due to command of road from Köln to Berlin. Taken by Elector of Saxony, 1551; besieged by Wallenstein, 1629; pillaged by Tilly, 1631; captured by French, 1806; restored to Prussia, 1813. Archiepiscopal see since 968; cruciform cathedral dates from XIV. cent. Great railway centre; enormous trade in sugar; also deals in grain, chemicals, iron manufactures, etc. Pop. (1910) 279,629.

MAGEE, WILLIAM (1766–1831), bp. of Raphoe, 1819; abp. of Dublin, 1822.

MAGEE, WILLIAM CONNOR (1821–91), bp. of Peterborough, 1869; active in defence of Irish Church; abp. of York, 1891, but died soon after.

MAGELLAN, FERDINAND, Magalhaens (*c.* 1470–1521), Portug. navigator; did good service to Portugal; ill-rewarded, and, with his friend Ruy Faleiro, entered into service of Charles V., and won his support for new attempt to reach Asia by West; sailed down E. coast of America, 1519; turned into strait afterwards called Magellan's, 1520; crossed Pacific, so named by M., as far as Philippines, 1521, undergoing terrible sufferings from scurvy and starvation; treacherously slain by native chief; of his fleet, *Vittoria* alone reached Spain, 1522, having circumnavigated globe; credit belongs to intrepid M.

MAGENTA (45° 28′ N., 8° 52′ E.), town, Lombardy, Italy; silk and matches; French and Sardinians defeated Austrians here, 1859. Pop. 8000.

MAGGIORE, LAGO, Roman *Lacus Verbanus* (46° N., 8° 30′ E.), lake, N. Italy, on border of Italy and Swiss canton Ticino; traversed by river Ticino; contains the Borromean Islands; length, 37 miles; greatest breadth, 5½ miles.

MAGIC, the working of marvels through supernatural power, has been believed in all through the world's history. Its relation to the primitive forms of religion has often been discussed, but both terms are used loosely, and it is difficult to determine. Various theories of m. have been propounded. Frazer's theory is that belief in m. is accounted for by a 'law of sympathy.' If two things have once been related to each other, there is a permanent bond of sympathy between them. Thus, if it be desired to injure an enemy, a wax figure of him is made, pins are stuck into it, or it is crushed or buried or roasted and magic formulæ are repeated. The enemy will feel the pain and injury which have been inflicted on his image; it would be made securer if his hair or parings of his nails were mixed with the waxen image.

It is extremely difficult to give a satisfactory definition of m. Amongst savage races by whom it is practised the term probably hardly occurs. M. is a loose term for a number of rites and customs which only have a unity to outside observers. One characteristic is that it is something private or illicit and existing side by side with established religious rites.

A conception which seems to underlie m. is that of *mana*, a force or energy which is present in things; the term is applied to people who use magical formulæ. The origin of m. is to be sought, probably, in the sense of mystery inspired by certain objects, *e.g.* a corpse. The primitive stages of religion were pre-animistic, but when religion became animistic, wizards pretended or believed themselves to be in communication with demons.

M. is sometimes divided into 'white,' that which is wrought with good purpose; 'black,' the converse with evil spirits and that which is essentially of malevolent intent. Though the belief in m. is generally confined to uncivilised and uneducated peoples, with the recent interest in Spiritualism and Psychical Research (*qq.v.*) there has been a revival of m. among educated Westerns. Those who practise it, though they may deceive themselves, often act in good faith. Extraordinary stories are still told of what is done in the East.

MAGIC SQUARE, one made of numbers so arranged that any line adds up to the same amount.

MAGISTRATE, Justice of the Peace for the county or the borough, app. by the Lord Chancellor. No salary is attached to the office, which is recognised as one of honour. All towns of importance now have a stipendiary magistrate, who must be a barrister of at least seven years' standing. Twenty-five stipendiary magistrates sit in London, and are known as Metropolitan Magistrates.

MAGNA CARTA, Great Charter granted by King John at Runnimede, 1215. General causes leading to it were king's oppression and heavy demands for *scutage*. In 1214 Northern barons refused to pay scutage and took arms against John; and, as the whole populace, for the first time, was united by common interest, the king had to give way to its demands. Conference took place at Runnimede, June 15 to 23. Document called *Articles of the Barons* was accepted and signed by John, June 15. Articles, numbering 48, were immediately converted into charter, of which several copies were made. Charter consists of preamble and 63 clauses. Principal provisions: declaration of freedom of Church of England; limitation of feudal obligations, *e.g.* relief, wardship, and marriage; establishment of fixed royal courts at Westminster, and of assize courts; regulation of fines; all accused persons to be tried by their peers; no taxes to be imposed without consent of Great Council of barons and tenants-in-chief; no imprisonment without lawful trial, and no delay or sale of justice; one standard of weights and measures. Sixty-first clause throws doubt on king's intention of keeping his word, and appoints committee of 25 to enforce his doing so. Four copies of charter still exist. M. C. was ratified and confirmed by different kings.

M'Kechnie, *Magna Carta* (1905).

MAGNA GRÆCIA, group of Gk. colonies, S. Italy; among leading cities were Cumæ, Sybaris, Crotona, Tarentum, Locri, Rhegium, Metapontum, Heraclea, and Neapolis; founded for the most part in VIII. cent. B.C.; conquered by Rome, III. cent. B.C.

MAGNESIA (39° 12′ N., 23° 12′ E.), an ancient district of E. Thessaly, bordering Ægean Sea.

MAGNESIA AD MEANDRUM (37° 40′ N., 27° 32′ E.), ancient city, Ionia, Asia Minor; celebrated for its magnificent temple of Artemis Leucophryne.

MAGNESIA AD SIPYLUM, modern Manissa (38° 36′ N., 27° 28′ E.), ancient city, Lydia, on Hermus; Antiochus the Great defeated here by Scipio, 190 B.C.

MAGNESIAN LIMESTONE, see Dolomite.

MAGNESIUM (Mg=24·32), metallic element related to zinc; occurs as magnesite $MgCO_3$, dolomite $(MgCa)CO_3$, Epsom salt $MgSO_4,7H_2O$, etc.; obtained by electrolysis of fused chloride. Silvery white, M.P. 632·7, may be made into wire, ribbon, or powder; *magnalium* (Mg+Al) is a light alloy giving good castings. M. tarnishes in moist air, forming MgO; burns with intensely white and *actinic* light; m. powder, mixed with potassium chlorate, is used for photographic flash-light; rapidly displaces hydrogen from dilute acids, even some from dilute nitric acid. *Magnesia*, MgO, forms salts, *e.g.* sulphate $MgSO_4,7H_2O$, basic carbonate $3MgCO_3$, $Mg(OH)_2$, $3H_2O$='magnesia alba.'

MAGNETISM.—From very early times it was known that a certain iron ore, originally found in

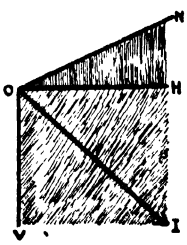
Magnesia, Asia Minor, and consisting chiefly of iron sesquioxide (Fe_3O_4), possessed the property of attracting iron. It was also known that if a bar of this ore were suspended so as to swing freely in a horizontal plane, it would come to rest in a direction approximately north and south. Later, it was found that iron and steel could by various means be temporarily or permanently endowed with the same properties, and such *artificial* magnets (as they have been termed) are now exclusively used in the study of magnetic phenomena. The chief elementary facts of the subject of magnetism may be summarised as follows: Tested by their property of being acted on by a magnet, a large number of substances exhibit magnetic properties, but only a comparatively small number show them to any marked degree. In one class may be placed such substances as iron, nickel, and cobalt, which can be attracted by either pole of a magnet, and are known as *paramagnetic* substances. Another class includes bismuth and antimony, which are repelled where those of the first class are attracted, and are known as *diamagnetic* substances.

Taking an ordinary steel magnet, it is found that its attractive power is situated at or near its ends, which are termed the *poles*. If it be free to swing horizontally, the end pointing northwards is termed the north pole, the other the south pole. If we bring near to such a suspended magnet another similar magnet, it will be found that similar poles repel and dissimilar poles attract one another. Assuming, meanwhile, some definite measure of the strength of a magnet pole, the law of magnetic attraction or repulsion may be stated in the same form as the laws of gravitation or electrostatics, viz. the force between two poles is proportional to the product of their strength, and inversely proportional to the square of the distance between them.

A magnet can *induce* magnetism in a piece of iron or steel to which it is brought near or in contact: in the case of soft iron the magnetic state ceases almost entirely on removal of the magnet: with steel, the magnetism is to a very large extent permanently retained. But there is an important difference, in that the soft iron is easily, while the steel is with difficulty, magnetised by this process of induction. A steel bar may be permanently magnetised by rubbing it from one end to the other, always in the same direction, with one and the same end of a magnet. The result of this is that that end of the steel bar which is last touched by the magnet is opposite in polarity to that end of the magnet used for the purpose. A steel bar may also be magnetised by placing it within a cylindrical coil of wire through which a powerful electric current is passed. The magnetism induced in steel or iron may be removed by heating the specimen to about 790° C., above which temperature iron or steel ceases to be magnetic. If a steel magnet be broken into two or more pieces, each part is still a magnet. Lastly, it may be mentioned that within recent years it has been found that certain alloys of manganese, aluminium, and copper have magnetic properties although each constituent is practically non-magnetic.

The space throughout which the magnetic force exerted by a magnet is appreciable is termed the *magnetic field* due to the magnet. Throughout any magnetic field, the intensity of the magnetic field may, and generally does, vary from point to point. In order to measure it in terms of definite quantities, we define *unit pole* as being a magnetic pole which, placed at unit distance from another similar unit pole, repels it with unit force, the medium between the two being air. Hence the intensity of a magnetic field at any point is known when we know the magnitude and direction of the force which would be exerted on a unit pole if placed at the point. We may obtain a general idea of the direction if we suspend a very short light magnet by a thread attached to its middle point and place it successively at different points in the field. At each point the magnet will assume a direction coincident with the direction of the field force at the point. We may further suppose that the whole field is mapped out by lines whose direction at any point is that of the magnetic force at the point. These are known as lines of magnetic force. Each will start from the north pole of the magnet to whose action the field is due, traverse the field until it reaches the south pole, and finally pass through the magnet to the north pole.

The study of the distribution of these lines of force is a convenient and suggestive method for ascertaining the character of a magnetic field. They can be given a material representation by placing above a bar magnet a sheet of thin cardboard on which iron filings have been uniformly sprinkled, and by gently tapping the cardboard. Each small particle of iron becomes, for the time being, a magnet, and consequently places itself in the direction of the magnetic force at the position it occupies. The particles therefore arrange themselves in more or less continuous lines which represent the lines of force in the field. Where the lines are closer together, the field is stronger; where they are parallel and equidistant, the field is said to be uniform. If a flat iron ring be placed on the cardboard so as to be in one of the stronger parts of the field, the filings within the ring are not affected by the field, owing to the neighbouring lines of force being drawn into the metal of the ring. This is an example of *magnetic shielding*, and also illustrates the fact that in any magnetic field the lines of force tend to crowd together where they pass through or near any mass of iron in the field, owing to the high magnetic permeability of soft iron. The question as to how far different kinds of iron and steel become magnetised when placed in a given magnetic field is one of very great practical importance.



The details of the theory of magnetisation cannot be given here, but it may be sufficient to state that the chief magnetic characteristics of a substance are its *permeability* and *susceptibility*. The former is that property in virtue of which the substance, when placed in a magnetic field, gathers into itself the lines of force in its neighbourhood to a greater extent than would be the case if the substance were not present. The susceptibility measures the facility with which the substance will become magnetised when subjected to a given magnetising force. Suppose an iron rod is subjected to a magnetising force which is gradually increased. At first, the permeability is constant; when the force increases beyond $\frac{1}{10}$ of a C.G.S. unit (see UNITS) it increases rapidly; for high values it increases at a slower rate. On the other hand, the susceptibility passes through three stages. In the first it is small, and very little magnetism is permanently retained; in the second, the susceptibility is much greater, the magnetic condition is assumed with great ease, and much magnetism is retained; in the third, the susceptibility is small and very little additional magnetism is induced. In this condition the iron is said to be *saturated*. Soft iron can be much more readily saturated than steel.

The results vary considerably, however, with temperature and with varying physical states of the metal. The susceptibility vanishes somewhat abruptly when the temperature reaches 800°, which is known as the critical temperature. It is fairly certain that at this temperature some important molecular change takes place in iron, for its other physical properties undergo a marked change at or near this temperature. Similar phenomena are exhibited in nickel. The phenomena of magnetism, particularly those of magnetisation, lead to the supposition that in iron each molecule is a magnet; that in the unmagnetised state the axes of these molecular magnets point in all directions which are possible under their mutual influences; that in this condition the molecular arrangement is stable, but that it becomes unstable as soon as a magnetising force beyond a certain value begins to act; that the molecular magnets then begin to direct themselves in

obedience to the field force thus imposed; and that as the magnetising force increases, an increasing number of the molecular arrangements break down and rearrange themselves under the imposed field.

Higher Text-Book of Electricity and Magnetism, Stewart; *Elements of the Mathematical Theory of Electricity and Magnetism*, J. J. Thomson.

Terrestrial Magnetism.—The fact that a magnet suspended so as to be free to swing in a horizontal plane tends to come to rest in an approximately north and south direction (popularly known as the 'magnetic north') has been referred to above. Also, a magnet free to swing in a vertical plane, coinciding with the plane of magnetic north, comes to rest in a direction which dips towards the north in the northern, and towards the south in the southern, hemisphere. These two facts would make it appear as if the earth were a huge spherical magnet. It is necessary, however, to treat the matter in greater detail, and for this purpose we frame the following definitions. Assuming that at each point of the earth's surface a definite magnetic force acts, we can represent this force by a line whose length represents the magnitude of the force, and whose direction coincides with its direction. Now let the plane VOH be the vertical plane in which this representative force OI lies, O the point of observation, OH and OV being horizontal and vertical lines through O. Also let ON be the direction of the geographical meridian. Then we may resolve the magnetic force OI into two components OH and OV. These are known as the *horizontal intensity* and *vertical intensity* respectively. The angle HOI which the direction of the magnetic force makes with a horizontal line is termed the dip, or *inclination*. The angle HON, between the geographical meridian and the vertical plane in which OI lies, is termed the variation, or *declination*. The three quantities, declination, inclination, and horizontal intensity, are sufficient to specify fully the magnetic force at any place, and are termed the *terrestrial magnetic elements* of a place. The fourth quantity, vertical intensity, may be deduced from the inclination and the horizontal intensity.

The declination is observed by an instrument known as a declination magnetometer, which can measure the angle between the direction of the geographical meridian and that of a freely suspended magnet. The inclination is measured by the *dip needle*, which consists of a magnet, carefully pivoted about its centre, and capable of swinging in a vertical plane. Turning this plane to coincidence with the magnetic meridian, the angle which the needle makes with the horizon is measured on a graduated circle. The horizontal intensity is measured by a modified declination magnetometer. The deviation produced in the magnetometer magnet by another magnet of known strength at a known distance is first observed. Then the time of oscillation of the magnetometer magnet alone is observed. The first observation gives $\frac{M}{H}$ where M is the magnetic moment of the magnetometer magnet; the second gives MH. From these we can obtain H, the horizontal intensity. In fixed magnetic observatories, the instruments are arranged so that their indications may be continuously recorded by photography.

With regard to the value of the magnetic elements, we have, first, to consider their value at different places on the earth's surface at the same instant. A general view of such matters can be best obtained from maps of the world on which lines have been drawn through all places at which the magnetic element in question has the same value. Lines of this kind for declination are termed *isogonic* lines. Starting from the north magnetic pole (explained below) there will obviously be a line passing round the earth through the south magnetic pole along which the declination will be zero. On one side of this, the declination will vary from 0° to 180° westwards; on the other side, from 0° to 180° eastwards. For the inclination, *isoclinic* lines may be similarly drawn through all places having the same dip. At the north and south magnetic poles the inclination is 90°, while the line of zero dip, or magnetic equator, passes round the earth and is roughly coincident with the geographical equator. Maps showing the distribution of horizontal intensity are also used. The lines drawn on such maps are average results, in that they do not show local peculiarities, of which there are numerous examples, due, it is believed, to the presence of magnetic matter near the earth's surface. The maps also must refer to some particular year or epoch for which they are drawn. For example, for the year 1910, the magnetic elements at London were as follows: declination, 16° 16′ W.; inclination, 67°; horizontal intensity, 0·185 C.G.S. units.

The North Magnetic Pole was discovered by Ross in 1831 at a point 70° 5′ N. latitude, 96° 43′ W. longitude. The South Magnetic Pole was also located by Ross, but was more closely determined by Shackleton's expedition in 1909 at 72° 25′ S. latitude, 155° 16′ E. longitude.

In the second place, we have to consider the manner in which the magnetic elements at a given place vary from time to time, and this opens up what is perhaps the most interesting and important part of the subject.

To begin with, all three elements show a *diurnal change*. For example, the declination changes towards the east until about 8 a.m. each day; then moves westwards until about 2 p.m., after which it turns back towards the east. The extent of this diurnal oscillation is greatest in midsummer and least in midwinter, and it has opposite characteristics in the two hemispheres. There is also evidence of changes due to the varying position of the moon, and it has been asserted that even the planets have some influence owing to their varying distance. Lastly, there are *secular changes*, requiring long periods of time for their completion. Thus, the declination at London in 1580 was 11° 15′ E. The needle gradually moved towards the true geographical north until, in 1657, the declination was zero. It then moved westwards until in 1818 it had reached 24° 38′ W., from which it has receded gradually to the figure mentioned above. This is equivalent to a rotation of the earth's magnetic axis about its geographical axis once in about 1000 years. Changes also take place in the inclination and horizontal intensity.

Over and above these diurnal and secular changes there are, however, a large number of disturbances of a non-periodic character. Some of these take the form of pulsations lasting a few seconds or a few minutes, but the great majority are of an irregular type. Larger disturbances are termed Magnetic Storms. They are associated with displays of auroræ in the polar regions and with the occurrence of electric currents in the earth's crust which frequently interrupt telegraphic communications. It has been established that they are more frequent and more pronounced when there are a large number of spots on the surface of the sun. It is known that the number of such spots shows a cyclical variation, being at a maximum once in eleven or twelve years. In the years of sunspot maxima, the declination and inclination show decided change, but the effect on the horizontal intensity is uncertain. With regard to the origin of terrestrial magnetism and the causes of its variation, many theories have been advanced. Those which have sought for an explanation by referring the phenomena to the presence of magnetic matter within the earth have proved to be inadequate, and it is now held that the most probable explanation is that which represents the earth as an electromagnet, the magnetising currents being caused by streams of electrified particles circulating in the

upper regions of the atmosphere. The diurnal and semi-diurnal variations of the magnetic elements are caused by atmospheric oscillations of the same nature and type as those which give rise to the diurnal variations of atmospheric pressure. The exact nature of the sun's disturbing influence has not as yet been elucidated. But the probability is that either solar activity and magnetic storms are due to a common cause, or, that the solar influence is only indirect, providing conditions for starting a disturbance.

Studies in Terrestrial Magnetism, by C. Chree.

MAGNETITE, or LOADSTONE, a ferrous mineral forming a natural magnet; black, opaque, and of metallic lustre; widely distributed, occurring in grains in such volcanic rocks as granite and dolerite.

MAGNETO OPTICS, the relation between magnetism and light. Faraday discovered that the plane of polarisation of a plane polarised ray of light is rotated when the ray is passed through a substance placed in a magnetic field; and, later, Verdet found that the amount of rotation varies with different substances, but for any one, it is proportional to the strength of the magnetic field and the length of the material through which the ray passes. The angle of rotation divided by the potential difference between the points where the ray enters and leaves the field is termed the *magnetic rotatory power* of the substance.

Dr. Kerr discovered that glass, under an electrostatic stress (as is the case in a Leyden jar), is strained as if it had been subjected to a pull, and gives rise to double refraction like a crystal of Iceland spar. Maxwell deduced that the specific inductive capacity of a dielectric ought to be equal to the square of its refractive index; experimentally a close agreement between the two has been found.

MAGNETOGRAPH, an instrument for recording values of the magnetic elements. A small light mirror is attached to the magnet whose movements are to be recorded, and a spot of light reflected from it on to photographic paper moved by clockwork. A straight line is traced on the paper if the magnet is still, and a curved line if it moves. There are four magnetic elements to be recorded—the declination, the horizontal component, the vertical component, and the dip. Their values change daily and even hourly. To record the first, a magnet which can turn freely about a vertical axis is used; for the second element, a magnet is suspended by two threads, which are twisted until the magnet is set at right angles to the magnetic meridian, and for the third a magnet is balanced about a horizontal axis so that one end can rise and the other drop. The dip is easily calculated from a knowledge of the horizontal and vertical components.

MAGNIFICAT, see HYMN.

MAGNOLIA, a genus of plants of shrubby or tree-like habit, cultivated for their gorgeous flowers. These possess three trimerous whorls or perianth leaves, enclosing numerous spirally arranged stamens and carpels inserted on an elongated conical receptacle. The fruit consists of a group of follicles containing fleshy and brightly coloured seeds.

MAGNUS, HEINRICH GUSTAV (1802–70), Ger. teacher and chemist; discovered 'Magnus' green salt,' $[(NH_3)_4Pt][PtCl_4]$, ethionic acid, $HO.SO_2.H_2C.CH_2.O.SO_2.OH$, isethionic acid, $HO.SO_2.H_2C.CH_2.OH$, periodic acid, H_5IO_6.

MAGO (d. *c.* 203 B.C.), Carthaginian soldier; s. of Hamilcar Barca; fought under Hannibal.

MAGPIE, see CROW FAMILY.

MAGWE (20° 10′ N., 94° 59′ E.), town, on Irrawadi, Burma. Pop. 6500.

MAHABALESHWAR (17° 58′ N., 73° 42′ E.), hill-station in W. Ghats, Bombay, India. Pop. *c.* 5600.

MAHABHARATA, one of the two great epics of Sanskrit literature (*q.v.*); translated by M. N. Duff.

MAHALLAT (33° 50′ N., 50° 30′ E.), town, capital of Mahallat, Central Persia. Pop. 9000.

MAHAN, ALFRED THAYER (1840–), Amer. rear-admiral and historian; pres. of Naval War Coll., 1886–89, 1892–93; member of Naval War Board during war with Spain, 1898; author of important books on naval history; at once obtained renown with *Influence of Sea Power upon History*, 1890; famous studies of modern international politics; pres. of American Hist. Association, 1902–3.

MAHANADI (20° 17′ N., 86° 44′ E.), river, Brit. India; flows by numerous mouths into the Bay of Bengal; length, 500 miles.

MAHANOY CITY (40° 50′ N., 76° 7′ W.), town, Schuylkill County, Pennsylvania, U.S.A.; anthracite coal-fields. Pop. (1910) 15,936.

MAHARAJPUR (26° 29′ N., 78° 5′ E.), village, Gwalior, Central India; here British defeated Mahrattas, 1843.

MAHASEER, see under CARPS.

MAHAVAMSA, chronicle in verse relating history of Ceylon from incarnation of Buddha to 301 A.D.; written by Hindu in V. cent. from Ceylon chronicles.

MAHDIA, MAHEDIA, MEHDIA (35° 32′ N., 11° 5′ E.), town, Tunis, on Mediterranean; sardine fisheries; occupies site of an ancient Phœnician city.

MAHÉ (11° 42′ N., 75° 34′ E.), seaport and Fr. settlement, Malabar coast, at mouth of Mahé, India. Pop. 10,000.

MAHESHWAR (22° 11′ N., 75° 37′ E.), town, on Nerbudda, Indore, Central India.

MAHI (23° 15′ N., 73° 34′ E.), river, India, flows into Gulf of Cambay.

MAHI KANTHA (23° 40′ N., 73° 20′ E.), collection of native states, Gujerat, Bombay, India.

MAHMUD II. (1785–1839), Sultan of Turkey; succ., 1808; defeated Ali of Jannina, 1822; crushed Janissaries; reformed army, 1826; during Gk. struggle for independence, formed alliance with Mehemet Ali of Egypt; defeated by Powers at Navarino, compelled to recognise Gk. independence, 1829; rebelled against by Mehemet Ali, 1831, and lost Syria; compelled by France and Britain to recognise Mehemet Ali's claims, 1833; renewed war, 1839.

MAHMUD OF GHAZNI (971–1030), Afghan ruler and conqueror; gov. of Khorasan, 994; by defeating bro. Ismail, became sole ruler of Khorasan and Ghazni; reign marked by campaigns against India; defeated several rajas, pillaged towns, seized treasure from temples; most notable campaign, 1025, against Gujarat; took capital, pillaged temple of Somnath; career of conquest ended with expedition to Persia, 1029.

MAHOBA (25° 18′ N., 79° 55′ E.), town, Hamirpur, United Provinces, India. Pop. 10,000.

MAHOGANY, wood of *Swietenia mahagoni*, a tree of S. America and W. Indies; reddish-brown; takes an excellent polish; 'Spanish m.' (from Cuba) is most valuable.

MAHOMET, see MUHAMMAD.

MAHOMET, AHMED IBN SEYYID ABDULLAH, see MUHAMMAD, AHMED IBN SEYYID ABDULLAH.

MAHOMMEDAN INSTITUTIONS, see MUHAMMADAN INSTITUTIONS.

MAHOMMEDAN LAW, see MUHAMMADAN LAW.

MAHRATTAS, a warlike Hindu race inhabiting Maharashtra, the north-western district of the Deccan, a territory watered by the Nerbudda, Godavari, and Kistna. For a long time they kept up a struggle with Britain for the supremacy of India, but were finally defeated by Sir Arthur Wellesley at Assaye, in 1803, and the greater part of their lands became absorbed in British India. In 1901 more than 18,000,000 persons spoke Mahratti in India. While the Mahratta Brahmans are typical high caste men, the rest of the M. are now mostly industrious peasants, with a sprinkling of robbers only dangerous in times of war or political excitement; Hindu in religion, following either Vishnu or Siva. Sindhia and Holkar, the Mahratta chiefs, submitted to Britain in 1803, and their descendants have been conspicuously loyal to the empire.

MAHSEER, see under CARPS.

MAI, ANGELO (1782–1854), Ital. scholar and

ecclesiastic; Vatican librarian, 1819; cardinal, 1838; discovered and edited classical MSS.

MAIDA (38° 50′ N., 16° 25′ E.), town, Calabria, Italy; French defeated by British, July 4, 1806. Pop. 5000.

MAIDEN, MAID.—(1) unmarried girl (Lat. *virgo*); also used in such phrases as 'maiden speech,' which are traceable to original signification. (2) instrument similar to guillotine (*q.v.*); used in Scotland, XVI. and XVII. cent's.

MAIDENHAIR, see ADIANTUM.

MAIDENHEAD (51° 32′ N., 0° 42′ W.), market town, on Thames, Berkshire, England. Pop. (1911) 15,218.

MAIDSTONE (51° 17′ N., 0° 32′ E.), county town, Kent, on Medway, England; principal buildings are the church of All Saints; former coll. of All Saints and a XVI.-cent. manor house containing museum and library opened in 1858; breweries, paper- and oil-mills; Kentish Royalists defeated by Fairfax, 1648. Pop. (1911) 35,477.

MAIHAR (24° 16′ N., 80° 48′ E.), native state, Baghelkhand, Central India. Pop. *c.* 70,000.

MAIMANA (35° 49′ N., 64° 23′ E.), chief town, Maimana, Afghan Turkestan. Pop. *c.* 7000.

MAIMAND (29° N., 53° E.), town, Fars, Persia; rose-water. Pop. 5000.

MAIMON, SALOMON (1754–1800), Jewish philosopher; b. in Russia; work admired by Kant.

MAIMONIDES, RABBI MOSES BEN MAIMON (1135–1204), Jewish theologian; lived in Spain, Africa, and Egypt; wrote commentary on *Talmud* and other works; revered by Jews as one of their greatest teachers.

MAIN, ancient *Mœnus* (49° 50′ N., 8° 34′ E.), river, Germany; joins Rhine opposite Mainz; navigable to junction with Regnitz.

MAINA, or **MANI,** modern MOREA (37° 30′ N., 22° 10′ E.), mountainous peninsula in south part of the Peloponnesus, Greece, between Gulfs of Koron and Kolokythia; the inhabitants, called Mainotes, claim to be descendants of the Spartans.

MAINE (43° 5′ to 47° 28′ N., 66° 57′ to 71° 7′ W.), extreme N.E. state of Union and of New England states; is bounded N. and E. by New Brunswick, S. by Atlantic Ocean, W. by New Hampshire and Quebec; area, 33,040 sq. miles; coast much indented, giving coast-line of 2500 miles; surface generally undulating, rising, towards centre of state, to 5300 ft. in Mt. Katahdin, a peak of Appalachian system; drained by Saco, Androscoggin, Kennebec, Penobscot, St. Croix, St. John, and other streams; contains great number of large lakes, including Moosehead, Sebago, Chesuncook, Schoodic, Allagash, Milinoket, and others. Largest towns, Portland, Lewiston, Bangor, Biddeford; capital, Augusta. Climate severe in winter, cool in summer. M. was discovered by Cabot in 1497; various early attempts at settlement by Dutch, French, and English were without success, but by 1630 English had established a permanent colony here, part of which was under control of Sir Ferdinando Gorges. Western part of M. was from *c.* 1651 onwards a detached district of Massachusetts, who further acquired the Gorges territory by purchase in 1677; while the eastern part was for some time claimed by Acadia. Whole became incorporated with Massachusetts in 1691. M. became a separate state in 1820, when it was admitted as such to Union. A long-continued boundary dispute with Great Britain was settled by the Ashburton Treaty in 1842, whereby a compromise was arrived at. Recent history has been comparatively uneventful. Government is a republic; executive power is vested in governor, who is elected by popular vote for two years, and is assisted by an advisory council, the seven members of which include three state assessors, sec. of state, agriculture commissioner, attorney-general, and treasurer. Legislative power is vested in a Senate of 31 members and House of Representatives of 151 members, both elected for two years by popular vote; M. is divided into sixteen counties for purposes of local administration, and is represented in Congress by two Senators and four Representatives.

M. has large forests all over northern districts, producing timber, bark, maple sugar; agriculture is important industry, oats, maize, buckwheat, potatoes, and hay being grown, and horses, cattle, sheep, and pigs raised. There are excellent fisheries, and fish canning is an important industry. Manufactures cottons, woollens, paper, flour, clothing, boots, leather, etc. Minerals are little worked, but there are some mineral springs, and granite is largely quarried. Railway mileage in 1908 was 2585. Education is free and obligatory; there is a state univ. at Orono; colleges at Brunswick, Lewiston, and Waterville. Principal religions, in order of numerical importance, are Rom. Catholic, Baptist, Congregational, Methodist, Episcopalian. Inhabitants include whites, negroes, Asiatics; considerable French-speaking element, including descendants of Acadian French and immigrants from Canada. Pop. (1910) 742,371.

Macdonald, *Government of Maine* (1902).

MAINE (48° N., 0° 15′ W.), ancient province, France; capital, Le Mans; now included in modern departments Mayenne and Sarthe.

MAINE, ANNE LOUISE, DUCHESSE DE (1676–1753), dau. of Prince de Condé; m., 1692, duc de M., natural son of Louis XIV.

MAINE, SIR HENRY JAMES SUMNER (1822–88), Eng. lawyer and historian; pub. *Ancient Law*, 1861; legal adviser to Council in India, 1863, when he commenced codification of Anglo-Indian law; obtained new chair of Hist. and Comparative Jurisprudence at Oxford, 1869; member of council of Sec. of State for India, 1871; pub. *Village Communities*, 1871; *Early History of Institutions*, 1875; *Early Law and Custom*, 1883; *Popular Government*, 1885; app. Whewell prof. of International Law at Cambridge, 1887; performed brilliant service to comparative study of institutions.

MAINE DE BIRAN, FRANÇOIS PIERRE GONTHIER (1766–1824), Fr. philosopher; treasurer of chamber of deputies under Louis XVIII., but devoted himself largely to psychology; elaborated a theory of consciousness.

MAINE-ET-LOIRE (47° 25′ N., 0° 30′ W.), department, W. France; formed part of ancient Anjou; surface hilly; traversed by Loire and its tributary, the Maine; soil, generally fertile, produces grain, flax, hemp, wine, fruits; linen, cotton, and woollen manufactures; capital, Angers. Pop. (1911) 508,149.

MAINLAND, see POMONA.

MAINPURI (27° 14′ N., 79° 3′ E.), town, capital, Mainpuri, United Provinces, India. Pop. 20,000.

MAINTENON, FRANÇOISE D'AUBIGNÉ, MARQUISE DE (1635–1719), second wife of Louis XIV. of France; m. the poet Scarron (*q.v.*), 1651, and was head of literary *salon* till his death, 1660; became governess to children of king by Madame de Montespan; bought estate of M.; cr. marquise, 1678; m. king, 1685–86; founded St. Cyr; devout, she tried to restrain licence of court; great political influence; author of often-published letters.

MAINZ, MAYENCE (50° N., 8° 16′ E.), town and fortress, grand-duchy of Hesse, Germany, on Rhine, below influx of Main; busy river port; fine old cathedral, museums, Electoral Palace (with Rom. antiquities); conserves, machinery, furniture, leather, wine trades. M. was an imperial free city until 1462; birthplace of Gutenberg, who invented movable type. Pop. (1910) 110,634.

MAISTRE, JOSEPH DE (1754–1821), Fr. author and politician; b. Chambéry; went as envoy to St. Petersburg, 1802; wrote various political and ecclesiastical works, the most famous, *Du Pape*, pub. 1817; he was a great opponent of the Fr. Revolution, and a believer in papal absolutism in Church and State.

MAITLAND, EAST AND WEST (32° 45′ S., 151° 35′ E.), two adjoining towns, Northumberland

County, New South Wales, Australia, on Hunter River; agricultural district; collieries. Pop. 11,000.

MAITLAND, FREDERIC WILLIAM (1850–1906), Eng. historian; Downing prof. of Laws of England, Cambridge, from 1888; wrote numerous hist. and legal works; one of the ablest scholars of his time.

MAITLAND, SIR RICHARD, LORD LETHINGTON (1496–1586), Scot. lawyer, poet, antiquary, and historian; his poems were pub. by the Bannatyne Club, 1830. A *Historie and Cronicle of the Hous and Surename of Seytoun* is his chief hist. work.

MAITLAND OF LETHINGTON, WILLIAM (*c.* 1528–73), chief Scot. statesman of time of Mary, Queen of Scots; subtle in intellect and character; share in crimes of time morally certain but never proved.

MAITREYA, a Buddha who is to come.

MAIWAND (32° N., 65° E.), village, Afghanistan; scene of British defeat by Ajub Khan, 1880.

MAIZE (*Zea Mays*), a gramineous plant indigenous to Mexico, but now cultivated extensively, especially in America and S. Africa. The plant differs considerably from typical grasses in its inflorescence, the florets of which are unisexual. The staminate flowers are massed apically, whilst the pistillate ones form a dense aggregate known as a 'cob,' with the long filamentous stigmas hanging from the top. The whole cob is protected when young by large sheathing bracts. The fruits constitute the well-known 'Indian corn.'

MAJOR, see OFFICERS.

MAJOR, JOHN, MAIR (1470–1550), Scot. hist. writer; had John Knox, George Buchanan, and Patrick Hamilton for pupils while teaching; chiefly associated with a History of England and Scotland, written in mediæval Lat.

MAJORCA (39° 35′ N., 3° E.), largest of the Balearic Islands, Mediterranean Sea; mountainous in N.W.; soil very fertile; produces cereals, wine, olive oil, fruit; chief occupations, agriculture and cattle-rearing; cotton, woollen, and silk industries; capital, Palma. Pop. 250,000.

MAJUBA (27° 30′ S., 30° E.), hill, Drakensberg range, N. Natal; scene of British defeat by Boers, Feb. 27, 1881.

MAKART, HANS (1840–84), Austrian painter; prof. at Vienna Academy; produced chiefly spectacular and hist. genre pictures, highly coloured and of great size.

MAKÓ (46° 11′ N., 20° 28′ E.), town, Csanád, Hungary, on Maros; several mills. Pop. (1910) 34,918.

MAKRAN, see MEKRAN.

MALABAR (11° N., 76° E.), district, Madras Presidency, India, sloping from W. Ghats to Indian Ocean; has extensive forests of teak; produces rice, coffee, cocoa-nuts; chief towns, Calicut, Tellicheri, Cochin; name is applied to whole S.W. coast of S. India.

MALACCA (2° 14′ N., 102° 13′ E.), town, Malay Peninsula; has harbour and is free port; exports tapioca, rice, spices; settled by Portuguese in 1511, remaining in their possession till 1641, when taken by Dutch; occupied by Brit., 1795–1818, when Dutch regained possession; finally returned to Brit. in exchange for Benkulen, 1824. Pop. *c.* 100,000.

MALACCA, see MALAY PENINSULA.

MALACHI, Old Testament book, last of 'Minor Prophets'; no records exist of M. himself. The book was written about the time of the return from Exile, either about 458 B.C., when Ezra arrived, or 432, when Nehemiah came. The same abuses of intermarriage and general remissness of the people are denounced. Though the author believes in ritual observance he is none the less a prophet. The tone of the book is gloomy.

Driver, *Minor Prophets*, vol. ii. (*Century Bible*).

MALACHITE, carbonate of copper ore; of dark green colour; laminated, fibrous, and massive. The finest m. is found in Siberia and Russia; m. also found in Australia, in nearly all copper mines. Used for ornamental purposes, mosaic, cameos, and for making pigment.

MALACHY, ST. (1094–1148), Irish ecclesiastic; studied at Rome and worked for Romanisation of Celtic Church; abp. of Armagh, 1139; friend of St. Bernard; canonised, 1190. Some books are falsely ascribed to him.

MALACOBDELLA, see under NEMERTINE WORMS.

MALACODERMIDÆ, see under POLYMORPHA.

MALACOSTRACA (Gk. *malakos*, supple; *ostrakon*, a shell).—The largest and most familiar of Crustaceans, crabs, lobsters, prawns, etc., are grouped in this great class. They differ much in shape and size, from the tiny half-inch 'Sand-Hoppers' of the shore, and the pin-head *Nebalia*, to the Giant Crab of Japan (*Macrocheira*), with a span of sometimes more than 10 feet, yet they have this in common, that all possess a definite number (19 pairs) of appendages, definitely arranged—5 pairs on the head, 8 pairs on the thorax, and 6 pairs on the abdomen. In addition there is often a gizzard—the gastric mill.

The Malacostraca fall naturally into two great series, the first of which (*Leptostraca*), with 7 pairs of abdominal appendages, is important mainly because of the simplicity of its members (e.g. *Nebalia*) which are marine and form a link between the higher Crustacea and the lower (*Entomostracan*) forms.

The second series (*Eumalacostraca*) is sometimes known as Thoracostraca (Gk. *thorax*, a breastplate), because head and thorax are protected by a continuous shield (*cephalothorax*). This group, in which the eyes are generally borne at the end of stalks, sometimes a couple of inches long, includes many well-known Crustacea—the Australian fresh-water *Syncarida*; the marine Oppossum-Shrimps (*Mysidacea*), which bear their young in brood pouches; the pelagic and deep-sea Cumacea; the Tanaidacea, found burrowing in mud in the sea; the Isopods, including the land Woodlice (*q.v.*) or Slaters, and many marine representatives (Sea-Slaters); the Amphipoda, amongst which are reckoned the Freshwater Shrimp (*Gammarus*), the shore 'Sand-Hoppers,' the littoral 'No-body Crabs' (*Caprellidæ*), and the Whale Lice (*Cyamidæ*); the phosphorescent marine Euphausiacea; and the most familiar group of all, the Decapoda, with the Shrimps (*q.v.*) and Prawns (*q.v.*), the Lobsters (*q.v.*) and Crayfish (*q.v.*), the Hermit Crabs, the Land Robber-Crabs, the Edible and Common Shore Crabs, and the Giant Crab of Japan.

MALAGA.—(1) (37° N., 4° 40′ W.) province, S. Spain, on Mediterranean; mountainous; rich in minerals; fertile and well cultivated. Pop. (1910) 523,429. (2) (36° 45′ N., 4° 27′ W.) seaport town, capital of above; chief buildings are cathedral, episcopal palace, hospitals, theatre, bull-ring; exports iron, lead, wine, olive oil, fruit; manufactures cotton, linen, machinery, pottery; taken by the Moors in 711; besieged and taken by Ferdinand in 1487. Pop. (1910) 133,045.

MALAKAND PASS (34° 38′ N., 72° E.), mountain pass, N.W. province, India, between Peshawar and Swat.

MALAN, SOLOMON CÆSAR (1812–94), Anglican clergyman and philologist; knew many Asiatic languages.

MALAPROPISM (Fr. *mal à propos*, inappropriate), blunder in use of words, *e.g.* 'Comparisons are odorous'; so called from Mrs. Malaprop, a character in Sheridan's *The Rivals*.

MÄLAR (59° 30′ N., 17° E.), lake, Sweden, stretching inland from the Baltic at Stockholm; contains over 1200 islands; length, 80 miles.

MALARIA, disease characterised by intermittent fever, enlargement of the spleen, and anæmia, caused by a parasite, *Plasmodium malariæ*, introduced into man by one or other of the species of mosquitoes belonging to the family *Anophelinæ*. Marshy soil and high temperature favour the presence of the mosquito, and the disease is most common in tropical countries in the

wet season, occurring also in more temperate regions in summer and autumn. Three types of the parasite may attack man, causing respectively the *tertian*, *quartan*, and *æstivo-autumnal* types of fever; the type of fever depends on the period of sporulation of the parasite, the spore formation of tertian taking two days, that of quartan three days, and that of æstivo-autumnal two days, but the last may vary to some extent; the rises of temperature correspond with the completion of sporulation, so that in tertian the temperature rises every third day, in quartan every fourth day, but in æstivo-autumnal the fever may continue after the rise of temperature for a week or two.

Tertian fever is the most common type, and a paroxysm occurs in three more or less definite stages: first, the *cold stage*, when the patient may have a rigor, and feels cold, although the temperature has risen some degrees; then the *hot stage*, in which the temperature rises still farther, there is pain in the head and the back, and the face is flushed; this is followed after a few hours by the third, or *sweating stage*, in which there is profuse perspiration and a fall in temperature. During the paroxysm the spleen is enlarged, and if the disease is not treated anæmia develops, followed by general weakness and wasting, with a characteristic pigmentation of the skin.

The treatment of *m.* is the administration of quinine, at first in large (10 grs. or more), and then in diminishing doses, while quinine is also taken with good results in small doses three times a day as a preventive. Iron is valuable in the anæmia arising from malaria. Other methods for prevention of the disease include the use of mosquito nets over beds, windows, doors, and verandahs; marshy country should, if possible, be drained, petroleum poured to form a film over pools, where mosquitoes breed; and all streams should be kept clean, free from weeds, with solid banks. See PARASITIC DISEASES.

MALATIA (38° 27′ N., 38° 27′ E.), town, ancient *Melitene*, Asiatic Turkey, near Euphrates; chief industry, fruit culture; produces opium; has Prot. and R.C. missions. Pop. 61,000.

MALAY ARCHIPELAGO (20° N. to 10° S., 95° to 150° E.), islands between S.E. Asia and N. Australia. One of greatest strata of volcanic rocks in the world passes through the archipelago, which is crossed by two curving lines of active and extinct volcanoes, the region being subject to frequent earthquakes. The Western islands, Sumatra, Java, Borneo, and a number of groups of smaller islands, have a close physical resemblance to Asia, which points to the conclusion that at a comparatively recent geological period they formed part of that continent; while the Eastern islands, from Celebes outwards, exhibit an equally close resemblance to Australia. The contrast between Asiatic and Australian flora and fauna is nowhere so sudden as in the adjacent islands of Bali and Lombock, which are only 15 miles apart.

Dutch East Indies include Java and Madura, Sumatra, Celebes, parts of Borneo and New Guinea, Rian Linga Archipelago, Timor Archipelago, Moluccas, Banca, Billiton, Bali, and Lombock; total area, *c.* 736,400 sq. miles.

European knowledge of M. A. dates from 1509, when Sumatra was reached by Portuguese explorer, Lopez de Sequeira. During XVI. cent. Portugal and Spain established spheres of influence here; later on, Dutch and English also appeared upon the scene; former gradually extended their territories and became principal power in archipelago by 1674. For a few years in early XIX. cent. British seized several of the islands, but Dutch regained chief control in 1816, and now hold practically whole archipelago except Philippines, Brit. N. Borneo, and part of New Guinea and Timor (*qq.v.*).

Administration is conducted by governor-general, who is appointed by Crown, and assisted by an advisory and legislative council. There is complete religious liberty, and education is controlled by government. Principal products are rice, maize, cotton, arachis, sugar-cane, tobacco, indigo, coffee, tea, cinchona. Minerals found are coal, tin, petroleum. Inhabitants are of Malay and Papuan stocks; foreign inhabitants include Europeans, Chinese, Arabs, and other Orientals. Pop. *c.* 40,000,000.

Wallace, *The Malay Archipelago.*

MALAY PENINSULA (1° 15′ to 10° 5′ N., 98° 15′ to 104° 7′ E.), a long narrow projection extending from Indo-China southward towards Sumatra, and forming extreme S. of mainland of Asia. Properly it extends from head of Gulf of Siam, with length of *c.* 900 miles; width, 45 to 210; area, *c.* 75,000 sq. miles, of which over 35,000 are British. Whole peninsula is traversed by mountain chain, which reaches height of 7000 to 8000 ft.; watered by Perak, Pahang, Kelantan, and other rivers. Northern part belongs to Britain on W. coast, to Siam on E.; centre is Siamese as far S. as 4° on E. and 5° 30′ on W.; in S. are British territories and protected states. Inhabitants include Malays, Chinese, Siamese, Eurasians. Climate is hot and damp. Central mountains are one of great tin-producing districts of world; gold, silver, coal, iron also found. There are magnificent forests—ebony, camphor, teak, sandalwood, palms, bamboo; produces sago, tapioca, rubber, nutmegs, tea, coffee, pepper.

First Europeans to reach M. were Portuguese, who took Malacca on W. coast early in XVI. cent. and made it centre of spice trade; it was later taken in turn by Dutch and English, finally coming to British hands in 1824. See MALAY STATES.

Malays, race inhabiting the Malay Archipelago and Peninsula, Polynesia, Philippine Islands, and Madagascar. They are brown in colour, short of stature, and have high cheek-bones and obliquely set eyes. The pure Malays are a quiet race of traders and sailors, mostly Muhammadans in religion, who at one time attained a very high degree of civilisation, inventing gunpowder and the art of writing for themselves. The M. commonly live on the banks of rivers, in houses raised on piles some feet from the ground. Rice is the staple food and chief product of agriculture, but maize, tapioca, and sugar-cane are also cultivated. Cotton and silk cloths, mats, earthenware, and silver ware are the chief manufactures. Many of the M. were formerly pirates, hence their character for ferocity. To-day they are by no means warlike, but are strictly aristocratic—loyal to their chiefs—and a courteous people.

Skeat and Blogden, *Pagan Races of the Malay Peninsula* (1906); *XX.-Cent. Impressions of Brit. Malaya*, edit. by Wright (1908).

MALAY STATES (*c.* 1° 15′ to 7° 7′ N., 100° 28′ to 104° 25′ E.), under Brit. protection, include the federated states of Pahang, Perak, Selangor, and Negri Sembilan, and the non-federated states of Kedah, Kelantan, Perlis, and Trengganu; while Johor (*q.v.*), in extreme S. of peninsula, has its foreign relations controlled by Britain. Surface generally flat along coast, hilly inland, as the mountain range that traverses whole peninsula passes down to W. of centre. The federated states were united under federal administration by treaty with Great Britain in 1896; they have total area of 27,700 sq. miles, and the federal capital is Kuala Lumpor, in Selangor.

Pahang, situated in E., has area 14,000 sq. miles; drained by P. and other rivers; capital, Pekan; produces tin, gold, lead, fish; under Brit. protection since 1888. Pop. (1911) 117,595.

Perak, in N.W., has area 7900 sq. miles; drained by P. and other streams; capital, Taiping; produces tin, sugar, rice, rubber, copra, ramie; under Brit. protection since 1874. Pop. (1911) 494,123.

Selangor, to S. of Perak, has area 3200 sq. miles; drained by S. and other rivers; capital, Kuala Lumpor; produces tin, coffee, rice, pepper, rubber; under Brit. protection since 1874. Pop. (1911) 294,014.

Negri Sembilan, S.W. of Selangor, has area 2600 sq. miles; capital, Seremban; produces tin, gold, coffee, tapioca, rice, gambier; comprises number of native

states, confederated under present name in 1889; whole under Brit. protection since 1895. Pop. (1911) 130,201.

The non-federated states came under Brit. protection by treaty with Siam in 1909; total area, *c.* 15,000 sq. miles.

Kedah, in W., has area 3150 sq. miles; drained by K.; capital, Alor Star; produces rice, rubber, tapioca, tin. Pop. (1911) 245,986.

Kelantan, in E., has area *c.* 5000 sq. miles; drained by K.; capital, Kota Bharu; produces tin, gold, pyrites, galena, rice, cocoa-nuts, rubber, tapioca, sugar; live stock raised. Pop. (1911) 300,000.

Perlis, N. of Kedah, has area 300 sq. miles; drained by P.; capital, P.; produces rice, tin, guano. Pop. (1911) 32,746.

Trengganu, in E., has area *c.* 6000 sq. miles; drained by T. and other streams; capital, Kuala T.; produces fish, tin, pepper, copra. Pop. (1911) 146,920.

Bellfield, *Handbook of the Federated Malay States* (3rd ed., 1907).

MALAY STATES, SIAMESE (*c.* 5° 35′ to 7° 30′ N., 99° 30′ to 102° E.), native states of Malay Peninsula, under Siamese protection, but ruled by their own rajahs; include Patani on E., which consists of seven small states; Palean on W., and Setul, S. of Palean; area, *c.* 6900 sq. miles. Pop. *c.* 380,000.

MALAYIR (34° 30′ N., 48° 30′ E.), small fertile province, Persia; fruit and grain.

MALAYS, see RACES OF MANKIND.

MALCHIN (53° 45′ N., 12° 45′ E.), town, summer resort, on Peene, Mecklenburg-Schwerin, Germany. Pop. (1910) 7067.

MALCOLM III., CANMORE, Scot. king (1053–93); m. Margaret, sister of Edgar Atheling, on whose behalf he twice, 1070 and 1091, invaded England; became vassal to William Rufus; slain at Alnwick.

MALCOLM, SIR JOHN (1769–1833), Brit. soldier, ambassador, and author; distinguished at siege of Seringapatam, 1799; ambassador to Persia, 1800, 1807, 1810; gov. of Mysore Residency, 1803; gov. of Bombay, 1827–30.

MALDA (25° 3′ N., 89° 11′ E.), district, Bengal, India, on Mahanada, near Ganges; silk and indigo industries. Pop. 886,000.

MALDEN (42° 25′ N., 71° 5′ W.), town, on Malden, Massachusetts, U.S.A.; manufactures rubber goods. Pop. (1910) 44,404.

MALDIVE ISLANDS (4° N., 72° E.), chain of 17 coral islands in Indian Ocean, S.W. of Ceylon; chief products, coir, cowries, and cocoa-nuts; natives are Muhammadans; ruled by a sultan and tributary to the government of Ceylon; capital, Mali. Pop. 50,000.

MALDON (51° 44′ N., 0° 41′ E.), market town, ancient *Camalodunum*, river port, Essex, England, on Blackwater; iron foundries; oyster fisheries; scene of English defeat by Danes, 993. Pop. (1911) 6253.

MALEBRANCHE, NICOLAS (1638–1715), Fr. philosopher; at first studied theol., becoming a priest of the Oratory, then deeply affected by work of Descartes (*q.v.*). M. maintained that we see all things in God, in whom all beings and thoughts exist, just as material things exist in space; God is also the real direct cause of all changes. His system was attacked by Bossuet and Arnauld.

MALER KOTLA (30° 31′ N., 75° 59′ E.), native state, Punjab, India. Pop. 78,000.

MALESHERBES, CHRÉTIEN GUILLAUME DE LAMOIGNON DE (1721–94), Fr. statesman; minister of the *maison du roi*, 1775, and introduced reforms; encouraged lit. and science, and helped to establish the *Encyclopédie*; pleaded for king in Convention of 1792; guillotined.

MALEVOU, see PARNON.

MALHERBE, FRANÇOIS DE (1555–1628), Fr. poet and critic; wrote verses from about 1584, but is chiefly known for his reform of the Fr. language and versification; called 'The tyrant of words and syllables'; to him Romantic school of XIX. cent. ascribed arrest of poetic production, as he introduced correctness which marked Classical school of XVII. cent.

MALIBRAN, MME (1808–36), Span. contralto operatic singer; dau. of Manoel Garcia (*q.v.*); début (London, 1825) was extraordinary success.

MALINES, MECHLIN (51° 2′ N., 4° 28′ E.), city, Antwerp, Belgium, on Dyle; seat of the cardinal-primate of Belgium; has a XIV.-cent. cathedral; manufactures furniture, linen, and woollen goods; formerly famous for lace. Pop. (1910) 59,142.

MALLANWAN (27° 2′ N., 80° 11′ E.), town, Hardoi, United Provinces, India. Pop. 12,500.

MALLARD, or WILD DUCK, see DUCK FAMILY.

MALLECO (38° S., 72° 30′ W.), province, S. Chile, S. America; capital, Angol. Pop. (1910) 113,020.

MALLET, DAVID, MALLOCH (*c.* 1705–65), Scot. poet and dramatist; pub. much miscellaneous verse, including *William and Margaret*, an adaptation of two old ballads, and wrote several plays, one of which, *Alfred* (in collaboration with Thomson), contains *Rule Britannia*, which some have claimed for him.

MALLING, WEST (51° 19′ N., 0° 24′ E.), small town, on Medway, Kent, England.

MALLOTUS, see under SALMON FAMILY.

MALLOW (52° 8′ N., 8° 38′ W.), watering-place, on Blackwater, Cork, Ireland; warm mineral springs.

MALLOW (*Malva*), herb with pinnatifid hairy leaves and pentamerous flower, characterised by five much-divided stamens which cohere by filaments.

MALMEDY (50° 24′ N., 6° 5′ E.), town, Rhine province, Prussia; tanneries. Pop. (1910) 5007.

MALMESBURY (51° 35′ N., 2° 6′ W.) market town, on Avon, Wiltshire, England; has remains of a VII.-cent. Benedictine abbey; breweries; silk and pillow lace; birthplace of Thomas Hobbes.

MALMESBURY, JAMES HARRIS, 1ST EARL OF (1746–1820), Brit. diplomatist; successively ambassador to Spain, Prussia, Russia, Holland; carried through negotiations by which republican party in Holland, friends of France, were overthrown.

MALMESBURY, WILLIAM OF, see WILLIAM OF MALMESBURY.

MALMÖ (55° 35′ N., 13° 1′ E.), seaport, Malmöhus, Sweden, on the Sound; ironworks; cotton and woollen industries. Pop. (1911) 88,158.

MALMSEY, see MALVASIA.

MALOCELLO, LANCELOTO, XIII.-cent. Genoese explorer; sailed to Canary Isles.

MALOLOS (14° 50′ N., 121° E.), town, capital, Bulacon, Luzon, Philippine Islands; rice. Pop. 12,500.

MALONE (44° 51′ N., 74° 22′ W.), village, Franklin County, New York, U.S.A.; woollen and paper manufactures; ironworks. Pop. (1910) 6467.

MALONE, EDMUND (1741–1812), Irish Shakespearean scholar and edit.; his *Variorum Shakespeare*, ed. by James Boswell the younger, and pub. in 21 vol's, 1821, is valuable.

MALONIC ACID, $CH_2(COOH)_2$, M.P. 132; crystallises in plates; soluble in water and in alcohol; it occurs as $(CH_2COO)_2Ca,2H_2O$ in beetroot. First obtained by oxidising malic acid; whence name.

MALORY, SIR THOMAS (fl. 1470), Eng. translator; was, as we learn from Caxton's preface to his great work the *Morte d'Arthur*, a knight, translated his book from Fr. sources, and completed it in the 9th year of Edward IV.'s reign. The work is a magnificent prose epic of Fr. romance.

MALPIGHI, MARCELLO (1628–94), Ital. anatomist and physiologist, studied philosophy and med. at Bologna, and lectured on med. at Bologna (1656), Pisa (1656), Messina (1662), and again at Bologna (1666) for twenty-five years, retiring three years before his death to become private physician to Pope Innocent XII.; the founder of the science of histology, he was the first to observe the circulation of the blood in the capillaries, he demonstrated the structure of the lung, the structure of secreting glands, the minute anat. of the brain and spinal cord, and made many other valuable observations; author of scientific works.

MALPLAQUET (50° 20′ N., 3° 50′ E.), village, Nord, France, on Belgian border; here in 1709, during War of Span. Succession, French under Villars and Boufflers were defeated by combined Brit. and Ger. forces under Marlborough and Prince Eugene; 30,000 slain.

MALSTATT-BURBACH (49° 15′ N., 6° 59′ E.), town, Rhine province, Prussia, on Saar; ironworks; collieries; incorporated with Saarbrucken (*q.v.*).

MALT and **MALTING**, see BREWING.

MALTA (*c.* 35° 50′ N., 14° 27′ E.), island in Mediterranean, S. of Sicily; has an area of 95 sq. miles, or 117 if Gozo and Comino be included; it is about 58 miles from Sicily and 180 from nearest point of Africa. E. and N.E. coasts are broken, with good inlets; along S., cliffs are *c.* 400 ft. high, and highest point of island is *c.* 800 ft. It is principal British naval station in Mediterranean, and as such is strongly fortified; centre of trade and port of call is Valetta, the capital, which is an important coaling station and contains church of St. John and many splendid palaces of the Knights. Old capital, Citta Vecchia, has old cathedral and catacombs. Climate generally mild and healthy.

M. belonged in early times to Phœnicians, Greeks, Carthaginians, and Romans in succession, and formed part of Byzantine empire after separation of East and West; it was occupied by Vandals in V. and VI. cent's, and was taken in 870 by Arabs, who were eventually expelled by Count Roger, the Norman ruler of Sicily, in 1090; as part of Sicilian dominions M. was held in turn by Hohenstaufens, Angevines, and Aragonese, and, having come to hands of Charles V., was granted by him to the Knights Hospitallers in 1530. It was unsuccessfully attacked by Turks in 1551 and again in 1565, when it was besieged for nearly four months by a Turk. fleet sent by Suliman II.

In 1566 Valetta was founded, and in 1571 the Knights were present at battle of Lepanto. They held the island until 1798, when it was taken by Napoleon on his way to Egypt; Knights were banished and large number of captive Turks set free. Few months later, Maltese rose in rebellion against French; they were supported by England and Naples, and after two years compelled French to surrender to British under Pigot. By Treaty of Amiens in 1802 it was arranged that the Knights should be reinstated; but as Maltese objected to this, preferring British control, Britain retained possession, and in 1814 M. was recognised by Treaty of Paris as part of British Empire. Changes in constitution have taken place at various dates; present constitution was established in 1903 and amended in 1909.

M. is administered by governor, assisted by executive and legislative councils. Education is free and compulsory, and there is one univ.; majority of children learn English at school, by choice, but Italian is still official language of courts of law. Inhabitants include English, Italians, native Maltese. About half island is under cultivation; produces cotton, potatoes, fruits, onions, cereals, honey; cattle, sheep, and goats reared. Manufactures lace, filigree, pottery. Has eight miles of railway. Pop. (1911) 228,442.

Ballou, *Story of M.* (1893); Boron and Ryan, *Malta* (1910).

MALTA, KNIGHTS OF, see HOSPITALLERS.

MALTA, or MEDITERRANEAN, FEVER, infectious disease, due to a specific micrococcus, characterised by, at first, headache, insomnia, constipation, and profuse perspiration, with enlargement of the spleen. Later the acute symptoms pass off, but the disease follows a prolonged and irregular course, often with arthritis or other complications. It has been ascertained that infection is, in Malta, chiefly conveyed by goats' milk, but the disease is endemic in other parts of the Mediterranean coast, and infection is probably also conveyed by mosquitoes. The treatment is as in other fevers, and the strength must be kept up with nourishing foods because of the lengthy duration of the disease.

MALTESE CROSS, see CROSS.

MALTHUS, THOMAS ROBERT (1766–1834), Eng. economist; was ed. at Cambridge, becoming Fellow of Jesus College; ordained, 1797; famous for his *Essay on the Principle of Population* (1798). This work has often been regarded as one of the greatest contributions to economic science, though some have attacked it. Economists now regard M.'s chief proposition (that population tends to increase faster than the means of subsistence) as really original.

MALTON (54° 8′ N., 0° 48′ W.), town, Yorkshire, on Derwent; comprises New Malton, Old Malton, and Norton; has remains of a priory, founded 1150; corn-mills; foundries; breweries. Pop. (1911) 4822.

MALUS, see ARGO.

MALVACEÆ, plants with simple, lobed, palminerved leaves and well-marked stipules. Flowers perfect, actinomorphic, and possessing an epicalyx. Stamens much subdivided (e.g. *Malva*). The group also includes the cotton plant (*Gossypium*).

MALVASIA, MONEMVASIA (36° 41′ N., 23° 3′ E.), small town, E. coast Laconia, Greece; formerly strong fortress; gave name to Malmsey or Malvoisie wine; near site of ancient *Epidaurus Limera*.

MALVERN (52° 7′ N., 2° 19′ W.), watering-place, near Malvern Hills, Worcestershire, England; comprises town of Great M. and several villages; has a priory church, a coll., and several hydropathic establishments; mineral springs. Pop. of district (1911), 16,514.

MALWA (24° N., 75° E.), province of India, N. of the Vindhya Mountains; contains Bhopal, Indore, Dhar, and other native states; chief product, opium. Pop. *c.* 1,110,000.

MAMARONECK (41° N., 73° 40′ W.), town, on Long Island Sound, New York, U.S.A. Pop. 5699.

MAMMALS, MAMMALIA (Lat. *mammæ*, 'breasts'), the class of animals to which man himself belongs, and which, on account of the unified complexity of the structures of its members, stands, with Birds, at the top of the Vertebrate stock. The old name Quadrupeds as applied to Mammals, is insufficient, since Whales (which are Mammals) have no limbs at all, whereas many Reptiles are 'quadruped.'

The most characteristic feature of Mammals is that which gives them their name—the presence in the female of mammary glands which secrete milk for the nourishment of the young. These milk glands may open simply on a bare hollow patch of skin from which the young lick the milk, as in Echidna, or they may be associated with raised mammæ or teats, by which the offspring is suckled. Other characters are distinctive of Mammals. They of all animals alone possess hair, even if in some it be reduced to a few bristles on the lips (see HAIR). The brain is very highly organised; and the body is separated by the diaphragm or midriff into two distinct cavities, the upper containing heart and lungs, the lower the digestive apparatus. In the skeleton the lower jaw hinges directly on the skull, and each half is composed of only a single bone; the vertebral centra have flat or slightly rounded surfaces, and there are usually only seven vertebra in the neck.

Mammals are predominantly land animals, although Bats have conquered the air, and Whales and their relatives the sea. Their habits are exceedingly diverse: many are vegetarians, the diet of some is confined to insects and small life, but perhaps the majority are carnivorous. The first feed mainly by day, but the remainder are as a rule nocturnal prowlers, often living in clans and hunting in packs. The males of mammals woo characteristically by force, and accordingly adaptations for combat are plentifully diverse, but the care exercised over their offspring is an outstanding feature, and to this the success of the class may be in great part due.

Mammals are indispensable to man, for from them he obtains most of his food and raiment, and their adaptibility to domestication has lightened his labour through all the ages.

The Class **Mammalia** falls into three lines of evolution:—

Sub-Class I. **Prototheria**, ORNITHODELPHIA or MONOTREMATA.—Primitive Mammals which lay large eggs, from which the young hatch; in which there are no mammæ, the mammary pores simply opening on a bare patch of skin, and no placenta; with a common vestibule into which both rectum and urogenital canal open; testes in abdomen; having a fluctuating blood temperature of only from 25° to 28° C., and a comparatively poorly developed brain. Examples—*Echidna* and *Ornithorhynchus* (qq.v.).

Sub-Class II. **Metatheria**, DIDELPHIA or MARSUPALIA (*q.v.*).—Mammals in which the young are born prematurely, in imperfect condition, and are afterwards nurtured in an external abdominal pouch furnished with teats; vestigial allantoic placenta occasionally present; the rectum and urogenital canal open separately, but are surrounded by a common sphincter muscle; scrotum in front of penis; blood temperature varying from 32° to 36° C.; brain less developed than in Eutheria, with or without convolutions:—

Order 1. POLYPROTODONTIA—Opossums, Dasyure, Bandicoot; *Order* 2. DIPROTODONTIA—Selvas, Wombats, Phalangers, Kangaroos.

Sub-Class III. **Eutheria**, or MONODELPHIA.—Mammals in which the young are vitally connected with the mother by an allantoic placenta before birth, and after birth are able to suck; anus and urogenital openings quite distinct; scrotum when present behind penis; blood temperature varying from 35° to 40° C.; brain highly developed and convoluted. Nine orders, which see separately for details:—

Order 1. EDENTATA—Sloths, Ant-Eaters, etc.; *Order* 2. SIRENIA—Dugongs and Manatees; *Order* 3. CETACEA—Whales and Porpoises; *Order* 4. UNGULATA—Hoofed Mammals; *Order* 5. RODENTIA—Rodents; *Order* 6. CARNIVORA—Carnivores; *Order* 7. INSECTIVORA—Insectivores; *Order* 8. CHIROPTERA—Bats; *Order* 9. PRIMATES—Apes, Monkeys, etc.

MAMMARY GLAND, or BREAST, the organ characteristic of the animals belonging to the order of Mammalia; the gland in the female which secretes milk and by means of which the young are suckled; present in the male only in a rudimentary form. In the human female the m. g's are two in number, situated on the front of the chest, in the adult extending from about the third to the seventh ribs. In the centre of the surface is a darker patch of skin, the *areola*, from which arises a conical projection, the *nipple*. The gland itself is composed of about a score of lobes branching to form smaller lobules, bound together with connective tissue and embedded in fat; from each lobe a duct proceeds, to open on the apex of the nipple. The m. g's become considerably enlarged during pregnancy, and very shortly after the birth of the child milk begins to be secreted.

DISEASES OF MAMMARY GLAND.—Inflammation of the m. g., or *mastitis*, practically only occurs while a woman is suckling her child, due usually to the entrance of micro-organisms through an abrasion of the nipple. The breast is tender and painful, and the patient feels ill and feverish. It is treated by immediately weaning the child, and applying fomentations and belladonna and glycerine to the breast. If it goes on to the formation of pus an incision is made to let out the pus. Massage and the application of a firm binder are beneficial. *Chronic mastitis*, in which the breast is enlarged, hard, and somewhat tender, may simulate cancer, and in doubtful cases it is best to excise the breast and examine it microscopically. *Paget's disease* is a form of chronic eczema around the nipple, which has a tendency to develop into malignant disease, so that, if the condition is not improving under soothing applications, the breast should be removed. A *Cyst* is most commonly due to blocking up of milk in one of the ducts, which becomes much enlarged, this condition being treated by incision, while various simple tumours may be situated in the breast, which may give no trouble, but are best removed. *Cancer* of the breast most usually occurs in women between the ages of forty and fifty, and its chief characteristic is its hardness. The cancer may infiltrate a considerable area around the breast, and secondary growths are apt to occur in the lymph glands of the armpit and even in more distant situations, so that the operation for removal of the breast in cancer, which is the only method of treating the condition, must be an extended one, and must include removal of the glands of the armpit. The operation ought to be carried out at as early a stage of the condition as possible, and if cancerous nodules recur afterwards they must also be promptly removed.

MAMMOTH, see under ELEPHANTS.

MAMMOTH CAVE (37° 11′ N., 86° 3′ W.), large limestone cave, Edmondson County, Kentucky, U.S.A.; total length of its tunnels is estimated at about 150 miles, of which 10 miles have been explored; contains great number of chambers and rivers. Main cave is about 4 miles long, its largest chamber, known as Chief City, covering area of 2 acres. There are fine stalactites and stalagmites, and many of the passages are covered with crystals of great beauty. Two remarkable species of fish are found in the cave, both blind, and one without even rudimentary eyes.

MAMORÉ (13° S., 65° 25′ W.), river, Bolivia; one of the head streams of the Madeira.

MAMUN, ABDALLAH MAMUN (*c.* 786–833), caliph of Bagdad; founded the coll. of Khorasan, and promoted science, astronomy, and general learning; one of the best Arab. rulers.

MAN, see RACES OF MANKIND.

MAN, ISLE OF (*c.* 54° 15′ N., 4° 30′ W.), island in Irish Sea, 16 miles from Wigtownshire, 28 from Cumberland, 33 from Ireland; has area of 220 sq. miles; surface undulating, sloping up from rocky coast to central ridge, which reaches 2034 ft. in Snaefell. Chief towns are Douglas, Ramsay, Castletown, and Peel. There are many Runic crosses, stone circles, and other interesting remains.

Island is sometimes conjecturally identified with Rom. Mona, but its early history remains obscure, although it is known to have been inhabited by Celts. Suffered from Scandinavian invasions in IX. cent., towards end of which it was taken by Harold Haarfager. In 1098 it was conquered by Magnus of Norway, and remained under Norwegian control until 1266, when it was transferred to Alexander III. of Scotland. Alexander died in 1285, and the Manx appealed to Edward I., who occupied island in 1290; it was regained by Scots under Bruce in 1313, but ultimately came to possession of English king, *c.* 1346. It was granted at various dates to royal favourites, and in 1406 Henry IV. bestowed it on Sir John Stanley, whose descendants, earls of Derby and kings of Man, held it for many generations almost without interruption. Title of lord was substituted for king in 1651. Island came by inheritance to James, Duke of Atholl, in 1735, from whose successor it was bought by the government in 1765; the Atholls still retained some rights, which were bought by the government in 1829. Perhaps most outstanding event of recent years was the failure of Dumbell's Bank in 1900.

Administration is carried out by lieut.-gov., a Council, and the House of Keys, latter having 24 members elected by popular vote. Education is free and obligatory. The Manx language is dying out. M. is united with Sodor as an episcopal see of English Church. Chief industries are fishing, agriculture, mining; live stock is raised, and oats and turnips are important crops. There is considerable mineral wealth, lead, zinc, copper, and iron being mined. Pop. (1911) 52,034.

Moore, *History of Isle of Man* (2 vol's, 1900); Herbert & Maxwell, *The Isle of Man* (1909).

MANAAR, GULF OF (8° N., 79° E.), arm of Indian Ocean between India and Ceylon.

MANACOR (39° 34′ N., 3° 14′ E.), town, island Majorca, Spain. Pop. 12,600.

MANAGUA (12° 25′ N., 86° 15′ W.), capital, Nicaragua, on Lake M.; exports coffee. Pop. 40,000.

MANAKINS (*Pipridæ*), a family of about 100 small brightly coloured Perching Birds found living in societies in the dense undergrowth of Central and South Amer. forests.

MANAOAG, town, Luzon, Philippine Islands, on Angalacan. Pop. 17,000.

MANÁOS (35° 15′ S., 60° 55′ W.), city, port, on Rio Negro, Brazil; important centre of river trade; chief export, rubber. Pop. 66,000.

MANASSAS (38° 41′ N., 77° 33′ W.), village, Virginia, U.S.A.; battles of Bull Run fought in vicinity (1861 and 1862).

MANASSEH, tribe of Israel named after the elder son of Joseph; occupied a large tract of land on both banks of the Jordan.

MANASSES, PRAYER OF, apocryphal book, probably written in Greek (in which it is preserved), in II. cent. B.C.; in form of a psalm.

MANATEE, see under SIRENIA.

MANBHUM (23° N., 86° 30′ E.), hilly district, Bengal, India; capital, Purulia.

MANCHA, LA (38° 47′ N., 3° 40′ W.), former prov. of Spain, now chiefly included in Ciudad Real; the Don Quixote country.

MANCHE (49° N., 1° 20′ W.), maritime department, France, on Mediterranean; part of ancient Normandy; surface hilly; cereals, flax, hemp, fruit cultivated; horses reared; large quantities cider manufactured; capital, Saint-Lô; on N. coast is Cherbourg. Pop. (1911) 476,119.

MANCHESTER (53° 29′ N., 2° 14′ W.), city, S.E. Lancashire, England. M. is said to have been important station of Druids, and was Rom. colony with name *Manucium*; damaged during Danish invasions in IX. cent.; obtained rights of self-government, 1301; manufacturing importance probably began in XIV. cent., when some Flemish weavers are said to have settled here; 'Manchester cottons' first mentioned in 1352. Had privilege of sanctuary, 1540–41; was taken by Fairfax during Civil War, 1643; old fortifications destroyed, 1652; taken by Charles Edward Stuart in 1745. Manufactures greatly increased in XVII. and XVIII. cent's; Bridgewater Canal opened, 1761. Became parliamentary borough, 1832; episcopal see, 1847; city, 1853; Fenian outrage occurred in 1867; Manchester Ship Canal (see CANAL) opened, 1894.

M. is centre of great manufacturing district; great staple is cotton—spinning, weaving, bleaching, printing—M. being central market for cotton trade; there are also works that deal with silk and almost every description of fibre. Excellent communication in every direction by canal, road, and rail; has been port since opening of Ship Canal; total net tonnage of arriving and departing vessels, apart from coasting trade, was 3,309,628 in 1910. The collegiate church, now cathedral, and the Chetham Hospital represent mediæval architecture, the Warden's Room—now the Library—in the latter being widely noted. Modern buildings include—Town Hall, built by Waterhouse, and containing fine tempera paintings by Ford Madox Brown; Victoria Univ., formerly Owens Coll., which was incorporated in 1880; Royal Exchange, built 1869; new Royal Infirmary, opened 1909; Ryland's Library, opened 1897. The art gallery has a number of pre-Raphaelite paintings; fine public parks; grammar school, at which de Quincey was educated, dates from 1519. Pop. (1911) 714,427.

Saintsbury, *Manchester* (1887); Shaw, *M.: Old and New* (1896); Tait, *Mediæval M.* (1904).

MANCHESTER.—(1) (37° 27′ N., 77° 26′ W.) former city, Virginia, U.S.A.; since 1910 part of Richmond; flour, paper, cotton. (2) (42° 35′ N., 70° 45′ W.) watering-place, Massachusetts, U.S.A., on Massachusetts Bay. Pop. 2673. (3) (42° 57′ N., 71° 29′ W.) largest city in New Hampshire, U.S.A., on Merrimac; extensive manufactures of cotton and woollen goods, boots and shoes, machinery; seat of St. Anselm's R.C. Coll. Pop. (1910) 70,063. (4) (41° 46′ N., 72° 30′ W.) town, Connecticut, U.S.A.; silks, woollens. Pop. (1910) 13,641.

MANCHESTER, EARLDOM AND DUKEDOM OF.—The noted judge and statesman, Henry Baron Montagu of Kimbolton, was cr. Earl of M., 1626. His s. Edward was great Parliamentary general; 4th earl, Charles, warm supporter of Hanoverian line, was cr. duke, 1719; direct descent to present duke.

MANCHESTER SHIP CANAL, see CANAL.

MANCHURIA (*c.* 39° 5′ to 53° 20′ N., 115° 50′ to 135° E.), large district of N.E. China; gave China the Ching dynasty; came much under Russ. influence towards end of XIX. cent.; Russ. occupation in 1900 led to Russo-Jap. War (1904), at close of which treaty was arranged (1905) whereby both countries evacuated the district, which was then restored to China. M. is irregular in outline, and has area of 363,610 sq. miles; belongs almost entirely to basin of Sungari, and drains northward to Amur River, which forms N. and N.E. frontier; surface generally mountainous; contains three provinces, Heilung-Kiang, Kirin, Sheng-king; capital, Mukden; chief industries, agriculture, cattle-rearing; rich in minerals, including gold, iron, coal; valuable forests; traversed by branch of Trans-Continental Railway. Pop. *c.* 20,000,000.

Hosie, *M.: Its People, Resources, and Recent History.*

MANCINI, PASQUALE STANISLAO (1817–88), Ital. Liberal statesman, lawyer, and orator; Minister of Justice and Ecclesiastical Affairs, 1860; of Public Instruction, 1862; of Foreign Affairs, 1881–85.

MANDÆANS, name given to the survivors, now only about 1200, of an ancient Oriental religious system, the successor of Gnosticism, and compounded of Jewish, Christian, Babylonian, and Parsee elements. They live in South Babylonia, speaking Arabic and Persian. Their sacred books, in Aramaic, date from about the VIII. cent., though parts of them may be earlier.

Their theology is really a mythology. The source of all things is the Great Abyss, and from him emanates the First Life, from this the Second Life, and from which again the 'messenger of life,' who takes the place of Christ in the Mandæan system, and corresponds to the Babylonian Marduk. The lower world is divided into various regions, ruled by demonic powers. Judaism and Christianity have left distinct traces on Mandæan mythology, but both are much disliked. Jesus and the Old Testament prophets are false, but John the Baptist is admired. The Mandæans are ruled by a priesthood of three grades, and have baptism and a kind of eucharist.

Siouffi, *Études sur la religion des Soubbas.*

MANDALAY (21° 59′ N., 96° 8′ E.), town, Upper Burma, on Irrawadi; founded, 1856; was capital of former kingdom of Burma; contains the royal palace; silk-weaving. Pop. 185,000.

O'Connor, *Mandalay* (1907).

MANDARIN, Chin. civil official, so named by foreigners; nine grades, each with different insignia; they govern Chin. provinces; carefully controlled by central board.

MANDAUE, town, Cebu, Philippine Islands. Pop. 11,000.

MANDEVILLE, BERNARD DE (1670–1733), Dutch physician, who, coming to England, wrote *Fable of the Bees* (1723) and other works. He thought most 'virtues' hypocrisy, and that society was only advanced by selfish interest.

MANDEVILLE, JEHAN DE, SIR JOHN M., pseudonym of writer of amazing book of travel, now generally attributed to Jehan de Bourgogne, or Jehan à la Barbe, a XIV.-cent. Liège physician, who, if not the author, certainly assisted largely in compiling the book. It has been suggested that de Bourgogne wrote the book in conjunction with a certain John Mangevilayn, who with a Johan de Burgoyne are mentioned as having taken part in the revolt against the Despensers, 1321.

The book is a truly astounding collection of tra-

vellers' tales, culled from various sources and eclipsing even Herodotus in fantastic extravagance. 'Mandeville' journeyed to Constantinople, through Asia Minor to India, and finally across the continent to China, where he took service with the emperor and only returned (1357) because of ill-health; he served under the Sultan of Egypt and made the acquaintance of Prester John. Between fragments of historic narrative come fabulous accounts regarding monsters, cannibals, and men of wondrous shapes.

The narrative of Friar Odoric, a XIV.-cent. traveller in the East, has been freely used by the compiler, who has also taken passages from Hetoum's *Historia Orientis* (XII. cent.) and de Beauvais' *Speculum historiale*.

MANDHATA (22° 16′ N., 76° 10′ E.), pilgrims' resort, Nimar district, Central Provinces, India.

MANDI (31° 43′ N., 76° 58′ E.), native state, Punjab, India; chief town, MANDI, on Beas. Pop. 8500.

MANDINGO, Negro race, W. Africa; many and various tribes speak Mandingo; reside chiefly in S.W. Sahara, on Upper and Lower Niger, in Upper Senegal, S.W. Liberia, interior of Sierra Leone and Ivory Coast; original settlement in Western Nigeria, about A.D. 1000; largely a commercial people in Middle Ages; Muhammadan, with some degree of civilisation; each tribe has its totem, usually an animal or plant.

MANDLA (22° 35′ N., 80° 24′ E.), chief town, on Nerbudda, Mandla district, Central Provinces, India. Pop. 5600.

MANDORE, see PANDURA.

MANDRILL, see CERCOPITHECIDÆ.

MANDSAUR, MANDASOR (24° 3′ N., 75° 8′ E.), town, Gwalior, India; trade in opium. Pop. 21,000.

MANDU, MANDOGARH (22° 21′ N., 75° 56′ E.), ruined city, Dhar state, Central India; capital of ancient kingdom of Malwa.

MANDURIA (40° 25′ N., 17° 37′ E.), town, Apulia, Italy; Roman *Manduria*. Pop. 13,000.

MANDVI (22° 50′ N., 69° 31′ E.), seaport, Cutch, India, on Gulf of Cutch. Pop. 25,500.

MANET, EDOUARD (1832–83), Fr. painter; the founder of the modern school of impressionism.

MANETHO, Egyptian historian; fragments of work survive in Josephus, etc.

MANFRED (*c.* 1232–66), king of Sicily; natural s. of Emperor Frederick II.; as guardian of nephew, Conradin, drove papal forces from Sicily, and himself assumed Conradin's crown, 1258; successfully opposed pope in Italy, but finally slain.

MANFREDONIA (41° 35′ N., 15° 55′ E.), seaport town. Foggia, Italy, on Gulf of Manfredonia; founded by Manfred; near site of ancient *Sipontum*. Pop. 12,000.

MANGABEY MONKEYS, see under CERCOPITHECIDÆ.

MANGALIA (43° 48′ N., 28° 36′ E.), small seaport, on Black Sea, Rumania.

MANGALORE (12° 52′ N., 74° 52′ E.), seaport, capital of S. Kanara district, Madras, India; besieged and taken by Tippoo Sahib, 1784; exports coffee, timber. Pop. 45,500.

MANGAN, JAMES CLARENCE (1803–49), Irish poet; slaved for years in an attorney's office, and closed a tragic career in hospital; the recurrent refrains of his verse are said to have given hints to Poe.

MANGANESE (Mn = 54·93); metal occurring in pyrolusite MnO_2, etc.; obtained by reducing oxide with carbon in electric furnace, or with aluminium (Goldschmidt); greyish-white, hard, brittle; S.G. 8·0, M.P. 1245° C.; displaces hydrogen from dilute acids, used in preparation of hard steels; alloys with iron, forming ferro-manganese, used in preparation of mild steel; widely distributed and found generally with ores of iron, calcium, and aluminium.

OXIDES, AND THEIR DERIVATIVES.—MnO: basic, forming manganous salts, *e.g.* $MnSO_4+5H_2O$, pink, soluble in water; Mn_3O_4: saline, stable high temperature; Mn_2O_3: basic, forming unstable manganic salts; alum $=K_2SO_4+Mn_2(SO_4)_3+24H_2O$; MnO_2: feebly acidic, used to depolarise batteries and in preparation of chlorine; 'Weldon mud' contains $CaO,2MnO_2$; MnO_3: acidic, forms manganates, *e.g.* Na_2MnO_4, green; Mn_2O_7: acidic, forms permanganates, *e.g.* $KMnO_4$, crimson, powerful oxidiser (mineral chameleon), and Condy's Fluid, prepared from crude $NaMnO_4$.

MANGEL-WURZEL, more correctly, the 'mangold-wurzel,' is a cultivated variety of beet much grown as cattle food. The large tap-root stores its carbohydrate food reserves as sugar.

MANGO, tree of order Anacardiaceæ; grows in E. Indies, Australia, etc.; fruit, oval in shape, is edible.

MANGROVE (*Rhizophora*), tropical tree whose branches droop to earth.

MANI, see MAINA.

MANIA, see INSANITY.

MANICHÆISM, a religion founded by Mani, and of considerable importance as a rival to Christianity. Almost from the start Christianity had been threatened by confused Oriental speculations; it came into conflict with Gnosticism,—some forms of Gnosticism, indeed, took on a semi-Christian dress,—then with Mithraism, perhaps the most serious rival it has ever had, then with Manichæism. Mani was a Syrian born about 215–16, crucified 276 A.D. His object was to renovate the old Zoroastrian faith, though he mixed it up with various other elements, viewing himself as the successor of Zoroaster, Buddha, and Jesus. He started with Persian dualism—the existence of an original good and an original evil power. Another feature was the great prominence M. gave to light in his system. Sometimes his language has a Christian sound, but its spirit is that of pagan sun-worship.

He drew, too, on Babylonian mythology, for the stars play an important part in his elaborate cosmogony. Manichæism is important for its struggle with Christianity. St. Augustine was an adherent of it before his conversion to Christianity. It was very widespread. It filtered into Eastern Europe and was at the root of the mediæval heresy of the Cathari and others. It extended far eastwards too, and recently there has been an important find of Manichæan documents (many believed to have perished) in Turkestan. It existed for about 1000 years. Notices of it are scattered. Many Manichæan documents were destroyed, and the accounts in Christian writers are sometimes biased, but Western and Eastern writers notice it, and Muhammadan writers are the most trustworthy. It probably owed its success to its moral code and its idea of redemption, though Mani himself was not a redeemer. It was hostile to Christianity; resemblances are more superficial than real, and though the name Jesus occurs in Manichæan liturgies it does not mean the historic Jesus of Nazareth.

See Rochat, *Essai sur Mani et sa doctrine; Recherches sur le Manichéisme*.

MANIDÆ, Pangolins, see under EDENTATES.

MANIHIKI (10° S., 115° W.), archipelago, Central Pacific, between Marquesas and Union Islands; dependency of New Zealand.

MANIKIALA (32° 27′ N., 73° 17′ E.), village, Rawal-Pindi district, Punjab, India; famous ruins.

MANILA (14° 53′ N., 120° 52′ E.), capital, Philippine Islands, on S.W. coast of Luzon; founded by Spaniards in 1571, remaining in their possession until taken by Admiral Dewey after destruction of Span. fleet in Manila Bay during Span.-American War, 1898; has cathedral and abp.'s palace, many monasteries and churches; site of St. Thomas Univ. (founded 1857); numerous colleges, schools, and charitable institutions; contains gov.'s palace, Justice of the Peace courts, arsenal, observatory. Situated on a fine harbour, M. is an important commercial centre; exports M. hemp (much used for cordage), cigars, sugar, copra, coffee, indigo, dyewoods, mother-of-pearl, tortoiseshell; imports manufactured goods, provisions;

annual tonnage of ships entering and clearing about 1,500,000. Pop. (1910) 234,409.

MANILA HEMP, the fibrous product of the leaf-stalks of *Musa textilis*, a plantain-like form which is a native of the Philippine Islands; used for similar purposes to ordinary hemp. See ABACA.

MANIN, DANIELE (1804–57), Venetian patriot; roused Venice against Austria, and was imprisoned, 1848; released by Venetians and made pres. of republic; after failure of joint Ital. rising, Venice still held out; M. forced to capitulate, after heroic defence, 1849; d. in exile.

MANIPLE, a narrow band of material, sometimes embroidered, worn on the left arm by subdeacons and higher orders in Catholic Church, mostly at Mass; probably developed from handkerchief carried by ancient Rom. magistrates.

MANIPUR.—(1) (*c.* 24° 42′ N., 94° E.) native state, N.E. India, bordering on Assam and Burma; area, 8400 sq. miles; surface generally mountainous, extensive valley in centre; forested; produces rice, tea, cotton; scene of Brit. punitive expedition, 1891, to avenge murder of Brit. officials. Pop. (1910) *c.* 225,000. (2) (24° 48′ N., 94° E.) capital of above. Pop. *c.* 70,000.

MANISSA, MANISA (38° 36′ N., 27° 27′ E.), town, Asia Minor, on Gediz-chai, at foot of Mount Sipylus; ancient *Magnesia ad Sipylum*; contains palace of Kara Osman Oglu; cotton and silk manufactures; active trade.

MANISTEE (44° 15′ N., 86° 20′ W.), city, summer resort, on M. River, Michigan, U.S.A.; lumber and salt manufactures. Pop. (1910) 12,381.

MANITOBA, province, Canada; bounded N. by Keewatin, E. by Hudson Bay, Keewatin, Ontario, S. by U.S.A., W. by Saskatchewan; area, 251,832 sq. miles. M. was first settled by French, 1734; afterwards came under control of Hudson Bay Company; became province of Dominion of Canada, 1870; Riel Rebellion, 1869–70; large part of Keewatin joined to M., 1912. Surface is generally undulating; many large lakes, including Winnipeg, Winnepegosis, Manitoba, Island, South Indian, Granville, Etawnay; drained by Nelson, Hayes, Winnipeg, Red River, and other streams; chief towns, Winnipeg (capital), Brandon; Port Nelson and Port Churchill on Hudson Bay. M. is administered by a lieut.-gov. assisted by executive council and legislative assembly; education is free; there is a provincial univ. M. is a great wheat-growing province; other cereals produced; live stock raised, dairy-farming carried on. Valuable fisheries. Pop. (1911), exclusive of new territory, 455,000. See CANADA.

G. Bryce, *Manitoba: its Infancy, Growth, and Present Position* (1882).

MANITOBA (51° N., 98° 40′ W.), lake, Manitoba, S.W. of Lake Winnipeg; outlet, Little Saskatchewan.

MANITOWOC (44° 5′ N., 87° 38′ W.), city, Wisconsin, U.S.A., on Lake Michigan, at mouth of Manitowoc; shipbuilding yards; iron and lumber manufactures. Pop. (1910) 13,027.

MANIZALES (5° N., 76° W.), city, Colombia; exports gold. Pop. 34,918.

MANKATO (44° 12′ N., 93° 58′ W.), city, Minnesota, U.S.A., on Minnesota; agricultural implements; numerous mills. Pop. (1910) 10,365.

MANKIND, RACES OF, see RACES OF MANKIND.

MANLIUS, name of Rom. patrician *gens*; plebeian Manlii who appear are due, it is thought, to confusion with names Manilius and Mallius. Chief members, MARCUS MANLIUS CAPITOLINUS, who saved Capitol from Gauls, 390 B.C.; TITUS MANLIUS IMPERIOSUS TORQUATUS, dictator, 353, 349; consul, 347, 344, 340; won famous victories over Gauls and Latins.

MANN, HORACE (1796–1859), Amer. educationist; b. Franklin, Massachusetts; sec. to the Board of Education for 11 years, and renounced legal profession to further the cause of education.

MANNA, the exudations of various plants growing in the Mediterranean region. Among these may be mentioned the manna ash (*Fraxinus ornus*) and *Tamarix mannifera*. This last is probably the m. of the Bible, and consists of a white substance produced by the attacks of an insect.

MANNERS, CHARLES (1857–), Brit. opera-singer (bass); with Mme Moody, his wife, fosters opera in Britain.

MANNHEIM (49° 29′ N., 8° 28′ E.), town, grand-duchy of Baden, Germany, at confluence of Rhine and Neckar; chief building, grand-ducal palace containing picture-gallery, antiquarian collections, and public library; principal commercial centre of Baden; manufactures machinery, chemicals, carpets; destroyed in Thirty Years War, and again by French, 1689. Pop. (1910) 193,600.

MANNING, HENRY EDWARD (1808–92), Eng. cardinal (1875); s. of a merchant; ed. at Harrow and Oxford; Fellow of Merton Coll., and ordained, 1832; m. 1833; widower, 1837; a parish clergyman from 1833; supported Tractarian movement and won name for eloquence; resigned; was received into R.C. Church, 1851, soon after ordained, and spent some time in Rome. In 1857 he went to Bayswater and founded Congregation of Oblates of St. Charles Borromeo; made abp. of Westminster, 1865. M. now led the Ultramontanists in England, and urged on the definition of papal infallibility at the Vatican Council of 1870; wrote several devotional works. Though rigid within the Church, he freely mixed with others in secular work, and became specially interested in social questions.

Hughes, *Life of Cardinal Manning*.

MANNY, SIR WALTER DE MANNY, BARON DE (d. 1372), founder of the Charterhouse. In 1349 he had bought land at Smithfield used as a burying-ground during the scourge of the Black Death. Here he founded a Carthusian monastery called *La Salutation Mère Dieu*.

MANNYNG, ROBERT, ROBERT OF BRUNNE (*c.* 1264–1340 ?), Eng. poet; chiefly remembered for long poem, *Handlyng Synne*, consisting of metrical homilies enlivened by legends, romances, and anecdotes; also author of chronicle entitled *The Story of Inglande*.

MANOA, see EL DORADO.

MANŒUVRES.—This term is applied in strategy and tactics to the movement of bodies of troops in a theatre of operations for the purpose of bringing an enemy to battle or of defeating him in battle; but the term is also used to denote a form of military training in which modern armies engage in the summer months, when a force is divided and the two portions act against one another under rival leaders in accordance with a Scheme of Operations drawn up by the General Staff.

MANOMETER, contrivance for measuring gaseous pressures. The chief types are: 'open air,' 'compressed air,' and 'barometric.'

MANOR (Lat., *manerium*; Fr., *manior*, habitation), estate of land granted by sovereign to subject (usually some person of power and importance) in return for services to be performed. With the lordship of the m. were certain rights. The right to hold a court of one's tenants, and to exact fines by the judgment of such court, seem to be older than the charters of XI cent. Purely civil powers exclusively were at first exercised by the m., but later criminal and penal jurisdiction was allowed. The court was in some respects the meeting of the village community with the lord of the m., or his officer as presiding judge. The tenantry of the m. were of two classes, villeins and cottars, the former compelled to give a certain amount of work to the lord of the m., the latter freemen in law, though freedom in Saxon England and in feudal times was a very relative state. After the Norman Conquest the manorial system became more and more complex, and the groups of tenantry increased. The commutation of labour service began the break-up of earlier and closer connection between the m. and the tenantry. Then the enclosures and the destruction of the old open fields necessitated rearrangements, while the manorial courts

lost all real power when the king's courts took over their functions.

Vinogradoff, *English Manor*; Seebohm; *English Village Community*.

MANOR-HOUSE, the residence of the lord of the manor. The house was usually surrounded by a moat with a drawbridge as defence against disturbances on the estate.

MANRESA (44° 45′ N., 1° 47′ E.), town, on Cardoner, Barcelona, Spain; iron manufactures; textile industries. Pop. (1910) 22,036.

MANSEL, HENRY LONGUEVILLE (1820–71), Eng. philosopher; prof. at Oxford; wrote *Prolegomena logica, Limits of Religious Thought, Gnostic Heresies*, etc.

MANSFELD, ERNST, GRAF VON (*c.* 1580–1626), Ger. mercenary soldier; famous as mercenary commander in Thirty Years War; severely defeated by Wallenstein at *Dessau*, 1626.

MANSFIELD.—(1) (53° 9′ N., 1° 12′ W.) manufacturing town, Nottinghamshire, England; lace, machinery. Pop. (1911) 36,897. (2) (40° 46′ N., 82° 29′ W.) city, Ohio, U.S.A.; machinery; agricultural implements. Pop. (1910) 20,768.

MANSFIELD, WILLIAM MURRAY, 1ST EARL OF (1705–93), Eng. judge; called to Bar, 1730. K.C., 1742; solicitor-general, 1742; attorney-general, 1754; supported government against Amer. colonies; made P.C. and lord chief justice, and cr. Baron M. of M., 1756; Earl of M., 1776; house sacked and burned in Gordon riots, 1780; resigned office, 1788.

MANSURA (31° 4′ N., 31° 26′ E.), town, Lower Egypt, on Damietta, branch of Nile; cotton and linen fabrics. Pop. *c.* 40,000.

MANTEGAZZA, PAOLO (1831–1910), Ital. anthropologist and physiologist; practised med. for some time in S. America; afterwards became prof. of Pathology at Pavia, later prof. of Anthropology at Florence, where he founded the first Ital. anthropological museum; author of physiological and other scientific works.

MANTEGNA, ANDREA (1431–1506), Ital. painter; favourite pupil of Squarcione, the founder of the Paduan school, who adopted him. A precocious artist, he set up an atelier when only 17, and before leaving Padua about 1549 had executed several frescoes and altar-pieces for the churches there. The remainder of his life, excepting a two years' sojourn in Rome, when he was painting a series of frescoes for Innocent VIII., was spent at Mantua, where some of his greatest works were produced. He was known also as engraver, architect, sculptor, and poet.

Mrs. Bell, *Mantegna* (Masterpieces in Colour).

MANTES (48° 59′ N., 1° 42′ E.), town, Seine-et-Oise, France, on Seine; interesting XII.-cent. church. Pop. 8600.

MANTEUFFEL, EDWIN, FREIHERR VON (1809–85), Ger. general; app. gov. of Schleswig, 1864; occupied Holstein, 1866; commanded 'Army of the Main' in Seven Weeks War; field-marshal in Franco-Ger. War.

MANTIDÆ, Praying Insects (*q.v.*).

MANTINEIA, Mantinea (37° 37′ N., 22° 23′ E.), Arcadian city, ancient Greece; scene of two famous battles—in 418 B.C., when Agis II. of Sparta defeated Argives and Athenians; and in 362 B.C., when the Thebans under Epaminondas defeated the Spartans and their allies; site of temple built by Hadrian.

MANTIS, Praying Insects (*q.v.*).

MANTIS FLIES (*Mantispidæ*), a family of Neuropterous insects, resembling, on account of their large prey-seizing fore-legs, the true Praying Insects (*Mantis*), from which they may be distinguished by their four, almost equal, netted wings. Both larval and adult stages are carnivorous. Found in most tropical and subtropical lands.

MANTISPIDÆ, see Mantis Flies.

MAN-TRAP, obsolete instrument for catching trespassers, shaped like modern spring rabbit-trap; now illegal. See Trap.

MANTUA (45° 9′ N., 10° 47′ E.), Etruscan city, N. Italy; strongly fortified; contains beautiful church dedicated to St. Andrea, cathedral, several palaces; belonged to Gonzagas till 1708, when passed to Austria; taken by French, 1797; held by French, 1801–14, by Austrians, 1814–66, when finally ceded to Italy; Vergil's birthplace. Pop. (1911) *c.* 32,690.

MANUCODE, a general name for Birds of Paradise (*q.v.*).

MANUEL I., COMNENUS (*c.* 1120–80), Byzantine emperor; attempted to restore power of East Rom. empire in Asia Minor, Greece, Italy, and along Danube; won brilliant successes at first, with no permanent result.

MANUEL DE MELLO, DOM FRANCISCO (1611?–66), Portug. author; b. Lisbon; led an adventurous life in youth in active service; during a period of exile in Brazil wrote the greater part of his masterpiece, *Apologos dialogaes*. Other noted works are *Obras morales* and *Cartas familiares*.

MANURES.—From the earliest times it has been recognised that the addition to the soil of such substances as wood ashes, ground bones, and especially of farmyard manure exercises a beneficial influence on the crops, and is essential for continued fertility. Only in the middle of the XIX. cent., however, did the researches of the Ger. chemist von Liebig and of other scientists explain the meaning of this fact. It was then shown that plants require a certain supply of the elements nitrogen, potassium, phosphorus, magnesium, calcium, and iron, and that this supply can be utilised only in the form of mineral salts present in the soil. All these elements are normally present in the soil, and in the case of natural vegetation the supply is kept up by the plants dying and returning to the soil, and the mineral elements which they contain ultimately become available again for their successors. Nitrogen is an exception, because the decomposition of the plant compounds containing it gives rise to a number of volatile compounds, including gaseous nitrogen, which escape with the atmosphere, and thus form a source of waste. The supply of nitrogen is, however, replenished by the activities of a number of soil bacteria which assimilate atmospheric nitrogen and convert it into available compounds. In the course of agriculture, however, the harvest is generally removed completely, and thus the compounds which it has abstracted from the soil are permanently lost.

If, then, land is to remain permanently fertile the mineral substances carried away by the crops must be systematically replaced. Iron, magnesium, and very generally calcium, are so abundant in ordinary soils that it is not necessary to make special provision for their return. The addition of lime is frequently necessary, to correct acidity in the soil. The essential feature of all manuring is to secure an adequate supply of nitrogen, phosphorus, and potassium. The natural manures—dung, guano, bone-meal, etc.—do this, as they all contain these elements to a greater or less extent; also the organic matter they contain gives the soil a suitable texture. But they are not available in sufficient quantity for the needs of modern agriculture, and recourse is largely had to mineral compounds. Of these the most important are *kainite*, containing 23 % of sulphate of potassium; sodium nitrate, ammonium sulphate, and cyanamide supplying nitrogen; basic slag and superphosphate giving phosphate of lime. The particular fertiliser to be used must be determined by practical acquaintance with the needs of the soil and of the crops—for example, cereals require abundant nitrogen, potatoes potash, and turnips phosphate. Recent experiments have shown that mineral fertilisers neutralise the effect of certain poisonous substances which are always present in the soil.

MANUSCRIPTS, GREEK, LATIN, MEDIÆVAL, see Palæography.

MANUZIO, Manutius, Ital. family of scholars and printers. **Aldo** (1450–1515) founded *Aldine*

Press at Venice, 1490. He was a humanist, friend of Pico della Mirandola, and distinguished Gk. scholar, and his press (*Aldine Press*) was established for preservation and dissemination of classics; noted for beautiful type and accuracy. His s. **Paolo** (1512–74) was an infant at Aldo's death, and printing was carried on by Aldo's less competent f.-in-law and his sons; Paolo obtained his f.'s reputation and made a speciality of Latin classics; he established a press at Rome, 1561, and produced theological works. Paolo's s. **Aldo** the younger (1547–97) compiled books from childhood, and superintended Venice press; less brilliant than two first Aldi.

MANX, see MAN, ISLE OF.

MANYPLIES, see under PECORA.

MANYTCH (45° 30′ N., 44° E.), river and depression, Russia, extending from Don to Caspian; supposed geographically to be boundary between Europe and Asia.

MANZANARES (39° 3′ N., 3° 25′ W.), town, on Azuel, Ciudad Real, Spain; wine. Pop. 11,600.

MANZANILLO.—(1) (19° 3′ N., 104° 27′ W.) seaport town, Colima, Mexico; exports hides, coffee. (2) (20° 23′ N., 77° 3′ W.) seaport, Santiago, Cuba, on S. coast; exports tobacco, woods, sugar. Pop. c. 17,000.

MANZONI, ALESSANDRO FRANCESCO TOMMASO ANTONIO (1785–1873), Ital. poet and novelist; b. Milan; pub. his first tragedy, *Il Conte di Carmagnola*, 1819; his great novel, *I Promessi Sposi*, 1825.

MAORI, the aboriginal race of New Zealand; branch of the Malay family; vigorous and intelligent; brown in colour, with thick lips and straight black hair. They live chiefly in the North Island, and were numbered in 1911 at 49,844—26,475 males and 23,369 females. In the Cook and other Pacific islands 12,340 Maoris were residing in the same year.

MAP, the delineation on a plane surface of some portion of a terrestrial or celestial sphere. *Terrestrial maps* dealing with the land, or with the land and water as a whole, are termed *geographical maps*, and those referring to water areas and coastal outlines are called *hydrographical maps* or *charts*, the last name being given to maps specially prepared for navigators. An exact representation of the earth, with every detail in true relative position and proportion can be made only on a globe, for it is not possible by any process of development to make a portion of a sphere coincide with a plane surface. For this reason map-makers are obliged to resort to some method of projection or approximate development. The chief projections are five in number; the orthographic, the stereographic, the globular, the conical, and Mercator's or the cylindrical. There are also many modifications of the five, the results of efforts to eliminate difficulties and defects.

In the *orthographic projection* the eye is assumed to be at an infinite distance from the centre of the earth, so that the rays of light from all parts of the surface are parallel and perpendicular. This method gives an almost exactly accurate representation of the central portions of the hemisphere, but contracts the parts towards the circumference. While it is useful for astronomical purposes, being used for maps of the moon and the planets, this projection is of small geographical value. In the *stereographic* method the eye is conceived to be on the surface of the sphere, opposite the part to be delineated. This method gives a result opposite to that of the orthographic, the centre being contracted and the circumference enlarged. Its use is limited on account of the difficulty of finding true latitudes and longitudes, but it is sometimes employed for maps of the hemispheres in atlases, and for star maps. The *globular* projection is a modification of the orthographic and the stereographic, used to adjust and rectify the opposite defects of the two. In it the eye is supposed to be removed from the surface to a distance equal to the sine of 45° of the circumscribing circle. The equator and the central meridian are straight lines at right angles, the point at which they intersect being the centre of the boundary circle. The meridians are arcs of circles passing through the poles and through points obtained by dividing the equator into equal parts; and the parallels are arcs of circles dividing into equal parts the central and the extreme meridians. This method is excellent for giving a general idea of the form and position of the continents.

The foregoing projections are of considerable utility in conveying general impressions, but it is not possible by means of them to secure a perfect representation of any special region. This great defect has led to the adoption of the conical and the cylindrical projections. If a portion of the terrestrial sphere lying between two not very distant parallels is compared with a similar region of a cone, there is observed to be a close correspondence between the two. For this reason conical developments are the most suitable for maps of special regions. By means of certain modifications *conical* projection may be made to represent faithfully quite large portions of the globe, and in fact it meets almost all the ordinary requirements of map-makers. In the conical method the parallels are represented by concentric circles, and the meridians by equidistant radii.

The navigator requires a map which will enable him to steer by compass in straight lines only, and none of the previously described projections satisfies this condition, for in each the directions of the north, south, east, and west points are represented by curved lines. The requirement is met by *Mercator's projection*, in which the meridians are straight lines perpendicular to the equator, and the parallels straight lines parallel to the equator. This map is the only one which gives a continuous view of the whole surface of the earth, but of course it does not give an accurate representation of the whole. Within 30° of latitude of the equator it may be considered accurate, but passing further northward and southward the exaggeration of area becomes larger and larger. This distortion is rectified by making the degrees of latitude increase proportionately to those of longitude.

Geographical maps are properly maps of the world in general or of very large regions, as opposed to *topographical maps*, which show a small area in great detail and on a large scale.

Topographical maps are often made on a scale of one inch to a mile, or of one square inch to an acre, and the maps of the Ordnance Survey of Great Britain are amongst the best examples of this type. In such maps it is not possible to avoid all exaggeration, as for instance with roads, which in the British one-inch ordnance maps appear as though 130 feet in width.

A map is of little use unless we know what relation it bears to the actual size of the earth, and this relation is indicated by a graduated linear scale, showing by its divisions the number of miles, or other local measures of length, corresponding to any distance measured on the map. The relation to nature is also expressed in numbers. The *meridian* of Greenwich has been almost universally adopted as the initial meridian, but foreign countries still generally use a local meridian in topographical maps. The most notable of these foreign meridians are those of Paris, Pulkova, Stockholm, Rome, Brussels, Madrid, and Ferro.

In maps previous to the close of the XVIII. cent., the delineation of the ground was very poor, but the introduction of horizontal contours and hachures considerably improved matters. *Contoured maps* show the height of the land, and afford an indication of the comparative steepness of the mountain slopes. In *strata maps* the different layers are shown by colours, as, for instance, green for lowlands, brown for hills, and blue for the sea; and still further accuracy is obtained by the use of various shades of these colours. The desire to have an absolutely true representation

of nature has led to the construction of *relief maps*, and provided that the scale of the maps is sufficiently large, and that the horizontal and vertical scales are identical, the results are remarkably accurate. The chief use of such maps is in the teaching of geography, and for elementary work they are invaluable.

The *globe* is also a useful piece of apparatus for teaching, but its shape is inconvenient, and its scale is of necessity too small for most other purposes. A large globe is usually placed on a stand, and arranged to rotate inside a meridian of metal to which its axis is fixed. The top of the stand carries an artificial horizon, other fittings being an hour circle, round the north pole, a compass, and a quadrant for measuring distances.

Maps are now constructed for many other than purely geographical or topographical purposes. Among the most important of these are *geological maps*, which have been brought to a remarkable state of perfection during comparatively recent years. The large scale maps issued by the Geological Survey are scarcely to be surpassed for accuracy and general finish. Maps are also constructed to illustrate magnetic declination and dip, winds, ocean currents, rainfall, etc., and for historical, military, statistical, and other purposes.

Maps are of very ancient origin. There is evidence of their use amongst the Egyptians hundreds of years before Anaximander of Miletus, 610–547 B.C., whom the Greeks considered the originator of map-making, and who probably was the first to make a serious attempt to construct a map of the then known world. These early maps were made on the assumption that the earth was flat, the spherical theory not being adopted until after Aristotle. Pytheas of Massilia, a Greek navigator of the time of Alexander the Great, was the first to apply astronomical observations to geography, being able to determine latitudes by the sun; and the first attempts at projections are attributed to Dicæarchus of Messana, 310 B.C. Ptolemy, 126–61 A.D., made great advances in geography, and his teachings ultimately laid the foundation of modern map-making. In his great geographical work, which was the standard treatise until the discoveries of the XV. cent. showed its defects, he gives an estimate of the earth's size, fixes all places by latitude and longitude, and introduces an improved method of projection. There is little of interest in Roman map-making except the Peutingerian table, made about 230 A.D., showing the then known world from Britain to India, with the principal roads. During the Middle Ages no advance was made, and it was not until the XIV. and XV. cent's, when the rapidly increasing commerce of Italy made good maps a necessity, that serious attempts at scientific cartography were made. The impulse received from the geographical discoveries of the XV. and XVI. cent's, and from the introduction by Mercator of cylindrical projection, has led to the present perfection of the map. See GEOGRAPHY.

Reeves, *Maps and Map-Making* (1910).

MAP, WALTER (d. *c.* 1209), Eng. churchman and writer; clerk of royal household to Henry II., and held various ecclesiastical appointments. It is much disputed how far M. was concerned in the authorship of the Arthurian romances. Probably he was too much occupied to have written very much, but he wrote a poem about Lancelot which was a source of other romances.

MAPLE (*Acer campestris*), a small tree indigenous to Britain, which possesses opposite, palmately veined leaves, with blunted lobes. These often exhibit the sticky exudations known as honey dew, which are caused by the attacks of aphides. The fruit is winged and is known as a samare. The best-known Eng. varieties are the sycamore and plane. The sugar m. is found in Canada and the eastern states of America; the average yield of a tree is 5 lb. of sugar a year. M. wood is much used in cabinet-making, especially curly or bird's-eye m. The m. leaf is the national emblem of the Canadians.

MAR, EARLDOM OF, title drawn from ancient province of Mar, Aberdeenshire, Scotland; one of the seven earldoms of Scotland in XIII. cent.; title nearly always in dispute; two earldoms brought into existence, 1885, by recognition of title of John Francis Erskine, Goodeve Erskine, under an earlier creation than the then existing earldom of Mar.

MAR, JOHN ERSKINE, 6TH OR 11TH EARL OF (1675–1732), Scot. Jacobite; proclaimed Old Pretender king in 1715; commanded Jacobites in great defeat of *Sheriffmuir*, then fled to France; attainted, 1716; intrigued for Pretender abroad till 1724, but pensioned by George I. (called 'Bobbing John,' as turncoat).

MARABOUS, see under STORKS.

MARACAIBO.—(1) (9° 50′ N., 71° 30′ W.) lake, Western Venezuela, communicating with Gulf of Venezuela. (2) (10° 38′ N., 71° 42′ W.) city, seaport, Zulia, Venezuela, on Lake Maracaibo; important commercial centre; exports coffee, hides; shipbuilding yards; leather manufactures; seat of national coll.; formerly seat of Jesuits' coll. Pop. 50,000.

MARAGAH, MARAGHA (37° 21′ N., 46° 17′ E.), town, Azerbaijan, Persia; remains of a celebrated astronomical observatory. Pop. *c.* 15,500.

MARANHÃO (5° S., 45° W.), maritime state, Brazil, on Atlantic; mountainous in the S.; well-watered and fertile, yielding rice, cotton, sugar, tobacco; much of it occupied by forests; minerals include copper, gold. Pop. *c.* 565,000. Capital, MARANHÃO. Pop. 32,000.

MARAÑON, see AMAZON.

MARASH (37° 37′ N., 36° 45′ E.), town, vilayet Aleppo, Asiatic Turkey, at foot of Mount Taurus; trade in Kurd carpets, embroideries; supposed to occupy site of an ancient Hittite city. Pop. 50,000.

MARAT, JEAN PAUL (1743–93), Fr. revolutionist leader; b. at Boudry, Switzerland; became distinguished physician; wrote *Philosophical Essay on Man*, and various scientific works; during Revolution edited *L'Ami du peuple*, which attacked many powerful public bodies; much persecuted; caught skin disease while hiding in sewers; twice fled to London, 1790–92; sat in Commune, Aug. 1792; deputy for Paris in Convention; engaged in struggle with Girondins, 1793; tried at their instigation, but acquitted; his last triumph was overthrow of Girondins; M.'s career of blood ended in his assassination by Charlotte Corday (*q.v.*). See FRENCH REVOLUTION.

MARATHON (38° 5′ N., 23° 59′ E.), plain, N.E. Attica, Greece, between Mount Pentelicus and the sea; celebrated as scene of victory of Miltiades over Persians, 490 B.C.; on it stood the village of Marathon. A soldier, carrying the glorious news, ran post-haste to Athens, over 20 miles away; hence long-distance road-races of about 25 miles are often called M. races. See RUNNING, ATHLETICS.

MARAZION (50° 8′ N., 5° 28′ W.), watering-place, on Mounts Bay, Cornwall, England; chief industry, market-gardening.

MARBLE, certain varieties of limestone, which take a brilliant polish; of various tints, and also pure white and black, variegated, and spotted. Used for ornamental purposes, decorative and statuary work. Marble is pure calcium carbonate, and is generally divided into seven classes: m. of uniform colour, as white or black; variegated with spots or veins; shell m., partly made up of shells; lumachella, wholly made up of shells; cipolino m., veined with green talc; breccia m., angular fragments of m. united by cement of different colour to the fragments; pudding-stone m., same as above, but rounded fragments. Parian m., which has a waxy appearance, was used for most of the Grecian sculptures, as the Venus de Medici. The Parthenon was built of Pentelicus m., which was white and fine-grained. Carrara m. is generally used nowadays for fine sculpture work, and is obtained from quarries of that name in Italy. Coloured marbles were known to the ancients as Rosso antiquo, a deep

red stone with small white dots; Giallo antiquo, a m. of deep yellow; Nero antiquo, deep black m.

MARBLEHEAD (42° 28′ N., 70° 56′ W.), town, summer resort, on Massachusetts Bay, Massachusetts, U.S.A.; boots and shoes. Pop. 7338.

MARBLES, children's game played from time immemorial; Rom. and Egyptian m's in Brit. Museum; made first from marble chips, then of clay, glass, and agate; formerly played by all classes; usually played by placing several m's in ring, object being to shoot greatest number out; shooting m's known as 'alleys'; another game consists in tumbling m's into series of holes; most m's manufactured in Germany and U.S.A.

MARBURG.—(1) (50° 49′ N., 8° 46′ E.) town, on Lahn, Hesse-Nassau, Prussia; chief objects of interest are Gothic church of St. Elizabeth, and univ. (1527); pottery, leather, iron goods. Pop. (1910) 21,869.—**Colloquy of Marburg** took place in 1529, to heal divisions of Ger. Protestants which had arisen specially about the Lord's Supper. Articles were drawn up and signed, and though permanent union was not effected, certain common principles were defined. (2) (46° 34′ N., 15° 39′ E.) town, Styria, Austria, on Drave; cathedral; leather manufactures; wine. Pop. (1911) 27,974.

MARCA, PIERRE DE (1594–1662), abp. of Paris; pub. *De Concordia sacerdotii et imperii*, under patronage of Richelieu, 1641, setting forth liberties of Gallican Church; pope refused to send bulls for his appointment to see of Conserans till he retracted, 1648; historical and ecclesiastical writings highly estimated.

MARCANTONIO (*c.* 1489–1534), Ital. engraver; b. Bologna. His first notable engravings were from plates of Albrecht Dürer. Later, when working at Rome, he employed himself chiefly on Raphael's pictures, his copies of which are regarded as superior to all others. His engraved works were shown in London in 1868.

MARCASITE, an iron ore; variety of pyrites, which it resembles in appearance; pale yellow in colour with metallic lustre.

MARCEAU - DESGRAVIERS, FRANÇOIS SÉVERIN (1769–96), Fr. general; with Kléber won victories of *Le Mans* and *Savenay*; commanded in Belg. campaign, etc., 1794; campaign on Rhine and Lahn, 1795; slain during invasion of Germany, 1796; one of most famous of young commanders under Republic.

MARCELLUS, MARCUS CLAUDIUS (d. 208 B.C.), hero of Rom. history; consul, 222, 214, 201, and 208; defeated Insubrians; prætor, 216; defeated Hannibal at *Nola*; took Syracuse, 212.

MARCH.—The progress by a foot soldier at drill is known as marching in slow, quick, or double-quick time, whereby a certain number of paces of a certain length are taken in a minute. The word is also used to designate a day's journey made by troops with their impedimenta, and it is assumed that infantry move at the rate of 3 miles an hour including short halts, and that they will be quartered for the night after 6 hours' marching; when this cannot be done, and the march is continued for 12 or 18 hours, it is called a 'forced march.'

MARCH (52° 33′ N., 0° 4′ E.), market town, on Nen, Cambridgeshire, England. Pop. (1911) 8403.

MARCH, EARLDOM OF.—(1) Welsh earldom held by Mortimers (*q.v.*) from XIV. cent. Edward IV. (*q.v.*) was Earl of March before his accession.

(2) Scot. earldom held by Dunbars.—**Patrick, 1st earl**, claimed Scot. crown, 1291.—**Patrick, 2nd earl** (1285–1369), helped Edward II. to escape after *Bannockburn*.—**George, 3rd earl** (d. 1420), fought for Henry IV. at *Homildon Hill* and *Shrewsbury*.—**George, 4th earl**, arranged for James I.'s release from England, 1423. Family is now represented by Marquess of Bute. Other M. earldoms were held by Stuarts, Earls and Dukes of Lennox, XVI.-XVII. cent's; by Dukes of Richmond since 1675; and by Dukes of Queensberry since 1697.

MARCHE (50° 14′ N., 5° 21′ E.), town, prov. Luxemburg, Belgium. Pop. (commune) 3700.

MARCHE, LA MARCHE (46° 5′ N., 1° 40′ E.), ancient province, France; capital, Guéret; corresponded to modern department Creuse and parts of Haute-Vienne and Indre.

MARCHENA (37° 19′ N., 5° 25′ W.), town, Seville, Spain; sulphur springs. Pop. 12,600.

MARCHES, THE (43° 25′ N., 13° 10′ E.), district, Italy, comprising provinces of Ancona, Ascoli-Piceno, Macerata, and Pesaro-e-Urbino; produces wine, tobacco, maize; became part of kingdom of Italy in 1840. Pop. 1,100,000.

MARCHMONT, EARLDOM OF.—First earl (cr. 1697), Sir Patrick Hume, Bart., of Polwarth, opposed government of James II. and had great influence under William III.; 2nd earl, Alexander, promoted Union of England and Scotland; dormant, 1794, on death of 3rd earl.

MARCION AND MARCIONITES.—Marcion came to Rome about 140 A.D., and died about 20 years later, after establishing many churches. He thought the God of the Old Testament was stern and revengeful, and not the God of the New—a God of love. Christ was the Son of God who appeared in the form of man (His true humanity therefore rejected). Marcion is sometimes called a Gnostic, hardly accurately. He 'edited' St. Luke's Gospel, and thought Paul alone understood Christ, though M. misunderstood Paul. After about 300 the Marcionite churches were absorbed into Manichæism (*q.v.*).

Harnack, *History of Dogma* (passim).

MARCONI, GUGLIELMO (1874–), Ital. scientist; inventor of a system of wireless telegraphy (see **TELEGRAPHY**); ed. Bologna, where he experimented; established wireless communication between England and France, 1899; between Canada and England, 1902; Chevalier of Civil Order of Savoy, 1905; invented persistent wave-system, 1906; established public wireless service between Britain and America, 1907; received Nobel Physics Prize, 1909.

MARCUS AURELIUS ANTONINUS (121–180), Rom. emperor and Stoic; b. at Rome; original name, *Marcus Annius Verus*; adopted by his uncle, Antoninus Pius, emperor; ed. by Stoic teachers; consul, 140. On death of Antoninus, 161, he became emperor, with Verus as colleague; reign marked by various disasters—flood, famine, earthquakes, plagues, insurrections; Parthian War concluded, 165; waged war in person against barbarians in Aquileia, Pannonia, and Noricum; subdued Marcomanni tribe, 168, 169; defeated Quadi, 174, and other Ger. tribes; subsequently marched to Germany; put down insurrections in various provinces; pacified Syria; returned to Rome *via* Athens, 176; had *triumph* for Ger. victories; again warred against Ger. tribes, 178, but died during campaign either from illness or poison; has been blamed for share in persecution of Christians, 177; opposed to Christianity. He wrote celebrated *Reflections* (*Meditations*), work of Stoic philosophy; chief doctrines, life according to nature, self-mastery.

P. B. Watson, *Marcus Aurelius Antoninus* (1884).

MARCY, WILLIAM LEARNED (1786–1857), Amer. politician; comptroller of New York State, 1823; senator, 1831; gov. of New York, 1832–38; secured bank reforms; War Sec., 1845–49; Sec. of State, 1853–57; instrumental in forming Gadsden Treaty, 1853; settled Koszta affair, and Brit. fisheries question; arranged reciprocity treaty with Canada; retired, 1857.

MARDIN (37° 16′ N., 40° 44′ E.), town, Diarbekir, Asiatic Turkey. Pop. 26,000.

MARDUK, MERODACH, guardian deity of Babylon, was originally a sun-god; gradually he absorbed the attributes of the more ancient Babylonian deities Ea and Bel, and also assumed the powers of the minor gods of the Pantheon, till he practically became the only recognised deity, the minor gods being regarded as his manifestations.

MARE, see **HORSE FAMILY**.

MARECA, Widgeon, see under DUCK FAMILY.

MAREE, LOCH (57° 42′ N., 5° 25′ W.), loch, western Ross-shire, Scotland; outlet, the Ewe.

MAREMMA (42° 20′ N., 11° E.), marshy region, on coast of Tuscany, Italy, extending from Orbetello to mouth of Cecino.

MARENGO (44° 53′ N., 8° 39′ E.), village, N. Italy, near Alessandria; scene of strenuously contested battle on June 14, 1800, when the French under Napoleon and Desaix defeated Austrians under Melas.

MAREOTIS, BIRKET-EL-MARIUT (31° 5′ N., 30° E.), lake, Lower Egypt, S.E. of Alexandria.

MARET, HUGUES-BERNARD, DUC DE BASSANO (1763–1839), Fr. statesman; moderate under Republic; aided Napoleon in *coup d'état,* 1799, and became private sec. and Sec. of State; edited State journal, *Moniteur Universel,* 1800; noted for devotion to Napoleon; cr. peer under Louis Philippe.

MARGARET (1353–1412), queen of Denmark, Norway, and Sweden; dau. of Valdemar IV. of Denmark; m. Haakon VI. of Norway, 1363; app. regent of Denmark for her infant s., Olaf, 1375, and in 1380 regent of Norway on her husband's death; recovered overlordship of Schleswig, 1386; established overlordship over Sweden, 1388; nominated her young nephew Eric of Pomerania king of the three kingdoms (united by the Union of Kalmar, 1397), but herself wielded the power; called 'Semiramis of North.'

MARGARET (1489–1541), queen of Scotland; dau. of Henry VII. of England; m. James IV. of Scotland, 1503; James IV. was slain, 1513, and M. became sole guardian of their son, James V.; m. Earl of Angus, 1514, and lost regency; dau. by Angus was Darnley's mother.

MARGARET (1221–95), dau. of Raymond Berengar V. of Provence; m. Louis IX. of France, 1234.

MARGARET OF ANJOU (1430–82), queen of England; dau. of 'Good King René' of Anjou; m. Henry VI. of England, 1445; strove with Duke of York for chief power during Henry's madness, and led Lancastrians against Yorkists in Wars of Roses; courageous and indefatigable, but without statesmanship.

MARGARET OF AUSTRIA (1480–1530), dau. of Emperor Maximilian I.; m. (1) John of Castile, 1497; (2) Philibert II. of Savoy, 1501; she was regent of Netherlands from 1507.

MARGARET OF AUSTRIA (1522–86), illegitimate dau. of Emperor Charles V.; m. (1) Alexander de' Medici, Duke of Parma, 1533; (2) Ottavio Farnese, Duke of Parma, 1542. M. was regent of Netherlands, 1559–67.

MARGARET OF NAVARRE, MARGUERITE D'ANGOULÊME (1492–1549), m. Charles, Duc d'Alençon, and later Henri d'Albret, king of Navarre; encouraged lit.; wrote *Heptaméron* (tales modelled on Boccaccio), *Letters,* and *Marguerites* (poems).

MARGARET OF VALOIS (1553–1615), dau. of Henri II. and Catherine de Medici; m. Henry of Navarre; marriage dissolved after his accession to Fr. throne as Henri IV.; wrote *Mémoires.*

MARGARET, ST., according to tradition was dau. of pagan priest at Antioch; embraced Christianity; refused marriage with potentate, was tortured and martyred; in Gk. Church she is called MARINA, perhaps identical with St. Pelagia.

MARGARITA ISLAND (11° N., 64° W.), mountainous island, belonging to Venezuela, Caribbean Sea, N. of Cumana; length, 45 miles; capital, Asuncion; formerly important pearl fisheries; discovered by Columbus, 1498. Pop. 42,000.

MARGARITANA, Freshwater Mussel, see under LAMELLIBRANCHIATA.

MARGATE (51° 23′ N., 1° 23′ E.), seaport, watering-place, Isle of Thanet, Kent, England. Pop. (1911) 27,086.

MARGHILAN (40° 28′ N., 71° 43′ E.), town, Ferghana, Asiatic Russia; silk and woollen industries. Pop. 44,000.

MARGUERITE, see MARGARET OF NAVARRE.

MARGUERITTE, PAUL (b. 1860), Fr. novelist; s. of Fr. general M. (1823–70), killed in Franco-Prussian War; early attained prominence in lit.; collaborated with his bro. VICTOR (b. 1866).

MARIA STELLA (d. 1843), putative dau. of Philip, Duke of Orleans; supposed child of Chiappini, but claimed to have been substituted for son of Chiappini by her real f., the Duke of Orleans, on account of his desire for man child.

MARIA THERESA (1717–80), archduchess of Austria, queen of Hungary and Bohemia, empress of Holy Rom. Empire; dau. of Emperor Charles VI.; m. (1736) Francis of Lorraine (emperor, 1745); mother of Marie-Antoinette; succ. her f., 1740, by virtue of Pragmatic Sanction; attacked by Prussia, Spain, and Bavaria, but won recognition in War of Austrian Succession; sought in vain to recover Silesia from Prussia in Seven Years War; she restored unity to Austrian dominions, and introduced reforms. *Life,* by Bright (1897).

MARIANAO (22° 55′ N., 82° 10′ W.), city, summer resort, Havana, Cuba. Pop. 5700.

MARIANNES, LADRONES (16° N., 145° E.), archipelago, N.W. Pacific, belonging to Germany, with exception of Guam (pop. (1911) 12,240), which belongs to U.S.A.; comprises northern group of ten and southern group of five; discovered by Magellan in 1521; occupied by Spain in 1668; chief export, copra. Pop. (including Guam) 2700.

MARIAZELL (47° 46′ N., 15° 19′ E.), village, Styria, Austria-Hungary; place of pilgrimage.

MARIE AMÉLIE THÉRÈSE (1782–1866), dau. of Ferdinand IV. of Naples; m. Louis Philippe, Duke of Orleans, afterwards Fr. king, 1809.

MARIE DE FRANCE (fl. latter half of XII. cent.), Fr. poetess; lived in England under protection of William, Earl of Salisbury; took name 'de France'; wrote 103 *Fables,* called, from their father Æsop, '*Ysopets*'; wrote *lais* founded on Breton stories, which formed models of later *trouvères.*

MARIE DE' MEDICI (1573–1642), wife of Henry IV. of France; regent after his assassination; on her son Louis XIII.'s accession she was exiled, and her favourite Concini was murdered; she failed to stir up civil war against Louis, and went to live with Henrietta Maria, Charles I.'s queen.

MARIE LESZCZYNSKA (1703–68), dau. of Stanislas L., king of Poland; m. Louis XV. of France, 1725.

MARIE LOUISE (1791–1847), archduchess of Austria; second wife of Napoleon I.; dau. of Francis II., Emperor of Holy Rom. Empire (Francis I. of Austria); m. Napoleon, 1810, and app. regent by him, 1814; mother of Napoleon II.; fled to Austria on Napoleon's first abdication, and refused to return; awarded government of Parma, Piacenza, and Guastalla.

MARIE THÉRÈSE (1638–83), dau. of Philip IV. of Spain; m. Louis XIV. of France, 1660.

MARIE GALANTE (15° 55′ N., 61° 15′ W.), island, Fr. W. Indies, S.E. of Guadeloupe, of which it is dependency. Pop. 16,000.

MARIE-ANTOINETTE (1755–93), queen of France; youngest dau. of Francis I., Emperor of Holy Rom. Empire, and Maria Theresa; education neglected; m. Dauphin Louis, grandson of Louis XV., 1770, aged sixteen; marriage was unpopular in France; her lightness, extravagance, and unconventionality alienated people; said to have given a million yearly to favourites, chiefly Austrians; nicknamed 'The Austrian'; despised her husband; attacked by calumnies so widely believed that she was hissed at Opera; birth of Louis XVII., 1785; scandal of diamond necklace followed; led opposition to Revolution; sought to win Mirabeau and after his death determined to fly; led king to Varennes, 1791, when her hair turned white in one night; brought back and tried to bring about foreign invasion; after popular attack on Tuileries, imprisoned in the Temple, 1792; execution of king, Jan. 1793; imprisonment of

queen in Conciergerie; tried and guillotined (Oct. 16). Hilaire Belloc, *Marie Antoinette* (1909).

MARIENBAD (49° 58′ N., 12° 43′ E.), watering-place, Bohemia, Austria; saline springs. Pop. (1911) 6279.

MARIENBERG (50° 38′ N., 13° 12′ E.), town, Saxony, Germany. Pop. (1910) 7736.

MARIENBURG (54° 1′ N., 19° E.), town, W. Prussia, Germany; the castle (founded 1274) was seat of Teutonic Knights from 1309 to 1457, when M. became a Polish possession; passed to Prussia in 1772; manufactures machinery, cottons, woollens. Pop. (1910) 14,025.

MARIENWERDER (53° 44′ N., 18° 54′ E.), town, W. Prussia, Germany; XIII.-cent. cathedral; iron foundries; sawmills. Pop. (1910) 12,982.

MARIETTA.—(1) (33° 55′ N., 84° 35′ W.) city, Georgia, U.S.A.; furniture, paper, marble-works. Pop. (1910) 5949. (2) (39° 27′ N., 81° 26′ W.) city, Ohio, U.S.A., at junction of Muskingum with Ohio; petroleum, coal, and iron region; seat of Marietta College. Pop. (1910) 12,923.

MARIETTE, AUGUSTE FERDINAND FRANÇOIS (1821–81), Fr. Egyptologist; devoted most of his life to archæological exploration in the Nile valley, and wrote and illustrated several vol's dealing chiefly with his explorations.

MARIGNANO, BATTLE OF, won by Francis I. over Swiss, Sep. 13–14, 1515. Francis invaded Italy, evading Swiss and crossing Alps, but was overtaken between Piacenza and Milan by Swiss with reinforcement of Milanese cavalry; one of most obstinately contested battles of history; success gave French Milan.

MARIGNOLLI, GIOVANNI DE (b. *c.* 1291), Ital. traveller; envoy of Benedict XII. to emperor of Cathay, travelling across Asia; leaving Peking, travelled through China, then to Madras, Java, back to Ceylon, across Persia to Avignon. Notes of travels in vol. ii., *Monumenta historiæ bohemiæ* (1768).

MARIGNY, ENGUERRAND DE (1260–1315), Fr. chamberlain; became chief minister of Philip IV., 1304; heavy taxes and peace policy offended nobles, who had him hanged as sorcerer on accession of Louis X.

MARIGOLD, name of several plants; the ordinary Annual M., with orange flowers (*Calenda officinalis*), is double-flowered, or single and unisexual; the African M. (*Tagetes erecta*), with more deeply coloured flowers; Corn M. (*Chrysanthemum segetum*), of Brit. cornfields, flower-heads used in dyeing; all of *Compositæ* (q.v.) order. Marsh M., 'Kingcups,' and in U.S.A. 'Cowslip' (*Caltha palustris*), like large buttercup with glossy golden petals, of *Ranunculaceæ* order.

MARIINSK (56° 15′ N., 88° 5′ E.), town, on Kiya; Tomsk, Russia; centre for gold mines. Pop. 9000.

MARINES, see ROYAL MARINES.

MARINETTE (45° 3′ N., 87° 40′ W.), city (and county), Wisconsin, U.S.A., on Green Bay; lumber manufactures. Pop. (1910) 14,610.

MARINI, GIAMBATTISTA (1569–1625), Ital. poet; wrote epics and lyrics in a stilted, bombastic diction, hence term 'Marinism.' See ITALY (LITERATURE).

MARINO (41° 47′ N., 12° 39′ E.), town, Rome province, Italy; wine. Pop. 8000.

MARINUS I., Pope, 882–84.—**Marinus II.**, same as MARTIN III., Pope, 942–46.

MARION.—(1) (40° 32′ N., 85° 37′ W.) city, Indiana, U.S.A.; natural gas region; iron and steel manufactures; glass-works. Pop. (1910) 19,359. (2) (40° 36′ N., 83° 5′ W.) city (and county), Ohio, U.S.A.; machinery; agricultural implements. Pop. (1910) 18,232.

MARION, FRANCIS (1732–95), Amer. soldier; app. brigadier-general of troops of S. Carolina, 1780; his brigade for long defeated Loyalists; retired, 1782; became commander of Fort Johnson, 1784.

MARIONETTES, puppets representing characters and moved by means of cords and springs by a concealed player, who speaks all the parts. A survival of the entertainment is the Punch and Judy show.

MARISCHAL COLLEGE, see ABERDEEN.

MARITIME PROVINCE (54° N., 145° E.), province, Eastern Siberia, extending along Pacific from Korea to Arctic Ocean, and including Kamchatka and part of Sakhalin; area, 716,000 sq. miles; surface largely mountainous and forest-covered; chief rivers, Anadyr, Amur, and Usuri; climate severe; thinly populated, mainly by Russians, who fish, hunt, and trade in furs; coal and gold found. Pop. (1910) 1,547,330. Capital, Vladivostok.

MARITIME PROVINCES, east coast provinces of Canada, viz. Nova Scotia, New Brunswick, and Prince Edward Is. (*qq.v.*).

MARIUPOL (47° 6′ N., 37° 35′ E.), seaport, Ekaterinoslav, Russia, on Sea of Azov, at mouth of Kalmius; iron and leather goods. Pop. (1910) 48,500.

MARIUS, GAIUS (155–86 B.C.), Rom. general; plebeian; rose in army under Scipio Africanus, and married a patrician; distinguished in Jugurthine War, and became consul, 107; subdued Numidia as proconsul; consul, 104–101; crushed Teutones and Cimbri, 102–101; great Triumph, 101; obtained command, already given to Sulla, against Mithradates; defeated and condemned to death by Sulla, but spared, and escaped; recovered Rome in Sulla's absence, 86, but died soon afterwards.

MARIVAUX, PIERRE CARLET DE CHAMBLAIN DE (1688–1763), Fr. author; introduced special style, called *Marivaudage*; his comedies are the delight of actors as his novels have often been of literary men; characters introduced are, like their language, full of wit and slightly affected; his novels, especially *Marianne* (1731–41), prized above his plays.

MARK, Ger. standard weight and coin; coin contains 5 grammes of fine silver; worth 11¾d. (100 *pfennig*); old Eng. and Scot. marks were nominally worth 13s. 4d. (1200 onwards).

MARK, GOSPEL OF ST., in our canon, second of Gospels, but by almost universal consent of present-day scholars earliest written—probably about 70 A.D.; shortest of four Gospels, and simplest, giving story from preaching of Baptist till Resurrection; original end is lost, 16^{9-20} being later addition; mostly narrative, with few discourses; traditionally and probably actually the work of John Mark, who derived much information from St. Peter; some think it influenced by Pauline theol.; known to Justin Martyr, *c.* 150, and from *c.* 200 universally accepted in Christian Church; not always so much regarded as other Gospels, and its supreme importance only recently emphasised.

Salmond, *Mark* (Century Bible); Burkitt, *Earliest Sources for Life of Jesus*; Swete, *St. Mark*; J. A. Robinson, *Study of the Gospels*.

MARK, ST., called sometimes John Mark; to his mother Mary's house St. Peter came (*Acts* 12^{12}); accompanied St. Paul on his first missionary journey (12^{25}), but left him at Perga, to grief and indignation of Paul, who refused to take him with them on next mission; Barnabas, however, accompanied M. to Cyprus; when Paul wrote *2 Timothy*, M. was reconciled to him (4^{11}); traditional author of the Gospel; according to some, M. himself is young man of *Mark* 14^{51-52}.

MARKET, a place of sale. Every town of importance in the Middle Ages possessed its m., and the right to demand a toll was a valuable privilege. Although steadily losing their importance, and in many towns extinct, the ancient m's have endured despite modern conditions of commerce. The annual pleasure fair is, however, all that exists of the once famous m. in large numbers of places. Although London has such places as Covent Garden M. for fruit, flowers, and vegetables, Smithfield M. for flesh meats, and there are similar institutions in other cities, the big store and general emporium have largely become the m.-place of our times. The term 'market' also applies to 'any body

of persons who are in intimate business relations, and carry on extensive transactions in any commodity,' and 'these m's may or may not be localised' (Jevons). Hence the phrases, money m., corn m., cotton m., and, within the Stock Exchange, consol m., home railway m., American m., etc.—meaning the persons whose business it is to buy and sell consols, railway shares, American securities, etc.

For the former use of the word, see Mrs. J. R. Green's *Town Life* and the Royal Commission on Market Rights, vol. i. (1889).

MARKET BOSWORTH (52° 37′ N., 1° 25′ W.), market town, Leicestershire, England.

MARKET DRAYTON (52° 55′ N., 2° 30′ W.), market town, on Tern, Shropshire, England; iron foundries.

MARKET HARBOROUGH (52° 29′ N., 0° 56′ W.), town, Leicestershire, England; hunting centre. Pop. (1911) 8853.

MARKHAM, SIR CLEMENTS ROBERT (1830–), Eng. traveller and geographer; author of many antiquarian and genealogical works; took part in the search for Sir John Franklin; in the Abyssinian expedition of 1867–68; and in the storming of Magdala.

MARKHAM, WILLIAM (1719–1807), abp. of York, 1777.

MARKIRCH (48° 15′ N., 7° 10′ E.), town, on Leber, Alsace, Germany; cotton and woollen manufactures. Pop. (1910) 11,778.

MARKO KRALYEVICH (d. 1374), Servian hero; many legends have grown up about him.

MARL, a clay consisting mainly of mixture of carbonate of lime. The term is also applied to various rocks and soils. M. is used as a dressing for soils by farmers, and is generally of a soft, earthy nature, and white, grey, or brown in colour. The *Red m's* belong to the Keuper division of Triassic period, and are many thousands of feet thick.

MARLBOROUGH.—(1) (51° 25′ N., 1° 44′ W.) town, on Kennet, Wiltshire, England; M. College occupies site of ancient castle. In vicinity is Castle Mound, an early fortification; industries include rope-making and brewing. Pop. (1911) 4401. (2) (42° 20′ N., 71° 33′ W.) city, Massachusetts, U.S.A.; boots and shoes; machinery. Pop. (1910) 14,579.

MARLBOROUGH, JOHN CHURCHILL, 1ST DUKE OF (1650–1722), Eng. general; served with distinction under Turenne, 1672; m. Sarah Jennings, confidante of Princess Anne, 1678; gained victory for king at *Sedgemoor*, 1685; subsequently attached himself to William of Orange, who made him lieut.-gen., Earl of M., and P.C.; distinguished in wars in Ireland and Low Countries, 1689–92; imprisoned for treason, 1692; was in communication with banished king concerning Brest affair, 1694; held many responsible positions under William. On Anne's accession M. became captain-gen. of army; commanded Brit. and Dutch armies in War of Span. Succession; captured Kaiserswerth, Venlo, and Liège, 1702; Duke of M., 1702; during second campaign, 1703, captured Bonn, Huy, Lemburg; won brilliant victories at *Blenheim*, 1704, *Ramilies*, 1706, *Oudenarde*, 1708; captured Lille, 1708; battle of *Malplaquet* was less decisive, 1709; M. was deprived of his commands by Tory ministry, 1712.

Saintsbury, *Life* (1885); Lord Wolseley, *Life* (2 vols., 1894).

MARLOW, GREAT MARLOW (51° 34′ N., 0° 46′ W.), town, on Thames, Buckinghamshire, England; manufactures chairs. Pop. (1911) 4683.

MARLOWE, CHRISTOPHER (1564–93), Eng. dramatist; b. in humble circumstances, but became B.A. and M.A. of Cambridge; was possibly an actor, possibly a soldier; led a life of great irregularity and was killed in a brawl. He is the first great Eng. dramatist, and has been described as 'the matrix from which Shakespeare's plays evolved.' His best-known plays were *Tamburlaine the Great* (1590), *Dr. Faustus* (1604), which was greatly admired by and had no little influence on Goethe, *The Jew of Malta* (1588), and *Edward II.* (1590). With the exception of the last named, these plays are very unequal, passages of real strength being followed by bombastic declamations; but they show great vigour and freshness, imaginative power, and dramatic sense. *Edward II.* is a play of sustained power worthy to rank with the best of Shakespeare's hist. plays. In estimating M.'s work account must be taken of his tragically short career; what we possess of him is the 'wild untrained efforts of youth.' Yet it suffices to earn him the title of founder of the English drama.

Best edition is Dyce's in 1 vol. (Pickering, 1858); see also *Christopher Marlowe*, by J. H. Ingram (1904).

MARLY-LE-ROI (48° 51′ N., 2° 2′ E.), village, on Seine, Seine-et-Oise, France; formerly famous for royal castle built by Louis XIV.

MARMANDE (44° 30′ N., 0° 10′ E.), town, Lot-et-Garonne, France, on Garonne; woollen goods. Pop. 9700.

MARMONT, AUGUSTE FRÉDÉRIC LOUIS VIESSE DE (1774–1852), Fr. soldier; served under Napoleon in Peninsular War and later campaigns; betrayed Napoleon at Paris, 1814; cr. peer of France at Restoration; went into exile with Charles X.; an able general, but self-interested man.

MARMONTEL, JEAN FRANÇOIS (1723–99), Fr. author; protected by Voltaire; wrote several plays and novels, and contributed to the *Encyclopédie*; *Mémoires* useful for literary history of time; much thought of as stylist.

MARMORA (40° 38′ N., 27° 35′ E.), island of Turkey, in Sea of Marmora; ancient *Proconnesus*; famous marble quarries.

MARMORA, SEA OF (40° 40′ N., 28° E.), between Europe and Asiatic Turkey, communicating with Black Sea by the Bosporus and with Ægean by the Dardanelles; ancient *Propontis*.

MARMOSETS, a family of Primates (*q.v.*).

MARMOTS (*Marmota*), a genus of Rodents, the members of which are related to Squirrels, and are found in the colder portions of Old and New Worlds, where they live in large companies in underground burrows; hibernate in winter.

MARNE (49° 2′ N., 4° E.), river, France, joins Seine at Charenton, 2 miles S.E. of Paris; length, 320 miles; Rom. *Matrona*.

MARNE (49° N., 4° 10′ E.), department, France, formed from part of ancient province of Champagne; surface level, with low hills W. and E.; chief stream, the Marne; principal product, champagne; capital, Châlons-sur-Marne. Pop. (1911) 436,310.

MARNE, HAUTE-, see HAUTE-MARNE.

MAROCCO, see MOROCCO.

MARONITES, Oriental Christian Church, in communion with Rome, but retaining Syriac liturgy and married clergy (though they no longer marry after ordination); its early history is obscure, and in XII. cent. it was heretical; now being increasingly Romanised; M's exist mostly around Lebanon, Hermon, and Antioch, and number about 500,000.

MAROONS, fugitive slaves who took refuge in W. Indies; M's of Jamaica were not conquered by British until end of XVIII. cent.; negroes of Surinam are descendants of M's.

MAROS-VÁSÁRHELY (46° 28′ N., 24° 31′ E.), town, on Maros, Transylvania, Hungary; chief town of the Szeklers; tobacco; wine and fruit. Pop. (1910) 25,517.

MAROT, CLÉMENT (1497–1544), Fr. poet; s. of Norman poet, Jean Marot, sec. to Anne of Brittany, appreciated also in his time; obtained patronage of Marguerite d'Angoulême and good graces of François I., to whom he addressed his best *Épitres*, and with whom he was captured at Pavia, 1525. Suspected of Protestantism; twice imprisoned, and escaped with court aid; avenged himself by writing *L'Enfer* to describe prisons of the Châtelet; escaped to Italy, 1535, but returned, 1536; after his trans-

lation of *Psalms*, condemned by Sorbonne, fled to Geneva, 1543; driven forth by Calvinists, and died in Turin; left seventy *Epîtres* addressed to influential people and friends, elegies, ballads, *rondeaux*, songs, about 300 epigrams, translations in verse of Vergil, Ovid, Petrarch, Erasmus; his *Psalms* had vogue among Protestants; skilful employer of mediæval forms of verse, but later works show coming Renaissance; unsurpassed for lightness and grace.

H. Morley, *Clément Marot*.

MARPLE (53° 24′ N., 2° 4′ W.), town, Cheshire, England. Pop. (1911) 6484.

MARPRELATE CONTROVERSY, a pamphlet war waged from 1588 to 1590 by the Puritans against the Episcopacy. The Puritan papers, although by various authors, were signed Martin Marprelate. Bacon intervened with a pamphlet urging toleration.

MARQUESAS ISLANDS, Medaña (10° S., 140° W.), archipelago of volcanic islands in S. Pacific; annexed by France, 1842; mountainous; fertile; the more southerly group was discovered by Medaña in 1595, the more northerly by Ingraham in 1791; chief product, tropical fruits. Pop. 3424.

MARQUESS, Marquis (from O. Fr. *marchis*, a mark or frontier; elliptical form of *comes marchiæ*, count of the march), Eng. title of peer, below duke and above earl; formerly ruler of a 'march.'

MARQUETTE (46° 30′ N., 87° 20′ W.), city, summer resort, Michigan, U.S.A., on Lake Superior; exports iron ore. Pop. (1910) 11,503.

MARRAKESH, see Morocco.

MARRI, tribe in Baluchistan.

MARRIAGE.—Marriage according to the law of England means 'the voluntary union for life of one man and one woman to the exclusion of all others.' It is, therefore, in the eye of the law a civil contract, and the fact that it is also a religious ceremony, and, in the R.C. Church, a sacrament, is only partially recognised by the law. Here we are concerned with the legal view of m.

The common law of England relating to m. is derived from the old Canon Law of Western Christendom, and though m. is regarded as a civil contract, it differs from other contracts in that it is made for life, cannot be rescinded at the will of either party, and can only be legally dissolved under certain circumstances and formalities. To constitute a legal and valid m. in England it is necessary that the parties should not be related within the prohibited degrees of affinity, and should be of an age and a mental condition that enable them to enter into the contract. Persons who have been certified as lunatics cannot enter into the contract legally, but minors can—males at 14 and females at 12. The absence of the parents' consent does not make the m. void, though the parents, by forbidding the banns, can prevent the m. In the absence of parental prohibition assent may be presumed. M. can be solemnised in England in the following various ways:—

(1) According to the rites of the Church of England, either by special licence of the Abp. of Canterbury (average cost, £29, 8s.), available at any time or place, or by ordinary licence (£1, 15s. to £2, 12s. 6d.), to be obtained from a surrogate, or after banns. The m. in these two latter cases can only take place in a consecrated church or chapel, between the hours of 8 a.m. and 3 p.m., a duly ordained clergyman officiating.

(2) By the Registrar—after 21 days' notice—full particulars of age, name, condition, and rank being published; 7 days' residence within the district is required; fee, 7s.

(3) The Registrar having granted his certificate, the m. may be solemnised in any registered place of worship, either in the presence of the Registrar or in the presence of an 'authorised person' (Marriage Act, 1898).

The position of married women in England has been radically changed by the Married Women's Property Act, 1882, the practical effect of which has been to place a woman married after the passing of that Act in the position of a *femme sole* or unmarried woman in the matter of her own property. Any real or personal property belonging to a married woman on January 1, 1883, or acquired after that date, is her own to hold and dispose of in any manner she likes. All wages, earnings, money, and property gained by her in the course of trade or by the exercise of professional or artistic skill are included in these provisions. A wife can only pledge her husband's credit in so far as she is acting as his agent. The widow of a husband dying intestate can claim the whole estate if it does not exceed £500 net, and there is no issue. The share of the widow is reduced to one-third if there are children of the marriage, two-thirds being divided amongst the latter. A wife dying intestate, the husband can claim the whole of her estate. See Divorce.

MARROW, the soft substance in the interior of bones; red m. used medicinally in anæmia, especially pernicious anæmia. See also Bone.

MARRUVIUM (42° N., 13° 45′ E.), formerly chief town of the Marsi, on Lacus Fucinus, Italy.

MARRYAT, FREDERICK (1792–1848), Eng. novelist; b. Westminster; spent several adventurous years in service under Captain Cochrane; author of several well-known books of adventure, e.g. *Mr. Midshipman Easy*, *The Phantom Ship*, *Masterman Ready*, and *Children of the New Forest*.

MARS, fourth planet in order of distance from sun; mean distance, 141 million miles; period, 687 days; rotation period, 24 hours 37 minutes 22·67 seconds; two satellites, *Deimos* and *Phobos*, revolving in 7 hours 38 minutes and 30 hours 14 minutes respectively. Mars is the planet concerning which we know most, its orbit being outside that of the earth, so that its surface is fully illuminated when it is nearest us. In addition, its atmosphere is not too dense to hide materially its surface markings. Some of these markings are permanent features, others are variable. The planet's equator is inclined to its orbit at an angle of 24° 50′, and in consequence there are seasons, as on the earth. At the poles are white caps, which shrink in summer and grow again in winter, just as the earth's polar ice-caps shrink and grow. Evidences of the existence of cloud have been obtained, for at times portions of the disc are obscured. In 1877 Schiaparelli discovered a number of narrow straight dark lines on M., which have since been called 'canals.' Lowell, who has studied M. very thoroughly, believes these 'canals' to be of artificial origin, but it appears improbable that the planet is capable of supporting life. Its atmospheric pressure must be very small, for gravity is only 38 % that of the earth, and the surface is easily seen. Again, the seasons are nearly twice as long as ours, and the inequality in length is far greater. Hence the mean summer and winter temperatures must differ greatly, and it must be remembered that M. receives only three-sevenths the amount of heat the earth receives from the sun.

MARS, an ancient Ital. god of war and identified with the Gk. Ares. Mars seems originally to have been a god of agriculture, worshipped primarily in the spring, and to whom first-fruits were dedicated. Mars was also worshipped as a war-god, and dedicated to him were the Salii—dancing priests with clashing shields. In later times Mars was identified solely with war, and his associations with agriculture were forgotten.

MARSALA (37° 50′ N., 12° 25′ E.), seaport, Italy, on west coast of Sicily; exports Marsala wine; Garibaldi landed here, 1860. Pop. *c.* 60,000.

MARSEILLAISE, Fr. national anthem; composed by de Lisle, an officer, 1792; sung by Marseilles contingent when entering Paris, hence name.

MARSEILLES, Marseille (43° 17′ N., 5° 22′ E.), second city and chief commercial port, France, on Mediterranean; built on four hills with background of mountains; overlooked by *Notre Dame de la Garde* (1848–93); chief street, *La Cannebière*; interesting old harbour and spacious modern docks; cathedral, Longchamp Palace, museum, Faculty of Sciences, etc.;

fine coast scenery; famous Château d'If, neighbouring island. Gk. colony of *Massalia* was founded by Phocæans, c. 600 B.C.; assisted Rome against Gauls and Hannibal; seized by Cæsar, 49 B.C.; taken by Visigoths, Saracens, and Burgundians in turn; by Henry III. of France, 1575; free port abolished by Louis XIV.; terrible plague, 1720–21; violently stirred at Revolution and Commune; importance greatly enhanced by Suez Canal; extensive trade with Algeria, Mediterranean ports, East, etc.; chief manufactures—oil, soap, candles, etc.; ironworks, shipbuilding; exports include sugar, flour, wine; imports grain, flour, oil-seeds, silk. Pop. (1911) 550,619.

E. Caman, *Marseille au XXe Siècle* (Paris, 1905).

MARSH GAS, FIRE-DAMP, METHANE, or LIGHT CARBURETTED HYDROGEN, CH_4. Evolved from marshes and coal seams; flame slightly luminous; the simplest hydrocarbon.

MARSH, GEORGE PERKINS (1801–82), Amer. lawyer, linguist, and author.

MARSH, HERBERT (1757–1839), Eng. New Testament scholar; bp. of Llandaff, 1816, Peterborough, 1819.

MARSH MALLOW (*Althæa*), genus of plants, order Malvaceæ; *A. officinalis*, growing near Brit. coasts, has pale blue flowers.

MARSH MARIGOLD, see MARIGOLD.

MARSH, NARCISSUS (1638–1713), abp. of Cashel, 1691, Dublin, 1694, Armagh, 1703.

MARSH, OTHNIEL CHARLES (1831–99), Amer. palæontologist, whose discoveries of Amer. fossil vertebrates—pterodactyls, birds, and mammals—have done much to strengthen the theories of evolution and natural selection.

MARSHAL (from O. Fr. *mareschal*, farrier, marshal), one of general appellations which became appropriated to titular officers of mediæval royal and princely households, and have obtained various technical meanings since, *e.g.* officers of state, as Earl M. of England; army commanders, as in France, Germany, England, etc.

MARSHALL.—(1) (32° 31′ N., 94° 24′ W.) city, Texas, U.S.A.; foundries; cotton industries. Pop. (1910) 11,452. (2) (39° 10′ N., 93° 15′ W.) city, Missouri, U.S.A.; carriages. Pop. (1910) 4869.

MARSHALL, ALFRED (1842–), prof. of Political Economy at Cambridge, 1885–1908; author of several works on economics.

MARSHALL ISLANDS (10° N., 170° E.), archipelago, Pacific Ocean, comprising two groups—Ralik in W., Ratak in E.; came under Ger. protection in 1885; chief product, copra.

MARSHALL, JOHN (1755–1835), Amer. chief justice and statesman; commanded in War of Independence; counsel in great case, *Hite* v. *Fairfax*, 1786; one of commissioners to France, 1797–98, to settle questions in dispute; returned to national House of Representatives, 1799; Sec. of State, 1800–1; chief justice, 1801, and occupied important place in history of U.S.A. law and constitution. Of great learning and strong personality, he led Supreme Court and by many of his decisions strengthened Federalist cause; of great eloquence; author of *George Washington*, valuable biography; *Constitutional Decisions* was published, 1905.

MARSHALL, JOHN (1818–91), Eng. surgeon; prof. of Surgery at Univ. College, London; prof. of Anat. at Royal Academy; pres., Royal College of Surgeons, 1883; introduced operation of excision of varicose veins, and other new methods in surgery; author of *Textbook of Physiology*.

MARSHALLTOWN (42° 1′ N., 92° 57′ W.), city, Iowa, U.S.A., on Iowa; agricultural district; foundries; machine shops. Pop. (1910) 13,374.

MARSHFIELD (44° 5′ N., 91° 20′ W.), city, Wisconsin, U.S.A.; lumber industries. Pop. (1910) 5783.

MARSI, ancient Ital. people of Sabellian race, who dwelt near Lake Fucinus; chief movers of celebrated *Marsic* or *Social War*.

MARSIGLI, LUIGI FERDINANDO, COUNT (1658–1730), fought in Austrian army, then pub. scientific works.

MARSILIUS OF PADUA (1270–1342), Ital. scholar, who with the assistance of John of Jandun wrote the famous *Defensor Pacis*, a treatise in which the power of the people is defended against the supremacy of the Papacy—the work is, in fact, a precursor of the doctrines of the Fr. Revolution. The *Defensor Minor* was written by M. to explain some obscure points in his theory.

MARSIVAN, MERZIFUN (40° 50′ N., 35° 30′ E.), town, vilayet Sivas, Asia Minor; seat of Anatolia Coll.; cotton manufactures. Pop. 15,000.

MARS-LA-TOUR (49° 12′ N., 5° 53′ E.), village, Meurthe-et-Moselle, France. A great battle between French and Germans was fought in vicinity, Aug. 1870.

MARSTON, JOHN (c. 1575–1634), Eng. dramatist and satirist; ed. Oxford; gave up playwriting and entered the Church; works include *The Scourge of Villany, Antonio and Mellida, Antonio's Revenge, What You Will*, and *The Malcontent*, usually considered his masterpiece; plays have much passion but are full of horrors, blood, and bombast; satires, like his tragedies, are too extravagant.

MARSTON, PHILIP BOURKE (1850–87), Eng. poet; s. of Dr. Westland M., the dramatist; repute of his verse was largely due to compassion for his blindness.

MARSTON MOOR, BATTLE OF (1644), between Royal forces under Prince Rupert and forces of Parliament and Scotland under Manchester, Fairfax, and Leven; field 7 miles W. of York; decisive Parliamentary victory due to Cromwell.

MARSUPIALS.—The members of the Mammalian sub-class Marsupialia, known also as Didelphia and Metatheria, include the curious pouched mammals of Australia and the Opossums of America. Except in the case of some of the latter, they are characterised by the presence of a brood-pouch or *marsupium*, into which the delicate young are placed after a short gestation of five weeks in some kangaroos and a fortnight in the opossum, equivalent respectively to the gestation periods of the rabbit and the mouse. Within the pouch the young are fed from teats to which they are firmly attached, and as they are incapable of sucking or swallowing, the milk is forced down their throats by compression of the muscles covering the mammary gland of the mother, the pouch serving the while to protect and support them.

The various animals of this section present many distinctive anatomical peculiarities, the more essentially characteristic being shown in the reproductive organs. In the female there are two uteri and two vaginæ, and the scrotum of the male is suspended in front of the penis. The brain is poorly developed and small in proportion to the size of the animals, and the succession of teeth is peculiar in that the milk dentition is represented only by a single tooth on each side of upper and lower jaws. In some no milk teeth at all have been discovered.

The habits of Marsupials present great diherences; some, as the Kangaroos, are entirely terrestrial; others burrow in the soil, such as the BANDICOOT (*q.v.*) and MARSUPIAL MOLE; the WATER OPOSSUM is aquatic in its habits, while its closest relatives, the OPOSSUMS, are arboreal; and the FLYING PHALANGERS have made an attempt to conquer the air.

While opossums are mostly carnivorous or insectivorous, except the aquatic forms which live on small fish, crustacea, and water insects, the smaller Marsupials, such as the Bandicoot and Wombat, live on roots and vegetable substances, the KANGAROOS and WALLABIES are altogether vegetarians, the larger subsisting on grass and herbage, while the smaller species eat roots.

The Order MARSUPIALIA is divided into two Sub-orders, each containing two families. The Sub-order POLYPROTODONTIA includes the DIDELPHYIDÆ, a family of AMERICAN OPOSSUMS of arboreal habit, with

the exception of the aquatic YAPOCK or WATER OPOSSUM. The prehensile tail is very long, and the mother, in cases where the pouch is absent, carries the young on her back, their tails coiled round hers.

The South Australian MARSUPIAL MOLE (*Notoryctes*) of burrowing habit is the sole representative of the Family Notoryctidæ, which, with the civet-like Dasyure (*q.v.*) and Bandicoot Families (*q.v.*), are also included in this division.

The second Sub-order, DIPROTODONTIA, comprises the nocturnal, vegetarian WOMBATS (*Phascolomyidæ*) found in Tasmania and Australia. They are short-tailed terrestrial creatures, about the size of a Badger. The nocturnal, arboreal PHALANGERS (*Phalangeridæ*), popularly known as Cuscuses, or Australian Opossums, are represented by species varying greatly in outward characteristics, from small shrew-like creatures such as the LONG-SNOUTED PHALANGER of West Australia to the tailless KOALA or 'native Bear' (*Phascolarctos cinereus*) of Eastern Australia, the size of a large cat. One genus, the so-called FLYING PHALANGER (*Petaurus*), is provided with a flap of skin stretching between the limbs, which enables it to leap great distances from tree to tree.

Lastly the Family MACROPODIDÆ includes the KANGAROOS, with allied forms, the WALLABIES, and the RAT KANGAROO or POTEROO. The true KANGAROOS (*Macropus*) are confined to Australia, New Guinea, and Tasmania. The GREY KANGAROO or OLD MAN (*Macropus giganteus*), the largest living quadruped in the continent, has amazing powers of leaping; the hind-limbs, bearing four claws, are excessively long, and give the animal great advantage in bounding. Its long tail helps to preserve the balance of the Kangaroo, which preserves an erect pose while at rest, the short fore-limbs bearing five claws, which, however, possess great strength, rarely touching the ground except when the animal is feeding. The POTEROO or RAT KANGAROO (*Hypsiprimnus*), a native of N.S. Wales, is a small greyish-brown creature the size of a rabbit, with long tail and long, thin snout.

The Kangaroos browse on crops and herbage, and are hunted down with dogs on account of the damage they do to pastures.

MARSUPIUM, see MARSUPIALS.

MARTABAN (16° 30′ N., 97° 30′ E.), small town, Lower Burma, on Salwin; formerly capital of Pegu; taken by British in 1825 and in 1852.

MARTEL, see CHARLES MARTEL.

MARTELLO TOWER, a rounded, solidly built piece of masonry, about 40 ft. high, originally erected for defence of coast in south of England and Ireland during Napoleonic Wars.

MARTEN, see WEASEL FAMILY.

MARTEN, HENRY (1602–80), Eng. regicide; member of Committee of Public Safety, 1642; most energetic promoter of king's death; found guilty of regicide, 1660, but suffered captivity, not death penalty.

MARTENS, FRÉDÉRIC FROMMHOLD DE (1845–1909), Russ. jurist and diplomatist; important influence on development of international law; employed in various international cases and prominent at Hague Conferences; writings of world-wide renown.

MARTHA'S VINEYARD (*c.* 41° 23′ N., 70° 38′ W.), island, off S.E. coast of Massachusetts, separated from Elizabeth Islands by Vineyard Sound; area, *c.* 100 sq. miles; discovered by Gosnold in 1602; formed part of Massachusetts, 1644–54, after which it was for several years independent; permanently annexed to Massachusetts, 1691; invaded by British, 1778, 1812; surface generally level; contains number of villages, some of which are favourite summer resorts; formerly whaling centre; sheep bred; fisheries. Pop. *c.* 4500.

MARTIAL, MARCUS VALERIUS MARTIALIS (43–*c.* 104), Lat. epigrammatist; b. in Spain in reign of Claudius; came to Rome, 66 A.D., in Nero's reign. As panegyrist of the emperors he was rewarded lavishly, yet fulsome flattery of Domitian was turned into severest ridicule after his patron's death. Trajan, however, was proof against M.'s obsequious flattery, and the last few years of the poet's life were passed in comparative poverty. Pliny the Younger published in his letters the extent of his generosity to M. He returned to his birthplace *c.* 100 A.D. His collected epigrams consist of 14 books. His flattery is despicable, and his coarseness deplorable, but his work had wit, brilliancy, and originality.

MARTIAL LAW, government of country or army, during suspension of ordinary codes, by military commander with absolute power. Its establishment is royal prerogative in Great Britain, and right of government in emergencies in all countries. In Great Britain exercise of royal prerogative is limited by parliamentary statute (*Petition of Right* and subsequent *Army Acts*). Its purpose is to facilitate execution or imprisonment of persons dangerous to existence of State; ordinary forms are observed as far as possible; act of indemnity is granted to military commander who has judged civilians, after civil code has been restored.

MARTIGNAC, JEAN BAPTISTE, VICOMTE DE (1778–1832), Minister of Interior, France, 1828–30.

MARTIGUES (43° 24′ N., 5° 9′ E.), seaport, Bouches-du-Rhône, France. Pop. 6300.

MARTIN, name of several popes.—**Martin I.** became pope, 649; summoned first Lateran synod, 649, which condemned Monothelitism; consequently deposed by emperor.—MARTIN II. and MARTIN III., wrong appellations of Marinus I. and II.—**Martin IV.** (1281–85); supported French against Italians and Germans; deposed.—**Martin V.** (1417–31); declared popes above General Councils; ended Great Schism.

MARTIN, CLAUD (1735–1800), of Fr. birth, but became major-general in service of East India Company.

MARTIN, HOMER DODGE (1839–1897), distinguished Amer. landscape painter.

MARTIN, LUTHER (1748–1826), Amer. advocate.

MARTIN, ST. (316–400), bp. of Tours; forsook army for Church; famous for sanctity, charity, and moderation; suffered Arian persecution.

MARTIN, SIR THEODORE (1816–1909), Brit. author; b. Edinburgh; settled in London, and became famous by his *Bon Gaultier Ballads*, written in collaboration with Prof. Aytoun. His wife (*née* HELEN FAUCIT) was well known as an actress.

MARTIN, SIR WILLIAM FANSHAWE (1801–95), Brit. sailor; saw no active service, but did much for *morale* of navy.

MARTINEAU, HARRIET (1802–76), Eng. writer; b. Norwich. Her name was first made by her *Illustrations of Political Economy*. Among her other works are *Deerbrook*, *Eastern Life*, *Letters on the Laws of Man's Social Nature and Development*; became agnostic.

MARTINEAU, JAMES (1805–1900), Eng. theologian and philosopher; ed. at Norwich and York; ordained and entered Unitarian ministry, 1828; pastor at Liverpool, 1832; prof. at Manchester College, 1840–85; pastor at Little Portland Street Chapel, London, 1859–72; received honorary degrees from Oxford, Dublin, Edinburgh, Harvard, and Leiden; wrote large number of theological and philosophical works, including *Types of Ethical Theory*, *Study of Religion*, *Seat of Authority in Religion* (these three his greatest works), *Study of Spinoza*, *Endeavours after the Christian Life*, *Hours of Thought*, *Rationale of Religious Enquiry* (representing the early stage of his theol.), and several vol's of essays; edit., with Dr. Sadler, *Common Prayer*; edit. two vol's of hymns. His eminence as a philosopher is generally recognised; in theol. at first conservative, he represented latterly more advanced schools, though he never moved outside Christianity.

Drummond and Upton, *Life and Letters*; Carpenter, *James Martineau*.

MARTINET, a strict disciplinarian or drill master; said doubtfully to be derived from Martinet, a Fr. colonel in Louis XIV.'s army.

MARTINEZ DE LA ROSA, FRANCISCO DE

PAULA (1789–1862), Span. statesman and author; banished, 1814; Prime Minister, 1820; banished, 1823; Prime Minister, 1831–34; failed as politician; important as pioneer of Romantic movement in Spain.

MARTINI, GIOVANNI BATTISTA (1706–84), Ital. musician; litanies, antiphones, oratorios, etc.; *Storia della Musica*, *Saggio di Contrapunto*.

MARTINIQUE (14° 40′ N., 61° W.), Fr. W. Indian island, one of Lesser Antilles; first colonised by French, 1635; taken by British in 1762, 1794, and 1809; ultimately restored to France, 1815; the former capital, St. Pierre, was totally destroyed by eruption of Mt. Pelé in 1902. M. has area 381 sq. miles; chief town, Fort de France; produces sugar, cocoa, coffee, tobacco, cotton. Administered by governor. Pop. (1911) 184,084.

MARTINMAS, a term day in Scotland, Nov. 11; the day of St. Martin (*q.v.*).

MARTINS, see under SWALLOWS.

MARTIN'S FERRY (40° 5′ N., 80° 50′ W.), city, Ohio, U.S.A., on Ohio River; iron and steel manufactures; glass-works. Pop. (1910) 9133.

MARTINSBURG (39° 23′ N., 77° 58′ W.), town, W. Virginia, U.S.A.; woollens, furniture. Pop. (1910) 10,698.

MARTINUZZI, GEORGE (1482–1551), Hungarian statesman; took important part in recovering Buda-Pesth for John Zapolya, king of Hungary; won recognition of Austria for Zapolya dynasty by Treaty of Grosswardein, 1538; followed patriotic Hungarian policy; assassinated.

MARTIUS, CARL FRIEDRICH PHILIPP VON (1794–1868), Ger. traveller and botanist.

MARTOS (37° 44° N., 4° 1′ W.), town, Jaen, Spain; in vicinity are sulphur springs. Pop. 17,000.

MARTOS, CHRISTINO (1830–93), Span. liberal statesman.

MARTYN, HENRY (1781–1812), Eng. missionary; chaplain in India, 1805; translated New Testament into Hindustani and Persian; an able and zealous man.

MARTYN, JOHN (1699–1768), English botanist.

MARTYR (Gk. *martyr*, witness), term used to describe any one who suffers death for his religious beliefs, whatever they may be; by extension m. is applied to those who suffer from devotion to anything, *e.g.* science, fear, etc.

MARTYROLOGY, a calendar of saints or martyrs, either giving only names or with appended biographies. Several Christian martyrologies of IV. and following cent's exist.

MARULLUS, MICHAEL TARCHANIOTA (d. 1500), Renaissance classical student.

MARVELL, ANDREW (1621–78), Eng. poet; b. Winestead, Yorkshire; ed. Trinity Coll., Cambridge; travelled on the Continent for several years; tutor to daughter of Lord Fairfax, 1650; assistant to Milton, 1657; M.P. for Hull, 1659; sec. to Lord Carlisle during his diplomatic mission, 1663–65.

M. was a zealous patriot, and although a keen Royalist in his youth, as may be gathered by his scathing verses on May, the Long Parliament historian, he admired Cromwell; wrote *Poems* (1680–81), *Poems on Affairs of State* (1689), *The Rehearsal Transposed* (1672–73); a clever satirist and a writer of exquisite lyrics.

MARWAR, see JODHPUR.

MARX, HEINRICH KARL (1818–83), Ger. Socialist; the son of a Jewish lawyer, a convert to Protestantism, was born at Trèves; took the degree of Doctor of Philosophy at Berlin, 1841; met Friedrich Engels in Paris, 1844, with whom he was associated till his death; pub. the Communist Manifesto (*Manifest der Kommunisten*), 1847, and became chief editor of the *Neue Rheinische Zeitung* at Cologne in 1848; acquitted on the charge of high treason, Marx was expelled from Prussian territory, 1849, and shortly afterwards settled in London, where he remained for the rest of his life.

He was the moving spirit in the International Working Men's Association from 1864 to 1870; pub. his most important book, *Das Kapital*, 1867, which has been justly called the Bible of German Socialists. (Two later vol's were edited and published by Engels after Marx's death.) *Das Kapital* had the influence that Darwin's work had. It is a scientific study of industrial conditions, and from these investigations the theory is maintained that materialist conceptions have guided the history of man. The theory of surplus value is also deduced, *i.e.* that the workman's wages tend to fall to the minimum of subsistence, and that all profits, rent, and interest are part of the value which the labour of the workman has produced, and are, in fact, surplus value. The political theory led to the creation of a working-class Socialist party which was to take the place of all other political parties, and assume direction not only of government but of all industries, when the revolution would take place because the capitalists could extend their business no further and capital could find no further outlet.

In Germany the Social Democrats have in the main accepted the Marxian doctrine, and on the Continent generally there are Marxian Socialists in every country; but in Great Britain Marx has had little influence.

Spargo, *Life* (1911).

MARY, MOTHER OF JESUS, called the Virgin M., is mentioned in the accounts of the nativity in Matthew and Luke, concerning which it has been said that Matthew tells the story from the side of Joseph, Luke from that of M.; elsewhere in the Gospels she appears only a few times; in Mark only it is recorded that His mother and brethren thought Christ mad; in *John* 19^{25} her presence is mentioned at Cana, and, at the Crucifixion, her Son's entrusting her to the care of St. John. Outside the Gospels she is only mentioned in *Acts* 1^{14}. According to apocryphal writings, which give an elaborate account of her infancy, she was the child of Joachim and Anna. Many controversies have raged round the amount of reverence to be paid to her. Opposition to the place accorded her in Catholicism has been one of the features of Protestantism.

The doctrine of the IMMACULATE CONCEPTION of the Virgin (*i.e.* that she was conceived without original sin) was defined as of faith in 1854.

MARY I. (1516–58), queen of England and Ireland; dau. of Henry VIII. and Catharine of Aragon; b. at Greenwich; after mother's divorce treated as illegitimate; forced to become lady-in-waiting to half-sister Elizabeth; succ. bro., Edward VI., 1553; crushed Wyatt's rebellion with great severity; had Lady Jane Grey executed, 1554; influenced by Gardiner; m. Philip II. of Spain, 1554; quelled resulting insurrection; in war with France, lost Calais. In her reign England was absolved by Cardinal Pole and reconciled to the pope; heresy laws were revived, and Protestants were persecuted, nearly 300 being burnt at the stake; hence epithet ('Bloody Mary') attached to her name.

Strickland, *Lives of Queens of England*.

MARY (1631–60), dau. of Charles I. of England; m. William of Orange, 1641; mother of William III.

MARY II. (1662–94), queen of England; dau. of James II. by first wife; m. William of Orange, 1677, with whom she became joint sovereign of United Kingdom in 1689.

MARY OF LORRAINE, MARY OF GUISE (1515–60), wife of James V. of Scotland; regent during minority of her dau., Mary, Queen of Scots, whose marriage with dauphin of France she arranged; governed during Mary's absence in France; with Fr. assistance warred against Protestants; deposed by Lords of Congregation, 1559.

MARY, QUEEN OF SCOTS (1542–87), dau. of James V. and Mary of Guise; b. at Linlithgow Palace, Dec. 1542; succ. on her f.'s death few days later. Betrothed to Francis, dauphin of France, 1548; went to France, where she remained twelve years; m.

dauphin, 1558; after his death, 1560, returned to Scotland, 1561. Met John Knox soon after arriving; first acts conciliatory to Protestants; consented to endowment of Prot. Church; principal advisers, her half-brother, Lord James Stewart, and Maitland of Lethington; former crushed Huntly's insurrection; became Earl of Murray, 1562; queen's lover, Chastelard, put to death, 1562; m. Henry, Lord Darnley, 1564, on which Murray and others raised forces against her, but were dispersed, 1565; Darnley's subsequent behaviour alienated her affection; he opposed her policy, and further offended her by share in Rizzio's murder, although reconciliation apparently took place. Bothwell now began to influence her; he probably made arrangements for explosion of Darnley's lodging in Kirk o' Field, Edinburgh, which occurred Feb. 9, 1567; Darnley was found dead next day in adjoining garden, apparently strangled by Bothwell's fellow-conspirators while trying to escape. M.'s knowledge of, or share in, murder has long been matter of debate; Bothwell was acquitted through lack of witnesses; three months later M. m. Bothwell. Prot. leaders took up arms with purpose of freeing her from him; beleaguered them at Borthwick Castle, whence Bothwell escaped; subsequently joined by M., who fled with him to Dunbar. At Carberry Hill M. surrendered, and Bothwell was allowed to withdraw in safety; M. was taken to Holyrood, subsequently to Lochleven, where she abdicated, June 24, 1567. Escaping from Lochleven, May 1568, by aid of George and Willie Douglas, M. revoked abdication; her followers assembled an army, which was utterly defeated at Langside. M., fleeing to England, lived some time in Bolton Castle, Yorkshire; removed to Tutbury, 1569; various insurrections in her favour took place; plot for her marriage to Duke of Norfolk and for R.C. rising, resulted in duke's imprisonment and M.'s removal to Coventry; subsequently taken to Sheffield Castle; concerned in plot for Span. invasion of England; Norfolk executed for implication in conspiracy; M. more strictly confined, 1572; removed to Wingfield Manor, 1584; to Tutbury, 1585; subsequently to Chartley Castle and Texall. Almost certainly concerned in Babington's conspiracy against Elizabeth's life and crown; removed to Fotheringay Castle, Sept.; tried, Oct. 1586, first at Fotheringay Castle, subsequently in Star Chamber; found guilty of plotting against Elizabeth's life and sentenced to death; executed after some delay, due to Elizabeth's reluctance to sign warrant; met death with same courage by which whole life was marked. Remarkable for personal fascination.

The **Casket Letters**, which played such an important part in M.'s trial, were 8 letters and some verses alleged to have been written by M. to Bothwell between Jan. and April 1567. The most important is Letter II., apparently written from Glasgow, which, besides expressing M.'s passionate devotion to Bothwell, hints at Darnley's murder. The Letters have been a subject of great controversy, but the balance of authority now falls on the side of their authenticity.

E. O'Neill, *Mary, Queen of Scots* (1912); D. H. Fleming, *Mary Stuart* (1898); Skelton, *Mary Stuart* (1893).

MARY (1496–1533), queen of France; dau. of Henry VII. of England; m. Louis XII., 1514; subsequently m. Duke of Suffolk.

MARY OF MODENA (1658–1718), second wife of James II. of England; supported Jesuits; escaped to France at Revolution, 1688.

MARY (1457–82), Duchess of Burgundy, 1477; m. Emperor Maximilian I.

MARY MAGDALENE, disciple of Jesus who had cast out of her 'seven devils'; first witness of His resurrection; type of repentant sinner (see also *Luke* 8^{2}, 7^{37}).

MARYBOROUGH.—(1) (25° 35′ S., 152° 43′ E.) seaport, Queensland, Australia, on Mary River; foundries, flour-mills, sugar-mills. Pop. (1911) 11,626. (2) (53° 2′ N., 7° 18′ W.) market town, capital, Queen's County, Ireland. Pop. 3000. (3) (37° 3′ S., 143° 44′ E.) town, Victoria, Australia; centre gold-mining district. Pop. (1911) 5675.

MARYLAND (37° 54′ to 39° 43′ N., 75° 5′ to 79° 30′ W.), state near centre of E. coast of U.S.A.; bounded N. by Pennsylvania, E. by Delaware, Atlantic, S. and S.W. by Virginia and W. Virginia, W. by W. Virginia; area, 12,210 sq. miles; has only about 35 miles of coast on Atlantic, but Chesapeake Bay, the Susquehanna, Patapsco, and Potomac Rivers provide harbours; surface rises to Blue Ridge district of Appalachians (*q.v.*), eastern half of state being low and the western mountains reaching height of 3500 ft. Capital, Annapolis; largest towns, Baltimore, Cumberland, Hagerstown, Frederick.

M. is named after Henrietta Maria, queen of Charles I., who in 1632 granted the district to Cecil, Lord Baltimore; a number of English Rom. Catholics led by Leonard Calvert, Lord Baltimore's bro., settled here in 1634, establishing amicable relations with the native inhabitants. Original grant had included portions of Pennsylvania and Delaware, the subsequent grant of which to William Penn resulted in long dispute. M. played an important part in War of American Independence, at close of which it became one of original 13 states of Union; had share in war of 1812–15 against Britain, and in Civil War remained loyal to Union, the battle of Antietam taking place within its bounds. Recent history is uneventful.

Executive power is held by governor, who remains in office four years; legislative authority vested in General Assembly consisting of Senate of 27 members and House of Delegates of 101 members, elected by popular vote for four and two years respectively. M. sends 2 Senators and 6 Representatives to Congress. Principal religious denominations in order of numerical importance are R.C., Methodist, Episcopalian, Lutheran, Baptist. Education is free and obligatory; most important univ. is the Johns Hopkins (*q.v.*) in Baltimore, which is also seat of M. Univ. and several coll's. Annapolis, Ellicot City, Chestertown, Emmittsburg, New Windsor, and Westminster are also seats of important coll's. Inhabitants are whites, negroes, and Asiatics; whites of foreign birth include Germans, Irish, Russians, English.

Excellent coal is mined in extreme W.; iron, chrome, copper, brick-clay, marble, soap-stone also worked; there are pine, chestnut, oak, hickory, and walnut trees, and lumbering is important industry. M. produces tobacco, fruits, vegetables, cereals; large trade in tinned fruit and vegetables. Live stock raised, dairy-farming carried on. Manufactures cottons, woollens, iron and steel, tin wares, flour, artificial manures. Railway mileage, c. 2660. Pop. (1910) 1,295,346.

Brown, *Maryland*.

MARYPORT (54° 38′ N., 3° 29′ W.), seaport, Cumberland, England, on Irish Sea; shipyards; iron foundries; in vicinity are collieries. Pop. (1911) 11,423.

MARZABOTTO, village, Italy, on Reno, 15 miles S.W. of Bologna; Etruscan remains.

MASAI, African people; originally inhabited the country between the Nile and the Karamojo; now consist of two tribes mostly residing in the Brit. East Africa Protectorate. Of fine physique, slender and tall, the M. are not given to hunting or industry, the women doing all necessary work.

MASANIELLO, TOMMASO ANIELLO (1622–47), Neapolitan fisherman who headed insurrection of Naples against the Spanish in 1647; assassinated.

MASANOBU, KANO (1453–90), Jap. artist; famous landscape painter of the Kano school.

MASAYA (12° 2′ N., 86° W.), town, Nicaragua, at foot of volcano M.; tobacco. Pop. 15,000.

MASCAGNI, PIETRO (1863–), Ital. composer; best-known opera, *Cavalleria Rusticana* (1890).

MASCARA (35° 22′ N., 0° 7′ E.), fortified town,

Algeria; burned by the French in 1835; occupied by them in 1841; wine. Pop. (1911) 24,254.

MASCARENE ISLANDS (20° S., 57° E.), group, Indian Ocean, viz. Mauritius, Réunion, and Rodriguez collectively.

MASDEN, JUAN FRANCISCO (1744–1817), Span. historian; wrote *Critical History of Spain.*

MASERU (29° 21′ S., 27° 31′ E.), chief town, Basutoland, S. Africa, on Caledon River.

MASHAM, ABIGAIL, LADY (d. 1734), favourite of Queen Anne; her cousin, Duchess of Marlborough, secured her a post as bedchamber-woman; superseded duchess in queen's favour.

MASHAM, SAMUEL CUNLIFFE LISTER, 1ST BARON (1815–1906), Eng. inventor of machines for wool- and silk-combing; peer, 1891.

MASHONALAND, see RHODESIA.

MASINISSA (c. 238–149 B.C.), king of E. Numidians; introduced civilisation into Numidia; deserted Carthaginian for Rom. alliance; commanded for Rome at battle of Zama, 202, and received western Numidia as reward; strove to annex Carthage, and stirred up third Punic War.

MASK, see MASQUE.

MASKELYNE, NEVIL (1732–1811), Eng. astronomer-royal; commenced publication of *Nautical Almanac,* 1767; determined gravitational attraction of mountain Schiehallion, 1774.

MASON AND DIXON LINE (39° 43′ N.), boundary line between Maryland and Pennsylvania; line, surveyed 1763–67, ran 244 miles W. of the Delaware; formed the general boundary between the free states (N.) and the former slave states (S.); derives name from two Eng. astronomers, Charles Mason and Jeremiah Dixon.

MASON CITY (43° 10′ N., 93° 10′ W.), city, on Lime Creek, Iowa, U.S.A.; manufactures bricks, tiles; stone quarries. Pop. (1910) 11,230.

MASON, FRANCIS (1799–1874), Baptist missionary in England, America, and India.

MASON, GEORGE (1725–92), Amer. politician; drafted Bill of Rights and Constitution of Virginia, 1776.

MASON, GEORGE HEMMING (1818–72), Eng. painter; studied on the Continent, and produced several pictures showing rich effects of colour. A collection was exhibited by the Burlington Club after his death.

MASON, JAMES MURRAY (1798–1871), Amer. politician; Confederate Commissioner to Britain, 1861; taken on steamer *Trent*; imprisoned till 1862.

MASON, JOHN (1586–1635), Eng. colonial gov. and vice-admiral; explored and made map of Newfoundland; founded New Hampshire, 1629, and tried to establish Anglican religion and social customs.

MASON, JOHN YOUNG (1799–1859), Amer. diplomatist; sec. of navy (1844–45) and (1846–49); attorney-general (1845–46); U.S. minister to France (1853–59); assisted in composing Ostend Manifesto.

MASON, SIR JOHN (1503–66), Eng. diplomatist; helped to arrange treaty restoring Boulogne to France, 1550; ambassador to Imperial Court, 1553.

MASON, SIR JOSIAH (1795–1881), Eng. pen-maker and philanthropist; founded Erdington Orphanage and Mason College (since 1900 part of Birmingham Univ.).

MASON, WILLIAM (1725–97), Eng. minor poet; wrote tragedies and miscellaneous verse, but is remembered as the literary executor of Gray, whose *Memoirs* he pub. in 1775.

MASONRY, the earliest remaining examples of m. are found in ruins of ancient Egyptian and Ind. temples. The most striking feature about these buildings is the great size of the stones, and it is difficult to understand how the ancients quarried and manipulated them with the machinery at their disposal. In structures such as the Egyptian Pyramids no mortar was used, and the joints were polished and fitted with minute accuracy. In some of the oldest remains in Greece and Italy irregular blocks of great size were used, the intervening spaces being filled up with small stones. Gk. and Rom. m. bears considerable resemblance to that of to-day. Buildings of the early Middle Ages consisted of rough rubble work, and though the Normans made considerable improvements their workmanship was generally poor. During the development of Gothic arch. m. advanced steadily, and ashlar walling, consisting of carefully dressed blocks of from 12 to 18 in. deep, with mortar joints up to ½ in. thick, took the place of rubble. Ashlar work was used by the Renaissance masons, and a later development is the employment of hammer-dressed m. The tools used consist of different kinds of hammers, mallets, saws, and chisels; rules, set-squares, spirit-levels, plumb-lines, mortar trowels, etc. Hoisting apparatus and scaffolding are also required.

MASPERO, GASTON CAMILLE CHARLES (1846–), Fr. Egyptologist and explorer; has written largely on his special study, his most notable work being perhaps the *Histoire Ancienne des Peuples de l'Orient* (*Dawn of Civilisation,* Eng. trans.).

MASQUE, MASK, drama in which spectacular effect, music, dancing, etc., are prominent and characterisation and plot subsidiary; originally a performance of 'masked' revellers. The m. flourished in England during early XVII. cent.; Ben Jonson wrote nearly 40; Inigo Jones as decorator and Henry Lawes as musician were usually employed. Milton's *Comus* is a typical m.; its subject is pastoral and allegorical. Other m. writers were Campion, Daniel, Carew, Browne, Shirley, Davenant.

The *Antimasque,* practised by Jonson, introduced grotesque characters as a foil to others. See also PAGEANT.

MASS (Fr. and Ger. *messe,* Ital. *messa,* from Lat. *missa*), first clear use of word for service of Eucharist (*q.v.*) by St. Ambrose (*q.v.*), and it came to denote the service from the formal dismissal (*missa*) of the congregation at the end *ite missa est*; language at first Gk. had become by V. cent. Lat.; present Rom. m., a service of gradual growth, has following order: preparatory prayers (foot of altar), introit, *Kyrie Eleison* (Lord have mercy upon us), *Gloria in excelsis* (Glory be to God on high), collects, epistle, gospel, offertory and *Lavabo,* preface, Canon (centring in the consecration and ending with *Amen* before saying the *Our Father*), Communion, prayers after Communion, dismissal (*ite missa est*), blessing of the congregation, Gospel of St. John. See also EUCHARIST.

MASS, see GRAVITATION, MATTER.

MASSA (45° 1′ N., 11° 18′ E.), town, capital of Massa-e-Carrara, Tuscany, Italy; marble quarries. Pop. (1911) 30,895. The province of **Massa-e-Carrara** has area of 687 sq. miles. Pop. (1911) 212,398.

MASSA MARITTIMA (43° 5′ N., 10° 55′ E.), town, Grosseto, Tuscany; bp.'s see; iron mines, mineral springs. Pop. 10,000.

MASSACHUSETTS (41° 16′ to 42° 50′ N., 69° 56′ to 73° 30′ W.), one of New England states of United States; bounded N. by Vermont and New Hampshire, E. by Atlantic, S. by Atlantic, Rhode Island, Connecticut, W. by New York State; area, 8267 sq. miles; off coast are Martha's Vineyard and Nantucket Islands; surface flat along coast, elsewhere undulating, reaching height of over 3500 ft. in W., which is occupied by Berkshire Hills, part of Appalachians (*q.v.*); highest peak, Mt. Greylock (3530 ft.). Drained by Housatonic, Connecticut, Millers, Merrimac, and Chicopee. Capital, Boston; other large towns are Worcester, Fall River, Lowell, Cambridge.

It is thought by some writers that M. was reached by Norsemen in XI. cent., but no proof of this exists; the first permanent settlement was made by the Pilgrim Fathers, a body of separatists (numbering over 100 men, women, and children) from Eng. Church, who sailed from England in the *Mayflower,* and landed at site of present town of Plymouth in

1620, forming what is known as the Plymouth colony. Another Puritan colony settled at Salem in 1628, and became the M. Bay colony. In 1629 the province of New England was created, and the government was divided between these two colonies, which were united in 1692.

Early history is marked by struggles with Indians; by rigorous enforcement of Puritan religion, nonconformity to which was punishable by death; and by continuous struggle against mother country. M. took leading part in War of Amer. Independence, which broke out soon after the throwing overboard of several cargoes of tea in the harbour of Boston by the citizens of that town as a protest against imposition of taxes by Brit. government; and battles of Lexington and Bunker's Hill were fought in this state, which after end of war became one of the original thirteen states of the Union, and as such took part in war of 1812–15 against Britain. During Civil War M. sent exceptionally large proportion of men to the field on Federalist side, besides considerably augmenting the Union navy.

Executive power is held by governor, assisted by lieut.-gov. and by an executive council of 8 members; the governor and council may apply to the supreme court for advice on legal matters; legislature is called the General Court of M. and consists of Senate of 40 members and House of Representatives of 240 members. M. is divided for purposes of local administration into 14 counties; in towns having population under 12,000 municipal administration is carried out by board of select men, chosen annually by popular vote. State is represented at Washington by 2 Senators and 16 Representatives.

Principal religion is R.C.; other denominations in order of numerical importance are Congregational, Baptist, Methodist, Episcopal, Prot. Episcopal, Christian Scientist, Unitarian, Universalist. The predominance of Rom. Catholicism in an originally Puritan state is attributed to continuous foreign immigration. Education is free and obligatory; state has seventeen univ's and coll's, of which most celebrated is Harvard Univ., Cambridge, founded in 1636; other towns containing coll's are Amherst, Boston, Medford, Northampton, South Hadley, Wellesley, Williamstown, Worcester. Boston (*q.v.*) has long been famed as centre of Amer. culture, and has associations with most of the great names of Amer. lit.

M. is densely populated; inhabitants include whites, coloured persons, Chinese, Indians, Japanese. Whites of foreign birth include Irish, Fr., and Eng. Canadians, British, Russians, Italians, Scandinavians, Germans. During last decade great numbers of Russ. and Ital. immigrants have settled here. M. is pre-eminently a manufacturing state at present time, although until middle of last cent. it was almost entirely agricultural. A considerable area is wooded, and the valleys are fertile, tobacco being grown; and it is centre of U.S. whale, deep-sea, and coast fishing; important centre also of commerce and export. Manufactures boots and shoes, cottons, woollens, iron and steel goods, machinery, leather, paper, rubber goods; shipbuilding, meat-packing, ice trade also carried on. Coal and iron pyrites occur, but mining is unimportant. Railway mileage in 1910, 2110. Pop. (1910) 3,366,416.

Barry, *History of Massachusetts* (1857); Palfrey, *History of New England*; Griffis, *Massachusetts* (1893).

MASSAFRA (40° 37′ N., 17° 7′ E.), town, Lecce, Italy; fruit, wine, olives. Pop. 11,200.

MASSAGE, term applied to a method of treatment of disease, consisting of the manipulation and movement of the patient's muscles and joints by the hands of the operator or masseur. It includes stroking, kneading, rubbing, and tapping the skin and deeper tissues; in the more advanced stages, moving and bending the limbs by the masseur while the patient remains passive; and, still more advanced, the patient offering resistance to the movement of his limbs by the masseur, thus leading up to ordinary exercise of the body. The effect of m. is to improve nutrition and to aid the elimination of waste products in the tissues, by hastening tissue metabolism and facilitating and increasing the flow of blood and lymph. The conditions for which the treatment is beneficial include such nervous derangements as hysteria, neurasthenia, neuralgia, sciatica, insomnia, melancholia and other forms of insanity, paralysis, chronic joint affections, rheumatism, anæmia, obesity, congestions, sprains, fractures, to break down adhesions, as a substitute for active movement, where that is impossible, to prevent the wasting of muscles. The treatment must be carried out under the supervision of a medical man, as there are many conditions in which it would do considerable harm instead of good.

MASSAWA, see MASSOWAH.

MASSÉNA, ANDRÉ (1758–1817), duke of Rivoli, marshal of France; won battle of Saorgio, 1795; commanded army in Switzerland, 1799; victorious at Zürich; defended Genoa, 1800; became marshal, 1804; defeated Archduke Charles at Caldiero, 1805; served against Austria, 1809; won victory at Aspern-Essling; commanded in Spain, 1809–12; defeated by British; subsequently commanded at Marseilles.

MASSENBACH, CHRISTIAN KARL AUGUST LUDWIG VON (1758–1827), Pruss. soldier; opposed to war against Napoleon; chief of staff to Prince Hohenlohe, 1805.

MASSENET, JULES ÉMILE FRÉDÉRIC (1842–1912), Fr. composer; best-known opera, *Manon* (1884); others, *Roi de Lahore* (1877), *Cid* (1885), *Werther* (1892), *Thaïs* (1894), *Sapho* (1897), *Grisélidis* (1901), *Le Jongleur de Notre Dame* (1902), *Don Quichotte* (1910); also orchestral works.

MASSEREENE, JOHN CLOTWORTHY, 1ST VISCOUNT (d. 1665), Irish Presbyterian leader; created viscount, 1660.

MASSEY, SIR EDWARD (*c.* 1619–*c.* 1674), Eng. soldier; successful Parliamentary general in first Civil War; impeached as Presbyterian agitator, 1647; fled, and took active part in invasion of 1651 and Restoration.

MASSICUS MONS, modern MONTE MASSICO (41° 12′ N., 13° 54′ E.), mountain, on border of Campania and Latium, Italy; wines.

MASSILLON (40° 48′ N., 81° 30′ W.), city, on Tuscarawas, Ohio, U.S.A.; coal mines; sandstone quarries. Pop. (1910) 13,879.

MASSILLON, JEAN BAPTISTE (1663–1742), Fr. ecclesiastic; famous preacher in Paris; bp. of Clermont, 1817; a tolerant and intellectual man, laying stress on morals rather than dogma.

MASSIMO, Rom. noble house claiming descent from Maximi, but cannot be traced earlier than XI. cent.

MASSINGER, PHILIP (1583–1640), Eng. dramatist; s. of a retainer in Pembroke family; ed. Oxford; collaborated with Fletcher, Dekker, and Tourneur in playwriting. Chief plays, *The Virgin Martyr* (1622) with Dekker, *The Duke of Milan* (1623), *The Great Duke of Florence* (1627), *The City Madam* (1632), *A New Way to pay Old Debts* (1633). Coming at end of great Elizabethan dramatic period he shows decadence, but he never descends to 'blood and thunder' as Ford does.

MASSINISSA (238 ?–*c.* 149 B.C.), king of Numidia; fought for Carthage against Rome till latter's victory in 206; then ally of Rome, from whom he received increased territory; disciplined army and civilised his kingdom.

MASSON, DAVID (1822–1907), Scot. man of letters; b. Aberdeen; prof. of Eng. Lit. at Univ. Coll., London, 1852, Edinburgh Univ., 1865–95; chief work, *Life of Milton*; wrote *De Quincey* (E.M.L.); edit. *Macmillan's Magazine*, 1858–65.

MASSON, LOUIS CLAUDE FRÉDÉRIC (1847–), Fr. historian; has written several works on Napoleon.

MASSOWAH, MASSAWA (15° 40′ N., 39° 30′ E.), fortified seaport, W. coast, Red Sea, Eritrea, on a small coral island; chief port for Abyssinia and Egyptian Sudan; exports hides, coffee, gold, ivory; hot and

unhealthy; became an Ital. possession in 1885. Pop. 7800.

MAST, upright pole composed of single tree or number of planks upon which spars and sails are hung; ordinary ships have three—fore, main, and mizen—generally divided into main, top, and top-gallant m's; nowadays frequently metal cylinders.

MASTER, a person qualified to be in authority. Hence m. of a British ship, an officer certified by the Board of Trade; M. of the Horse, third great officer of Royal Household, and superintendent of royal stables, rides next to the sovereign on State occasions. So of Arts, Surgery, Theology.

MASTER AND SERVANT.—Generally, if the master is liable for provision of food, clothing, or lodging for the servant, neglect of these things, resulting in illness, is punishable by law. Servants must obey all lawful orders, but not orders involving unlawful acts. Contract of service, as a rule, can only be rightfully terminated by death, by mutual consent, or by completion. Dismissal without notice is quite lawful under certain circumstances; but a servant leaving without notice except for grave reasons will most probably forfeit wages, or be compelled to pay damages.

MASTER OF THE ROLLS, the judge ranking next after the Lord Chief Justice in England; usually presides over the Court of Appeal; he is Keeper of the Public Records; salary, £6000.

MASTIC, MASTICH, resin exuded from *Pistacia lentiscus*, an evergreen shrub growing on Mediterranean shores; found as yellow 'tears'; M.P *c.* 108° C. Alcohol separates two resins.

MASTIFFS, see DOG FAMILY.

MASTODON, see under ELEPHANT.

MASUDI (X. cent.), Arabian author; his hist. work has mostly been edited with Fr. translation.

MASULIPATAM (16° 9′ N., 81° 11′ E.), seaport, capital of Kistna, Madras, India, on Coromandel coast; cotton manufactures. Pop. 40,000.

MASURI, see MUSSOORIE.

MATABEI, IWASA (1578–1650), Jap. artist; founder of the Ukioyé school, the members of which commonly used subjects drawn from the daily life of the people, and only occasionally birds, flowers, and landscapes. Morrison, *The Painters of Japan* (1912).

MATABELE, Zulu race in Rhodesia (*q.v.*).

MATADOR, see BULL-FIGHTING.

MATAMOROS (18° 23′ N., 98° 40′ W.), city, port on Rio Grande, Tamaulipas, Mexico; exports hides, wool; taken by Americans, 1846. Pop. 9000.

MATANZAS (23° 3′ N., 81° 37′ W.), city, capital of Matanzas, Cuba, on N. coast; exports sugar, molasses; after Havana, chief commercial port of the island. Pop. 36,000. Matanzas province has area of 3700 sq. miles. Pop. 260,000.

MATARÓ (41° 33′ N., 2° 24′ E.), seaport, Barcelona, Spain, on Mediterranean; textiles. Pop. 20,000.

MATCH replaced tinder-box *c.* 1820; at first mixture of potassium chlorate and sugar fired by sulphuric acid; friction-matches used *c.* 1835; now made of potassium chlorate and phosphorus on pine chip, which react on friction; in safety matches red phosphorus is placed on striking surface, match consisting of antimony sulphide and potassium chlorate; chiefly made in Sweden and Belgium; government monopoly in France.

MATCH-LOCK, see GUN.

MATE.—(1) nautical term; officers of merchant vessels next in rank to captain; (2) naval; m. signifies subordinate to warrant officer, *e.g.* boatswain's mate.

MATÉ, PARAGUAY TEA, is the product of *Ilex paraguayensis*, a S. Amer. tree, allied to the holly, *Ilex aquifolium* (*Aquifoliaceæ*). The leaves contain caffeine, an alkaloid also contained in the berries of the coffee plant. They are carefully prepared, and are broken up and used like tea. The flowers are unisexual.

MATERA (40° 40′ N., 16° 36′ E.), town, Potenza, Italy; seat of abp. Pop. 17,000.

MATERIALISM, explains universe on assumption of matter, extended, eternal, impenetrable, capable of movement; mind explained as dependent on matter.

MATHEMATICAL TABLE, a time- and labour-saving device by which calculations are expedited and results obtained with a definite accuracy. They range from simple factor tables to tables of all the functions met with in higher math's, such as Bessel and Gamma functions, integrals, *ber* and *bei* functions, etc. *Factor tables* give usually the least factor of numbers which are not divisible by 2, 3, or 5. Chernac's *Cribrum Arithmeticum* (1811) gives all the prime divisors of such numbers up to 1,020,000. It contains a few inaccuracies. Lehmer's *Factor Table* (1909) gives the least factor of all numbers not divisible by 2, 3, 5, or 7 up to 10 millions. The best *multiplication table* is Crelle's *Rechentafeln* (1857), giving all products up to 1000×1000. It is arranged to give all the multiples of any one number on a single page.

For *Powers and Roots* of numbers the best for general use is Barlow's *Tables* (1840), giving cubes, squares, square and cube roots, and reciprocals of numbers up to 10,000. Errata in these and other power tables are given by Cunningham (*Messenger of Math.*, vii. p. 87, and Appendix, p. 23, 1878). For *reciprocals* Barlow's tables extend to 10,000, while those of Oakes (1865) give to 7 figures reciprocals to 100,000.

Trigonometrical tables and *tables of logarithms* are usually published together, and since the invention of logarithms the logarithms of the various trigonometrical functions have been given in preference to the natural functions. Ten-figure logarithms of numbers to 100,009 are given in Report of U.S. Coast and Geodetic Survey, 1895–96, Appendix 12. Babbage's seven-figure logarithm tables extend to 108,000; Sang's tables are from 20,000 to 200,000. For general purposes Schrön's *Seven-Figure Logarithms*, or Bruhns' *New Manual of Logarithms* are both good. Besides the logarithms, they give log-sines, cosines, etc., for every 10″. Bruhns' manual also contains log-sines, etc., for every second to 6°. Another useful collection of tables is Chambers's *Mathematical Tables*, with logarithms to 100,000, log-sines, tangents, etc., and natural sines to 7 places, besides other tables. Among smaller works, that of Dale, *Five-Figure Tables* (1903), is good; various functions, *e.g.* elliptic functions, functions of Legendre and Bessel, etc., are included. *Hyperbolic logarithms* are included in the tables of Barlow, Hutton, and others, and in various four- and five-figure tables. Tables of values of e^x and e^{-x} are given in *Camb. Phil. Trans.*, xiii. p. 243 (Glaisher). The tables also include $\log_{10} e^x$ and $\log_{10} e^{-x}$, and extend from 0·001 to 0·1 (interval 0·001), from 0·01 to 2 (interval ·01), from 0·1 to 10 (interval 0·1), from 1 to 500 interval (1·0). *Bernoulli's numbers* (first 250) to 9 figures and their ordinary logarithms to 10 places are given in *Camb. Phil. Trans.*, xii. p. 384 (Glaisher). Legendre's table of the *Gamma Function* is given in his *Traité des fonctions elliptiques*. Seven-figure values are given in Bertrand's *Calcul Integral*, and six-figure values in Williamson's *Integral Calculus*. *Bessel's functions* are tabulated in Rayleigh's *Theory of Sound*; the table is taken from that of Lommel (Leipzig, 1868). Others are to be found in various Brit. Assoc. Reports. The Brit. Assoc. Report for 1912 contains four sheets of new tables of elliptic functions for four modular angles, also some tables of *ber* and *bei* functions.

MATHEMATICS is the science which deals with the laws and properties of plane and solid figures, numbers, and quantities. PURE MATHEMATICS includes the following branches:—

Arithmetic, which deals with numbers only; *Algebra*, wherein arithmetical laws are developed and extended to general quantities which are expressed by symbols (usually letters of the alphabet); *Geometry*, dealing with the properties of plane and solid figures, was developed to a high stage by the Greeks over 2200 years ago, and greatly advanced in the XVII. cent. by

Descartes, who introduced a general method—now called *Analytical Geometry*—of attacking geometrical problems; *Trigonometry*, which deals chiefly with angles and lengths of sides of triangles, and is essential to land-surveying; the *Differential Calculus*, invented independently by both Newton and Leibnitz, treats of the rates of increase of functions by infinitely small steps (as a simple example, if $y=3x$, y is said to be a function of x; now, if x is increased by an amount, however small, y will evidently also be increased by three times that amount, and the rate of increase of y with respect to x will be 3); the *Integral Calculus*, in which the Differential Calculus is utilised in summing up infinitely small quantities.

Some subjects which specially require mathematical treatment, such as Astronomy, Optics, Statics, Dynamics, Hydrostatics, etc., come under the heading of APPLIED MATHEMATICS. There is no branch of natural philosophy which can be satisfactorily developed without an application of mathematics; very recently solutions to some of the problems in Mendelism and Heredity have been found by mathematical methods.

Russell, *Principles of M.* (1903); Jourdain, *The Nature of M.* (1912).

MATHER, COTTON (1663–1728), Amer. Congregationalist divine; ed. at Harvard; pastor at Boston, 1681; prominent in prosecutions for witchcraft, in which he firmly believed; helped to found University of Yale, 1718, intensely disliking the liberal tendencies of Harvard; aroused great opposition by favouring vaccination; a learned and able, if narrow, man; wrote several works.—SAMUEL MATHER (1706–85), his s., minister at Boston.

MATHER, INCREASE (1639–1723), Amer. divine; ed. at Harvard and Trinity Coll., Dublin; went to Boston, 1661; became a religious leader in New England; came to England in 1683, and made the acquaintance of Eng. theologians; on his return to America continued preaching in Boston while pres. of Harvard Univ., but the liberal school to which he was opposed came into power there. M. was an orthodox Congregationalist, but hardly so narrow as he is sometimes represented.

MATHER, RICHARD (1596–1669), Eng. Congregational divine; refused to conform to ritual law of Anglican Church, and went to America, 1635; became preacher at Dorchester; wrote theological tracts.

MATHERAN (18° 59′ N., 73° 18′ E.), hill sanatorium, on W. Ghats, Kolaba district, Bombay, India.

MATHESON, GEORGE (1842–1906), Scot. Presbyterian divine.

MATTHEW, THEOBALD (1790–1856), Irish Capuchin priest, famous for vigorous advocacy of total abstinence.

MATHEWS, CHARLES (1776–1835), Eng. actor; b. London; played at the Haymarket, Drury Lane, Covent Garden, and the Lyceum, but found the work cramped his individuality; subsequently became an 'entertainer,' and as such made his fame.

MATHEWS, THOMAS (1676–1751), Brit. admiral; app. commander of Brit. Mediterranean fleet, 1741; attacked Span. fleet leaving Toulon, 1744; disorderly and disgraceful engagement ensued; Lestock, second in command, held aloof, and Mathews allowed foe to escape; parliamentary inquiry followed, and M. was condemned to dismissal by court-martial.

MATHY, KARL (1807–68), politician in Baden.

MATILDA (1046–1115), Countess of Tuscany, supported popes against emperors in Investiture contest; learned and pious; gave her large estates to Papacy. *Life*, by Mary E. Huddy (1905), Nora Duff (1909).

MATINS, in Catholic Church, first of the seven canonical hours.

MATLOCK (53° 8′ N., 1° 34′ W.), watering-place, on Derwent, Derbyshire, England; hot springs; adjoins Matlock Bath. Pop. (1911) 6746.

MATSUKATA, MARQUIS (1835–), Jap. statesman; became Minister of Finance, 1881; reformed currency, established Bank of Japan; regulated taxation, introducing European methods; Prime Minister, 1891–92, 1896–98; Minister of Finance, 1898–1900.

MATSUMOTO (36° 15′ N., 137° 58′ E.), town, Hondo, Japan; baskets, silk, preserved fruit. Pop. 35,000.

MATSUYE (35° 33′ N., 133° 3′ E.), town, Hondo, Japan; paper. Pop. *c.* 36,000.

MATSYS, QUENTIN, MASSYS (1466–1530), Flemish artist; studied at Antwerp; best known by his religious pictures, but he also ranks high for his genre pieces and portraits.

MATTEAWAN (41° 30′ N., 73° 55′ W.), former village, New York, U.S.A.; 1913, joined with Fishkill Landing to form city of Beacon; first city in N.Y. State to adopt comm. form of government; hats, rubber. Pop. (1910) 6727.

MATTER is most frequently defined as 'that which occupies space,' and is classified into three groups—solid, liquid, and gaseous. The definition immediately suggests the possession of *mass*. Other general properties of m. are *attraction, inertia, elasticity, indestructibility*. At present the study of m. proceeds from three standpoints—the mathematician's, who investigates its behaviour under the action of forces; the physicist's, who seeks to discover its properties; and the chemist's, who inquires into its constitution and the results of combinations of various forms.

The constitution of m. has long engaged the attention of scientists. The *atomic* theory has been the most fruitful one—modern chemistry has been built up on it. It assumes that m. cannot be subdivided without end. The ultimate indivisible particle, named the *atom*, is supposed to be of a simple structure, and of it there are in the known Universe only about eighty different kinds, called *elements*. All forms of m. are either elements or constituted of various combinations of these elements.

This theory has had to be modified since the discovery of *radium* in 1900. According to the present *electron* theory, the atom is not a simple structure, but consists of a vortex of corpuscles or electrons in rapid motion, half of them being charged with positive and half with negative electricity. Under certain conditions one or more negative electrons may be discharged from the atom with the velocity of light. When a large number of them are so discharged, the equilibrium of the atom may break down and a rearrangement of the corpuscles take place with a consequent change into another element.

MATTERHORN, MONT CERVIN (45° 58′ N., 7° 40′ E.), peak of the Alps, on border between Valais, Switzerland, and Piedmont, Italy; height, 14,780 ft.; first ascended, 1865, by Whymper.

MATTHEW, CANTACUZENUS (fl. 1353–57), Byzantine emperor; s. of John. VI., whom he assisted against Thracians; warred against Servians; forced to abdicate.

MATTHEW, GOSPEL OF ST., first in our canon, but later than *Mark* and probably than *Luke*; written perhaps *c.* 100 A.D., possibly twenty or thirty years earlier; based largely on St. Mark; also (with *Luke*) on another lost document or documents, for discourses, etc., and with some peculiar matter, *e.g.* story of the Nativity; distinctly Jewish in colouring, it contains some very early elements (specially, teaching of Jesus) and some late ones (*e.g.* sayings reflecting existence of Church organisation); the editor has somewhat modified and rearranged his materials in incorporating them; traditionally work of Apostle St. Matthew, who was more probably author of *Logia* (sayings)—one of sources.—Slater, *Matthew* (Century Bible).

MATTHEW OF PARIS, monastic writer of Eng. birth; monk of St. Albans, 1217; wrote *Chronica Majora*, continuing chronicle of Roger of Wendover from 1235–59, and also *Historia Anglorum*; M. is one of chief authorities for reign of Henry III.

MATTHEW, ST., one of twelve apostles, and tradi-

tionally author of Gospel of M., and identical with Levi the toll gatherer, son of Alphæus (*Matthew* 9⁹; *Mark* 2¹⁴).

MATTHEW, TOBIAS (1546–1628), abp. of York (1606); wrote against Campion and sought to stamp out Rom. Catholicism in north; his s., Sir Tobias (1577–1655), was exiled as R.C.

MATTHEWS, STANLEY (1824–89), Amer. lawyer and Republican politician.

MATTHIAS (1557–1619), Holy Rom. emperor; superseded his bro., Emperor Rudolph II., as king of Hungary, Austria, and Moravia, 1608; wrested Bohemia from Rudolph, 1611; emperor, 1612; tried policy of religious toleration, but was opposed by his bro., Maximilian, and Ferdinand, Archduke of Styria, ardent Catholics; lost all influence over empire.

MATTHIAS (*Acts* 1), new apostle chosen in place of Judas Iscariot.

MATTHIAS I., HUNYADI, CORVINUS (1440–90), king of Hungary; b. Kolozsvár; became king by election, 1458; defeated Emperor Frederick, his rival for Hungarian crown, 1462; defeated Turks; invaded Bosnia; captured Jajce, 1463; crushed revolt in Hungary, 1471; defeated Poles, 1474; claimed Bohemian crown, and after war with Bohemia acquired Silesia, Moravia, and Lausitz, 1479; defeated Turks at Szászváros, 1479; recaptured Jajce; expelled Turks from Servia. Again warred against emperor, 1481; took Vienna, 1485; subsequently reduced Styria, Carinthia, Carniola, becoming most powerful ruler in Central Europe; distinguished as soldier, politician, and administrator.

MATTO GROSSO (12° 30′ S., 55° W.), a western state of Brazil, bordering Bolivia; forms part of the Brazilian plateau; traversed by several low mountain chains; much of it occupied by dense forests; rich in minerals; chief industry, cattle-raising; capital, Cuyaba. Area, 532,680 sq. miles. Pop. 142,000.

MATTOON (39° 27′ N., 88° 22′ W.), city, Illinois, U.S.A.; foundries, machine-shops. Pop. (1910) 11,456.

MATVYEEV, ARTAMON SERGYEEVICH (d. 1682), Russ. statesman; important under Tsar Alexius, introducing Western reforms; failed in attempted revolution, 1682. His s., ANDREAS (1666–1728), was distinguished diplomatist and author.

MAU RANIPUR (25° 14′ N., 79° 10′ E.), town, Jhansi, United Provinces, India; cotton cloth.

MAUBEUGE (50° 17′ N., 4° 1′ E.), town, Nord, France; metal goods; machine tools. Pop. 21,500.

MAUCH CHUNK (40° 52′ N., 75° 52′ W.), town, on Lehigh, Pennsylvania, U.S.A.; anthracite coal mines. Pop. (1910) 3952.

MAUCHLINE (55° 31′ N., 4° 23′ W.), town, on Ayr, Ayrshire, Scotland; associated with poet Burns; snuff-boxes.

MAULE (35° 20′ S., 72° 20′ W.), maritime province, Chile, S. America; agriculture and stock-raising industries; capital, Cauquenes. Area, 2474 sq. miles. Pop. 115,000.

MAULMAIN, MOULMEIN (16° 26′ N., 97° 45′ E.), capital of district Amherst, and of Tenasserim division, Lower Burma, on Salwin; exports timber, rice. Pop. 60,000.

MAUNDY THURSDAY, in Holy Week precedes Good Friday. In Middle Ages custom grew up among rich to wash feet of poor (hence derivation from *mandatum*, i.e. the divine commandment given by Christ when He washed the disciples' feet). In England the sovereign used to wash paupers' feet on M. T. till the time of James II.; a relic of the custom still exists in the practice of distributing 'Maundy Money,' for which purpose special coins were minted; M. T. is also held in all R.C. countries.

MAUPASSANT, HENRI RENÉ ALBERT GUY DE (1850–93), Fr. author; enjoyed private fortune; employed under Ministry of Marine and subsequently that of Public Instruction, but chief interests were sports and lit.; disciple of Flaubert, to whose Norman types he owed much; drew towards Zola's school, and contributed to the *Soirées de Médan* (see FR. LITERATURE), *Boule de Suif*, an episode of the Prussian occupation of Normandy, a bold and original story; he continued to be a member of the Naturalistic school, but stood alone in grace, wit, and epigram; so Rabelaisian in matter and frankness that sale of the *Une Vie* (1883) was forbidden on railway book-stalls, and caused a sensation at the time. In 1880 he had published *Les Vers*, but abandoned verse for the short story, of which he became a master; his cynicism, habit of jesting at all things, art, and imagination, find typical expression in the most malicious of tales, *L'Héritage*. *Life*, by his valet (1912).

MAUPEOU, RENÉ NICOLAS CHARLES AUGUSTIN (1714–92), Chancellor of France (1768); supported Crown against Parlement; Parlement crushed by *édit de réglement et de discipline*, 1770.

MAURER, GEORG LUDWIG VON (1790–1872), Ger. statesman; member of Gk. council of regency, 1832–34; founded judicial system of new state; wrote important works on Ger. and Gk. history.

MAURETANIA (34° N., 4° W.), an ancient country, N.W. Africa; corresponded to the modern Morocco and Western Algeria; was made a Rom. province by Claudius in 42 A.D.; invaded by the Vandals in 429 A.D. Modern M. is a protectorate in Fr. West Africa, N. of Senegal. Area, 345,000 sq. miles. Pop. (1911) 225,000.

MAURIAC (45° 13′ N., 2° 20′ E.), town, Cantal, France; marble quarries. Pop. 3600.

MAURICE (1521–53), Elector of Saxony. Elector John Frederick was defeated by Charles V. and M. at Mühlberg, 1547, and compelled to resign electorate to latter; M. refused to recognise *Interim*, 1548, and gathered troops against emperor; emperor driven to flight, 1552, and Treaty of Passau obtained; defeated Prince of Bayreuth at Sievershausen, 1553; ambitious, able ruler.

MAURICE, JOHN FREDERICK DENISON (1805–72), Anglican clergyman; s. of Unitarian minister; ed. Trinity Hall, Cambridge, and Exeter Coll., Oxford; ordained, 1834; prof. at King's Coll., London, 1840, and of Moral Philosophy at Cambridge, 1866; worked largely in London, a leader in religious educational and social movements; wrote many books.

Masterman, *Life* (1907).

MAURICE OF NASSAU (1567–1625), prince of Orange; Stadtholder of Holland and Zeeland, 1584; distinguished in war with Spain; secured Oldenbarneveldt's execution.

MAURICE, ST., traditional general who with his legion refused to persecute Christians at instigation of Maximinian; martyred with his soldiers, c. 286.

MAURIER, see DU MAURIER.

MAURISTS, see BENEDICTINES.

MAURITIUS (20° 10′ S., 57° 35′ E.), island, belonging to Britain, in Indian Ocean; has area c. 720 sq. miles; it is volcanic, and surrounded by coral reefs; surface consists of tableland, with mountains some 2000 ft. high in centre N., centre E., and S.W.; highest point, Rivière Noire (2710 ft.) There are several volcanic lakes, of which Grand Bassin is largest. Temperature ranges from 60° to 100° Fahr., and hurricanes frequently occur between Dec. and April. Chief towns, Port Louis (capital), Curepipe, Mahébourg. Dependencies of M. are Rodriguez, and the Cargados, Chagos, and Eagle Islands.

M. was first discovered by Portuguese in 1505; earliest settlements made in 1598 by Dutch, who remained till 1710, when they left the island; colonised by French in 1715, remaining in their possession till 1810, when it was taken by British, to whom it was formally ceded by *Treaty of Paris*, 1814; became episcopal see, 1854; suffered from hurricanes, 1868, 1892, 1894; plague, 1899–1903; floods, 1904.

Administered by governor, who is aided by executive and legislative councils. Principal religion, R.C.; other religions, Anglican, Presbyterian, Hindu, Muhammadan. Education is free, but not obligatory. Inhabitants

include French, British, Creoles, Indians, Chinese, half-breeds. M. produces sugar, spice, vanilla, fibres, rice, cocoa-nut oil, ebony, ironwood, bamboo, aloes, benzoin. Railway mileage, c. 140. Pop. (1911) 370,393.

Keller, *Madagascar, Mauritius, and other E. African Islands* (1900).

MAURY, JEAN SIFFREIN (1746–1817), Fr. cleric; eloquent writer, witty, profligate, ardent royalist; emigrated, 1792; abp. *in partibus*, 1792; cardinal, 1794; submitted to Napoleon, 1806; abp. of Paris, 1810; exiled at Restoration.

MAURY, MATTHEW FONTAINE (1806–73), Amer. scientist; naval officer until lamed by an accident, 1839; devoted attention to conditions of navigation, and greatly contributed to knowledge of meteorology, etc. *Life*, by his dau. (1888).

MAUSOLUS, Pers. gov. of Caria (377–353 B.C.).

MAVROCORDATO, MAVROCORDAT, MAUROGORDATO, Italo-Gk. family residing in Gk. quarter of Constantinople. Alexander (c. 1636–1709) was chief dragoman of sultan; his descendants held important offices under Porte; greatest was ALEXANDER (1791–1865), hero of War of Independence and Gk. statesman.

MAW-WORM, see under NEMATODA.

MAXENTIUS, MARCUS AURELIUS VALERIUS, Rom. emperor, 306–12 A.D.

MAXILLARY, see NERVOUS SYSTEM.

MAXIM, SIR HIRAM STEVENS (1840–), Amer. inventor; settled in London, 1883; invented *Maxim gun* (see MACHINE GUN), the *pom-pom gun*, and a smokeless powder; greatly interested in aerial flight.

MAXIMA AND MINIMA (mathematical terms).—A function of a variable is said to be a maximum or minimum when it is the greatest or smallest value in a *series* immediately preceding and following that value. Thus *sine* x is a maximum when $x=\frac{\pi}{2}$, since if x be slightly smaller or greater than $\frac{\pi}{2}$, the function becomes smaller than when $x=\frac{\pi}{2}$; similarly *sine* x is a minimum when $x=\pi$. From geometrical considerations it follows that a function may have a number of maxima and minima. For a proper investigation of the subject an application of the Differential Calculus is necessary.

MAXIMILIAN I. (1459–1519), Holy Rom. emperor; b. at Vienna; m. Mary of Burgundy, 1477; warred intermittently against France for possession of Burgundy and Netherlands; Ger. king, 1486; defeated Hungarians, 1491; regained Artois and Franche-Comté from Charles of France, 1492; emperor, 1493; suppressed rebellion in Netherlands, 1494; waged war against Swiss without success, 1499; concluded League of Cambray against Venice, 1508; subsequently joined Holy League; again took field against Fr. king in Italy, 1516; compelled to cede Milan to France by Treaty of Brussels, 1516; carried out reforms in administration.

Seton-Watson, *Maximilian I.* (1901).

MAXIMILIAN II. (1527–76), Holy Rom. emperor; b. at Vienna; Ger. king, 1562; king of Hungary, 1563; emperor, 1564; wished to reform Church; granted religious freedom to Lutherans in Austria; waged war against Turks, whom he kept in check; established friendly relations with Spain; tried to obtain Polish crown for himself or son.

Holtzmann, *Life* (1903).

MAXIMILIAN I. (1573–1651), 'The Great,' Duke of Bavaria; occupied Prot. city of Donauwörth for emperor, 1607, and helped to form Catholic league which fought with Prot. Union in Thirty Years War; important party to Treaty of Westphalia, 1648; ablest Catholic ruler.

MAXIMILIAN I. (1756–1825), king of Bavaria; elector of Bavaria, 1799; encouraged trade and education, and reformed administration; helped Napoleon, and was constituted king as reward, 1806; kingship recognised by Allies on his desertion of Napoleon, 1813; opposed Ger. federation.

MAXIMILIAN II. (1811–64), king of Bavaria; succ., 1848; opposed new Ger. constitution, excluding Austria; supported Austria in restoring old diet.

MAXIMILIAN, EMPEROR OF MEXICO (1832–67), see MEXICO (HISTORY).

MAXIMINUS, GAIUS JULIUS VERUS, Rom. emperor, 235–38 A.D.

MAXIMINUS, GALERIUS VALERIUS, Rom. emperor, 308–14.

MAXIMS, LEGAL, various axioms, general principles, or leading truths in law. Lord Esher declared them to be 'almost invariably misleading,' and said that 'they always include something which really is not intended to be included in them'; 1500 are published in Bouvier's Law Dictionary. 'Caveat emptor' and 'Qui facit per alium facit per se' are two of the most familiar of these maxims.

MAXIMUS, name of four Rom. emperors: M. Clodius Pupienus Maximus, 238 A.D.; murdered. Magnus M., commander in Britain, 368; joint emperor with Valentinian II., 384–388. M. Tyrannus, erected by rebel army, 408; slain, 422. Petronius M., emperor 455, on murder of Valentinian III.

MAXIMUS, ST. (580–662), Gk. theologian; became monk at Chrysopolis on orthodox side in Monothelite controversy; mutilated for his belief.

MAX-MÜLLER, FRIEDRICH (1823–1900), Anglo-Ger. Orientalist; b. Dessau; d. Oxford; made a special study of Sanskrit, and, coming to England, where he permanently settled, was commissioned by the East India Company to edit the *Rig-Veda*. He was first Taylorian prof. of Modern Languages at Oxford, and later prof. of Comparative Philology. He wrote or edited several works on different philological subjects.

MAXWELL, family name of Scot. barons of M., Roxburgh; 7th baron, JOHN, held earldom of Morton, 1581–86. ROBERT was cr. earl of Nithsdale, 1620.

MAXWELL, JAMES CLERK (1831–79), Scot. physicist; b. and ed., Edinburgh; second wrangler; fellow of Trinity, Cambridge; prof. at Aberdeen, King's Coll. (London), and ultimately Cambridge, where he d.; elected Fellow, Royal Soc. (1864); developed Faraday's ideas in mathematical form; wrote: *Electricity and Magnetism* (considered *Principia* of subject), *Theory of Heat, Matter and Motion*, and important papers in philosophical publications.

Campbell and Garnet, *Life* (1882); Glazebrook, *James Clerk Maxwell and Modern Physics* (1896).

MAXWELL, MRS. JOHN, see BRADDON.

MAXWELLTOWN (55° 4′ N., 3° 37′ W.), small town, Kirkcudbrightshire, Scotland, on Nith, opposite Dumfries; woollens. Pop. (1911) 6200.

MAY, 5th month of year, is associated with rejoicing; cf. 'bringing home the May,' 'Queen of the May.' **The Maypole**, a tall mast round which children dance.

MAY, ISLE OF (56° 11′ N., 2° 33′ W.), island at entrance to Firth of Forth.

MAY, PHIL (1864–1903), Eng. black-and-white artist; great humorist in sketches of London East End types; excellence of drawings lies in economy of pen lines.

MAY, THOMAS (1595–1650), Eng. dramatist, poet, and historian; app. during Civil War historiographer to Parliament; he produced a *History of the Parliament of England, 1640–43*, frequently reprinted.

MAYA, Amer. Indian race in Mexico and Yucatan.

MAYAGUEZ (18° 13′ N., 67° 4′ W.), seaport, Porto Rico, on W. coast; exports sugar, tobacco, coffee. Pop. (1910) 16,591.

MAYAVARAM (11° 6′ N., 79° 42′ E.), town, on Cauvery, Tanjore, Madras, India; fine cloth manufactures. Pop. 24,000.

MAYBOLE (55° 21′ N., 4° 40′ W.), town, Ayrshire, Scotland; boots and shoes. Pop. (1911) 4889.

MAYEN (50° 20′ N., 7° 11′ E.), town, Rhineland, Prussia; textile industries. Pop. (1910) 14,423.

MAYENCE, see MAINZ.

MAYENNE (48° 19′ N., 0° 39′ W.), department, France, formed from parts of ancient provinces, Maine and Anjou; surface varied and well wooded; chief stream, the Mayenne; principal industries, agriculture, stone-quarrying, manufacture of coarse textiles; capital, Laval. Pop. (1911) 297,732.

MAYENNE (48° 19′ N., 0° 39′ W.), town, Mayenne, France; cloth manufactures. Pop. 10,000.

MAYENNE, CHARLES OF LORRAINE, DUKE OF (1554–1611), of family of Guise; became head of anti-Huguenot League; made lieut.-gen. of kingdom, and prevented capture of Paris by Henry IV.; on death of Charles X. agreed to accession of Henry IV., but stipulated his conversion to Catholicism.

MAYER, JOHANN TOBIAS (1723–62), Ger. astronomer; superintendent of Göttingen observatory, 1754; famed chiefly for lunar tables, giving longitude at sea to about 0·5°.

MAY-FLIES, DAY-FLIES (*Ephemeridæ*), a group of familiar neuropterous insects to be seen near water, rising and falling in a fairy dance on warm evenings. The adult insect lives only a few days or even a few hours, and never feeds. Its mouth-parts are poorly developed and its empty food canal serves only as a balloon. May-flies spend most of their lives as larvæ under water, in a state very different from that finally assumed. Many moults take place before the adult insect emerges in the air to take part in the marriage dance, to lay its eggs in the water near by, and then to die. The flies are favourite food of fishes, and are much used by anglers.

MAYFLOWER, see MASSACHUSETTS.

MAYHEW, JONATHAN (1720–66), Amer. Congregationalist divine, of unorthodox tendency.

MAYMYO (22° N., 96° 30′ E.), hill sanatorium, Mandalay, Upper Burma.

MAYNOOTH (53° 24′ N., 6° 33′ W.), town, Kildare, Ireland; seat of R.C. coll. for education of priests, founded 1795.

MAYO (*c.* 53° 50′ N., 9° W.), county of Connaught, N.W. coast, Ireland; was practically independent under de Burgh family till Elizabeth's reign. Bounded by Sligo, Roscommon, Galway, Atlantic; area, 2156 sq. miles; mountainous in W., flat in E.; coast much indented; drained by Moy; contains Lough Conn and other lakes; chief towns, Castlebar, Ballina; cattle-rearing, salmon and other fisheries, linen-weaving; small deposits of coal, slate. Pop. (1911) 191,969.

Knox, *History of M.* (1908).

MAYO, RICHARD SOUTHWELL BOURKE, 6TH EARL OF (1822–72), Sec. for Ireland, 1852, etc.; Viceroy of India, 1869, where he was murdered.

MAYOR, in England, the chairman of the borough or city council; elected annually by the aldermen and councillors, he may receive such remuneration as the council thinks reasonable; the chief magistrate of the town or borough. In all the chief cities of England and Ireland he is styled Lord Mayor; in Scotland chief magistrate is called provost (*q.v.*). In U.S.A. m. is elected directly by city voters for term of years; is chief executive officer, has important administrative powers, appoints heads of departments, etc.

MAYOR OF THE PALACE, great official among the Franks of the Merovingian era. He was chief administrator of the king's household and adviser to the court.

MAYOTTE (12° 52′ S., 45° 13′ E.), one of the Comóro Islands, in Mozambique Channel; since 1843 Fr. possession. Area, 140 sq. miles. Pop. 10,000.

MAYOW, JOHN (1643–79), Eng. physiologist; studied law and med. at Oxford, and practised med. at Bath and London; M. recognised the presence of a constituent which he termed *spiritus nitro-æreus*, now known as oxygen, necessary for combustion and for life, believing it to be separated from the air by the lungs and then passing into the blood; he was thus the first both practically to recognise the presence of oxygen and also to understand the mechanism of respiration.

MAYSVILLE (38° 35′ N., 83° 35′ W.), city, Kentucky U.S.A., on Ohio; tobacco, flour-mills, whisky distilleries. Pop. (1910) 6141.

MAZAGAN (33° 17′ N., 8° 20′ W.), fortified sea port, W. coast Morocco; exports cereals, wool, hides.

MAZAMET (43° 39′ N., 2′ 19′ E.), town, Tarn, France; cloth manufactures. Pop. 14,000.

MAZANDARAN (36° 30′ N., 53° E.), province, N. Persia, between Caspian Sea on N. and Elburz Mts. on S.; mostly level; partly jungle and partly under cultivation; unhealthy climate; yields rice, cotton, sugar, fruits; administered by a governor; capital, Sari. Area, 10,460 sq. miles. Pop. 200,000.

MAZARIN, JULES (1602–61), cardinal; an Italian by birth; ed. in Rome and Spain and fought in war of Valtelline; showing capacity for diplomacy, entered service of Louis XIII., 1639, as Richelieu's *protégé*; cardinal, 1641; on Louis' death, minister of the queen (Anne of Austria); became chief statesman of France; suspected, not without cause, of double dealing; the troubles of the Fronde were partly due to him; greatly increased the power of France in Europe, and himself left a large fortune, but did little for the internal condition of the country; one of the cleverest statesmen of the XVII. cent.

Hassall, *Mazarin.*

MAZAR-I-SHARIF (36° 45′ N., 67° 9′ E.), town, Afghan Turkestan, with fortress of Takhtapul. Pop. 23,000.

MAZARRON (37° 35′ N., 1° 20′ W.), town, Murcia, Spain; iron and lead mines. Pop. (1910) 22,878.

MAZATLAN (23° 11′ N., 106° 23′ W.), seaport, Sinaloa, Mexico, on Pacific; exports hides, gold, silver. Pop. 19,000.

MAZEPPA, MAZEPA-KOLEDINSKY, IVAN STEPHANOVICH (*c.* 1644–1709), hetman of the Cossacks; was page to John Casimir, king of Poland. As punishment for a court intrigue he was bound naked to a wild horse, but escaped death. His plot against Peter the Great failed.

MAZURKA, dance popular in Poland and Germany; four or eight couples participate. The music is noticeable because of its uncommon rhythm.

MAZZARA DEL VALLO (37° 42′ N., 12° 34′ E.), walled city, Trapani, Sicily; sulphur springs; oil, linseed. Pop. 20,000.

MAZZARINO (37° 17′ N., 14° 15′ E.), town, Caltanissetta, Sicily; sulphur springs, wine. Pop. 16,000.

MAZZINI, GIUSEPPE (1805–72), Ital. patriot of Genoese family; devoted to the cause from childhood; founded *Indicatore Genovese*, 1828; imprisoned, 1830; exiled and, settling in Marseilles, turned Carbonarist party into secret soc. of Young Italy with organ, *La Giovine Italia*; motto, *Dio e Popolo*; religious element alienated many, and M. was dreamer, not organiser; condemned to an ignominious death by Piedmontese government; invasion of Savoy failed, 1834; M. fled to Switzerland, and in 1836 to London; watched with great suspicion by Brit. government; returned to Italy, 1848, and became dictator at Rome as one of triumvirs, 1849; vainly opposed surrender of Rome to French; returned to England, 1850, and became heart of conspiracies against Austria; responsible for Quixotic outburst at Milan, 1853, and attack on Genoa, 1857; opposed action of Garibaldi and Cavour, 1859–60; refused to acknowledge monarchy by becoming member of Ital. parliament; remained conspirator till death.

Bolton King, *Life of M.* (1903).

MEAD, liquor made by fermentation of honey; very popular in Europe, especially among Anglo-Saxons, till displaced by wine.

MEAD, RICHARD (1673–1754), Eng. physician; studied med. abroad; practised in London; physician to St. Thomas's Hospital; after 1714 the recognised head of his profession in England; author of various medical works.

MEADE, GEORGE GORDON (1815–72), Amer. general; commanded army of the Potomac in Civil War; won battle of Gettysburg.

MEADE, WILLIAM (1789–1862), Amer. Episcopal divine; bp. of Virginia, 1841; of Evangelical sympathies and against High Church movement.

MEADVILLE (41° 38′ N., 80° 13′ W.), city, Pennsylvania, U.S.A., on French Creek; machine shop; iron and woollen manufactures. Pop. (1910) 12,780.

MEAGHER, THOMAS FRANCIS (1823–67), Irish revolutionary; imprisoned and escaped to U.S.A., where, as Federal general, he fought in Civil War.

'MEAL-WORM,' see under HETEROMERA.

MEALY BUGS, see HEMIPTERA.

MEAN, in math., used to denote a term intermediate in value between two terms of a series. The chief kinds of means are the Geometrical, the Arithmetical, and the Harmonical.

MEARNS, THE, see KINCARDINESHIRE.

MEASLES, an infectious fever, characterised by catarrh of the respiratory passages and by the appearance on the skin of a red eruption. The disease is in all probability caused by a specific micro-organism which has not yet been discovered, and infection is conveyed by the breath, secretion of the nasal passages, and by articles which have been in contact with an affected individual. The incubation period is about ten to fourteen days, and fever comes on suddenly, accompanied by running at the nose and eyes, while characteristic whitish spots, *Koplik's spots,* are found on the mucous membrane just inside the angle of the mouth; the eruption appears on the fourth day as raised, red spots, running together in irregular crescentic patches, usually appearing first on the face and neck, spreading downwards over the whole body, and disappearing gradually by the seventh day, the temperature also falling.

The treatment is to keep the patient in bed on a light diet; a cough mixture containing ipecacuanha is usually given to relieve the bronchitis. A hot bath is of benefit at the commencement, to bring out the rash. As the complications of measles are its greatest danger, the mortality otherwise not being high except in very young children, great care is taken during convalescence to avoid chill, which has a tendency to develop into broncho-pneumonia, pneumonia, or even eventually phthisis; and tonics and cod-liver oil are given.

'MEASLY' BEEF, see under TAPEWORMS.

MEASURES, see WEIGHTS AND MEASURES.

MEAT, see DIETETICS, FOOD.

MEATH (53° 40′ N., 6° 40′ W.), maritime county, Leinster, Ireland, on Irish Sea; area, 906 sq. miles; surface level and undulating; traversed S.W. to N.E. by the Boyne; fertile, but almost entirely under pasture; abounds in relics of Irish antiquity; capital, Trim. Pop. (1911) 64,920.

MEAUX (48° 57′ N., 2° 52′ E.), town, Seine-et-Marne, France, on Marne; XII.-cent. cathedral; manufactures flour, textiles, machinery; trade in grain and cheese. Pop. 14,000.

MECAPTERA, see SCORPION FLIES.

MECCA (21° 21′ N., 40° 11′ E.), nominal capital of Arabia, sacred city of Muhammadans; is mentioned by Ptolemy as Makoraba, and before the time of the Prophet was held by the Kosaites and Koreish in succession; Muhammad was born here about 571; he was compelled to flee in 622, but returned and captured the city in 627. M. was besieged by Hosein in 682, and fell to Abdul Melek in 692; remained for many years in hands of caliphs; pillaged by Karmathians in 930, when the black stone was removed by the invaders, who retained it until 952. M. was under sway of Fatimites, Ayyubites, and Mamelukes in succession, and came eventually to the sultans of Turkey by conquest in 1517. Captured in 1803 by Wahhabis, who were driven out by Mehemet Ali, pasha of Egypt, in 1818, since when Turk. authority has at least nominally endured. Most important event of recent years is construction of Hedjaz railway, which will unite M. and Damascus. Burckhardt and Burton are among the few Christian Europeans who have succeeded in entering Mecca.

Principal building is the Great Mosque, in the centre of which is the Caaba, or Ka'ba, a small oblong building containing the sacred black stone towards which all Moslems turn in worship, and to which all are expected to make at least one pilgrimage. According to Muhammadan tradition this stone was originally white, its present black colour being due to the tears shed for sin by the vast crowds of pilgrims who visit it annually. The Caaba is regarded with great reverence; it is usually covered by a black curtain, and is opened for worship on three occasions only during the year. The Great Mosque also contains univ. hall and library, and has seven minarets. M. was a religious city long before time of Muhammad. Pop. *c.* 60,000.

Wavell, *A Modern Pilgrim in Mecca* (1912).

MECHANICAL TRANSMISSION, see POWER TRANSMISSION.

MECHANICS.—Mechanical science originated in the efforts of man to understand the tools and instruments for his needs, and the natural phenomena of motion. The lever, the inclined plane, and the wedge are pictured in the carved stone records of Egypt and Assyria, while their practical use was known before the dawn of history. Scientific explanations of the principles of their application were first attempted by Archimedes of Syracuse (287–212 B.C.). To him also are due the first clear ideas on the phenomena of floating bodies and the determination of weight in relation to volumes or the conceptions of specific gravity or density. Very little advance was made until Leonardo da Vinci (1452–1519), and then Simon Stevin of Bruges (1548–1620) again took up the problems of the lever, the inclined plane, and the general conditions of equilibrium of three forces acting in one plane. Galileo-Galilei (1564–1642), breaking away from Aristotelean logic and scientific explanation, saw the value of experimental examination. His experiments on falling bodies shattered pre-existing theories, and determined the laws that govern these phenomena. In mechanical science he was the first of the moderns; his methods are a model of scientific investigation for all time. Contemporary with Galileo was Lord Bacon (1561–1626). Isaac Newton (1642–1727) applied Galileo's dynamic principles to astronomy. Besides the creation of gravitational astronomy, he placed the science of dynamics firm on the basis prepared by Galileo, and collected the principles of mechanics and embodied them in three laws, known as 'Newton's Laws.'

The term mechanics, by a gradual development of the science, is now better applied to the theory of mechanisms. The science which treats of force and its action upon bodies is called dynamics (*q.v.*); and, since force may be considered as acting in one or other of two distinct ways, there is a corresponding division of the science into branches.

The science of mechanics may be divided broadly according to the following scheme:—

- Mechanics
  - Rigid Bodies
    - Kinematics.
    - Statics.
    - Dynamics.
  - Fluid Bodies
    - Hydro-mechanics.

Dynamics.—The principles of this subject have been dealt with more theoretically under DYNAMICS (*q.v.*). It were better here to mention only a few of the more important definitions and units which apply more to the practice of mechanics. In watching any motion we are conscious of two main perceptions, space and time. A moving body describes a certain length of path in a certain time. The *velocity* (V) of the moving body is measured by the length (L) moved over in a given time (T), divided by the time; or by writing the result in symbols—

$$V = \frac{L}{T}$$

Again, if velocity vary from instant to instant, its change in unit time gives the *acceleration* (a) of the moving body.

$$a = \frac{V}{T} = \frac{L}{T \times T} = \frac{L}{T^2}.$$

As the sense of sight gives us an idea of motion, so the sense of touch supplies a perception of force, of which the muscular senses give a rough measure. The conception of mass can be derived from that of force. The mass of a body is defined by the force required to produce a given acceleration, and so *force* (F) is measured by the product of the acceleration (a) and the mass (M) of the body on which it acts, or

$$F = Ma.$$

Work or *energy* is defined as the product of a force into the distance (L) the force moves its point of application, so that, in terms of fundamental units,

$$\text{work or energy} = FL = MaL = \frac{ML^2}{T^2}.$$

Momentum is the product of the mass of a body into its velocity.

Inertia, the most important conception of kinematics, is that property of a body which tends to resist motion when at rest, and, when in motion, to resist to the action of external implied forces.

Statics.—Statics is that branch of m. which investigates the conditions of equilibrium of bodies. It is based on the principle of the balancing of forces. Since forces possess both magnitude and direction, they can be represented by straight lines. The *moment of a force* is the product of the force into the perpendicular distance of the line of action of the force from any given point of reference. This product is called the moment of the force about that point. To ensure equilibrium, the moments of the forces about each and every axis must be zero. The fundamental theorem in statics is the parallelogram law of forces. If two forces be represented by two straight lines, they can be replaced by a resultant force, represented by the diagonal of the parallelogram determined by the two lines.

This fundamental theorem is amplified and applied to systems of bodies and forces, so that the statical solution of a problem deals with the resultant of systems of forces, or conversely when necessary the resolution of a force into components or subsidiary forces.

The statical definition of a moment leads to the explanation of the *moment of inertia* of a body. Conceiving a body to consist of a large number of particles, the moment of inertia is the product of the mass of each into the perpendicular distance from a given axis. The sum of all these products is the moment of inertia about that axis. From the definition of the moment of inertia it is evident that there is a distance (K), such that

$I = MK^2$, where I = the moment of inertia, and
M = mass of body.

The distance or line K is called the *radius of gyration* with respect to that axis, and may be defined as the distance from that axis at which the whole mass of a body can be concentrated without any change in the moment of inertia. Thus the moment of inertia is a mechanical quantity, while the radius of gyration is a distance.

The modern vector theory, or graphic statics, and its representation of forces by straight lines, reduces the mathematical calculation of stresses and forces acting upon a structure to a more mechanical and rapid solution by geometrical drawing with accurate results. Graphic statics is indispensable to the modern engineer.

Applied Mechanics.—The application of mechanics can be divided into two classes :—

(*a*) **Fixed machines or structures ;**
(*b*) **Moving machines or mechanisms.**

THEORY OF STRUCTURES.—The whole theory of structures is an application of the principles of mechanics, especially statics, to the considerations of equilibrium resulting from the resistance of structures to external applied forces. The various parts which go to form a structure are called pieces or members; such are the stones in an arch or the girders of a bridge.

There are two types of structures :—

i. Framed structures, the members or pieces of which are subject to direct compression and tension only ;
ii. Structures, the members of which are subject to bending as well.

Speaking broadly, the theory of structures may be divided into three distinct operations :—

(*a*) A calculation of the stability of a structure ;
(*b*) A determination of the stresses upon and in the materials of the structure ;
(*c*) A design of the member according to scientific principles.

The last does not come under the category of mechanics. The first and the second involve a practical use of the principles of statics and dynamics.

THEORY OF MACHINES.—The parts of a machine are of two kinds :—(*a*) The fixed parts, or frame ; (*b*) the moving parts, or mechanism.

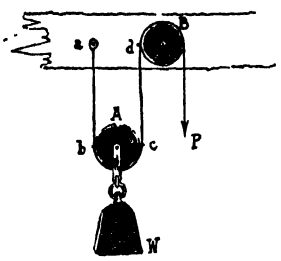
The design of the frame depends on the size and formation of the moving parts or mechanism. In a machine, energy is communicated to the moving parts by prime movers, or mechanism, and thence to the working parts. For the purposes of scientific design, the usual method is to consider first the force and the variation of force required ; to proceed then to a solution of the motion to be given by the machinery; and, lastly, to design the machine for that particular motion.

All varieties of machinery are based upon the three simple mechanical powers :—(i.) The lever ; (ii.) the pulley ; (iii.) the inclined plane.

A lever is the name given to any rod (taken as absolutely rigid and inflexible) capable of motion about a fixed point or support (*fulcrum*), and under the influence of two forces and the reaction at the fulcrum. Since the purpose of machines is to overcome resistance or weight, one force resists motion and the other produces it. Levers may be straight or bent, but in either case the power, P (the force exerted), the weight, W (the force overcome), and the fulcrum, F, may be arranged in three different ways, whence the usual division of levers into the first, second, and third orders. The arrangement may be represented thus :—

(1)	P	F	W
(2)	P	W	F
(3)	W	P	F

In all, however, the general principle of the lever is satisfied, viz. that the power and weight vary inversely to their shortest distances from the fulcrum. This may be expressed for equilibrium, thus :—



$$P \times FW = W \times FP.$$

Generally, therefore, the inference holds good that the smaller the power the greater the distance it must move through, and that a gain in power is, hence, a loss in speed. In the second and third orders it is always speed which is gained, power being lost, *i.e.* at a disadvantage.

The first order of levers includes balances, see-saws, scissors, and spades in the act of raising earth ; the second, crowbars and wheelbarrows ; and the third, sugar-tongs and fishing-rods.

A pulley (which, like the *wheel and axle*, is equivalent to a continuous lever) is simply a cylinder with a groove cut on its circumference to carry a rope ; it is capable of rotation about an axis carried in a piece called a block. The figure illustrates a movable pulley A, and a fixed pulley B. Suppose a weight carried at *b*. Then the whole weight (W) is carried by the portions

of the cord *ab* and *cd*, the tension in each being $=\frac{W}{2}$. If the cords are not parallel the forces must be resolved, and the tension in the cord being greater, there is a loss of power.

A movable pulley comprises a number of wheels in a block; this apparatus is called a block and fall. A combination of pulleys in one machine is called a system. The most common combination is a block and tackle, consisting of two blocks containing pulleys. The upper is fixed, the lower carries the weight. The rope is fastened to one or other of the blocks, and passes round the sheaves or wheels.

The inclined plane is a device for the lifting of weights. If a body rest on a horizontal plane, the plane sustains the whole weight. If the plane be inclined, however, only a part of the weight is carried by the plane; hence the use of this device for lifting weights.

The wheel and axle is a wheel provided with a cylindrical axle, both wheel and axle being fitted to take a rope round the circumference. When it is required to lift a weight, this is attached to the axle rope, and the power is then applied to the wheel rope, the power supporting a larger weight in proportion to the diameters of the wheel and axle.

MECHANICVILLE (41° 50′ N., 73° 40′ W.), village, New York, U.S.A., on Hudson River; paper, sash, and blinds. Pop. (1910) 6634.

MECHLIN, see MALINES.

MECKLENBURG (53° 5′ to 54° 23′ N., 10° 31′ to 13° 52′ E.), two grand-duchies, N. Germany (M.-Schwerin and M.-Strelitz), at W. end of Baltic, along which there is coast-line of *c.* 66 miles; surface flat, with low ridge in centre; area, 6199 sq. miles; produces cereals, amber; manufactures beet-sugar, beer, spirits, leather; famous for merino sheep, cattle, pigs, horses. M. was conquered by Wallenstein in 1628; after various changes the two existing duchies were established in 1701, while grand-ducal title dates from 1815. **M.-Schwerin** has area 5068 sq. miles; capital, Wismar; largest towns, Rostock, Schwerin; sends two representatives to Bundesrath, six to Reichstag. Pop. (1910) 639,958.

M.-Strelitz has area 1151 sq. miles; capital, New Strelitz; sends one representative to Bundesrath, and one to Reichstag. Pop. (1910) 106,442.

MEDAL (French, *médaille*; Lat. *metallum*), a piece of metal, shaped more or less like a coin, stamped with image and inscription, and struck to commemorate some event or to honour some person, but not for circulation as money. Coins struck for particular occasions are not to be counted as medals, because intended for use as money, and many so-called *medallions* of the Rom. emperors must for the same reason be excluded.

Three classes of m's are notable: (1) The religious m. of Christian devotion—perhaps the earliest of all; (2) the commemorative m., struck particularly at commencement of new reigns, and dating from the Renaissance; (3) the decorative m., awarded for eminent services, not brought into general use before the end of the XVIII. cent., and now of wide popularity.

(1) The *religious* m. worn by Catholics recalls mysteries of faith, and inculcates lessons of piety, and serves either as the badge of a guild or for the consecration and protection of the wearer. The small pectoral crosses, worn by early Christians in place of the pagan amulets, were not m's; but moulds and m's have been found with Christian devices dated as far back as the III. and IV. cent's (see de Rossi, in the *Bullettino di Archeologia Cristiana*, 1869, and *Catholic Encyclopædia*). In the Middle Ages the pilgrim's metal token and the *jeton* (a counter, frequently stamped with a religious device) were akin to m's, but not till the XV. cent. was the religious m. fashioned with any real beauty. From that time forward m's have been struck in large numbers, and blessed, to be worn as a protection against pestilence, to commemorate some miracle of the Holy Eucharist, in honour of a saint, as a private memorial of baptism, marriage, or first communion, and as the badge of membership in some religious society.

(2) The *commemorative* m. had its first great artist in Vittore Pisano (1380–1456), the painter of Verona. The beauty of his work, signed '*Opus Pisani Pictoris*,' done by casting, the *cire perdue* process, has never been surpassed. In the XVI. cent. the best m's were those struck by Benvenuto Cellini, from the designs of Raphael and Giulio Romano. Dies for medal-striking were then introduced, and gem-engravers and jewellers, with their own methods and excellences of *repoussé* work, became the chief exponents of the art in Germany and Italy. Albrecht Dürer was a distinguished medallist, and Nuremberg was a famous centre of the art. In France, Jacques Primavera and Germain Pilon in the XVI. cent., and Briot and Dupré in the XVII. cent. were great artists at m. work. In England not until Elizabeth's reign were m's the work of native artists, and even then the best examples were fashioned by continental artists. During the Commonwealth and Charles II.'s reign Rawlins and the brothers Simon were the best Eng. medallists; in the XVIII. cent. the names of Croker, Richard Yeo, and Thomas Pingo may be recalled; and the Wyons similarly in the XIX. cent.

At first the subjects to be represented were almost exclusively classical, but with the XV. cent. the custom began of sovereigns inaugurating their reign and celebrating its chief events by the issue of m's (hence the important historic value of m's). Pope Paul II. (1464–71) was the first of the Rom. pontiffs to have m's struck in commemoration of his reign, and each pope has continued the practice till the present day without a break—a mint for the striking of these m's being established at the Vatican. The Dutch m's were noted for the elaborate views, maps, and plans engraved upon them. In England the unbroken series of coronation m's commences with Henry VIII., while America begins its portrait m's of the Presidents of the U.S.A. with Washington. The commemorative m's of Napoleon I. were so numerous that more than one treatise has been written upon them. Now, no longer do kings and rulers and the great naval and military events of their reigns form the exclusive subjects of historic m's, but events of general interest in science, art, or literature are also widely commemorated in similar fashion.

(3) The *decorative* m. is conferred by the sovereign as a mark of distinction, particularly for military or naval services. The decoration commonly has a ribbon attached with clasps or small bars bearing the name of a battle, and is to be worn on the breast. Charles I. presented the first Eng. military m. in 1643, and in 1650 an oval m. was executed by order of Parliament for distribution amongst the officers and soldiers of Cromwell's army who had fought at *Dunbar*. Then a long blank ensued, and only since 1793 have m's again been awarded to Brit. troops. The *Waterloo* m., issued by the Prince Regent's orders in 1816, and conferred on every Brit. officer and soldier present at the battle, was of silver. On the obverse was the head of the Prince Regent, on the reverse a figure of Victory, seated on a pedestal, inscribed 'Waterloo,' with beneath the date, June 18, 1815, and above, 'Wellington.' The *Peninsular* m., for military services in the war with France, 1793–1814, was not issued till 1847, when Queen

Victoria conferred it upon every surviving officer and private who had been present at any battle and siege during those years. It has no less than 28 separate clasps for different engagements. The *long service* and *good conduct* m's were first awarded to soldiers and sailors in 1830 and 1831. On the edge of each of these m's is engraved the name, rank, and regiment (or ship) of the man to whom it has been awarded. The governments of all civilised nations now issue m's for the decoration of their soldiers and sailors. The *Victoria Cross* in Britain, the *Iron Cross* of Germany, the *Medal of Honor* in U.S.A., are bestowed on officers and privates alike for some special deed of valour.

Other m's to be mentioned are the *Edward Medal*, 1907, for the saving of life in industrial perils; the m's of the Royal Humane and other societies, for saving life; the *Kaiser-i-Hind*, for public services in India; the m's awarded by geographical and other learned societies, and to students at schools, colleges, univ's; and the trade m's, awarded at industrial exhibitions.

MEDEA (classical myth.), famous sorceress, who helped Jason to obtain the Golden Fleece. Euripides made a tragedy and Cherubini an opera out of her story.

MEDELLIN (6° 2′ N., 75° 49′ W.), city, Colombia; bp.'s see; educational and commercial centre; gold-mining industries. Pop. 70,000. Department of Medellin has area of 12,137 sq. miles. Pop. 275,000.

MEDEMBLIK (52° 17′ N., 5° 7′ E.), seaport town, on Zuider Zee, Netherlands.

MEDFORD (42° 23′ N., 71° 5′ W.), town, Massachusetts, U.S.A.; contains Tuft's Coll., established 1852; armoury, opera-house, libraries, museums; manufactures chemicals, bricks, machinery, woollens; shipbuilding formerly important. Pop. (1910) 23,150.

MEDIA (*c.* 35° N., 48° E.), ancient country, Asia, between Caspian Sea and Parthia on E., and Armenia and Assyria on W., and now included in Persian province of Iran (*q.v.*). M. was subject to Assyria in early times; said to have attained separate existence under Deioces, *c.* 710 B.C.; became powerful kingdom under Phraortes, who conquered Armenia and Persia, and Cyaxares, who took Nineveh and destroyed Assyrian empire *c.* 606 B.C. In next reign Persia rose in revolt, and King Astyages was deposed by Cyrus, who founded Persian empire, of which M. remained part until whole was conquered by Alexander of Macedon, *c.* 330 B.C. After Alexander's death, greater part was included in Syrian kingdom, subsequently M. formed part of Parthian empire, and was eventually united to Persia under the Sassanids, *c.* 226 A.D. The northern part of M., known as *Atropatene*, became an independent kingdom after death of Alexander; after various changes became part of second Persian empire, *c.* 226 A.D.

Rawlinson, *Five Great Monarchies* (1879); Ragozin, *Media, Babylon, and Persia* (1889).

MEDICAL JURISPRUDENCE, etc., see MEDICINE.

MEDICI FAMILY, Ital. house, to which belonged many great Renaissance statesmen, ecclesiastics, and patrons of culture. Origin of family is unknown; appears in Florentine history in XII. cent.; first important member SALVESTRO, who started Medicean opposition to great family of Albizzi by aiding revolt of populace against greater gilds, 1378. GIOVANNI (1360–1429) founded the family wealth by establishing banks in numerous cities, and won popularity as defender of poor against the Albizzi, etc.

His son **Cosimo** (1389–1464) started the literary tradition of his house and heaped up wealth, but Albizzi secured his banishment, 1433; war with Milan and low finances made Cosimo's recall necessary; Albizzi and most of great families were permanently expelled, and Medici were henceforth supreme in Florence. Cosimo managed to control all elections of magistrates, became universal banker, built palaces, employed Brunelleschi, Donatello, Ghiberti, etc., collected MSS., and established public libraries; of great importance in history of Renaissance.

His son and successor, **PIERO** (d. 1469), crushed plot against family; terribly afflicted by gout and rheumatism; left son, **Lorenzo** (1449–92), most famous of house, known as *The Magnificent*. Lorenzo is one of most brilliant and mild of despots of history; universally gifted (except as to good looks) and of lordly generosity, won enthusiastic affection of Florence, but had to face republican plot; assassins slew his bro., 1478, but failed to kill Lorenzo; Pazzi family were hanged or exiled; republican institutions retained, but Lorenzo became virtual tyrant and sole conductor of foreign policy; maintained peace of Italy by negotiations.

Successor, PIETRO (1471–1503), was deposed for submission to French, 1494. Lorenzo's second s., **Giovanni** (1475–1521), became pope, 1513, as LEO X.; patron of letters and art, employing Raphael to decorate Vatican, but unwisely assisted Emperor Charles V. against France, and prepared way for Papacy to become tool of empire. Pietro's son, LORENZO (1492–1519), re-established Medici rule in Florence, but was not absolute like his grandfather; his dau. **Catherine** (1519–89) m., 1533, Duke of Orleans, afterwards Henry II. of France (see CATHERINE DE' MEDICI). On Lorenzo's death, 1519, Cardinal **Giulio** de' M., an illegitimate son of the house, assumed government of Florence; he became pope as CLEMENT VII., 1523, suffered sack of Rome by imperial troops, 1527, and fell into emperor's power. Medici were expelled from Florence, 1527, but restored by papal and imperial forces, 1530. Illegitimate **Alessandro** de' M., vicious and cruel, was appointed by emperor duke-in-fee, 1531, and established new constitution, 1532; plots to restore republic led by another bastard Medici, Cardinal IPPOLITO, poisoned probably by Alessandro, 1535; Alessandro, last of elder branch, was murdered by his boon-companion, LORENZINO de' M., a literary man, 1537.

Cosimo, descendant of younger branch, succeeded, and started rule by stamping out revolt with great cruelty; ruled as able but terrible despot; conquered Lucca, Siena, and Montalcino, and became first grand-duke of new state, Tuscany, 1567, by creation of pope; Tuscany was ruined by his taxation. He was succeeded, 1574, by son, FRANCESCO I., who won imperial recognition for his archduchy, continued ruin of country by taxation, and neglected government, while dabbling in lit. and science; founded Uffizi Gallery, etc.; constant poisonings, murders, and intrigues. His dau. Maria married Henry IV. of France (see MARIE DE' MEDICI). His bro. and successor, FERDINAND I., founded Villa Medici at Rome, and presented art treasures to Florence, drained marshes and improved communications, and greatly developed Tuscany. Son, COSIMO II. (duke, 1609–21), died at age of thirty; young son, FERDINAND II. (1621–70), was a weak ruler, tyrannised over by Church, but patron of science and lit.; succ. by son, COSIMO III. (1670–1723), even feebler and devoted to pleasure; surviving son, GIOVAN GASTONE, was childless, and Powers refused to allow Cosimo either to bequeath succession to sister, or to restore Florentine republic; Giovan Gastone (1723–27) a hopeless invalid; general corruption; persuaded to acknowledge Infante of Spain as successor, but an agreement, 1735, was made between Spain and Austria, by which Duke of Lorraine succeeded. M. rule was fatal to Tuscany. See FLORENCE, TUSCANY.

Young, *The Medici* (1909).

MEDICINE, the science which deals with the treatment of disease; may be subdivided more particularly into *internal m.*, the province of the physician; *surgery*, or the treatment of wounds and deformities, and of conditions requiring operative interference generally; *obstetrics* or *midwifery*, which treats of pregnancy and the bringing of a child into the world; *forensic m.*, treating of the relations of m. with civil and criminal law; and *state m.*, dealing with the

prevention of disease and the preservation of the public health.

Ancient History.—The art of healing is as old as the human race itself, and the most primitive peoples have always had remedies of some sort for injuries and for disease. In ancient Egypt the practice of m. was subordinate to religion and was carried out by the priests, and was specialised in that different priests attached to a temple applied themselves to the treatment of different diseases. A great part of the revenue of the temples consisted in gifts offered as fees for the cure of diseases. The earliest extant medical work is an Egyptian papyrus, dating from about 3500 B.C., describing diseases and prescriptions for their cure. Mention of the art of healing is found in various parts of the sacred Vedas of the Indians, which date from about 1500 B.C., and with them, as with the Egyptians, the art was in the hands of the priestcraft. From the records of ancient Israel and Persia we find also that m. was closely bound up with religion. In ancient Greece, in Homeric times, m. was, however, no longer subordinate to religion: physicians ranked as members of a distinct profession, and received fees for their services. The worship of ÆSCULAPIUS, the god of healing, had no connection with the practice of m. by the physicians, who were quite distinct from the priests of Æsculapius, and the theory, held by authorities of some note, that Gk. m. was a development from the cult of Æsculapius, must be rejected. In Hippocrates' days this worship still existed widely, but was looked upon as a superstition of the ignorant.

M. was thus already a definite science of reputation by the time of HIPPOCRATES (c. 460 B.C.), who gathered together its traditions, developed the science in the light of his own experience, and formed and handed on in his writings the highest conceptions of it. The chief features of Hippocrates' teaching were his high ideals of the physician's duty, as embodied in the well-known 'oath of Hippocrates,' his insistence that disease was not of supernatural origin but was a process governed by the laws of the nature, and his method of basing a diagnosis on the patient's previous history, and on accurate observation and comprehension of the meaning of symptoms. *Percussion* and *succussion* (shaking the patient to elicit internal noises) were employed as aids to diagnosis by Hippocrates and his followers, and, although their knowledge of m. was very incomplete and inaccurate, without any scientific foundation, the Hippocratic physicians have been famed for their accuracy of *prognosis*, or the art of forecasting the course and termination of a disease. In regard to treatment, much stress was laid by Hippocrates upon dietary treatment, drugs being regarded as of secondary importance. For a cent. after Hippocrates no progress was made in m., the explanation no doubt being the general decline of science and art during the Macedonian ascendancy in Greece. On the break-up of the Macedonian empire, however, various centres of learning sprang up, and, in regard to m., the school of Alexandria was the most important. The leaders of this school were the contemporaries and rivals, HEROPHILUS and ERASISTRATUS. The former followed the teaching of Hippocrates, paying great attention to symptoms, and, in treatment, employing chiefly drugs and bleeding: the latter condemned the doctrines of Hippocrates, was less attentive to anat., and found an explanation for inflammation and fever in excess of nutrition. The school of Herophilus produced some distinguished anatomists, while that of Erasistratus, which lasted a hundred years longer than the other, became famous from the study of special diseases. From the Erasistrateans developed the school of the EMPIRICS, whose chief features were the importance attached to the previous history of the patient, observation, and inference by analogy, while they discarded the study of anat. as useless; but it must be noted that the Empirics studied carefully the works of Hippocrates, and they had much success in practical matters, such as surgery and obstetrics.

With the subjection of the Gk. world by the Romans many Gk. physicians proceeded to Rome to practise their profession there. The Romans themselves, although they had a system of collected superstitions regarding the treatment of disease, developed no native school of m., and before 200 B.C. Gk. physicians had already come to practise among them. The most prominent of the early Gk. physicians was ASCLEPIADES, a native of Bithynia, whose theory of disease was that the body was composed of innumerable atoms, the arrangement and movement of which controlled health and disease. In regard to treatment he relied chiefly on diet, exercise, cold baths, and massage. A pupil of Asclepiades, Themison, developed his theories, treating disease by inducing a condition opposite to that in which the patient was found (*e.g.* administered a purgative in constipation), and founded the school of the METHODICS, the greatest of whom was Soranus of Ephesus, who flourished in Rome in the reigns of Trajan and Hadrian. The Methodic school endured for several cent's, and had even considerable influence upon the mediæval revival of m.

The most eminent name in Rom. medicine, from the hist. point of view, is that of a man who was not a physician by profession—AULUS CORNELIUS CELSUS, whose *De medicina* formed part of a series of works dealing with all branches of human knowledge. The *De medicina* is mainly derived from older medical writers; it summarises the medical knowledge of Hippocratic and Alexandrian times, and gives an account of the science of m. up to the time of the writer. The influence of Celsus was not, however, felt in his own time, but dates from the XV. cent., when his works were re-discovered, to become, from that time onwards, the most widely read of medical classics.

In the I. cent. A.D. arose the PNEUMATIC SCHOOL, which attempted to combine the doctrines of the Methodics with the Hippocratic school, and about the same period the ECLECTIC SCHOOL appeared, the chief followers of which were Rufus of Ephesus and Arctæus of Cappadocia, who tried to select and reconcile what was of value in the different contending schools of m. At this period, then, comes GALEN (b. at Pergamus in 131 A.D.), who practised m. with great success in Rome from about 170 A.D. to the end of the II. cent. He based diagnosis upon a knowledge of anat. and physiology—obtained by the dissection of animals and necessarily inexact—and placed great importance on the state of the pulse. He was guided, however, too much by the Hippocratic elements (hot, cold, wet, and dry), tried to cure diseases supposedly due to mixture of the elements by drugs of opposite qualities, and combined with scientific m. a system of philosophy, finding an answer for every question. It was this last feature that made the great reputation Galen had later, chiefly through the advocacy of his doctrines by the Arabian physicians, and his name dominated m. up to the XVII. and XVIII. cent's.

Middle Ages.—The BYZANTINE SCHOOL followed in the footsteps of Galen, and its most eminent teachers were Oribasius and Ætius, whose works were compiled from Hippocrates, Galen, and other older writers, Alexander of Tralles, of more original achievements, and Paul of Ægina, who was the author of valuable treatises on surgery and obstetrics. With the establishment of Muhammadan rule in the Hellenic cities of the Levant a school of Arabian m., deriving its knowledge mainly from Galen, Aristotle, and other Gk. medical writers, arose in the IX. and X. cent's. Among the more notable names in this school are Mesua and Joannitius of Bagdad, Rhases, who also practised in Bagdad and was the first to describe accurately smallpox and measles, Hali, author of an important work on m., Mesua of Damascus, whose work on materia medica was used in the compilation of a pharmacopœia by the College of Physicians in the reign of James I., and

AVICENNA, the most eminent of the Arabian medical writers, author of an encyclopædic work on m., which shows, however, but little practical experience. There is no real break with Rom. m. and the m. of the Middle Ages, the tradition, degenerate though it was, being carried on by the religious orders.

In the early Middle Ages arose the famous medical SCHOOL OF SALERNO, the origin of which is not known and which was a secular, not a religious, institution. Its fame attracted many persons in search of health, among them William the Conqueror, in addition to numerous students of m. None of the works emanating from Salerno were much more than compilations, one well-known work being the *Regimen Sanitatis Salerni*, written in rhyme for the king of England. The school of Salerno, although it actually existed up to the time of Napoleon, declined with the introduction of Arabian m. to western Europe through the medium of Latin translations, Cornelius Africanus (*c.* 1050) being the first of such translators. At this period were founded the medical schools of Montpellier, Bologna, and Padua, basing their teaching on the Arabian medical works derived from those of the Gk. physicians.

Modern Times.—With the fall of Constantinople and the Revival of Learning the science of m. received a fresh impulse, and, in place of Latin translations of Arabian versions and compilations from the Gk., Hippocrates, Galen, and the forgotten Celsus became known in the original, interest in anat. and physiology awoke, and, in this period of exploration and discovery, new plants and new remedies for disease became known. Gradually the teaching of Galen took the place of the doctrines of Avicenna and the other Arabian physicians, and, although the latter long prevailed in the schools of m., by the middle of the XVI. cent. Galenism was supreme. About this time there appeared a figure not in accordance with the spirit of reverence for Galen, in the person of PARACELSUS (*c.* 1490–1541), who defied tradition, lectured in his native German in place of Latin, publicly condemned Galen and Avicenna, advocated personal experience and research in place of academic theorising, and introduced some new substances, the chief of which were antimony and laudanum, for the treatment of disease. Except, however, for his additions in materia medica, and the value of his example in independence, the influence of Paracelsus was but slight outside his own country.

In addition to the revival of the study of the classical medical writers the XV. and XVI. cent's are notable for the outbreaks of epidemics in forms unknown to the ancients, chief among them 'sweating sickness' in England and syphilis on the continent of Europe. This period is also memorable by the introduction of clinical teaching in the hospitals, first of all in connection with the medical school of Padua. New discoveries in physics and other sciences stimulated research in m., especially in regard to physiology and therapeutics.

In 1628 WILLIAM HARVEY made public his discovery of the circulation of the blood, which gave an explanation of many obscure phenomena in health and disease; clinical teaching in the hospitals became more general, to be followed by a rise in estimation of the works of Hippocrates and a proportionate fall in those of Galen. Various systems of m. were promulgated, including that of Van Helmont, who believed that the symptoms of disease were due to the disturbance of a central *archæus* controlling the body and soul; the *Iatro-physical* school explained the functions and diseases of the body on mechanical grounds, the most prominent members of this school being Borelli and the Scotsman, Pitcairne; the *Iatro-chemical* school tried to reconcile m. with the new discoveries in chem. and physiology, and explained the physiological and pathological processes in the body as chemical phenomena, its chief advocate being Sylvius, prof. of m. at Leiden. Willis, the Eng. physician, agreed with many doctrines of this last school, and in addition to applying chemical methods to the examination of the bodily secretions, he is notable as having first described diabetes and certain nervous diseases. Thomas Sydenham followed none of the systematic schools, but took nature as his guide, regarding it as the duty of the physician in disease to assist nature in the restoration of a normal condition. He placed much faith in bleeding, while his description of gout is classic.

Coming to the XVIII. cent. the next great name is that of BOERHAAVE of Leiden, who, in addition to being a great anatomist, was the founder of the modern method of clinical instruction, founding his teaching upon the doctrines of Hippocrates and of Sydenham; his chief work, embodying the experience of a lifetime, was his systematic *Institutiones*, which was long a standard work. The tendency to establish a system of m. is found also in Hoffmann, who explained life and disease by the existence of a universal ether, which accumulated in the brain and generated a 'nervous fluid,' while Stahl attributed the symptoms of disease to the efforts of the soul in getting rid of morbid influences.

Apart from theoretical systems were HALLER, who investigated practically the effects of drugs in health, and also laid the foundations of modern physiology, and Morgagni, who marks the beginning of the study of morbid anatomy. Following Haller and Morgagni came William Cullen of Edinburgh, who drew up a classification of diseases according to the new ideas regarding physiology and pathology, and also John Brown, founder of the *Brunonian* system, who explained all the phenomena of life and disease as due to stimulus, his treatment of practically all diseases being a 'stimulating' one. Hahnemann, who founded the homœopathic school, and who belongs to this period, had a considerable influence upon therapeutics, his main theory being that a disease is cured by a drug which, in a normal person, would produce similar symptoms. In this cent. must also be noted Valsalva, who made important researches on heart disease and aneurism; Auenbrugger, who introduced direct percussion as an aid to diagnosis; John Fothergill, who described 'putrid sore throat,' now termed diphtheria, as well as the condition of the douloureux; John Huxham, who investigated epidemic fevers; and, most famous of all, EDWARD JENNER, who introduced vaccination as a preventive against smallpox, which marks the beginning of the science of *preventive* m.

The first half of the XIX. cent. showed the triumph of research and experiment over theorising and generalisation, influenced by the work of WILLIAM and JOHN HUNTER, both of whom died just before the commencement of that cent., the latter particularly leaving behind him a valuable legacy in anatomical and pathological research, as well as in the stimulus he gave to such pupils as Edward Jenner and Matthew Baillie. The method of percussion of Auenbrugger was improved by Corvisart and Piorry, and Laenneo introduced a more valuable aid to diagnosis in the *stethoscope*. At this time the PARIS SCHOOL was supreme in clinical teaching, and attracted students from all parts to study under Bretonneau, Rostau, D'Alibert, Rayer, Trousseau, and others.

Great progress was also being made in m. in Britain, Willan laying the basis for all subsequent work on diseases of the skin, Bright making the important discoveries in regard to diseases of the kidneys associated with his name, and, somewhat later, Addison investigating the obscure disease of the suprarenal capsules called after him. The researches of Sir Charles Bell and of Marshall Hall concerning the physiology of the nervous system are also noteworthy. The reputation of the EDINBURGH SCHOOL of m. was sustained by Gregory, Alison, and Abercrombie, and that of DUBLIN by Graves and Stokes. In Germany, again, Skoda improved the art of auscultation, Rokitansky made discoveries of note in morbid anatomy, Romberg in nervous diseases, and Schönlein, by his efforts in many

different directions, increased the fame of the Ger. school.

In more recent times progress in other departments of thought and science has exercised great influence upon m. With the appearance of Darwin's epoch-making *Origin of Species* the classification of diseases into isolated types, without relation one to another, was seen to be wrong, and the changing of form, with the development and relation of processes, began more clearly to be observed. A morbid process was seen no longer to be limited by the individual, and the possibility of inheritance of disease, such as various nervous disorders, or of susceptibility to disease, such as to tuberculosis, assumed an aspect of much greater importance.

The teaching of Schönlein, who discovered, in the first half of the cent., that the disease termed favus was due to a parasitic fungus, led to the development of the science of *bacteriology*, which, receiving its most important impulse from the work of PASTEUR, and of KOCH, who discovered the bacilli of anthrax and of tuberculosis, has been able to assign both a cause and a cure to many of the most obscure and most fatal diseases, and is daily becoming more complete and more exact. The development of preventive m. has accompanied that of bacteriology, infant mortality has been enormously lessened, the ravages of the population by infectious diseases have been substantially decreased, housing is improved, food and water supplies rendered purer and more healthy, sanitary science is becoming more exact, and the physical conditions of life, especially in towns, have been rendered very much cleaner and more pleasant. In the tropics, as well as in temperate climates, disease is being checked; the parasite of malaria was discovered two years before the tubercle bacillus, and preventive methods are successfully employed to prevent the propagation of the infecting mosquito, with the result that the disease is being stamped out in districts where it was endemic, while cholera, enteric fever, and yellow fever are beginning to be controlled.

While perhaps most general attention has of recent years been paid to infectious diseases, the progress made regarding other conditions must not escape consideration. The development of the microscope and of microscopic methods in the XIX. cent. had the greatest possible influence on the development of physiology and anat., and therefore on the development of m. In the history of the investigation of nervous diseases the names of Lockhart Clarke, Cajal, Golgi, Brown-Séquard, Gowers, Duchenne, Charcot, and Romberg are prominent, Sir Charles Bell discovered the paths of sensory and motor impulses, followed by Marshall Hall's discovery of the laws of reflex action, and Waller, Sherrington, and others have done valuable work; while in regard to research on the physiology of the brain, and, in consequence, the wonderful achievements in cerebral surgery, Broca, Hitzig, and Ferrier are noteworthy. At present considerable attention is being devoted to the investigation of mental diseases, and, although up to the present the results have been comparatively small, the patient work now proceeding is bound to bear valuable fruit in the near future. The treatment of the insane has not developed to any great extent beyond the non-restraint methods of the first half of the XIX. cent.

Diseases of the lungs and heart were investigated in such a way by Laennec that his successors in the XIX. cent. have simply added additional details to his broad outline; pneumonia has become recognised as an infection, and the treatment of tuberculosis of the lungs and pleura has undergone a drastic change from protection from the outside air and close confinement to placing the patient as constantly outside as possible, and feeding him on nutritious diet. In abdominal conditions great progress has been made in accuracy of diagnosis as well as in the enormous increase in successful treatment through the introduction of the antiseptic and aseptic methods of surgery by LISTER, and such conditions as stone in the kidney or gall-bladder, gastric ulcer, peritonitis, ovarian disease, and even cancer of the stomach or intestine, which formerly practically invariably ended fatally, are treated to-day with every prospect of cure. Examination of stomach contents, the application of *X-rays*, and improved methods of examining the urine have been of great assistance in the diagnosis of abdominal disease. Great progress was made in the XIX. cent. in regard to the diseases of women, the name of Matthews Duncan of Edinburgh being notable in this regard, and the possibility of successful operative interference has given wonderful results in this department of m.

Knowledge concerning the circulation has been greatly augmented by the physiological researches of Morey, Ludwig, Leonard Hill, and others; the diseases of blood-vessels, such as the degeneration of the walls of blood-vessels from such reasons as old age, lead-poisoning, syphilis, persistent high blood-pressure, are better understood, and specific treatment is applied with much success. The phenomena of embolism and thrombosis have been investigated by Kirkes and VIRCHOW, and are guarded against and treated successfully; while the causes of the more obscure anæmias are being gradually evolved. Dietetic diseases, as, in children, rickets, scurvy, and marasmus, are now being more exactly comprehended, and are successfully cured or prevented.

In regard to diagnosis, in addition to such aids as examination of stomach contents, and the X-rays, many improvements have been made; the ophthalmoscope has made diseases of the eye more clear; the sphygmograph is of value in investigating changes of blood-pressure; the *thermometer* has become an exact instrument, and is invaluable as a recorder of the temperature; the application of the galvanic and faradic currents is of great assistance in various nervous conditions; instruments have been devised for different purposes in the examination of the blood; the laryngoscope throws light on the condition of the throat. In regard to therapeutics, less reliance is being placed in drugs, and other remedies are being widely employed, such as diet, change of climate, physical exercises, baths, mineral waters, massage, electricity, hypnotism, while the discoveries in bacteriology are providing a host of specific remedies in antitoxins, vaccines, and similar preparations. Hypodermic injection has been added to the other methods of the administration of drugs, saline injections are employed for various conditions, and transfusion is being carried out more scientifically and more successfully.

Medical Education.—Until 1858 the different licensing authorities in Great Britain and Ireland granted degrees or licences in medicine and surgery without supervision by the State, but by the Medical Act of that year the *General Medical Council* was established, now composed, by the later amended Act, of twenty members elected by the licensing bodies, three elected by medical practitioners, and six app. by the Crown. The General Medical Council supervises the courses of study and examinations of the licensing bodies, and may report any body which does not meet its requirements to the Privy Council, which can deprive such body of its power to grant licences. It requires that before commencing medical study candidates should be sixteen years of age and should pass an examination in general knowledge in (*a*) English, (*b*) Latin, (*c*) math's, (*d*) any one of Greek, French, German, Italian, or another modern language, but the entrance examination certificates of the Brit., Ind., and colonial univ's, and examination certificates of certain government and chartered bodies' examinations, are accepted in lieu of this examination. After having fulfilled the above requirements, a candidate must register as a medical student and carry out the approved course of five years' study. The subjects of this course must include physics, chem., elementary biology, anat., physiology, materia medica, and pharmacy, pathology, therapeutics, medicine and clinical med., surgery and clinical surgery, midwifery with diseases peculiar to

women, vaccination, forensic med., public health, mental diseases. A candidate cannot be licensed and admitted to the Medical Register before he is twenty-one years of age.

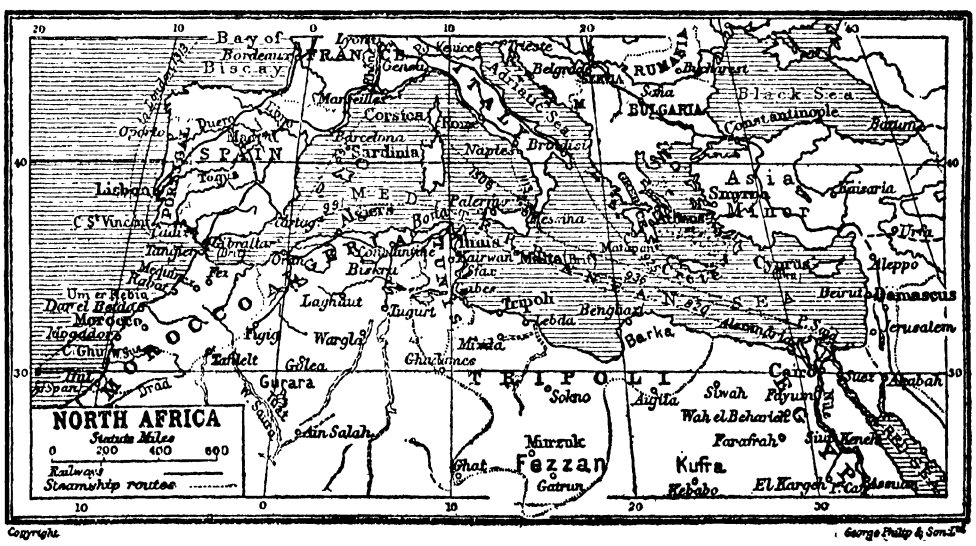
In the U.S.A. the different states regulate the practice of med. within their own borders, and candidates must satisfy the supervising board that they have graduated from a reputable medical school and are twenty-one years of age. In the medical schools the course of study lasts four years, and a certain standard of general knowledge, in some cases graduation in arts or science, is demanded before entrance.

Medical Jurisprudence, or FORENSIC MEDICINE, is that branch of med. which deals with the application of medical science to questions of law, chiefly in regard to civil rights and to injuries to the person. Although we find traces in ancient times among the Greeks and Romans of the application of certain principles of m. j., more especially in regard to questions of legitimacy, the development of the subject is of recent date. In the XVI. cent., in Germany under the Emperor Charles V., magistrates were ordered to take medical evidence in doubtful cases of personal injury, poisoning, pretended diseases, and the like, while the first work dealing with the subject, *Constitutis Criminalis Carolina*, appeared in 1553. As knowledge of anat., physiology, and other branches of med. became more exact, so their application to legal matters developed, and we find the first course of lectures on m. j. given by Michaelis in the Univ. of Leipzig in the middle of the XVII. cent., while at the commencement of the same cent. Henry IV. of France had appointed physicians and surgeons to make medico-legal reports in the different cities of his kingdom. Several professorships of the subject were instituted in the univ's of Germany in the XVIII. cent., and many works dealing with medico-legal subjects were published. The first work on m. j. produced in Britain was the *Elements*, by Samuel Farr, which appeared in 1788, and the first lectures in the country were given by Duncan, in the Univ. of Edinburgh, in 1801.

The different subjects connected with m. j. are dealt with under such articles as MURDER, DROWNING, RAPE, INSANITY, POISON.

Taylor, *Principles and Practice of Medical Jurisprudence*; Osler, *Principles and Practice of Med.* (1909); Taylor, *The Practice of Med.* (1911).

MEDICK, see LUCERNE.



MEDINA.—(1) (24° 58′ N., 39° 58′ E.) small town, Hejaz, Arabia; second great holy city of Muhammadans; contains tomb of Muhammad, who took refuge here after his flight from Mecca in 622 A.D.; was Muslim capital until superseded by Damascus in time of Moawija; came under control of Turkey in XVI. cent.; captured by Wahhabis, 1804; retaken by Tusun, s. of Mehemet Ali, pasha of Egypt, in 1812; most important recent event, opening of railway to Damascus, 1908. M. is strongly fortified and encircled by walls; principal building is mosque, which contains Prophet's tomb, and has lofty cupola and four towers; present building is result of frequent reconstruction. Pop. c. 18,000. (2) (43° 15′ N., 78° 20′ W.) town, New York State, U.S.A., on Oak Orchard Creek; iron manufactures; sandstone quarries. Pop. (1910) 5683.

MEDINA SIDONIA (36° 27′ N., 5° 53′ W.), town, on Sequillo, Cadiz, Spain; ancestral seat of dukes of M. S. Pop. 11,000.

MEDINA SIDONIA, DON ALONSO PEREZ DE GUZMAN EL BUENO, 7TH DUKE OF (1550–1615), commander-in-chief of Span. Armada; descendant of noble family of Guzman, richest and most powerful of Spain; incapable, and promoted by favour; app. captain-general of Lombardy, 1581; commander of Armada, 1588; responsible for Eng. success at Cadiz, 1596.

MEDIOLANUM, name of several Rom. cities; that in Cisalpine Gaul, founded by Insubres (according to Livy), was taken from that people by Romans, 222 B.C.; chief city of Western Empire when captured by Goths, 569.

MEDITERRANEAN SEA (*c.* 30° 30′ to 44° 10′ N.,

Copyright George Philip & Son, Ltd.

5° to 35° E.), great inland sea, with Europe on N., Asia on E., Africa on S.; communicating with Atlantic by Strait of Gibraltar, with Black Sea by Dardanelles, Sea of Marmora, and Bosporus, with Red Sea by Suez Canal; area over 1,000,000 sq. miles; practically uninfluenced by oceanic tidal wave. M. S. has great depth, three basins being revealed by soundings; these are: western basin, W. of Corsica and Sardinia; Tyrrhenian depression, between Corsica and Sardinia, Sicily and Italy; eastern basin, between S. Italy and coast of Palestine. Submerged mountains connect Sicily with Tunis.

MEDIUM, term used in spiritualism for person through whom messages are believed to be conveyed from the other world; such messages are not necessarily genuine, as the medium may be deliberately deceiving, or may unconsciously deliver ideas not derived from any extraneous source.

MÉDOC (45° 9′ N., 0° 42′ W.), district, Gironde, France, stretching along Gironde; famous wines.

MEDULLA, see BONE.

MEDULLA OBLONGATA, see BRAIN.

MEDUSA, see GORGONS, THE.

MEDUSA, general name for a jelly-fish, either the large floating mass belonging to the Scyphomedusæ (*q.v.*) or the small swimming-bell of the Hydromedusæ (*q.v.*).

MEDUSOID, see under HYDROMEDUSÆ.

MEDWAY (51° 27′ N., 0° 43′ E.), river, S.E. England; joins Thames at Sheerness; length, 60 miles, of which over 40 are navigable.

MEEANEE, see MIANI.

MEENIN, see MENIN.

MEERANE (50° 51′ N., 12° 28′ E.), town, Saxony, Germany; woollen cloth. Pop. (1910) 25,406.

MEERSCHAUM, hydrated silicate of magnesium occurring as fine white clay in Austria, Turkey, Spain, and other places in Europe; used for making tobacco pipes.

MEERUT.—(1) (28° 55′ N., 77° 30′ E.) district, United Provinces, India; area, 2360 sq. miles; produces cereals, cotton, sugar-cane. Pop. 1,540,175. (2) (29° N., 77° 41′ E.) town, United Provinces; trades in cotton; here Mutiny first broke out, 1857. Pop. (1911) 116,227. M. division has area 11,310 sq. miles. Pop. *c.* 6,000,000.

MEGACHILE, see LEAF-CUTTER BEES.

MEGALOPOLIS, magnificent city of ancient Greece, built by Arcadians under direction of Epaminondas, near junction of Alphæus and Helisson, 370 B.C.; idea was to collect forces against Spartan inroads as Argives had done in Argos; sacked by Spartans, 222; speedily fell into decay; now deserted ruins; famous inhabitants were Philopœmen and historian Polybius; excavations by Brit. school at Athens, 1892.

MEGANUCLEUS, see under NUCLEUS.

MEGAPODES, MEGAPODIDÆ, family of seven species of Rail-like birds found in Australia and many S. Pacific islands; most interesting on account of their nesting habits; eggs are simply laid in sand or dead leaves, where they are hatched by heat of sun or decaying vegetation.

MEGARA, town of ancient Greece; capital of the Megarid district; Dorian, but dependent on Athens until time of Codrus; being on route from Athens to Peloponnesus, and possessing excellent ports, became great mart and was mother of colonies in Sicily, Asia Minor, Black Sea, Sea of Marmora, etc.; nearly ruined by Delian League.

Megarian School, a Gk. school of philosophy founded in Megara, his native city, by Euclid (not the geometer), a friend of Socrates. The school seems to have asserted the unity of Being or the Good to the point of denying all reality to changeable and imperfect things.

MEGATHERIUM, Ground Sloths, see under EDENTATES.

MEGHNA, MEGNA (23° 15′ N., 90° 45′ E.), the delta estuary of Ganges and Brahmaputra, India; noted 'bore.'

MEHADIA (44° 55′ N., 22° 22′ E.), town, Krassó-Szörény, Hungary; in neighbourhood are sulphur 'Hercules Baths,' known in Rom. times.

MEHALLA EL KOBRA, town, EGYPT (*q.v.*).

MEHDIA, see MAHDIA.

MEHEMET ALI (1769–1849), viceroy of Egypt. As pasha of Egypt, M. A., an illiterate peasant of genius, and his s. IBRAHIM played an important part in the Gk. War of Independence (1827), and won some support from Gt. Britain and France in their revolt against M. A.'s suzerain, the Sultan of Turkey. Finally the Powers agreed by the Convention of London to force terms on M. A., who had assumed the title of viceroy of Egypt in 1834. France held out and aided him, but Napier forced him to return the Turk. fleet, captured by Ibrahim, and he made submission, France consenting on Turkey's agreeing to make the pashalik hereditary.

MEHIDPUR (23° 29′ N., 75° 42′ E.), town, on Sipra, Indore, India; scene of victory of Sir John Malcolm over army of Holkar, 1817.

MEIDERICH (51° 30′ N., 6° 45′ E.), town, Rhine province, Prussia; iron and steel manufactures; incorporated with Duisburg, 1905.

MEIKTILA (*c.* 20° 52′ N., 96° 10′ E.), district and division of Upper Burma. District (2178 sq. miles) consists of an undulating plain; chief occupation, cattle-breeding and agriculture. Pop. 250,000. Division includes districts of Meiktila, Kyaukse, Yamethin, and Myingyan; area, 10,854 sq. miles. Pop. 1,000,000; town, 6000.

MEINBERG (51° 45′ N., 9° E.), watering-place, Lippe, Germany; sulphur springs.

MEININGEN (50° 34′ N., 10° 25′ E.), capital, Saxe-Meiningen, Germany, on Werra; contains theatre and ducal palace, with collections. Pop. (1910) 17,182.

MEÏR (fl. II. cent. B.C.), Jewish philosopher; noted for fables and epigrams, as was his wife Beruriah for her godliness.

MEIRINGEN (46° 42′ N., 8° 12′ E.), tourist centre, canton Berne, Switzerland, in valley of Aare. Pop. 3000.

MEISSEN (51° 10′ N., 13° 28′ E.), town, Saxony, Germany; famous for Dresden china; has beautiful Gothic cathedral dating from XIII. cent. Pop. (1910) 33,884.

MEISSEN (51° 10′ N., 13° 28′ E.), district, Saxony; gave name to margraviate in X. cent.; in 1423 the Margrave, Frederick the Warlike, who succ. his uncle, 1407, was cr. elector of Saxe-Wittenberg; and henceforth M. was included in duchy, afterwards kingdom of Saxony.

MEISSONIER, JEAN LOUIS ERNEST (1815–91), Fr. painter; first distinguished himself as book-illustrator, later for his elaborate genre pictures, including several celebrated military scenes; executed some striking portraits, one being of Dumas *fils*. Many of his pictures are known by engravings.

MEISTERSINGERS, see MINNESINGERS.

MEKINEZ, see MEQUINEZ.

MEKONG (9° 55′ N., 106° 38′ E.), river, Indo-China; rises in Tibet, separates Annam from Siam; enters China Sea; length, over 2700 miles; basin, 400,000 sq. miles.

MEKRAN, MAKRAN (26° N., 61° E.), district in S.W. Baluchistan and S.E. Persia, bordering Arabian Sea; corresponds to ancient *Gedrosia*; is an arid and barren plateau region; divided into petty districts under separate chiefs.

MELA, POMPONIUS (fl. *c.* A.D. 43), earliest Rom. geographer; a native of Spain. His geography, called *De Situ Orbis*, is in three parts.

MELANCHOLIA, see INSANITY.

MELANCHTHON, PHILIPP (1497–1560), Ger. Reformer; original name, SCHWARZERD; ed. at Heidelberg and Tübingen; prof. of Greek at Wittenberg, 1518. In 1519 he began to play his part in the Reformation struggles at the Leipzig disputation. When Luther was in the Wartburg M. led the Protestants in Wittenberg. He disputed with Zwingli at Marburg, 1529, over the Eucharist. He was one of the more moderate of the Reformers, and as such had intercourse with Catholics when compromise was attempted. He tried to shelve difficulties by using vague language; his theology was really Lutheran. He wrote *Loci Communes Rerum Theologicarum* and other works.

Richard, *Life* (1898).

MELANESIA (10° S., 155° E.), collective name for island groups in Pacific, comprising Bismarck, Solomon, Santa Cruz, New Hebrides, New Caledonia, Loyalty, and other archipelagoes.

MELBA, *née* NELLIE MITCHELL (1859–), famous Brit. singer (soprano); b. Melbourne.

MELBOURNE.—(1) (37° 49′ S., 144° 59′ E.) capital, Victoria, Australia; founded, 1835; episcopal see, 1847; made capital of Victoria, 1851; suffered from financial depression, 1892–93. M. is temporary seat of Commonwealth government; contains Houses of Parliament, Government House, Anglican and

R.C. cathedrals, observatory, mint, various museums, libraries, and charitable establishments; seat of univ., founded 1855; has fine parks and public gardens; great gold, wool, and farm-produce centre; has fine harbour; exports frozen meat, wool, dairy produce, fruit, wine, grain. Pop. (1911) 591,830. (2) (52° 51′ N., 1° 27′ W.) small town, Derbyshire, England; market gardens.

MELBOURNE, WILLIAM LAMB, 2ND VISCOUNT (1779–1848), Brit. statesman; Prime Minister, 1834 and 1835–41; polished dilettante; trained young queen, Victoria, as constitutional ruler.

MELCHIADES, pope, 310–14.

MELCHITES, Christian sect, founded V. cent.; with Eastern rites, but under authority of R.C. Church; consist of 90,000 Syrians and Egyptians.

MELCHIZEDEK, in *Genesis* 14, priest-king of Salem, who blesses Abraham, and is taken as the type of Jesus Christ in the *Epistle to the Hebrews*.

MELEAGER (classical myth.), king of Calydon; slew wild boar sent by Artemis, and gave skin to Atalanta; brothers of Althæa, M.'s mother, robbed Atalanta, and were slain by M., whereupon his mother cursed him; later tradition states that Althæa slew him by burning a mystic log.

MELEAGRINA, see under LAMELLIBRANCHIATA.

MELEDA (42° 45′N., 17° 30′ E.), island, in Adriatic, Dalmatia, Austria-Hungary; ancient *Melita*.

MELEGNANO (45° 21′ N., 9° 19′ E.), town, Lombardy, Italy; formerly *Marignano*; scene of Fr. victories in 1515 and 1859. Pop. 7000.

MELES, Badger, see WEASEL FAMILY.

MELETIUS, bp. of Lycopolis; his followers formed *Meletian sect.*

MELETIUS OF ANTIOCH (d. 381), bp. of Antioch, 360; obliged to go into exile owing to Christological disputes, but returned later. M. at first held to the *Homoean* view, but gradually became orthodox.

MELFI (41° N., 15° 38′ E.), town, Potenza, Italy; was Norman capital of Apulia (XI. cent.); fruit, grain. Pop. *c.* 15,000.

MELILLA (35° 16′ N., 2° 58′ W.), fortified seaport and Span. penal settlement, Morocco. Pop. 10,000.

MELIPHAGIDÆ, see HONEY-EATERS.

MELKSHAM (51° 23′ N., 2° 8′ W.), market town, on Avon, Wiltshire, England; cloth manufactures. Pop. (1911) 3102.

MELLE (46° 13′ N., 0° 8′ W.), town, Deux-Sèvres, France; trade in agricultural produce.

MELLITUS (d. 624), bp. of London; then abp. of Canterbury, 619.

MELLIVORA, Ratels, see WEASEL FAMILY.

MELODY, in music, may be defined as a well-ordered and pleasing succession of sounds intended for voice or instrument; less strictly, the air, or tune, or leading theme in a composition.

MELOLONTHA, see CHAFERS.

MELON (*Cucumis melo*), member of the Cucurbitaceæ; climbs by means of leaf tendrils. Fruit (a berry) is very large for the size of the plant. The plant requires plenty of light and moisture, and should be grown in a frame, with an average temperature of 70° F. Judicious pinching back produces advantageous results, especially during fruit formation.

MELOPSITTACUS, see under PARROT TRIBE.

MELORIA (*c.* 43° 35′ N., 10° 15′ E.), island, off Leghorn, Italy; here Genoese were defeated by Frederick II., 1241; Genoese defeated Pisans, 1284.

MELOS, MILO (36° 42′ N., 24° 25′ E.), one of Cyclades Islands, Ægean Sea; settled by Dorians at an early date; taken by Athenians, 416 B.C. Here the Venus of Milo (now in Louvre) was found in 1820. Pop. 6000.

MELROSE (42° 27′ N., 71° 0′ W.), city, Massachusetts, U.S.A.; shoes and rubber goods. Pop. (1910) 15,715.

MELROSE (55° 37′ N., 2° 44′ W.), small town, Roxburghshire, Scotland; contains ruins of Cistercian abbey, said to be finest in Scotland, and described in Scott's *Lay of the Last Minstrel*.

MELTON MOWBRAY (52° 47′ N., 0° 53′ W.), town, Leicestershire, England; hunting centre; pork pies. Pop. (1911) 9203.

MELUN (48° 32′ N., 2° 39′ E.), chief town, Seine-et-Marne, France; ancient *Melodunum*; taken by Labienus, 52 B.C.; agricultural implements; active trade. Pop. 14,000.

MELUSINE, MELUSINA, lady in Fr. romance *Melusine*; married Raymond on condition that he should not see her on a certain day of each week. One day he broke his oath, sought her out in her seclusion, and found her bathing; her lower body was that of a serpent. She erected by magic the castle of Lusignan.

MELVILLE, ANDREW (1545–1622), Scot. scholar and theologian; b. near Montrose; was reckoned finest scholar of his day; champion of Scot. Presbyterianism, his vehemence and zeal roused the hatred of James VI. and I., who had him imprisoned in the Tower of London for four years.

MELVILLE, EARLDOM OF, see LEVEN, EARLDOM OF.

MELVILLE, JAMES (1556–1614), Scot. reformer; one of leaders of Presbyterian party against James VI.; letters and diary important hist. source, and of literary value.

MEMBRANELLE, a delicate flat membrane, often with frayed edge, resulting from the fusion of cilia; frequently found in neighbourhood of mouth of Infusorian Protozoa, such as *Stentor*.

MEMEL (55° 42′ N., 21° 10′ E.), seaport town, on Kurisches Haff, E. Prussia, Germany; ships timber; iron foundries, shipbuilding yards. Pop. (1910) 21,470.

MEMEL, NIEMEN (55° 4′ N., 22° 15′ E.), river, Russia and Prussia; rises in government of Minsk; falls by several mouths into Kurisches Haff; length, 500 miles; navigable from Grodno.

MEMLINC, HANS (*c.* 1430–94), Flemish painter; pictures, including fourteen adorning the shrine of St. Ursula at Cologne, are mostly religious, with a few portraits.

MEMMINGEN (47° 58′ N., 10° 11′ E.), town, Swabia, Bavaria; manufactures iron, leather, textiles. Pop. (1910) 12,362.

MEMNON (classical myth.), s. of Eōs (Dawn) and Tithonus; slain by Achilles at siege of Troy. Name M. was given to one of the two colossal statues of Amenoph III. at Thebes; it emitted a musical sound at dawn and was one of the Seven Wonders.

MEMORY, see PSYCHOLOGY.

MEMPHIS.—(1) (29° 51′ N., 31° 21′ E.) ancient town of Egypt, once capital, now in ruins; probably established by Menes, founder of first dynasty; contained Serapeum, temple of Ptah, various palaces and pyramids. (2) (35° 9′ N., 90° W.) town, on Mississippi, Tennessee, U.S.A.; enormous export of cotton; railway centre; episcopal see. Public buildings include cotton exchange, government building, various charitable and educational establishments; fine system of parks. M. was taken by Federals after severe naval engagement, 1862. Pop. (1910) 131,105.

MENABREA, LUIGI FEDERICO, MARQUIS OF VALDORA (1809–96), Ital. soldier and statesman; conducted military operations in war of Ital. liberation; tried to establish peace between papacy and nation; condemned Garibaldi's invasion.

MENAI STRAITS (53° 12′ N., 4° 13′ W.), channel, separating island of Anglesey from Carnarvonshire, Wales; from ¼ to 2 miles wide; crossed by suspension bridge, built by Telford (1825), and Britannia Tubular Bridge, constructed by Robert Stephenson, (1850). See BRIDGES.

MENAM (15° N., 100° 30′ E.), river, Siam; flows by several mouths into Gulf of Siam.

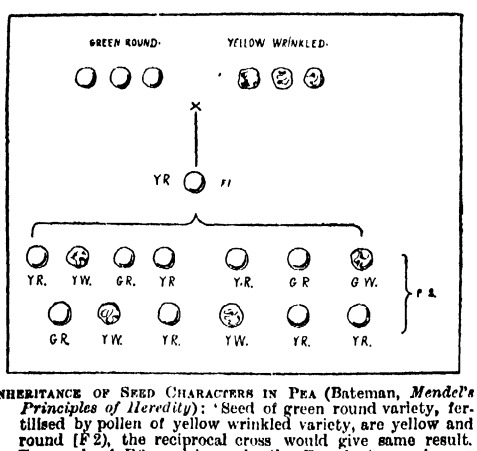
MENANDER (II. cent. B.C.), Gk. king of Bactria; said to have been greater conqueror than Alexander the Great; Strabo preserves statement that he conquered India as far as mouth of Indus; coins remain, and he appears as 'Milinda' in Indian legend.

MENANDER (342–291 B.C.), Gk. dramatist of the new comedy; important fragments of his comedies have recently been discovered; excelled in delineation of intrigue and in subtle character-drawing. His style and plots were closely imitated by Terence (*q.v.*).

MENASHA (44° 14′ N., 88° 28′ W.), city, Wisconsin, U.S.A., on Lake Winnebago; paper, woodenware. Pop. (1910) 6801.

MENASSEH BEN ISRAEL (*c.* 1604–57), Portug. rabbi; established Hebrew printing press in Holland; obtained toleration for Jews from Commonwealth in England; wrote *Vindiciæ Judæorum* against Prynne, 1656; revered by Jews as great patriot; great influence on Spinoza.

MENCIUS, MANG-TSE (*c.* 372–289 B.C.), Chin. philosopher; ed. carefully by his mother, who has been made the ideal of motherhood amongst the Chinese; like his pattern, Confucius, he founded a school of thought; endeavoured, when well advanced in years, to find a prince who would put into execution his social and political ideals. His sayings were collected by his disciples into the *Book of Mang-tse*, upon which modern Chin. ethics are largely founded.



MENDAÑA, see MARQUESAS ISLANDS.

MENDE (44° 31′ N., 3° 30′ E.), chief town, Lozère, France, on Lot; XIV.-cent. cathedral; serges and shalloons. Pop. 7500.

MENDELÉEFF, DMITRI IVANOVITSCH (1834–1907), Russ. chemist; worked on solutions and petroleum; chief founder of periodic law (see ELEMENT); author of *Principles of Chemistry*.

MENDELISM, a branch of the study of HEREDITY, concerned with the facts and theories centred upon the discoveries made by GREGOR MENDEL from his experiments in plant hybridisation, and announced in 1865; of great importance on account of its bearing on stock-breeding, and of its possible bearing on the development of humanity.

The essence of the Mendelian hypothesis is that certain characters in plant or animal remain by themselves (*unit characters*) and will not blend with other unit characters when the two are brought into juxtaposition in breeding. In the common pea, tallness and dwarfness are unit characters. A tall pea bred with a dwarf pea gives a generation of tall peas—there are no dwarf or intermediate individuals; and tallness being apparent is called the *dominant* character. But when those tall peas are interbred the offspring is not uniform, but possesses characteristic individuals, dwarf and talls, in definite ratios; for every dwarf pea (and this, self-fertilised or interbred, remains dwarf to

INHERITANCE OF SEED CHARACTERS IN PEA (Bateman, *Mendel's Principles of Heredity*): 'Seed of green round variety, fertilised by pollen of yellow wrinkled variety, are yellow and round (F 2), the reciprocal cross would give same result. Two pods of F 2 seed borne by the F 1 plant are shown: there were 6 yellow round, 3 green round, 3 yellow wrinkled, 1 green wrinkled.'

all generations) there are three tall peas, but only one is pure and when self-fertilised shows always pure tall progeny. The other two are impure, and when interbred yield mixed generations of talls and dwarfs in the proportions just stated—3–1, or 1 pure tall, 2 impure tall, 1 pure dwarf. Dwarfness has been latent or implicit even in the first (tall) hybrid generation—it is a *recessive* character. Throughout, the unit characters remain by themselves, and finally appear in their purity in definite proportions.

These definite proportions are explained by the hypothesis of segregation: that the unit characters are kept apart in different groups of the germ cells of the hybrids, and that fertilisation by a hybrid with similar groups gives a rearrangement of the unit characters according to the laws of chance grouping.

The unit character may be obvious, such as size, texture, colour, or less apparent, as qualities of resistance to disease in wheat, or broodiness in poultry. But the Mendelian law has not been shown to be universal in its application, though it has been exhibited in peas, beans, wheat, maize, barley, and a few other plants, and in mice, rats, guinea-pigs and rabbits, farmyard fowls and canaries, snails, silkworms, beetles, and some other animals.

MENDELSSOHN, MOSES (1729–86), Jewish philosopher; b. Dessau; s. of Jewish schoolmaster; head of mercantile house, but principally occupied in philosophical pursuits; writings marked by beauty and lucidity of style; laboured for emancipation of Jews, and sought to remedy their neglect of secular studies; first known to public through Lessing; claimed complete freedom for thought; plurality of truths possible, each suited to needs of the time and place; upheld ontological argument for God's existence; argued for immortality of the soul.

MENDELSSOHN-BARTHOLDY, FELIX (1809–47), Ger. composer; b. Hamburg; came of wealthy Jewish family, which finally adopted Christianity, his grandfather being the famous Moses M., the philosopher and historian; before he was ten M. played in public, and at twelve was already a composer; professional training, completed at Berlin and Paris, was supplemented by a liberal general education, and rounded off by extensive tours on Continent and in England, a visit to Scotland resulting in the *Scotch Symphony* and the *Hebrides Overture*, while Italy produced the *Italian Symphony*. Before this, at age of seventeen, he had written his great orchestral work, the *Midsummer Night's Dream* overture. Settling in Leipzig, he directed the famous Gewandhaus concerts there and founded the Conservatoire. His activity was incessant, and directly led to his early death. His works range over almost the entire field of musical form, from song to symphony and oratorio. Himself a skilled pianist and organist, he wrote some splendid works for both instruments, including *Songs without Words*, a form of his own creation; but his genius is best exhibited in his symphonies and two oratorios, *St. Paul* and *Elijah*. M. falls short of the grandeur and dramatic force of the greatest composers, but atones by fine blending of the classic with the romantic.

Cowen, *Mendelssohn* (1912).

MENDÈS, CATULLE (1841–1909), Fr. poet, novelist, dramatic and musical critic; started Parnassian movement; wrote poetry, novels, plays, but greater as critic than stylist; much of his vogue *succès de scandale*.

MENDICANT FRIARS, non-cloistral religious orders formed in XIII. cent.; chief—Franciscans, Dominicans, Claresses, Tertiaries, Carmelites, Austin, Servites; 2nd Council of Lyons, 1274, recognised four orders, Franciscans, Dominicans, Carmelites, and Austin friars, and forbade further orders; root idea absence of property; hence, when engaged in preaching, etc., necessity for mendicancy.

MENDIP HILLS (51° 18′ N., 2° 42′ W.), range of hills, Somersetshire, England; highest point, Blackdown (1067 ft.).

MENDOZA.—(1) (*c.* 33° 20′ S., 68° 20′ W.) province,

Argentina, S. America; area, 56,502 sq. miles; mountainous in W.; drained by M. and other rivers; coal, petroleum; cereals, tobacco, wine. Pop. (1910) 225,246. (2) (32° 52′ S., 68° 48′ W.) town, Argentina, S. America; ruined by earthquake, 1861, since rebuilt; produces wine, fruit. Pop. (1911) 42,496.

MENDOZA, DIEGO HURTADO DE (1503–75), Span. novelist and statesman; represented Charles X. at the Council of Trent, and wrote *The War of Granada*, dealing with the revolt of the Moriscoes against the tyranny of Philip II.

MENDOZA, PEDRO GONZALEZ DE (1428–95), Span. cardinal and statesman; fought for Henry IV.; helped to establish Isabella on throne and capture Granada from Moors; made abp. of Toledo, 1492.

MENELIK II. (1844–), emperor of Abyssinia; succ., 1889; owing to illness, duties entrusted to regent, 1909; gave French and British trading facilities and aided British in Sudan War. See ABYSSINIA.

MENENIUS AGRIPPA, see AGRIPPA, MENENIUS.

MENEVIAN, see CAMBRIAN SYSTEM.

MENGTSZE (23° 24′ N., 103° 20′ E.), city, treaty-port, Yunnan, China. Pop. 20,000.

MENHADEN, see under HERRING FAMILY.

MENIÈRE'S DISEASE, an affection characterised by sudden dizziness, noises in the ear, deafness in one or both ears, intense nausea and vomiting—and the individual may stagger and fall down unconscious. The symptoms arise from disturbance of the internal ear caused by hæmorrhage or inflammation, due, for example, to intense heat, rheumatism, influenza, syphilis, anæmia. The treatment is to remove the cause if possible, treat any primary cause, such as the diseases noted above; remove wax which may be pressing on the drum of the ear, and, in an attack, apply cold compresses to the head, keep the patient quiet in a darkened room; bromide and iodide of potassium have both proved valuable internally.

MENIN, MEENEN (50° 47′ N., 3° 6′ E.), town, on Lys, W. Flanders, Belgium; textiles, tobacco. Pop. 20,000.

MENINGITIS, inflammation of the membranes enveloping the brain (cerebral m.) or the spinal cord (spinal m.), or both. *Simple acute m.* is caused by injury, by extension of inflammation from neighbouring parts, *e.g.* middle ear, or as a complication of various fevers, the upper surface of the brain being the usual site of the inflammation. The symptoms are at first headache and restlessness, then fever, irritation, and convulsions, with retraction of the head, the patient lying in a distinctive position, and then stupor and paralysis ensue, accompanied by the characteristic cry and difficulty in breathing, and death may soon take place. The treatment is to remove any cause, if possible, keep the patient quiet in a darkened room, ice to the head, a purge of calomel, bromides, and keep up the strength by nourishing fluids.

Tubercular m. is usually part of a general tuberculosis, the site of the inflammation generally being the base of the brain, and the symptoms resemble those of simple acute m., the head, however, being usually more retracted and the neck more rigid. The treatment is also the same, but in the early stages the inflammation should if possible be modified by the treatment of the general tuberculosis by cod-liver oil, fresh air, and careful general hygiene. *Epidemic cerebro-spinal m.* is an acute infectious disease due to a bacterium, the *diplococcus intracellularis*, an attack coming on suddenly, with nervous shock, extreme pain at the back of the head and neck, dizziness, rise of temperature, delirium, and perhaps coma, the head being strongly retracted and the limbs and body rigid, and there may be paralysis of one or other of the limbs. Cutaneous eruptions are usually present, in the form of herpes, on the face or on the body, or as a purpuric rash, generally commencing on the legs. The treatment in the early stages is warmth and stimulants to prevent collapse, and later to relieve pain by opium, with bromides for the spinal irritation, but serum treatment is now being introduced with success, the serum being administered as early as possible in the attack.

Spinal m. may be acute or chronic, the symptoms in the former being pain in the back, cutaneous pains, then anæsthesia and paralysis, first of the legs; and the treatment is if possible to remove the cause, as the disease is generally due to extension of disease in the neighbourhood, *e.g.* caries of the spine, extension of other forms of m., with rest, counter-irritation, while bromides and morphine may be given, but drugs are of little use. The chronic form may be the sequel of the acute, or it may be chronic from the beginning, and after symptoms of irritation, on the spinal cord being affected symptoms of local myelitis develop, with hyperæsthesia above the lesion, reflexes lost and muscles atrophied at it, and paralysis below it. The treatment is the same as in the acute form.

MENIUS, JUSTUS (1499–1558), Lutheran divine; at first humanist, then disciple of Luther; wrote various works, one against the bigamy of Philip of Hesse.

MENNO SIMONS (1492–1559), Dutch theologian and founder of sect bearing his name. Influenced by Luther, M. left R.C. Church, 1536. His theology was mostly orthodox, rather puritan in tone. He went from place to place in Holland preaching.

MENNONITES, religious sect called after Menno. They were anti-sacerdotalist, and persecuted by Catholics and Protestants alike, as they disapproved of civil authority although willing to submit to it. They now exist on the Continent and in U.S.A., about 250,000 altogether.

MENOMINEE (45° 3′ N., 87° 36′ W.), city (and county), Michigan, U.S.A., on Green Bay; ships' lumber. Pop. (1910) 10,507.

MENOMINIE (44° 50′ N., 91° 55′ W.), city, Wisconsin, U.S.A., on Red Cedar River; lumber mills, foundries; trade in grain. Pop. (1910) 5036.

MENORRHAGIA, see GYNECOLOGY.

MENSHIKOV, ALEXANDER DANILOVICH, PRINCE (*c.* 1663–1729), Russ. soldier and statesman; of lowly origin and upbringing; became favourite of Peter the Great; won fame as commander-in-chief of army and as agent of Peter's reforms, but extravagantly corrupt; helped to place Catherine on throne, 1725, and Peter II., 1727; overthrown, 1727.

MENSTRUATION, see GYNECOLOGY.

MENSURATION gives the rules for the measurement of length, areas, and volumes, and shows their practical application. It is based on geometry and trigonometry. In the case of a curve which can be expressed by an equation, the formulæ are best obtained by the integral calculus methods. The commonest rules are :—

Lengths.—Circumference of a circle $= \pi \times$ diameter. $\pi = 3{\cdot}1416$ to four decimal places. Arc of circle = circumference × angle at centre in degrees ÷ 360. Cycloid $= 4 \times$ diameter of generating circle.

Plane Areas. — Triangle $= \frac{1}{2}$ base × height $= \sqrt{s(s-a)(s-b)(s-c)}$, where a, b, c are the side and $s = \frac{1}{2}(a+b+c)$. Other formulæ for area : $\frac{1}{2}\, bc \sin A$; $\frac{a^2 \sin B \sin C}{2 \sin A}$. Rectangle = length × breadth. Parallelogram = base × perpendicular height $= ab \sin A$, where AB $= a$, BC $= b$, and angle DAB $=$ A. Quadrilateral, trapezium, rhombus, or irregular polygons are divisible into triangles. Thus, quadrilateral $= \frac{1}{2}$ diagonal × sum of perpendiculars on it. Rhombus $= \frac{1}{2}$ product of diagonals. Trapezoid $= \frac{1}{2}$ sum of parallel sides × perpendicular height. For regular polygons, multiply (side)^2 by the numbers which follow : pentagon, 1·7205; hexagon, 2·5981; heptagon, 3·6339; octagon, 4·8284; nonagon, 6·1818; decagon, 7·6942. Circle, radius r, $= \pi r^2$. Circular ring $= \pi \times$ sum of radii × difference of radii.

Sector = area of circle × angle of sector in degrees ÷ 360 = ½ radius × arc = ½ (radius)² × angle in radians. Segment less than semicircle = corresponding sector − triangle formed by chord and radii. Ellipse = ·7854 × major × minor axis. Cycloid = 3 × generating circle. Parabola = ⅔ base × height. Some irregular areas can be found by *Simpson's rule*: approximately by the use of paper ruled in known squares. The quickest method is to apply the planimeter or integraph. Similar areas vary as the squares on corresponding sides.

Surfaces.—Sphere = 4 (radius)² × π. Curved surface of zone or segment = height × circumference of sphere. Lune = angle in degrees × area of sphere ÷ 360. Spherical triangle = spherical excess × area of sphere ÷ 720. Cone = base × ½ circumference of base × slant height. Right cylinder = ends × circumference × height. Pyramid = base + sides. Prism = ends + sides. Frustrum of cone = ½ sum of circumferences at ends × slant height.

Volumes. — Rectangular parallelepiped = length × breadth × height. Cube = (edge)³. Parallelepiped, prism or cylinder = area of base × perpendicular height. Sphere = (diam.)³ × ·5236 = ⅙ circum − cylinder. Segment = ·5236 $h(3R^2+h^2)$, where R = radius of base, h = height. Pyramid and cone = ⅓ area of base × height; frustra = ⅓ height × (areas of ends + $\sqrt{\text{product of areas}}$). In gauging, the volume of a cask occupied by liquid is the wet ullage, the remaining volume the dry ullage. For a standing cask less than half-full the mean diameter is estimated as the bung diameter—(dry inches)² × difference of bung and end diameters ÷ (length)²; whence the volume is obtainable. No exact rule can be given for a lying cask. An irregular volume may be determined by finding the amount of water displaced by the body, or by dividing its weight by the weight of a cubic inch of the same substance. For the displacement of a ship or for earthwork the procedure is according to Simpson's rule, where areas of cross sections take the place of ordinates. Volumes of similar bodies vary as the cubes of corresponding dimensions.

MENTANA, see NOMENTUM.

MENTAWEI (2° S., 98° E.), group of islands, off W. coast of Sumatra.

MENTEITH (c. 56° 9′ N., 4° 15′ W.), district, S. Perthshire, Scotland, between Teith and Forth.

MENTHOL, camphor made from oil of peppermint; chief source is *Mentha arvensis*; m. cones produce coldness by evaporation when rubbed on skin, hence use for neuralgia, etc. See TERPENES.

MENTONE (43° 49′ N., 7° 29′ E.), town, France, on Mediterranean; sold to France by Prince of Monaco, 1861; favourite winter resort; produces oranges, lemons, olive oil. Pop. 11,000.

MENTZ, see MAINZ.

MENURA, LYRE-BIRDS (*q.v.*).

MENZEL, ADOLPH FRIEDRICH ERMANN VON (1815–1905), Ger. artist; illustrated *History of Frederick the Great*; brought Realism into Germany.

MENZELINSK (55° 45′ N., 53° 8′ E.), town, Ufa, Russia; large annual fair. Pop. 8000.

MEPHISTOPHELES (Gk. 'he who loves not light') is name given to incarnation of evil. In *Faust* M. is not Satan himself, but his chief minister.

MEPHITIS, Skunk, see WEASEL FAMILY.

MEPPEL (52° 42′ N., 6° 11′ E.), town, Drenthe, Netherlands; dairy produce. Pop. (1910) 11,000.

MEQUINEZ, MEKINEZ (33° 55′ N., 5° 30′ W.), city, Morocco, N. Africa; one of the royal residences; royal burying-place. Pop. 25,000.

MERAN (46° 41′ N., 11° 8′ E.), health-resort, Tyrol, Austria. Pop. (1911) 11,570.

MERCANTILE SYSTEM, the regulation and control by the government of all international commerce. It lasted in England from the reign of Elizabeth to the acceptance of *laissez-faire* in the beginning of the XIX. cent., and its revival is now sought under the name of Tariff Reform. According to the principles of the system, commerce must be conducted as a branch of statesmanship.

MERCATOR, GERARDUS (1512–94), Flemish mathematician; original name, KREMER; studied at Louvain; became lecturer on geography and astronomy; entered service of Charles V. of France; cosmographer to Duke of Juliers, 1559; author of method of projection known by his name, in which meridians and lines of latitude are straight and cut at right angles.

MERCERISING, method of treating cotton so as to give silky appearance; cotton is steeped in solution of caustic soda, and at the same time stretched; soda shrinks material, stretching gives wrinkled silky appearance; discovered by Mercer, and patented, 1850.

MERCHANDISE MARKS, see TRADE MARK.

MERCIA, central kingdom or division of England in olden times, so called because it lay between the remaining Saxon lands and Celtic Wales. Mercians are first mentioned in early VII. cent., when they had already a king. Penda (626–55) established Mercian supremacy, which, after lapses, was restored by Wulfhere (659–75), Ethelbald (716–57), and the great Offa (757–96); culmination under Offa, called *rex Anglorum* by Pope Hadrian I. M. came under Dan. overlordship, 874. Last independent ruler was Ethelfled, 'lady of the Mercians,' who died 918.

MERCIER, HONORÉ (1840–94), Fr.-Canadian statesman; editor of *Courier de St. Hyacinthe*; Solicitor-General in Quebec, 1879; leader of Liberal opposition, 1883; Prime Minister and Attorney-General, 1887–91.

MERCURY, see HERMES.

MERCURY, smallest planet; nearest to sun—mean distance being about 36 million miles; completes a revolution of its orbit in 88 days, and is about 3000 miles in diameter. Professor Newcomb places its mass at $\frac{1}{17}$th that of earth, and density the same as earth's. M. is difficult to see with naked eye owing to proximity to sun; telescopically is of little interest. Faint markings can indeed be seen, but all are indefinite.

MERCURY, QUICKSILVER (Hg = 200·6), liquid metal, occurs native and as *cinnabar*, HgS, at Idria (Austria), Almaden (Spain), California, etc.; obtained by roasting ore ($HgS + O_2 = Hg + SO_2$) and condensing vapour; silvery white, forming spherical globules; 'tails' when impure; purified by dilute nitric acid or distillation; S.G. 13·59, M.P. −38·8°, B.P. 357·2°; slowly vaporises at atmospheric temperature, vapour monatomic; very slowly oxidised to HgO by heating in air; used for thermometers, barometers, etc., for collecting soluble gases, for mirrors and amalgams, and in electrolytic production of caustic soda; forms two series of compounds: mercurous and mercuric; probably divalent in each.

Mercurous oxide, Hg_2O, black powder.

Mercurous chloride, Hg_2Cl_2, *calomel*, prepared by sublimation: $HgCl_2 + Hg = Hg_2Cl_2$, white, tasteless, insoluble in water; dissociates when vaporised ($Hg_2Cl_2 = Hg + HgCl_2$) unless absolutely dry; used in med.

Mercurous nitrate, $Hg_2(NO_3)_2 + 2H_2O$, from cold, dilute nitric acid and mercury.

Mercuric oxide, HgO (Hg = O), 'mercurius calcinatus,' red precipitate; brick-red scales by ignition of nitrate, yellow by precipitation; decomposed by heat: $2HgO = 2Hg + O_2$.

Mercuric chloride, $HgCl_2$, *corrosive sublimate*; from common salt and mercuric sulphate ($HgSO_4 + 2NaCl = HgCl_2 + Na_2SO_4$).

'White precipitate,' from mercuric chloride and ammonia, is $NHgH_2Cl$.

Mercuric iodide, HgI_2, scarlet precipitate.

Mercuric sulphide, HgS, cinnabar, vermilion; black when precipitated.

Mercuric sulphate, $HgSO_4$, white powder.

MERCURY, DOG'S (*Mercurialis*), genus of plants, order Euphorbiaceæ; *M. perennis* or Common Dog's Mercury, a greenish flower, is poisonous.

MERCY, FRANZ, FREIHERR VON (d. 1645), Ger. general in Thirty Years War; defeated French at *Tuttlingen* and made general field-marshal, 1643; defeated at *Freiburg*, 1644; great victory of *Marienthal*, 1645; slain at *Nördlingen*, 1645. Nephew, CLAUDIUS FLORIMOND, COUNT MERCY DE VILLETS (1666–1734), distinguished field-marshal.

MEREDITH, GEORGE (1828–1909), Eng. novelist and poet; b. Hampshire; issued *Poems*, 1851, and *The Shaving of Shagpat*, a burlesque tale, 1855. The first of his great novels, *The Ordeal of Richard Feverel*, appeared, 1859; then followed *Evan Harrington* (1861), *Adventures of Harry Richmond* (1871), *Beauchamp's Career* (1875), *The Egoist* (1879), *Diana of the Crossways* (1885), *One of our Conquerors* (1891), *The Amazing Marriage* (1895).

M. is an acknowledged master of fiction; his psychological studies are great; his fiction is philosophy made readable.

MEREDITH, OWEN, *nom de plume* of 1st Earl Lytton (*q.v.*).

MERGANSER, see under DUCK FAMILY.

MERGENTHEIM (49° 29′ N., 9° 46′ E.), town on Tauber, Württemberg, Germany; mineral springs; seat of grand master of Teutonic Order, 1525–1809. Pop. 4500.

MERGUI.—(1) (12° 29′ N., 98° 31′ E.) town, Tenasserim, S. Burma; pearl trade. Pop. 14,000. (2) district, has area of 9790 sq. miles; forested; produces rice, tin. Pop. 95,000.

MERGUI ARCHIPELAGO (12° 26′ N., 98° 35′ E.), group of islands, in Bay of Bengal, Lower Burma. Pop. 12,000.

MERGULUS, Little Auk, see under GUILLEMOT AND AUK FAMILY.

MERIDA.—(1) (20° 50′ N., 89° 35′ W.) city, capital of state Yucatan, Mexico; cathedral; several educational institutions; exports sisal fibre; manufactures straw hats, hammocks, cigars. Pop. (1910) 62,000. (2) (38° 52′ N., 6° 22′ W.) town, Spain; chiefly famous for fine Rom. remains, which include large bridge, triumphal arch, theatre, and temple. Pop. 11,168.

MERIDEN (41° 32′ N., 72° 46′ W.), city, Connecticut, U.S.A.; plated ware; cutlery. Pop. (1910) 27,265.

MERIDIAN (32° 15′ N., 88° 26′ W.), city, Mississippi, U.S.A.; extensive cotton manufactures. Pop. (1910) 23,285.

MÉRIMÉE, PROSPER (1803–70), Fr. novelist; fought against sentimentalism of other members of early Romantic movement; chief productions short stories, full of imagination, wit, and art, which place his works among chief masterpieces of his cent. Among his chief novels are *Colomba* (1840), *Carmen* (1847), *Chronique du Règne de Charles IX.* (1829), *Matteo Falcone* (1829); characterised by elaborate simplicity, frankness, and cynicism, shown by Maupassant and Anatole France later; chief Romantic effect that of horror, exemplified in *Lokis*; as Inspector of Historical Monuments of France pub. *Voyages Archéologiques*; posthumous *Lettres à une Inconnue*, a lady who has been identified, produced great sensation and curiosity.

MERINO, breed of sheep originally introduced from Africa into Spain; now found in Australasia, Cape of Good Hope, etc.; has short wool; ewes usually hornless; frequently cross-bred with other varieties.

MERIONETH (*c.* 52° 50′ N., 3° 50′ W.), coast county, N. Wales; area, *c.* 668 sq. miles; surface rugged, reaching heights of over 2900 ft.; among highest peaks is Cader Idris; drained by Dee, Dovey, and other streams; capital, Dolgelly. M. has an excellent breed of ponies; sheep reared; has slate and limestone quarries, manganese ore; manufactures woollens. Pop. (1911) 45,573.

MERIVALE, CHARLES (1808–93), Eng. historian; Dean of Ely, 1869; pub. *History of Romans under the Empire*, 1850–62; valued for its style; little contribution to research; member of Apostles' Club.

MERKARA (12° 26′ N., 75° 47′ E.), capital of Coorg, Brit. India.

MERLE D'AUBIGNÉ, see AUBIGNÉ.

MERLIN, bard of Welsh legend; was a son of the devil and an unwilling human mother, and was intended by the infernal powers to be the great Antichrist. The mother, however, had him baptized, and he became a Christian, but retained his magical powers. His prophetic gifts were soon enlisted in the favour of the kings of Britain; through him Uther-Pendragon won his bride, the mother of Arthur, and M. until he finally disappeared from the earth is Arthur's counsellor.

MERLIN, a member of HAWK FAMILY (*q.v.*).

MERLIN 'OF DOUAI,' PHILIPPE-ANTOINE, COUNT (1754–1838), Fr. statesman and jurisconsult; pres. of Convention and member of Committee of Public Safety, 1793; one of Directory; used influence on side of moderation when safe to do so.

MERMAIDS AND MERMEN, in folk-lore sea-dwelling beings, half human, half fish. The mermaid is usually represented as a beautiful woman to the waist, but having a fish tail; she has exceptionally fine hair, which she combs with a golden comb and studies in a golden mirror. Mermaids were sometimes supposed to wed mortal men, and mortal maids were sometimes enticed to the sea by mermen.

MERODACH, see MARDUK.

MEROË, 'ISLE' OF (15° 30′ N., 34° E.), district, S. Nubia, almost surrounded by Nile, Blue Nile, and Atbara; contains ruins of Meroë, capital of ancient Ethiopia.

MEROVINGIANS, first Frank dynasty; named from ancestor Merovech, almost mythical ruler of V. cent.; ruled until 751, when throne was seized by Pippin, founder of Carolingian dynasty. See FRANCE (*History*).

MERRILL (45° 12′ N., 89° 40′ W.), city, Wisconsin, U.S.A., on Wisconsin; trade in lumber. Pop. (1910) 8689.

MERRIMAC (43° N., 71° 30′ W.), river, New Hampshire and Massachusetts, U.S.A., formed by union of two streams at Franklin, New Hampshire; falls into Atlantic at Newburyport.

MERRIMAN, HENRY SETON, pseudonym of HUGH STOWELL SCOTT (1863–1903), Eng. novelist; among novels are *The Last Hope* and *Barlasch of the Guard*.

MERSEBURG (51° 21′ N., 12° E.), town, on Saale, Prussian Saxony, Germany; cathedral and castle; machinery and leather. Pop. (1910) 21,231.

MERSEY (53° 20′ N., 2° 55′ W.), Eng. river; rises in N.W. Derbyshire, flows westward, and falls by an estuary into Irish Sea; length, 70 miles; navigable to mouth of Irwell.

MERSINA (36° 45′ N., 34° 30′ E.), seaport, vilayet Adana, Asia Minor. Pop. 10,000.

MERTHYR TYDFIL (51° 45′ N., 3° 22′ W.), town, Glamorgan, S. Wales; great coal, iron, and steel centre; one of most important iron-smelting towns in country. Pop. (1911) 80,999.

MERV (37° 32′ N., 62° 21′ E.), oasis, Asiatic Russia; taken by Russia, 1884; produces cereals, fruit; live stock raised. Pop. 175,000. Ancient town of MERV dates back to time of Alexander the Great; it belonged successively to Parthians, Arabs, Seljuks, Mongols, Uzbegs, Persians, Bokharians, Turkomans, Russians; new town has pop. 9000.

MÉRYON, CHARLES (1821–68), etcher; b. Paris; s. of an Eng. doctor; died insane; excelled in etchings of Parisian street scenes and buildings.

MESHED (36° 15′ N., 59° 41′ E.), walled town, Khorasan, Persia; has magnificent mosque, which contains sacred shrine of Imam Reza, annually visited by many pilgrims of Shiite sect; manufactures carpets, shawls; formerly an important trade centre. Pop. *c.* 60,000.

MESHED ALI, see NEJEF.

MESMER, FRIEDRICH ANTON (1733–1815), Austrian physician; interested first in astrology and magnetism; promulgated his theory of animal magnetism, believing in the existence of a force in the atmosphere and in himself, with a strong influence on other persons, through which he professed to cure disease; posing as a magician, had great success in Paris, but his theories were eventually discredited. See HYPNOTISM.

MESOPOTAMIA (*c.* 35° 30′ N., 41° 30′ E.), region, Asia. M. is so called from its situation between the two great rivers, Tigris and Euphrates, and in prehistoric times was a centre of radiation of population, racial traits and traces of its religious cults being found in the early races of Egypt, as represented in the inscriptions of the Great Pyramids. In historic times it was divided into the great kingdoms of Babylonia and Assyria (*q.v.*). It was thus an early centre of Sumerian civilisation at the time when it was invaded by the Semites; formed part of empire of Sargon of Akkad, who died *c.* 3800 B.C., and was included in dominions of Babylon under king of first dynasty in III. millennium B.C.; was among dominions of second Assyrian empire in XIII. cent. B.C., and in VII. cent. was again held by Babylonians, from whom it was subsequently taken by the Medes; conquered by Cyrus of Persia *c.* 538 B.C., and was included in conquests of Alexander the Great *c.* 330 B.C.; was among dominions of Parthia under the Arsacid king, Mithridates the Great, II. and I. cent's B.C.; taken by Romans under Trajan, 115 A.D.; conquered by Sapor of Persia, 258; by Emperor Galerius, 298; was part of Arabian empire in VII. cent., and was included in dominions of the caliphs; overrun by Mongols in XIII. cent.; taken by Turks, 1516.

M. has area *c.* 55,000 sq. miles; surface generally level, most of it of extraordinary fertility when under good cultivation; drained by Khabur, Belikh, and other tributaries of Euphrates. Historic towns are Edessa, Nisibus, Harran, Mosul, Diarbekr. M. produces cereals, fruits, cotton, tobacco; live stock raised; climate is very hot in summer.

Baedeker, *Palestine and Syria* (1906); Le Strange, *Lands of Eastern Caliphate* (1905).

MESOZOA, small group containing a few simple and minute animals, which consist of an outer layer of ciliated cells surrounding a varying internal mass. The majority are parasitic in the bodies of Cephalopods, Turbellarian and Nemertean worms, and Brittle-stars. Most authors regard them as lowly Metazoa, linking these to Protozoa, but some consider their relationship to be with Trematode worms.

MESSALLA CORVINUS, MARCUS VALERIUS (64 B.C.–A.D. 8), Rom. general; took republican part against Cæsar; deserted it after *Philippi*, 42; consul, 31; suppressed Aquitanians and enjoyed triumph, 27; distinguished patron of letters; writings lost.

MESSAPII, tribe of ancient Italy; dwelt originally in Calabria, which was also called *Messapia*. All that is known of their language is found in a certain number of inscriptions which were collected by Mommsen. According to Herodotus they defeated the Greeks of *Tarentum*, 473 B.C., and were traditionally subjects of Minos, king of Crete.

MESSENE, a strongly fortified city of ancient Messenia, founded by Epaminondas, 369 B.C., and situated at foot of hill of Ithome.

MESSENIA (*c.* 37° 10′ N., 21° 55′ E.), nomarchy, Greece; settled by Dorians in early times; conquered by Sparta, VIII. cent. B.C.; Messenians rose in rebellion in VII. cent. and again in 464, after which most of them were exiled; returned in 371 B.C., and remained an independent community till coming of Romans, 146 B.C. Pop. 127,991.

MESSIAH (in New Testament, *Messias*) is from the Gk. form of the Hebrew—'the anointed one.' From early times anointing has been thought to convey a sacred character (compare the anointing at the coronation of Eng. kings), and priesthood and kingship were at first intertwined. The idea of Messiahship among the ancient Hebrews only appears after the exile, when the monarchy was no longer and a national redeemer was looked for. It grew in intensity under foreign domination, and in the two cent's before the birth of Christ the expectation of a Messiah-King was part of the circle of eschatological ideas. A suffering Messiah was not expected, hence the difficulty for Jews in accepting Christianity. The belief in the future coming of a Messiah is still part of the creed of every orthodox Jew. The Messianic expectations are shown specially in the *Psalms of Solomon*. Belief in a Messiah has existed far outside Judaism. It appears in the ancient Indian Scriptures, and the Babylonian god, Marduk, has Messianic attributes. Parallels likewise exist elsewhere—even among the North Americans.

Drummond, *Jewish Messiah*; Stanton, *Jewish and Christian Messiah*; Oesterley, *Evolution of the Messianic Idea*.

MESSINA (38° 12′ N., 15° 33′ E.), fortified seaport, Sicily, Italy; capital of province M.; on Strait of M.; had several fine churches, Villa Rocca Guelfonia, museum, univ. (1549), excellent harbour, etc. Ancient *Zancle* (the Sickle), was founded *c.* 732 B.C.; successively conquered by Carthaginians, Romans, Saracens, Normans, Spaniards (1282), and Italians (1860); destroyed by earthquake, 1783; and again, Dec. 28, 1908; chief industries—muslin, silk, linen, coral ornaments, essences; exports oranges, lemons, citrons, wine, almonds, walnuts, pumice-stone, etc. Pop. (1911) 126,172. Province of MESSINA has area of 1245 sq. miles. Pop. (1911) 514,851.

METABOLIC DISEASES is a general term including such functional disturbances as affect the general nutrition of the body. See CRETINISM, DIABETES, GOITRE, GOUT, MYXŒDEMA, RICKETS, RHEUMATISM.

METABOLISM, term applied to the chemical changes which take place in living cells, by which energy is provided for vital activity. See PHYSIOLOGY, ANIMALS.

METAL (Lat. *metallum*, a mine or quarry), from a chemical point of view, an element which can be replaced by hydrogen in an acid and thus form a salt. The chief characteristics of m's are that they are heavy, opaque, insoluble in water, solid (except mercury), fusible by heat or electricity (of which they are good conductors), and capable of uniting with acids and forming salts. Many m's are malleable, some ductile. Some are found in their virgin state, and pure, but they are more generally combined with oxygen sulphur, and are then known as *ores*. The under-mentioned are generally regarded as the chief m's: aluminium, antimony, barium, bismuth, cadmium, calcium, chromium, cobalt, copper, gold, iron, lead, lithium, magnesium, manganese, mercury, nickel, palladium, platinum, potassium, silver, sodium, strontium, thorium, tin, uranium, zinc. The most malleable are gold, silver, copper, tin, lead, zinc, platinum, and iron.

Metallic oxides are solid bodies,—white, black, or coloured,—and oxides of the m's with which their name is associated, as iron-oxide.

Metallography is the study of the internal structure of metals and alloys in relation to the composition and properties. The methods are twofold—thermal and microscopic. The *thermal* method consists in observing and mapping curves of the rate of cooling of the fused material, to discover changes of state, and interpret the phenomena by the phase rule. The *microscopic* method consists in the examination of the illuminated surfaces of prepared slabs of metal by microphotography; characteristic crystalline markings are thus recorded. The results are of much scientific and technical value.

Metallurgy is the science of the properties of metals and the means by which they are extracted from their ores. These properties are: density, fusibility,

tenacity, elasticity, ductility, malleability, conductivity. Metals may occur native (uncombined), or as oxides, sulphides, carbonates, etc. The processes of extraction generally include crushing the ore, roasting to oxide, if possible, and smelting in a furnace with fuel to reduce oxide to metal. Fluxes remove gangue as slag; lastly, the metal is refined. Practical details include the construction of furnaces, lined with suitable refractory materials, and the preparation and valuation of the solid or gaseous fuels to be employed. See ELECTRO-METALLURGY.

METAL-WORK.—The metals mostly used for art metal-work are gold, silver, bronze, iron, and lead. Copper and tin have been employed alone, but their great use has been in forming bronze. The adaptability of gold and silver for almost any treatment has led to their use for the finest work, bronze being used chiefly for casting. The main use of iron is in large work requiring strength along with lightness. Metals are worked principally by casting or by hammering and punching. More metal is used in casting than in hammering, and therefore casting has been employed more for bronze than for the costlier metals.

The earliest *castings* were made by pouring fluid metal into moulds of clay, sand, or stone, and were therefore solid. This involved an unnecessary expenditure of metal, and later a saving was effected by using an iron core. Finally, castings became little more than a thin layer of metal round a clay core. In early *hammer-work* a block of wood was cut roughly into the desired shape, and the metal was hammered over it. A later and more satisfactory method was that of laying the metal upon an elastic mixture of pitch and pounded brick, and beating it from the back. This method was employed with bronze by the Greeks and the Assyrians, and with precious metals by the workers of the Middle Ages. Little is definitely known of the earliest Gk. work, but according to Homer the ancient Greeks had great skill in working bronze and the precious metals. Hammer-work appears to have been used first, but later it became chiefly confined to gold and silver. The Greeks frequently ornamented their bronzes with inlays of gold, silver, or precious stones. The Romans were skilful workers, but largely imitated the Greeks. After the fall of the Rom. Empire, Byzantium became the centre of the art, and Byzantine artists executed the gold and silver work for St. Peter's, Rome, during the VI.–VIII. cent's, and the wonderful gold and enamel work on the altar front in St. Mark's, Venice. XI.-cent. Byzantine workers also produced fine bronze work, especially cathedral doors. Ital. artists gradually learnt Byzantine methods, and their work became celebrated. The magnificent gilt-bronze candelabrum in Milan Cathedral dates from the XIII. cent., and every description of metal-work was produced by the Florentine artists of the XV. cent.—notable examples being Ghiberti's doors in the Baptistery, Florence.

In England, fine ecclesiastical work in precious metals was done in Saxon times, and XIII. cent. wrought-iron work was specially good. Amongst Ger. work the cast-bronze doors of the X. and XI. cent's, and the bronzes of the XV.-cent. Augsburg and Nuremberg workers are famous. In France the Limoges artists were remarkably expert in all kinds of metal work, particularly enamel-ornamented brass, and Fr. designs for decorative doors became celebrated. In the time of Shah Abbas the Great, 1585–1628, Pers. work reached a high standard, especially gilt brass work with inlays of gold and silver. During early Victorian times metal work in England fell to a low level. The foundation of a revival was laid largely by the efforts of the Prince Consort, and the publication of a treatise by Digby Wyatt, but it is only during comparatively recent years that a modern school of art metal-work has come into being, producing work in new combinations of metals, with coloured wax, stained ivory, enamel, etc. Modern Fr. work is distinguished by its great refinement, and Jap. and Chin. work still maintains its excellence, but is in danger of losing something of its unique individuality through Western influences.

METAMERES, see under METAMERISM.

METAMERISM.—The body of some bilaterally symmetrical animals is divided into successive segments, *i.e.* divided into segments or *metameres*, similar chambers of the body cavity in which organs are repeated. This is most noticeable in the Annelid Worms, *e.g.* Lobworm and Earthworm, where the body is marked off into rings, five of which typically form a segment or *arthromere*, the beginning of which is indicated by the presence of appendages, gills, or sense organs. In each segment is a section of the alimentary tract, and often a pair of nephridia or testes, accompanied by a repetition of the nervous and blood-vascular systems. M. in the Vertebrate body is more obscure, each segment being known as a *diarthromere*.

METAMORPHISM, a name used to describe the change which takes place in certain rocks when subjected to subterranean heat, extreme pressure, or to chemical action. Both their structure and mineral character are altered, and they lose their original sedimentary nature and become hard, shining, and crystalline, being, in fact, transformed into entirely new types. Thus limestone may be changed into marble, granite into gneiss, coal into graphite, etc. Such rocks (metamorphic) occur on the Azoic strata and contain neither animal nor vegetable remains, and are therefore sometimes called the non-fossiliferous rocks. Percolating water is another agent by which rocks may be changed, as is the weathering of exposed rocks. All these changes take place gradually, and although a large number of metamorphic rocks are sedimentary, yet there is almost an equal number which are of igneous origin.

The term *Metamorphic* was introduced by Sir Charles Lyell, and is now generally adopted by geologists, to describe the deepest system of rocks composing the earth's crust and consisting of crystalline schists, and including granitoids, gneiss, quartz, mica-schist, and clay-slate, etc. M. rocks have a well-defined character, are of great thickness, and cover large areas in many parts of the globe.

METAMORPHOSIS.—Though formerly more generally used in treating of development, this term is now restricted to a series of changes from egg to adult, where, to meet a special environment, the introduction of an intermediate or larval stage is necessary in the life-history of a species. The occurrence of a *larva* is general in aquatic forms, especially when marine, but is rarer in terrestrial animals, insects being the most specialised in the last group. Among aquatic larvæ we find the Pilidium of Nemerteans, the Bipinnaria of Starfishes, the Pluteus of Sea-Urchins and Ophiurids, the Auricularia of Sea-Cucumbers, the Trochosphere of Worms and Molluscs, the Cipris, Mysis, Nauplius, Zoëa, and Megalopa of Crustacea. The Tadpole larva of Frog is of interest, as pointing to the transition from aquatic to aerial respiration as a step in Vertebrate evolution. The development of the Ascidian larva is an interesting case of retrogressive m., the highly organised Tadpole degenerating into a simple adult. M. is carried to its highest point among insects, where such a complete reconstruction of the wormlike larva is necessary before reaching the imago or perfect insect, that a quiescent or *pupal* stage is required. When an insect has no m. it is *ametabolic*, when it has an incomplete m. with larval but no pupal stage, it is *hemimetabolic*, when it has a full m. with larva and pupa, it is *holometabolic*. See also LARVAL FORMS.

METAPHOR, figure of speech in which one thing replaces another resembling it, *e.g.* 'He was a lion in the fight.' A SIMILE introduces a comparison, *e.g.* 'He fought like a lion.' In a *mixed metaphor* the images are confused, *e.g.* 'To take arms against a sea of troubles.'

METAPHYSICAL POETS, term applied by Dr. Johnson to the Donne school of poets, who strove to catch a meaning 'after the physical': Crashaw, the

worst offender, shows the school's fanciful conceits at their worst when he writes of a lady's eyes as 'Walking baths, compendious oceans.' Cowley was one of them.

METAPHYSICS, the inquiry into the nature of Being and of the fundamental ideas connected with it. In its widest usage M. includes *Ontology* and *Epistemology*. Kant limits it to the latter. Wolff divides m. into ontology, dealing with existence in general, and rational psychology, cosmology, and theology, the sciences respectively of the nature of the soul, the world as a whole, and of God. The term itself is taken from the position after the Physics of Aristotle (*meta ta physika*), of a treatise dealing with 'being as being,' i.e. ontology. This ontological inquiry into the nature of the unity behind the multiplicity of phenomena was the main pursuit of the Gk. metaphysicians. Later thinkers have inquired into the process of knowing. Nevertheless, modern m. tends to return to the Gk. inquiry into being as being, for the theory of knowledge of the epistemologist must at the same time also be a theory about things as being.

Gk. speculation, in the pre-Socratic period, belongs to the Ionic, the Eleatic, and the Pythagorean schools. The earliest, the IONIANS, natives of Gk. colonies on the Ægean Sea, sought a physical unity underlying the universe, basing their conception on an examination of facts of the world. Thus Thales (VI. cent. B.C.) finds the origin of all things in Water, Anaximander in the 'Infinite,' Anaximenes in Air, Heraclites (fl. 500 B.C.) in a universal cycle to and from 'Cosmic Fire.' The PYTHAGOREANS, following Pythagoras of Samos (575–500 B.C.), found the key to the universe in number and proportion, which determine the nature of each thing whatever we take as its original matter. The ELEATICS, of Elea in S. Italy, unlike the Ionians, sought a notional principle of unity, which they derived from religious reflections on the nature of God. Its founder, Xenophanes (b. 570), affirms the government of all things by an effortless exercise of God's thought; Parmenides, in opposition to Heraclitus, denies change and variety and maintains the indestructibility of matter. This divergence between the Ionian and the Eleatic views of nature influenced the philosophers who followed. Empedocles of Agrigentum (*c.* 500 B.C.), Anaxagoras (500–428 B.C.), and the Atomists, Leucippus and Democritus (b. 460 B.C.), accepted the Eleatic immutability of matter, but not its absolute oneness; the Ionic 'becoming' is explained as due to the mixture of a number of unchangeable substances. Empedocles affirms four elements—Air, Earth, Fire, Water, united under the influence of Love and Strife. Anaxagoras conceives a number of 'seeds' of different kinds of matter, with 'Nous,' or Intelligence, as the combining principle. This leads to the *atomic theory* of Democritus, according to whom, bodies are composed of indivisible, unchangeable atoms, solid, incompressible, having no secondary qualities, differing only in figure, position, arrangement, and weight. After the Atomists. Gk. thought becomes sceptical of our ability to determine the existence or attributes of God and nature. The PRE-SOCRATICS, however they differ in their metaphysical views of being, agree in their epistemology; they are all SENSATIONALISTS, taking account only of sensation, which they take to proceed in us in a material fashion. The SOPHISTS, Protagoras (490–415 B.C.), and Gorgias (480–375 B.C.), keep so closely to the subjective standpoint of individual experiences that physical science having objective validity seems impossible; hence they devote themselves to practical affairs.

SOCRATES (469–399 B.C.) holds that knowledge is possible, but only of men as a moral agent; in this sphere, he aims at concepts scientifically true, definitions reached by generalisations from particulars. PLATO (427–347 B.C.) unites the Heraclitean 'becoming' with the Eleatic being and the Socratic 'Definition.' The senses are unreal, yet participate in being, since the sensible objects are copies of eternal ideal bodies. With these archetypes, the soul was familiar in a previous existence, learning being thus merely a process of remipiscence. God is the highest Idea, and forms the universe by impressing the ideas on to the formless matter. According to ARISTOTLE (384–322 B.C.) matter is mere potentiality, a capacity for existence, to which actuality is given by 'form,' or the essence of things. In Plato and Aristotle are found the highest development of Gk. m. After them, speculation forms part of the general thought of civilisation due to the fusion of the Mediterranean peoples under the Rom. power. The materialism of Democritus is revived by the EPICUREANS and STOICS, though the former grant to the atoms, in order to explain the formation of the world, power to swerve from the straight line. The NEO-PLATONISTS of Alexandria attempt to combine Platonism with Christianity. Gk. thought reaches Arabia (see ARABIAN PHILOSOPHY) through the expulsion of the Nestorians from Syria in the V. cent. The speculations of the PATRISTICS and of SCHOLASTICISM (*q.v.*) are an attempt to unite the thought of Plato and Aristotle with Christianity.

Modern Metaphysics approaches the problem in a different way from the ancient. Aristotle inquired the nature of being as being, not always making clear whether we can really know the things whose existence he affirmed. Modern metaphysicians, on the other hand, ask rather what are the things we know, and thus treat ontology in close connection with epistemology, the theory of knowledge.

According to the importance placed on matter and mind, modern metaphysical systems may be classed as *Materialistic* or *Idealistic*, with *Realism* as an intermediate doctrine. MATERIALISM, in its modern sense, holds that all we can know is body, of which mind is a function. Its development in the middle of the XIX. cent. is due to the rapid advances in science, under Lavoisier, Lamarck, Laplace, and Lyell, in commerce, manufactures, and industrialism. Its leading exponents of this period are Moleschott, Vogt (who taught that thought is related to the brain in the same way as the bile to the liver), and Büchner, with his doctrine of life as due to the spontaneous generation of certain combinations of matter under favourable circumstances. More recently, Haeckel has identified substance with body, of which mind is an attribute, and has traced the evolution of all organisms from a single cell originated by spontaneous generation from inorganic carbonates. Conscious soul is a mere function of brain; soul is a function of all substances; God is the force or energy of nature. Tendencies towards materialism are found in Comte's denial of God and the soul, in Spencer's definition of evolution, and in the writings of Huxley and Tyndall.

Metaphysical IDEALISM, which affirms that objects of knowledge are mental, develops, from Descartes to Fichte, out of the psychological idealism according to which we perceive only mental objects. The *dualism* of Descartes (*q.v.*) tends to idealism through the emphasis placed on the will of God; Spinoza's *pantheism* does not reduce extension to thought, but only affirms the same substance as at once extended and thinking; Leibnitz comes nearer metaphysical idealism with his doctrines of monads, simple, indivisible, unextended substances, capable of perception and appetite. In England, Locke's reference of primary qualities to external things is followed by Berkeley's doctrine of ideas as the objects both of perception and of knowledge, and by Hume's denial of substantial souls. Kant teaches the combination by the synthetic understanding of a world of sensation into phenomenal objects of experience (*Transcendental Idealism*). Fichte takes the final step by denying things in themselves and making the not-self the product of the Ego. This is *Noumenal Idealism*; the mental things we know are not mere phenomena of sense, but noumena. After Fichte are various forms of Idealism, varying in their definitions of what the noumenal mental world consists of. Schelling identifies the noumenal

Subject and Object; these are products of the Absolute which is known by an intellectual intuition; Hegel affirms the differentiation of Absolute Reason into Subject and Object, and the identity of both; according to Schopenhauer, the world as phenomenal is idea, as noumenal, will; with von Hartmann, the world as noumenal is both unconscious intelligence and unconscious will; Lotze regards nature, or bodies moving in time and space, as a system of phenomena caused in us by the activity of God, but as in itself the system of the universal actions of God's infinite spirit aiming at a supreme Good; Fechner sees in the universe a communion of spirits; the souls of plants, animals, men, are different members of the soul of the world (*Panpsychism*). Later Germans, Lange and Mach, returning respectively to Kant and Hume, hold that we perceive at first and know finally only phenomena of sense (*Phenomenal Idealism*). In England, Hume's phenomenalism has influenced the Mills, Bain, and Spencer; Kant and Hegel have found interpreters in Caird, Green, Bradley, Laurie, and Martineau. Recently, a school of Personal Idealists (Pringle-Pattison, Schiller, Hastings Rashdall), protest against all Idealist systems which merge all minds in one, and thus exclude personality and responsibility; we have in consciousness a sure proof of a real and indivisible self (see *Personal Idealism*, Oxford, 1902).

Metaphysical REALISM regards both mind and body as substances. Descartes and Locke are Psychological Idealists, but Metaphysical Realists. In Germany the leading Realists are Trendelenburg (1802–72), Dühring, Günther (1783–1863), and von Kirchmann (1802–84). In France, the *Spiritualistic Realism* of Cousin (*q.v.*) lays stress on spirit rather than on body. Brit. Realism is represented by the Scot. philosophers, Reid, Stewart, Hamilton, and more recently by Mansel, Veitch, and Calderwood; an immediate perception is affirmed of an external world, taken to consist of matter, not of ideas. The *Hypothetical Realism* of Shadworth Hodgson (1832–1912), Martineau, and A. J. Balfour supposes that we infer a material something on perceiving a mental something.

Metaphysical systems may also be classified as *monistic* or *dualistic*, according as they affirm one or two forms of reality. Those who believe only in mind and those who believe only in body are equally monists; thus Spinoza is a materialistic monist, Hegel an intellectualistic. Monism and dualism are not really opposed, since conceivably one kind of reality may be neither body nor soul entirely, *e.g.* the Realism of Aristotle is a monism of substance and a dualism of body and soul. Dualism may affirm either that mind and matter are absolutely heterogeneous, with no causal relation between them, or that mind cannot know matter in itself, though compelled by its own laws of cause and effect to assume matter as the origin of sensations. A third term, *pluralism*, assumes more than one principle of being.

Ladd, *Introduction to Philosophy*.

METAPONTUM, colony in Italy, founded by Achæans, *c.* 700 B.C.; inhabitants aided Hannibal and fled with him, 207 B.C. Pythagoras taught here.

METASOMATISM, a process in which the chemical composition of rocks is altered or modified; generally caused by water or steam; often forms new minerals, or changes rocks of igneous character into massive quartz. Of all rocks perhaps limestones are most subject to m., owing to their solubility in water.

METASTASIO, PIETRO, TRAPASSI (1698–1782), Ital. poet; b. Rome; protégé of Rom. lawyer, who left him his wealth; 'discovered' by La Romanina, the great singer, he became world-famous as writer of librettos, his plays being set to music; app. Court Poet at Vienna, 1729, where he died. His plays, all written on classical themes, have been translated into English.

Life, by Fanny Burney (3 vols., 1796).

METATHERIA, see MARSUPIALS.

METAURUS (43° 47′ N., 13° E.), small river, Umbria, flowing into Adriatic; modern Metauro; on its banks Romans defeated Carthaginians, 207 B.C., Hasdrubal being killed.

MÉTAYAGE SYSTEM, the payment by the farmer of a fixed proportion of the crop as rental instead of money; still very common in Italy, Austria, Portugal, and Russia.

METELLUS, name of Rom. family of *gens Cæcilia*. Chief members: (1) LUCIUS CÆCILIUS METELLUS, who distinguished himself in first Punic War, 251 B.C., and rescued Palladium from flames in temple of Vesta.—(2) QUINTUS CÆCILIUS METELLUS MACEDONICUS (d. 115 B.C.), who made Macedonia a Rom. province; one of first two plebeian censors, 131.—(3) QUINTUS CÆCILIUS METELLUS NUMIDICUS, consul, 109, defeated Jugurtha in Numidia.—(4) QUINTUS CÆCILIUS METELLUS PIUS, consul, 80.—(5) QUINTUS CÆCILIUS METELLUS PIUS (Scipio), s. of Scipio Nasica; adopted by (4); Pompey's f.-in-law.

METEMPSYCHOSIS, called popularly **Transmigration of Souls**, the belief that our life here is only one of a series of incarnations in the past and future. A human soul can so inhabit the body of another human being or an animal. It is very prominent in Hinduism, whence it has been taken over by Western theosophists, but it is generally regarded as unscientific and as unchristian.

Bertholet, *Transmigration of Souls*.

METEOR.—Meteors, commonly known as 'shooting stars,' are dark bodies, revolving around the sun, or drawn to solar system from outer space, which happen to meet the earth. Their rate of travel is so great that the friction caused by their passage through our atmosphere renders them incandescent, and we on earth, below, see a streak of light in heavens. It is supposed that they commence to glow at a height of about 80 or 90 miles, and move at a speed of anything up to 20 miles a second. They seldom get nearer than 10 or 15 miles from earth's surface, and are very small bodies, as a rule not weighing more than a few ounces, if so much. See METEORITES.

Meteoric Showers.—On certain nights a greater number of meteors are seen than at ordinary times, and these are known as meteoric showers. While meteors are solitary stray bodies, meteoric showers are caused by swarms of meteors moving in orbits round the sun, which orbits intersect that of the earth, and when the earth happens to be at the point of intersection at the same time as the meteor swarm, a meteoric shower is seen. Connection has been established between certain swarms and comets, and it is believed they are really the débris of disintegrated comets.

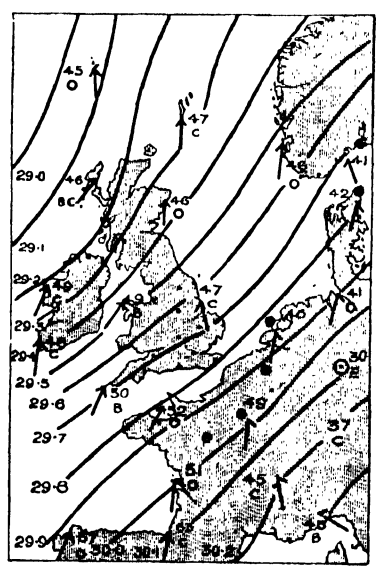
The principal meteoric showers, with the constellations from which they radiate, are as follows:—

Quadrantids	Jan. 2, 3.	from Corona Borealis.
Ursids .	Mar. 24.	Ursa Major.
Lyrids .	Apr. 20–23.	Lyra.
Perseids .	Aug. 10–14.	Perseus.
Leonids .	Nov. 13–15.	Leo.
Andromedids	,, 17–23.	Andromeda.
Germinids	Dec. 10–12.	Gemini.

METEORITES (Gk. *meteoros*, 'raised up on high'), masses of mineral matter which sometimes fall to earth from the sky. M's are divided into three classes: (1) *Siderolites*, composed of iron and stone; (2) *siderites*, composed chiefly of iron; and (3) *aërolites*, composed entirely of stone. Some of these bodies weigh many pounds, whilst others have been found (but none actually seen to fall) weighing tons; from the composition of these latter there is no room for doubt that they have an origin of this nature. A curious fact is that no fossil meteorites have ever been discovered. Many m's may be seen in our museums, and perhaps the best known of all is the Rowton siderite, which weighs 7¾ lb. This specimen is now in the Natural History Museum, South Kensington. It fell to earth some 10 miles N. of the Wrekin, Shropshire, on April 20, 1876.

Fletcher, *Introduction to Study of Meteorites*.

METEOROLOGY is the science which deals with the physics of the atmosphere, particularly in its relation to weather and climate. The meteorological elements whose study is thus included are the temperature, pressure, and humidity of the air; the direction and speed of the wind; the amount of rainfall, including snow and hail; the duration of bright sunshine; the nature, amount, and motion of the clouds; the occurrence of such phenomena as thunderstorms, aurora, etc. Now the *atmosphere* is a gaseous envelope, subject to gravity, lying on a spheroidal surface, of which three-fourths is water and one-fourth is land, and on which the distribution of water and land is unsymmetrical. Further, this surface is in rotation on its axis at a comparatively high speed. Lastly, the atmosphere is affected directly and indirectly by solar radiation. This brief statement will show that the elucidation of the physics of the atmosphere, so that the diurnal and annual march of phenomena may receive particular explanation, and so that the occurrence of non-periodic phenomena may be predicted, is a problem of an exceedingly complex kind. All that is possible here is to indicate the methods by which it has been attacked.



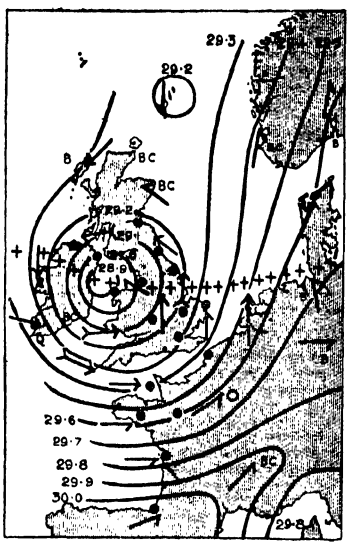
In a few places there are fully equipped weather *observatories*, at which, either by self-recording instruments or by hourly readings taken day and night, a continuous record of the values of the meteorological elements is obtained. At a large number of stations one or more of the elements is observed at a fixed time or times daily. The data so obtained may be utilised in different ways, the chief of which are (1) the preparation of climatological data, (2) weather forecasting, and (3) the investigation of special problems.

Before dealing with these, it has to be mentioned that the meteorological elements undergo variations of three kinds. The first is the change due to the axial rotation of the earth, which at any instant brings one-half of the earth and its overlying atmosphere under the influence of solar radiation. In consequence there is a diurnal variation of temperature, pressure, humidity, etc., at each point of the earth's surface. Secondly, owing to the obliquity of the ecliptic and the consequent changing declination of the sun throughout the year, there is an annual variation which marks the seasons. Thirdly, over and above these periodic changes, there are aperiodic or irregular fluctuations frequently large enough to mask the diurnal change and to reverse, for the time being, the effects of the annual change. Roughly speaking, the combination of the average value of the meteorological elements at a place with the diurnal and annual variations locally, constitutes the *climate* of the place. The combination of the average value with the aperiodic fluctuations constitutes the *weather* experienced at the place.

Treating meteorological observations from the climatological point of view, the object, therefore, is to obtain in the first place the average value of each element at the locality of observation. As an example, we may take the temperature of the air. If observations of temperature be made at each hour on a particular day, the average of these twenty-four readings will give a fairly accurate estimate of the mean temperature of that day. Doing this for a month, adding together the mean daily temperatures and dividing the sum by the number of days in the month, we obtain the mean temperature for that month. Similarly, the average of twelve successive mean monthly temperatures will give the mean annual temperature of the place. It should be mentioned here that the average of all observations taken at a particular hour of the day over a sufficiently long period gives the mean temperature for that hour. Similarly, we can obtain the mean temperature for each hour of the day, and the figures so obtained will represent the diurnal variation of temperature. Mean monthly temperatures may be grouped in the same way to give the annual variation of temperature.

Suppose now that observations of this kind have been taken at a large number of places on the earth's surface, and that we take the mean temperature for January at each. Marking these on a map of the earth, we can draw a line through all places where the mean temperature at that season is, say, 50° Fahr. We should find it to be a line which, in the northern hemisphere, passes from Amoy, through Tibet, Afghanistan, northern Persia, Asia Minor, southern Greece, southern Italy, Corsica, central Spain, Cape Finisterre, then northwards to the west of Land's End, across the Atlantic to Charlestown, and after crossing the U.S.A. and through Brit. Columbia, it traverses the Pacific. In the southern hemisphere it is a line passing round the globe in an average latitude of about 48° S., and only approaching land in the vicinity of Cape Horn. These, then, are the *isothermals* (*i.e.* lines of equal temperature) of 50° Fahr. for January. Similar lines can be drawn for other temperatures and the whole series gives a map from which important conclusions can be drawn, especially when compared with a similar isothermal map for July, the opposite season of the year. Again, with atmospheric pressure we may draw *isobars*, or lines of equal pressure, on a map; and so on for any other meteorological element whose distribution has to be studied.

Turning now to the second purpose for which meteorological observations may be made, we have to consider the *forecasting* of weather. In many countries arrangements are made whereby observations made at a certain hour at a number of stations are telegraphed to a central office where they can be compiled into a *synoptic chart* showing for the area under consideration the principal meteorological elements. In the case of the U.K. the area dealt with is a rectangle lying in latitude between the Arctic Circle and the southern shore of the Mediterranean, and in longitude between Constantinople and the middle of the Atlantic. The data are received from 29 Brit. stations, 31 on the Continent, and 7 in the Atlantic islands. Information is also received by wireless telegraphy from ships at sea.



SYNOPTIC CHART SHOWING SOUTH-WESTERLY TYPE OF WEATHER, DECEMBER 19, 1911, 7 A.M. The lines are isobars, numbers at the ends showing pressure; other numbers show temperature; arrows show the direction of the wind and the force by the number of barbs; black dots, places where rain fell; three parallel lines indicate fog; O, overcast; B, blue sky; C, cloudy; BC, blue sky with broken clouds.

With regard to the methods adopted in forecasting weather, 'the fundamental principle is that weather travels, and that if we can find out what weather there is within range and in what direction it is travelling, we can warn one part of our area of changes that have already shown signs of their appearance in some other part.' Accumulated experience in the compilation of weather charts has led to the recognition of certain fairly well-defined types of disturbance or change, to a knowledge of the direction in which, and the speed with which, these generally travel; and of the results they produce in the several parts of the areas they

affect. The chief are the cyclone, anticyclone, V-shaped depression, and secondary depression. With the experience referred to it is possible to predict with tolerable certainty what will happen in the area through which the disturbance travels.

For example, take the case of a cyclonic storm from the Atlantic, whose centre travels in a straight line from Valentia to Dover — a fairly common track for such disturbances. Its appearance at Valentia is heralded by a fall in the barometer and by a shift of wind towards the south. As it crosses the Brit. Islands, the weather is characterised by easterly winds in the northern half of its front, southerly winds in the southern half, and also by cloud, rain, and squalls. The wind tends to circulate round the storm centre in a direction (in the northern hemisphere) opposite to that of the hands of a watch held horizontally and with face upwards. At the storm centre there is a comparative calm (although this is not so pronounced as it is in the case of tropical cyclones), but after it passes a given point the wind changes rapidly in direction (*veering* and *backing* of wind) and again increases in velocity. But this passes off, the barometer rises, and the skies clear. Where the indraught to the cyclone is from the north, lower temperatures are experienced. If the track of a cyclonic storm were known beforehand, or if it could be predicted with certainty, the work of forecasting the weather in its track would be comparatively simple. This, however, is not the case. In an anticyclone we have an area of high pressure in which the wind circulation is in a direction opposite to that in a cyclone. Further, it is an area where the wind velocity is low, the skies are clear, and (in summer) the temperature higher than usual.

Cyclone of March 24, 1902, 6 P.M.: Lines are isobars, the numbers at the ends showing pressure; B, blue sky; BC, blue sky with broken clouds; O, overcast; Q, squalls; black dots, places where rain fell; crosses show path of cyclone; arrows show direction and force of wind.

The third use to which meteorological observations may be put is the investigation of special problems. Of these there are, of course, a very large number. The following may be mentioned as typical instances: (1) The diurnal variation of pressure and temperature, a matter of some importance in connection with the diurnal changes in magnetic declination. (2) The law of diminution of temperature with increasing height above sea-level. This has been investigated in recent years chiefly by the aid of sounding balloons, and has resulted in the discovery of the *isothermal layer* of air which (in temperate latitudes) occupies a stratum about six miles above sea-level. (3) The relation of wind velocity to barometric gradient. (4) The inclination of wind direction to a given system of isobars. (5) The oscillations of the atmosphere on a large scale, a matter of some importance in the forecasting of Indian monsoons. (6) The detection of periodicity in annual mean values of a given meteorological element; and the companion of seasonal changes at one place with others at another place at a subsequent date.

Bartholomew and Herbertson, *Physical Atlas*; Mill, *Realm of Nature*, *Annual Reports of the Chief Signal Officer* (Washington, U.S.), *Indian Meteorological Memoirs*, *Daily Weather Reports* (London); Lempfert's *Weather Science*; Shaw's *Forecasting Weather*; and the treatises on Meteorology by Dickson, Davis, Russell, Scott, Cleveland Abbe.

Electricity, Atmospheric.—The phenomena of thunderstorms show that the atmosphere is capable of being charged in different parts to different electric potentials. This state of electrification is usually investigated by means of Kelvin's water-dropping collector. This consists of a metallic vessel containing water, insulated from the earth, and from which the water issues through a stopcock to a long tube whose end is at the point whose electric potential is required, and at which the water falls in drops. Each drop as it leaves the tube is charged oppositely to the electrification of the air in its immediate vicinity. Consequently, if an electrometer be connected by a wire to the metallic vessel, the electrification of the electrometer is similar to that of the atmosphere. The indications of the electrometer may be recorded continuously by a photographic process, and such records are of value in showing the diurnal and seasonal variations of atmospheric potential. They show that the atmosphere is practically always in a state of electrification, positive or negative; that it is generally positive in fine clear weather, and negative in wet weather; that a change from positive to negative often precedes or is accompanied by rain; that the difference of potential between earth and air increases with the height, averaging about 200 volts per metre, being greatest at those hours of the day when the temperature is increasing most quickly, and being generally greater in winter than in summer.

The origin of atmospheric electricity may be traced to the ionised state of the air, which state is produced either by radio-active elements in the earth's crust, by the action of ultra-violet light from the sun, or by the emission of streams of charged particles from the sun's surface. At all events, the air is in that state, and in consequence there are contained in it positively and negatively charged particles. According to the condensation hypothesis put forward by Gerdien and others, expansion of the air due to local heating produces ascending currents of air, and, subsequently, condensation of water vapour contained in these currents. To effect this condensation, some nucleus is necessary, and the negative electrons act as nuclei to begin with, because condensation will take place upon them at a lower degree of supersaturation. Being loaded in this way, they will tend to sink in the air, and thus there is caused a separation of the two charges, positive and negative. This may go on until the difference of potential becomes so great that a disruptive discharge (flash of *lightning*) passes between oppositely electrified masses of air. This discharge tends to produce further ionisation of the air, and the process goes on until the air is largely cleared of moisture by the water vapour being precipitated in the form of rain.

This hypothesis is sufficient to explain the ordinary phenomena accompanying a thunderstorm. Lightning, as is well known, is simply an electric spark on a colossal scale passing from one mass of electrified air to another at a greatly different potential. Its passage through the air is greatly facilitated by the ionised state of the air. In its path the air is suddenly heated and expanded, and this sudden expansion causes the noise we know as *thunder*. Sheet lightning is simply the illumination of clouds by lightning flashes so far distant that the thunder produced by them is not audible, and this takes place when the observer is about 10 or 12 miles from the flash. Globe lightning, consisting of a luminous ball travelling

slowly and afterwards exploding violently, has been described, but its occurrence is not clearly authenticated.

METER, ELECTRIC.—The Board of Trade unit of electric energy supplied to the public is the *Kilowatt-hour*; that is equivalent to a current of 1000 amperes at 1 volt running for 1 hour, or a current for which the product of amperes, volts, and hours is 1000. In order to assess the current supplied to a consumer an electric meter which will register the amount supplied is placed at the point where the supply enters the consumer's premises. If, as is usual, the voltage of the supply is fixed and steady, the only factors which have to be determined are the amperes and hours. Meters generally act by employing some measurable effect of the current (or part of the current), *e.g.* electro-deposition of a metal from a solution, acceleration of a clock by attraction of a coil on the pendulum, motion of a train of wheelwork actuated by a small motor.

See Fleming's *Handbook to the Electrical Testing Laboratory.*

METHANE, see MARSH GAS.

METHODICS, see MEDICINE.

METHODISM, see FREE CHURCHES.

METHODIST NEW CONNEXION, religious community split off from Wesleyans in 1797; together with *Bible Christians* and *United Methodist Free Churches* formed **United Methodist Church** in 1907.

METHODIUS (825–85), 'Apostle of the Slavs'; with his bro. Cyril (*q.v.*) made it his life's work to evangelise the Slavs; laboured mostly in Moravia; translated the Scriptures and liturgy into Slavonic.

METHUSELAH, character in Old Testament; f. of Lamech; lived, according to Hebrew tradition, 969 years. See *Genesis* 5^{21}.

METHVEN (56° 25′ N., 3° 35′ W.), village, Perthshire, Scotland.

METHYL ALCOHOL, wood spirit (CH_3OH); distilled from wood; B.P. 66°; intoxicating; used for making dyes and varnishes and for 'methylating' spirit.

METHYLATED SPIRIT, see SPIRITS.

METRE, see PROSODY.

METRIC SYSTEM, see WEIGHTS AND MEASURES.

METRODORUS.—(1) Of Lampsacus, disciple of Anaxagoras, interpreted the Homeric poems allegorically; (2) of Chios, disciple of Democritus; (3) the Epicurean (*c.* 330–277 B.C.), intimate friend of Epicurus.

METRONOME, an instrument indicating the exact speed at which a composition should be played; invented by Winkel about 1812, but patented in Paris, 1816, by Maelzel, to whom the invention is generally attributed.

METRORRHAGIA, see GYNECOLOGY.

METTERNICH-WINNEBURG, CLEMENS WENZEL LOTHAR, PRINCE (1773–1859), Austrian statesman; of ancient noble Ger. family; handsome and tactful; representative of Westphalian nobility at Congress of Rastadt, 1797–99, in which he took prominent part; envoy to Saxony, 1801; ambassador to Berlin, 1803–5, when alliance was formed between Britain, Prussia, Russia, and Austria against France; ambassador to France, 1806; became great favourite of Napoleon, but intrigued against him; arrested at outbreak of Franco-Austrian War, 1809, but released; Minister of Foreign Affairs, 1809, and advised peace with France; Treaty of Schönbrunn, 1809, not due to M., fatally weakened Austria, and M. set himself to recover lost territory; insisted on acceptance of Napoleon's offer for hand of Marie Louise of Austria, conducted her to Paris, 1810, and obtained relaxation of Treaty of Schönbrunn; returned and advocated aiding neither France nor Russia, but playing them off against each other, fearing Russ. designs on Turkey should Russia win; induced emperor to offer support to Napoleon, but assure Russia of non-intervention; Treaty of Vienna, 1811.

After retreat from Moscow, 1812, M. became European mediator; he resolved on reducing power of Napoleon, but skilfully persuaded him of his friendship; rejection of M.'s demands formed a pretext for Austria's declaring war against France, 1813; made treaty with Russia, 1813, but had little common interest with Allies, fearing Russia; was party to Treaty of Chaumont, 1813, to restore Bourbons and old territorial arrangement of Europe; made prince of empire, 1813; prominent at Congress of Vienna, secured domination of Austria in Ger. Confederation and at Congress of Aix-la-Chapelle, 1818. M.'s attitude towards Italy was determined by terror of popular insurrections, and he obtained consent of international congresses to suppress new movements; opposed Gk. independence on principle, and also for fear of weakening Turkey against Russia; Berlin Convention, 1833, recognised right of Powers to intervene to prevent revolutions; called by Palmerston 'Holy Alliance of East,' and M. was its soul.

An excellent administrator, M. was blind to need for reform, and opposed to changes; 1848 was a year of revolutions, and M. fell from power before clamour of Viennese populace; fled to England; returned, 1851, and assisted ministry by advice. Caution and diplomacy, M.'s greatest gifts, were of little use amid general convulsions of his later career. He failed to stem rising tide of Liberalism.

Malleson, *Metternich* (1888); Strobl von Ravensberg, *M. und seine Zeit* (1906).

METZ (49° 7′ N., 6° 11′ E.), town, Lothringen, Germany. M. was Rom. fortress named Divodurum, and was known as Mettis in the V. cent., when it was taken by the Franks, under whom it became capital of Austrasia; passed to the empire in 870, and subsequently became free city of empire; invested by Charles VII. of France, 1444; taken by Henry II., 1552; unsuccessfully besieged by Emperor Charles V. in 1552–53; came into possession of France by Treaty of Westphalia, 1648; fortifications reconstructed by Vauban and Belleisle, 1674; scene of various battles during Franco-German War of 1870, in which year French under Bazaine were shut up in M. and besieged by Germans, who eventually captured the town, which was formally annexed to Germany by Treaty of Frankfort, 1871; has since remained a German possession. M. is a fortress of first class; it is seat of bishopric, and has fine Gothic cathedral dating from XIII. cent. Important public buildings are the town hall, library, museum. Pop. (1910) 68,598.

MEUDON (48° 48′ N., 2° 14′ E.), town, Seine-et-Oise, France; glassworks. Rabelias was Curé de Meudon. Pop. 10,500.

MEURTHE-ET-MOSELLE (*c.* 48° 40′ N., 6° 30′ E.), frontier department, N.E. France; area, 2036 sq. miles; forests, vines, sugar-beet, hops; iron, rock salt; chief town, Nancy. Pop. (1911) 564,730.

MEUSE.—(1) (49° 10′ N., 4° 52′ E.) river, rises Haute-Marne, France, flows through a great part of Belgium and Holland, joins the Waal and enters North Sea; length, 570 miles, of which 400 are navigable. (2) (*c.* 49° N., 5° 25′ E.) department, N.E. France; area, 2408 sq. miles; surface undulating; drained by M.; forests; hemp, iron, wine. Pop. (1911) 277,955.

MEW, a sea-gull. See GULL FAMILY.

MEWS, PETER (1619–1706), bp. of Bath and Wells, 1672, Winchester, 1684.

MEXBOROUGH (53° 30′ N., 1° 20′ W., town, Yorkshire, England; ironworks, potteries. Pop. (1911) 14,398.

MEXICO (14½° to 32½° N., 86½° to 118° W.), a federal republic in the S.W. of N. America, has an extreme length of some 2000 miles, a breadth varying from 1000 to 130 miles (Isthmus of Tehuantepec), and an area of 767,005 miles. It is bounded on the N. by U.S.A., E. by the Gulf of Mexico and the Caribbean Sea, S.E. by Brit. Honduras and Guatemala, S. and W. by the Pacific. The Rio Grande forms 1136 miles of the 1833 miles of the N. boundary. The peninsula of Yucatan forms one of the arms of the Bay of Campeachy, S.W. of the Gulf of Mexico; on the W. coast the long, narrow

Gulf of California runs up between the peninsula of Lower California and the mainland; and S. of the Isthmus of Tehuantepec is the minor inlet of the Gulf of Tehuantepec. The soils are metamorphic, and igneous rocks with sandstone and limestone are found in the north. The greater part of the surface is plateau, along each side of which is a coastal strip of an average width of 60 miles; its border is composed of mountain ranges, from which the height drops to the plateau. The lowest line along the Isthmus of Tehuantepec has a height of less than 400 ft., and the low ground extends along the peninsula of Yucatan, the centre of which has an average height of *c.* 800 ft.

To the S. of the Isthmus begin the Cordilleras of Central America. To the N. two lines of mountains commence—the Sierra Madre range (9000 ft.) on the W. coast, and on the E. the line of heights (16,000 ft.) that pass N. into the Rocky Mts. (sometimes spoken of as the Sierra Madre Oriental). The centre of Lower California is occupied by a range with a height of 7000 to 10,000 ft. In the extreme S., farther inland, a connecting chain with peaks from 12,000 to 19,500 ft. runs parallel to the Sierra Madre. Hence stretches northward the great central plateau, flat, or undulating in surface, with height varying from 6000 to over 8000 ft. There are many dormant or extinct volcanoes, and in the S. a few still in action, but there have been no violent outbursts for a long time, and earthquake shocks, though frequent, are never severe. The N. of the plateau is drained by the Rio Grande and its tributaries; in the interior many of the streams are lost in salt lakes, or are used up for irrigation, and the streams of the coast slopes are mostly short and too rapid to be of use for communication. The coastal strips and low ground are hot and unhealthy, with a maximum temperature of over 100° Fahr., and a rainfall ranging in places up to 130 in. Along the plateau the maximum temperature in summer is about 88°, and in winter the minimum may fall to 30°, falls of snow, though very rare, occasionally taking place. The line of perpetual snow is 15,000 to 16,000 ft. In the extreme N. there is the European succession of seasons, but farther S. there is a rainy season from the end of May to the end of October. Along most of the plateau the rainfall averages 25 in. Members of the extensive fauna are the monkey, wolf, bear, musk rat, raccoon, opossum, armadillo, alligator, vampire, turtle, and pearl oyster.

HISTORY.

It is believed that the ancient inhabitants were, like those of America generally, of the Mongolian race, and that as the Eskimos show resemblances to the Japanese, so the old civilisation of M. was established by people related to the Chinese. When Cortes and his Spaniards landed in 1519 they named the natives *Mexica* (since called Azteca), and their capital and country Mexico. They possessed evidences of a civilisation superior to that of Europe, palaces so extensive that they wearied the sight-seer, forts proving great engineering knowledge, and an elaborate legal code, besides having evolved picture-writing apparently independently. It is probable that they derived their arts from the Toltecs, a kindred Amer. people who, according to the Aztec traditions, settled in M. in the VIII. cent., and became almost extinct in the XI. cent. The peaceful Toltecs contrast (if the legends be true) with the Aztecs, who were, at the coming of the Spaniards, the most bloodthirsty of all Red Indian peoples, sacrificing human victims to their deities, feeding on the victims' corpses, and dressing on State occasions in their skins. Cortes was at first welcomed by the Aztec emperor Montezuma, but as the Span. purpose of annexation became clear there were risings which the conquerors found great difficulty in crushing. Mexico was captured in 1521; Cortes, governor in 1522, was soon recalled, and Mendoza became viceroy of the new Span. kingdom. Armies of Span. Jesuits aided the soldiery in building a European civilisation in place of the Amer. one which was destroyed. Spain obtained vast wealth from this colony, the centre of New Spain, and it was not until the XIX. cent. that successful revolt was made.

The rising of the priest Hidalgo in 1810 ended in his execution; and the attempts of Morelos in 1815, and of General Iturbide, proclaimed emperor of a native state in 1822, failed, but after the deposition of Iturbide, the Span. viceroy O'Donoju (of Irish descent) was forced to recognise the republic of M. (1823). Spain refused to confirm the viceroy's action, and, in 1829, made an attack on M. from Cuba, but was defeated by Santa Anna (*q.v.*), a statesman who now becomes prominent. He profited by the civil strife which broke out between the Conservatives (*Escoceses*) and Liberals (*Yorkinos*), and, in 1833, became dictator. He established a highly centralised government. After his retirement Congress drew up a constitution, 1836, on the lines which he had laid down. In 1836 Spain recognised the independence of M.

Under President Bustamante war with France broke out; San Juan de Ulua was seized, 1838, but restored and disputes settled in 1839. U.S.A. declared war in 1845 as M. refused to acknowledge the independence of Texas; Mexican defeats ended in 1847 with the capture of M. city by General Scott, and M. was forced to agree to a treaty (1848) surrendering Texas in return for 15 million dollars. Santa Anna was again made dictator (1853), but retired in 1855. Civil war speedily followed between the Church party and the Liberals. Church lands were confiscated in 1856, and in return the clerical party overthrew the new Liberal constitution of 1857. The war, which broke out in 1858, ended in the triumph of the Liberals, 1860, and Radical measures followed.

To guard the rights of their subjects who had suffered injury under the new régime, Britain, Spain, and France sent warships to make a demonstration in Mexican waters in 1859, and in 1861 Spain captured Vera Cruz. Juarez, made dictator in 1861, negotiated a peace with England and Spain in 1862, but Napoleon III. sent a strong force under Forey, who in 1863 occupied the capital. He summoned a council of Mexicans and it was decided to establish a monarchy. The Archduke Maximilian of Austria, who accepted the new throne (1864) landed and allowed freedom of the press (1864) and a new constitution (1865), but was not strong enough to keep the warring parties in check, and both Mexicans and U.S.A. complained of the Fr. army which remained in M. The Republican party increased in power; in 1867 the emperor was tried by court-martial and shot, and 2 days later the capital surrendered after 9 weeks' siege. Juarez, president until his death in 1872, showed himself a merciless but skilful ruler, crushing rebels, but his successor, Lerdo de Tejada, speedily fell before the revived party strife; in 1876 Porfirio Diaz headed an armed rising, became president in 1877, and continued the policy of Juarez until 1911, when he resigned. Madero succeeded him, and civil strife led to his being shot dead, along with Vice-Pres. Suarez, two days after their resignation of posts, Feb. 22, 1913.

General Huerta was elected Provisional President of Mexico, Feb. 20, 1913.

M. has also been extremely unfortunate with regard to great natural disasters (earthquakes, floods, etc.).

Government is on the lines of the constitution, amended in some particulars, of 1857. The federal republic is composed of 27 states, 1 federal district, and 3 territories, with a good deal of autonomy. The central government is composed of elected president, appointed for 6 years, Senate, and House of Representatives, the members of each of which are elected for 2 years by universal male suffrage; the separate states have a governor and local congress. The three territories, Tepic, Lower California, and Quintana Rio, are more under control of the central government than the rest. There is a supreme law-court with

various circuit and district courts. Both revenue and expenditure are about £10,000,000. From the nominally universal service in the army exemption is easily obtained by the propertied classes. There is a small, fairly well-equipped fleet. The services budget amounts to over £2,000,000.

The towns with over 30,000 inhabitants are Mexico (470,659), the capital, Guadalajara, Puebla, Luis Potosi, Monterey, Leon, Mérida, Aguascalientes, Morelia, Chihuahua, Pachuca, Oaxaca, Guanajuato, Queretaro, Saltillo, Durango, Orizaba, Toluca. Vera Cruz and Tampico, on the Gulf of Mexico, are the chief ports. They are connected by rail with Mexico; from this line railways northwards form junctions at various points with U.S.A. systems. Across the Isthmus of Tehuantepec a line (200 miles) connects the port of Salina Cruz on the Pacific with Coatzocoalcas on the Gulf of Mexico; should a ship railway ever be constructed, as is often proposed, it will form a route between E. and W. coasts of America shorter by 700 miles than the Nicaragua Canal, and by 1000 miles than the Panama Canal. The total railway mileage is about 10,000.

The soil is fertile, and where irrigation is good two crops can be got in one year, but many of the coast districts are useless as no white man can stand the climate, and much of the plateau is desert from want of water. In the N. great herds of horses, cattle, sheep, and pigs are reared, largely for the U.S. market. Mahogany and dye-woods, wheat, maize, rice, beans, bananas, sugar, molasses, coffee, cotton, henequen (agave, sisal-hemp), cacao, oranges, cocoa-nuts, vanilla, mulberry, cochineal, cinchona, and rubber are obtained, and efforts are being made to introduce vines, olives, and European fruits.

M. is one of the richest mineral countries in the world. Coal is said to exist; silver and gold, which seem to have been worked from the earliest times, are still very productive; the output of silver being estimated at £19,000,000 yearly, that of gold at £1,500,000; copper, iron, lead, tin, platinum, mercury, cobalt, antimony, bismuth, manganese, zinc, petroleum, salt, sulphur, amber, and onyx are obtained. The manufactures, chiefly rum, various spirits, cottons, woollens, cigars, cigarettes, and pipe tobacco, paper, leather, and earthenware, are increasing. The imports are valued at over £13,000,000, the exports at about £30,000,000, chiefly from minerals. An excellent system of national compulsory education has been organised in the last two decades. There is no State Church, but the large majority of the population is R.C. There are about 15 million inhabitants, of whom about 40 % are Indians, a slightly larger proportion mulatto and half-caste Indian.

Prescott, *Conquest of M.*; Bancroft, *Popular Hist. of the Mexican People* (1888), *Resources and Development of M.* (1894); Gooch, *Face to Face with the Mexicans* (1890); Terry, *M.* (1911).

MEXICO.—(1) (*c.* 20° N., 99° W.) state, Mexican Republic; area, 9247 sq. miles; mountainous in S.; gold, silver, cereals, tobacco, coffee; live stock raised. Pop. (1910) 975,019. (2) (39° 10′ N., 91° 55′ W.) city, Missouri, U.S.A.; seat of Hardin Coll. (for women); flour-mills. Pop. (1910) 5939.

MEXICO CITY (19° 25′ N., 99° 5′ W.), capital, Mexican Republic; founded by Aztecs, *c.* 1326; taken by Cortes, 1521, under whom new city was founded; scene of hostilities during war between Mexico and U.S., 1847; held by Americans, 1847–48; headquarters of Maximilian of Austria, emperor of Mexico, 1864–67, when it was successfully besieged by republicans under Diaz. More recent events include riots in 1884, earthquakes in 1908 and 1909, revolution in 1913. M. C. is great railway transit and distributing centre; connected by railway with Vera Cruz, El Paso, Manzanillo, Laredo, and other important towns; manufactures include textiles, clothing, tobacco, paper, firearms. Town is regularly laid out, and has many fine squares and streets; important public buildings are the national palace, containing government offices, observatory, and national museum; municipal palace, national art galleries and library, mint. There is a magnificent cathedral, built 1573–1811; great number of churches, many educational and philanthropic establishments. M. was seat of a univ., 1551–1865, and formerly contained many religious houses. Pop. (1910) 470,659.

MEXICO, FEDERAL DISTRICT OF (*c.* 19° N., 99° 25′ W.), district in S.E. of M. state; area, 463 sq. miles; includes M. City and other towns, and belongs entirely to Federal government of Mexican Republic; administered by governor and other officials nominated by national executive. Pop. (1910) 719,052.

MEXICO, GULF OF (25° N., 90° W.), inland sea, S. of N. America, along coasts of U.S. and Mexico; area, *c.* 1,716,000 sq. miles.

MEYERBEER, GIACOMO, Jakob Liebmann Beer (1791–1864), Ger. composer and pianist; b. Berlin; studied under Clementi and Vogler; visited Italy, 1815; London, 1826; a transition composer, regarded by some as Wagner's forerunner; among his operas are *Robert le Diable, Les Huguenots, Le Prophète, L'Étoile du Nord, Dinorah, L'Africaine,* etc.

MÉZIÈRES (49° 45′ N., 4° 43′ E.), capital of Ardennes, France, on Meuse; leather manufactures; taken by the Germans in 1815 and 1871. Pop. 8500.

MÉZIÈRES, PHILIPPE DE (*c.* 1327–1405), Fr. soldier and scholar; born in Picardy; served in Italy, and in the Fr. Crusade, 1345–46; planned a religious order of Knights of the Passion; chancellor of Cyprus, 1362–72; in Paris, 1373–1405; tutor of Charles VI.

MEZŐTÚR (47° 1′ N., 20° 39′ E.), town, Hungary, on Beretyo; potteries. Pop. (1910) 25,835.

MFUMBIRO, Kirunga (1° 30′ S., 29° 50′ E.), chain of volcanic mountains, E. Central Africa.

MHOW (22° 33′ N., 75° 46′ E.), town, Indore, Central India; military station. Pop. 30,000.

MIAGAO (10° 40′ N., 122° 10′ E.), town, Iloilo, Panay, Philippine Islands; manufactures hemp. Pop. 21,000.

MIAMI (25° 45′ N., 80° 15′ W.), city, Florida, U.S.A., at mouth of Miami; agricultural and fruit-growing centre. Pop. (1910) 5471.

MIANI, Meeanee (25° 27′ N., 68° 22′ E.), village, Sind, India; scene of Napier's victory over army of Sind, 1843.

MIANWALI (32° 35′ N., 71° 33′ E.), chief town, Mianwali district, Multan, Punjab, India, on Indus.

MIAOULIS, ANDREAS VOKOS, or **BOKOS** (1768–1835), Gk. admiral; commander of national fleet in Gk. War of Independence, 1822–27, assisting in relief of Missolonghi, 1823, the fighting at Navarino, 1824, and second siege of Missolonghi, 1825.

MICA (Lat. *micare,* to glitter), a mineral of foliated structure, consisting of thin scales; composed of alumina silicate and containing potash, soda, lithia, and magnesia; of shining, pearly lustre; sometimes m. scales are over 20 in. in diameter and only $\frac{1}{300,000}$ in. thick; it is found in Sweden, Norway, Siberia, Peru, China; varieties are biotite, lepidolite, sericite, damourite, zinnwaldite, iron m., black m. Muscovite, or potash m., is a silicate of alumina and potash, and occurs in granite, gneiss, mica-schist, and other plutonic rocks.

M. is used as window-panes in some countries (as Russia), for lamp chimneys, and stove doors, because of heat-resisting power.

MICAH, BOOK OF, in Old Testament, one of 'Minor Prophets.' M. wrote about the time of Isaiah and before the fall of Samaria in 722. Chapters 1–3 are a denunciation of the sinfulness of the two kingdoms, particularly of the rulers, and prophesy destruction; 4 contains a prophecy of future peace and bliss; 6 describes the wickedness of the people, but 7 ends with a note of hope. Some would make 6 and 7 a later addition.

Horton, *Minor Prophets,* vol. i. (Century Bible); Cheyne (Cambridge Bible).

MICA-ROCKS, an important group of rock-

forming minerals, entering into the composition of crystalline, sedimentary, volcanic, and plutonic rocks, such as talcose rock, granite, gneiss, etc., and

Mica-Schist, a very abundant mineral, and one of the crystalline schists; often contains other minerals, *e.g.* garnet, hornblende, beryl; is often of wavy structure, and may have alternate layers of mica and quartz, or only small shiny scales of mica.

MICHAEL, one of the archangels (*q.v.*).

MICHAEL, name of nine Byzantine emperors.—M. I. persecuted iconoclasts; defeated by Bulgarians, 813, and deposed.—M. II. was condemned to death for conspiracy, but seized throne, 820.—M. VII. lost wide dominions, and resigned, 1078, and retired to a monastery.—M. VIII., founder of Palæologus dynasty; conquered Constantinople, 1261; accepted papal supremacy at Council of Lyons, 1274; won victories in Greece and Italy.

MICHAEL OBRENOVICH III. (1823–68), Prince of Servia; organised Servian resistance to Turkey; sought to expel Turk. garrisons; made defensive alliance with Greece, Bulgaria, and obtained neutrality of Austria and France; Turk. troops withdrawn, 1867; reformed army and civil service; assassinated.

MICHAELIS, JOHANN DAVID (1717–91), Ger. scholar; b. Halle; s. of a noted theologian; prof. of Philosophy at Göttingen, 1746; treated the Bible narratives as valuable documents of Oriental history.

MICHAELMAS DAISY, see ASTER.

MICHAUD, JOSEPH FRANÇOIS (1767–1839), Fr. historian and editor of *La Quotidienne*, but escaped death in Revolution; compiled earliest biographical dictionary, 1789; made hist. collections.

MICHAUX, ANDRÉ (1746–1802), Fr. traveller and botanist; author of two well-known works on N. Amer. plants.

MICHELANGELO, MICHAEL ANGELO (1475–1564), Ital. artist of Florentine school; b. Caprese, s. of Ludovico Buonarroti, who accepted minor duties of State to eke out his income. M. early showed aptitude for art, and in 1488 succeeded in getting himself apprenticed to Domenico Ghirlandajo (*q.v.*); secured the patronage of Lorenzo de Medici, in whose school of sculpture he studied and imbibed much of the Platonic doctrines that had been newly reintroduced into Italy. After Lorenzo's death he went to Bologna, where he executed some commissions for the Aldovrandi, but soon returned to Florence, and fell under the influence of Savonarola. On the advice of the Cardinal di San Georgio, M. journeyed to Rome (1496). To this period belong his *Bacchus* and *Pietà*, but the troublous times in Florence had impoverished his father, and M. returned in 1501. Three years later he finished a colossal statue of *David* (now in the Academy of Fine Arts, Florence), *The Holy Family* (Uffizi Gallery), and was in the midst of several other works when he suddenly returned to Rome (1505), where, at the request of Julius II., he commenced a magnificent monument, but as the pope grew tired of the idea, M. fled to Florence, where he continued his interrupted companion-piece to da Vinci's *Battle of Anghiari*. Reconciliation between the artist and Julius took place after the latter's capture of Bologna (1506). M. was commissioned to cast a colossal bronze statue of the pope, and after great difficulty, as he had no knowledge of metal-casting, finished the work in 1508. He now devoted himself to painting the frescoes in the Sixtine Chapel at Rome, a task which he performed practically unaided, owing to the insubordination of his assistants. The magnificent work took four and a half years to complete, and was delayed by the many difficulties placed in the artist's way by his enemies. After the death of Julius (1513) M. continued his work on the sepulchral monument, which was again interrupted, owing to an offer from Pope Leo to execute a façade in the Church of San Lorenzo (Florence), a scheme which he abandoned owing to difficulties regarding the marble-supply. M. continued in Florence, doing little good work till 1529, when he was appointed chief military engineer to defend the city from the expelled Medici and their allies. After the fall of the city, M. resumed several unfinished commissions, including the Laurentian library and the Medici chapel. He left Florence again in 1534, and journeyed to Rome, in order to complete the Julian monument, but was ordered by Clement to add to his Sixtine frescoes another picture, to replace a painting of Perugino. This task he completed in 1541, and the fresco, known as *The Last Judgment*, is one of the most magnificent pictures, both in conception and execution, that the world has ever seen.

During the later years of his life, M. wrote many sonnets, principally to his friend Vittoria Colonna. These express the artist's emotions and feelings all the stronger because they had been pent up for well-nigh sixty years. His poetry is, like his painting, impetuous, accurate, and compressed. In his old age he became chief architect of St. Peter's, Rome, and to him is due the present design of the great dome. He was busy with other schemes for decorating the city till his death.

In character, M. was proud, somewhat scornful and intolerant, impetuous and violent; he was amazingly versatile and productive, while his devotion to his art and his unsparing labour are fit models for artists of a later age. The more generous qualities came with the advent of old age. His art reflects the qualities of the man. See also PAINTING, SCULPTURE.

Berenson, *The Drawings of Florentine Painters* (1903); Holroyd, *Michelangelo* (1911); J. A. Symonds, *Sonnets of Michelangelo and Campanella* (translations) (1878).

MICHELET, JULES (1798–1874), Fr. historian; prof. of History at Collège Rollin, 1821–26; after Revolution, 1830, app. head of hist. section of *Archives*, and lecturer under Guizot at Sorbonne; became prof. at Collège de France, 1838, and gave celebrated lectures; wrote *Des jésuites*, 1843; *Du prêtre, de la femme et de la famille*, 1844; *Du peuple*, 1845; incurring enmity of Church and suspension of lectures; *Histoire de la Révolution*, 1847–53; monumental work, *Histoire de France*, pub. 1833–67; classic prose, picturesque and eloquent, but strongly partisan treatment.

MICHIGAN (41° 45′ to 47° 28′ N., 82° 24′ to 90° 26′ W.), state in N.E. of U.S.A.; consists of two detached portions, one a peninsula between Lake Superior and N. end of Lake M., the other a larger peninsula between Lake M. on W. and Lake Huron, Lake Erie, and province of Ontario on the E.; area, 58,915 sq. miles; surface of northern peninsula hilly; of the other, hilly in N. and flat in S. M. is drained by Muskegon, Grand, Kalamazoo, Saginaw, and many smaller streams. Capital, Lansing; largest towns, Detroit, Grand Rapids, Saginaw.

M. was first permanently settled by French in 1668, when Marquette established a Jesuit Mission at Sault de Ste Marie; and in 1701 a Fr. fur-trading station was founded at Detroit by colonists under Cadillac. M. remained under Fr. control until 1760–61, when it came to hands of the British, from whom it was transferred to the U.S. after the War of Amer. Independence. After forming part of N.W. territory and Indiana territory in succession, it was organised as separate territory in 1805; temporarily occupied by British during war of 1812–15; admitted as state to Union, 1837.

Executive power is vested in governor, who holds office for two years and is assisted by lieut.-gov.; legislative authority vested in Senate of 32 members and House of Representatives of 100 members, elected for two years by popular vote. M. is divided for local administrative purposes into 83 counties, and is represented at Washington by 2 Senators and 13 Representatives. Religious denominations, in order of numerical importance, are R.C., Methodist, Lutheran,

Baptist, Presbyterian. Education is free and obligatory; there is a state univ. at Ann Arbor, besides a number of important coll's at Detroit, Albion, etc. The **University of Michigan** is an important seat of learning. Charters were granted by governor and judges of territory of Michigan, 1817, 1821, and 1837; opened, 1841; endowed by state, 1867; thoroughly well equipped departments of science, med., law, arts, pedagogy; fine libraries and museums; open to women from 1870.

M. has extensive forests, and lumbering is important industry. Agriculture is also important; M. produces cereals, fruits, vegetables, peppermint; sheep and cattle raised; fresh-water fishing and large shipping trade on lakes. Minerals include iron, copper, coal, salt, gypsum. Manufactures—furniture, flour, beer, leather, paper. Railway mileage, *c.* 10,000. Inhabitants include whites, negroes, Indians, Asiatics; whites of foreign birth include Canadians, Germans, Scandinavians, British, Dutch. Pop. (1910) 2,810,173.

Cook, *M.: its History and Government* (1905).

MICHIGAN CITY (41° 40′ N., 86° 52′ W.), city, Indiana, U.S.A., on Lake Michigan; railroad cars, furniture; trade in lumber. Pop. (1910) 19,027.

MICHIGAN, LAKE (43° 30′ N., 87° W.), one of chain of great lakes of N. America; area, *c.* 22,500 sq. miles; bounded N. and E. by Michigan state, S. by Indiana, W. by Illinois, Wisconsin; connects with Lake Huron by Strait of Mackinac. Chief port, Chicago. Fisheries are important.

MICHMASH (32° 19′ N., 34° 52′ E.), ancient place, Palestine; the modern Mukhmas.

MICHOACÁN (*c.* 19° N., 101° 30′ W.), state on Pacific coast of Mexico; area, 22,874 sq. miles; surface mountainous; rich deposits of gold and silver. Pop. (1910) 991,049.

MICKIEWIEZ, ADAM (1798–1855), Polish poet; b. Lithuania; banished to mid-Russia as being a student agitator, 1824; visited the Crimea in 1825 and described the country in a series of sonnets; pub. four fine epics—*Dziady, Konrad Wallenrod, Grazyna,* and *Pan Tadeusz*; for three years he was prof. of Slavonic at Paris.

MICROBE, see BACTERIOLOGY.

MICROCEPHALIA, see under TERATOLOGY.

MICROCOCCI, see PARASITIC DISEASES.

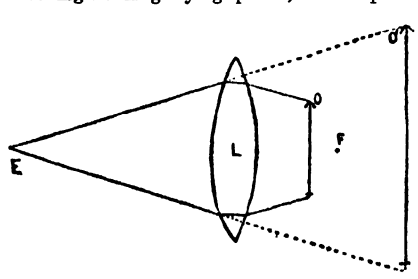
MICROLEPIDOPTERA, see LEPIDOPTERA.

MICROMETER (Gk. *mikros,* small; *metron,* a measure), an instrument for measuring small things, the name, however, being reserved for those mechanical attachments to microscope or telescope with which minute objects under the former, or diameters and distances through the latter, are gauged.

The simplest microscope micrometer consists of a glass disc marked with a network of fine lines forming squares, or with a series of equidistant lines. The disc is slipped within the eye-piece, and rests upon a diaphragm at the focal plane of the image, the lines or squares thus dividing the image into equal parts. With the aid of a stage-micrometer, with lines 1/100 mm. apart, which is put in place of the object, the value of the divisions of the eye-piece micrometer can be discovered, and the dimensions of the original or any other object read off.

Much more complicated than this simple type are the micrometers used with telescopes for measuring the heavenly bodies or the apparent distances separating them. Those most commonly in use depend for the accuracy of their readings upon spider threads placed in parallel strands, and all lying in the plane of the lenses. One or both of the webs, which are placed in the focal plane of the telescope, can be adjusted by an arrangement of exceedingly finely threaded screws, so that each web touches one boundary of the distance to be measured. The heads of the screws are graduated, so that the movement of the screw, which indicates in definite proportion the separation of the webs, can be read on a Vernier scale to the smallest detail. The many varieties of micrometers which utilise spider threads or fine wires, set in parallels or interscoting, as means of measuring are known as FILAR MICROMETERS, and complicated arrangements of lights and mirrors are adopted for lighting the web during nocturnal observations.

Another common form of micrometer is known as the DOUBLE IMAGE M., used for measuring the apparent diameter of the sun, and hence also called a HELIOMETER. In essence this consists of an object-glass cut centrally into two segments which slide along each other. The sliding is regulated and measured by graduated screws, and as each half objective forms a separate image so soon as the optical centres of the segments fail to coincide, the diameter of the object can be converted into the known movement of the optical centres.

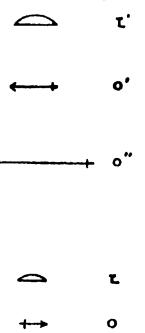


Some other types of micrometer are Rochon's DOUBLE-REFRACTION M., utilising the divergence of ordinary and extraordinary light rays in passing through a prism of rock crystal; the LINEAR M., a graduated scale intersected by perpendicular lines marked upon glass or mica, and placed in the field of the telescope; and the RING MICROMETER, a ring of steel placed in a disc of glass, and inserted in the focus of the telescope. In the two latter cases, the daily motion of the earth was employed as a distance measurer, for from it together with the time occupied by any two objects in passing over a known chord of the ring or along the scale, and with the approximate position of one of the objects in the heavens, the differences between the right ascensions and declinations of the two objects on their relative positions could be computed.

MICRONESIA (*c.* 3° S. to 14° N., 138° to 178° E.), group of small islands, Pacific, Oceania; includes the Caroline, Gilbert, Ladrone or Marianne, Marshall, and Pelew Islands (*qq.v.*); Gilbert Is. belong to Britain; Marshall Is. annexed by Germany, 1886; Caroline, Pelew, and Mariana Islands belonged to Spain till 1899, when they were sold to Germany. Natives are of Polynesian stock, with admixture of Malayan and Mongolian blood.

MICRONUCLEUS, see under NUCLEUS.

MICROPEGMATITE, a felspar of quartz and alkali, occurring in granite and porphyry; generally fine grained and thread-like in appearance.



MICROSCOPE, an optical instrument used for rendering visible objects which cannot be distinguished by unaided vision. In its *simple* form, it consists of a single lens, or of two lenses placed close together. The object, O, under examination is placed between the lens L and the principal focus F. Rays from O are refracted by the lens to a focus at E, and if the eye be placed there, a virtual image of the object will be seen as if proceeding from a similar but magnified object at O′. By means of this simple microscope, an object may be magnified 10 to 20 times, and in this form it is used as a reading-glass, as a magnifier to help in dissecting minute animal or vegetable tissues, and for other such simple requirements. It is conceivable, of course, that lenses of this kind could be made of higher magnifying power, even up to 80,

but this would necessitate the object being placed very close to one side of the glass and the eye equally close to the other side. Apart from this serious difficulty,

there are others. Owing to the difference in the refrangibility of different kinds of light, rays from any object produce, after passing through a simple lens, a series of differently coloured images of the object. This is termed *chromatic aberration*. Also, the rays passing through the peripheral part of the lens are refracted in a different manner from those passing through the parts nearer the centre, and this results in a line of foci being formed instead of a single focus. This defect is known as *spherical aberration*. Owing to the difficulty and defects mentioned, the *compound* microscope has been introduced.

The essential features of the optical system of this instrument are shown in the accompanying figure. Rays of light from the object O pass through a compound system L of lenses (known as the *objective*), and form a real inverted image O′. Above this real image there is placed another compound lens L′ (known

as the *eye-lens*), through which the rays from O′ pass and, reaching the eye above, give a virtual and further magnified image O″. The arrangement should be such that the image O″ is at a distance from L′ slightly greater than that of normal vision, *i.e.* about 10 inches. In order that this may be the case, the real image O′ must be between the eye-lens L′ and the principal focus of the objective L. The chief point of interest in the optical system of a compound microscope is in the objective, for it is here that the elimination of aberration—chromatic and spherical—has been effected in a surprisingly complete manner. In chromatic aberration the less refrangible red rays are brought to a focus farthest from the lens, while the violet rays, being more refrangible, are nearer the lens. If, however, the lens is made up of two parts, one consisting of a convex lens of crown glass, the other of a concave lens of flint glass, the greater dispersive power of the latter allows two colours to combine into light which is approximately white. Thus we may have a combination of yellow and green rays at one point. Such a combination cannot do more, however, in the way of bringing the colours together, and the remaining uncorrected colours form what is known to microscopists as the *secondary spectrum*. The task of the optician is to find other combinations of lenses which will remove this spectrum. Hitherto this was a matter of great difficulty, because the variety of refractive index in different glasses was limited. Owing to the researches of Abbe and Schott at Jena, these difficulties have been overcome, and the optician has now at his command a large variety of optical glass for different purposes. Combinations of lenses which remove the secondary spectrum and correct the spherical aberration are termed *apochromatic* objectives. There are also *semi-apochromatic* objectives in which the secondary spectrum is not entirely eliminated.

The mechanical part of a compound microscope takes many forms, but the following principal parts are found in all. The eye-lens and objective are placed at opposite ends of a brass tube, termed the *draw-tube*, and by means of a screw or toothed wheel this tube can be raised or lowered so that the objective may be brought to any convenient distance from the object under examination. The draw-tube is attached to a stand which supports a *stage* on which the object may be placed. The object is generally mounted on a slip (or *slide*) of glass, and is covered with a disc of thin glass. The stage has a slot or hole over which the slip is placed. Beneath the stage the stand also supports a *substage condenser* which concentrates on the object examined the light reflected from a mirror. Another device used in order to increase the illumination, and to concentrate the rays of light from an object so that they can enter the objective, is to place a drop of oil between the objective and object. The oil has the same refractive index as the glass used. Microscopes of special design are used for the examination of thin sections of rocks by means of polarised light transmitted through them, and for metallurgical purposes to study the microstructure of metals.

For an elementary explanation of the optical systems of simple and compound microscopes, see *The Illustrated Annual of Microscopy* (1898), pp. 99–104. For full description of different forms of microscopes and accessories, and for hints in the use of the instrument, consult Cross and Cole, *Modern Microscopy*, and Spitta, *Microscopy*.

MICROSOME, one of the minute granules embedded in protoplasm; m's seem to vary in nature and function, but it is thought they are produced by the living substance and share in its activities.

MICROSPORIDIA, a sub-class of Sporozoa (*q.v.*).

MICROTOMY (Gk. *mikros*, small; *tome*, a cutting), the finer investigations of morphology have necessitated examination of exceedingly minute structures, and this can often be accomplished only by cutting exceedingly thin sections of the tissues in question. M. is the art of preparing such thin sections, sometimes only 0·015 mm. in thickness. The tissue to be cut is prepared by embedding it in some substance which permeates the cells and, hardening, offers sufficient resistance to the knife, the most common agents being paraffin or celloidin; but the preparation may be simply frozen. The hardened block of tissue is then sliced by a microtome, the cutting edge of which may be a razor worked by hand, or a razor or heavy blade which automatically slices off successive sections of known thinness, such as the automatic and rocking microtomes.

MICROTUS AMPHIBIUS, section of genus Vole (*Microtus* or *Arvicola*), Water-Rat or Water-Vole; well-known Brit. rodent of Mouse family (*q.v.*), found also throughout N. Europe and Asia, except Ireland; frequents banks of rivers and streams; chiefly vegetarian, but at times eats young birds or mice.

MIDAS (classical myth.), king of Phrygia, given, by Dionysus, the power of turning everything he touched into gold; another legend gave him ass's ears, which he tried vainly to conceal.

MIDDELBURG.—(1) (51° 30′ N., 3° 39′ E.) town, Walcheren Island, Zeeland, Holland; has former monastery; XVI.-cent. town hall. Formerly commercial centre. Pop. (1910) 19,564. (2) (31° 43′ S., 24° 59′ E.) town, Middelburg, Transvaal; trading centre; coal-fields. Pop. 4000. Middelburg division has pop. (1911) 63,277.

MIDDLE TEMPLE, see INNS OF COURT.

MIDDLEBOROUGH (41° 53′ N., 70° 55′ W.), town, Massachusetts, U.S.A.; boots and shoes, woollens. Pop. (1910) 8214.

MIDDLEBURY (44° N., 73° 10′ W.), village, on Otter Creek, Vermont, U.S.A.; seat of Middlebury Coll. (Congregational); marble works; iron foundries. Pop. (1910) 2848.

MIDDLESBROUGH (54° 35′ N., 1° 14′ W.), port, Yorkshire, England; iron and steel manufactures; R.C. episcopal see; has R.C. cathedral. Pop. (1911) 104,787.

MIDDLESEX (*c.* 51° 30′ N., 0° 15′ W.), county, S. England, to N. of Thames. M. was invaded by Danes in X. and XI. cent's; battles fought at Barnet during Wars of Roses, and at Brentford during Great Civil War. M. is second smallest county of England;

area, 233 sq. miles, or, including county of London, 283; bounded by Hertford, Essex, Kent, Surrey, Berkshire, Buckingham; surface flat or undulating, nowhere above 450 ft.; drained by Thames; dairy produce, market gardens, orchards. Pop. (1911) 1,126,694.

Middlesex, in Victoria County Histories.

MIDDLETON (53° 33′ N., 2° 12′ W.), town, Lancashire, England; textiles, chemicals. Pop. (1911) 27,983.

MIDDLETON, CONYERS (1683–1750), Anglican divine; aroused great opposition by giving up nearly everything held essential in Christianity; wrote *Life of Cicero*; an able thinker on rationalistic lines; a good stylist.

MIDDLETON, THOMAS (c. 1570–1627), Eng. dramatist; pub. *The Honest Whore* (1604); *A Chaste Maid in Cheapside* is a broad but clever comedy; *The Witch* in some scenes resembles Shakespeare's *Macbeth*, and probably was written before it. *The Mayor of Quinborough* is a tragi-comedy, and contains some of his best work. His most famous dramas are *The Changeling* (his masterpiece), *The Spanish Gypsy* (a romantic comedy), and *Women beware Women*. M. is never sublime, but he never sinks to bathos.

MIDDLETOWN.—(1) (41° 30′ N., 72° 40′ W.) city, Connecticut, U.S.A.; site of Wesleyan Univ., founded 1831; Episcopal see; trades in rubber, cotton. Pop. (1910) 11,851. (2) (40° 12′ N., 76° 45′ W.) city, Pennsylvania, U.S.A., on Susquehanna; ironworks, machine shops. Pop. (1910) 5374. (3) (39° 30′ N., 84° 25′ W.) city, on Miami, Ohio, U.S.A.; tobacco; agricultural implements. Pop. (1910) 13,152. (4) (41° 27′ N., 74° 32′ W.) city, on Wallkill, New York, U.S.A.; ironworks, car-shops. Pop. (1910) 15,313.

MIDDLEWICH (53° 12′ N., 2° 27′ W.), market town, Cheshire, England; salt-works. Pop. (1911) 4910.

MIDGES, see FUNGUS-GNATS.

MIDHAT PASHA (1822–84), Turk. statesman; Grand Vizier, 1871; helped to organise reforming party which deposed Abdul-Aziz and Murad V., 1876, and again became Grand Vizier; failure of reforming party was followed by his exile.

MIDHURST (50° 59′ N., 0° 44′ W.), market town, Sussex, England.

MIDI, south of France; said to begin at Valence.

MIDIAN, N. Arab. tribe in Old Testament; traditionally descendants of Abraham; name applied in Middle Ages to district near Gulf of Akabah.

MIDLETON, MIDDLETON (51° 54′ N., 8° 10′ W.), market town, Cork, Ireland; whisky distilleries. Pop. 4000.

MIDLOTHIAN, EDINBURGHSHIRE (55° 40′ to 56° N., 2° 50′ to 3° 40′ W.), county, Scotland, bordering S. shore of Firth of Forth; crescent-shaped; area, 367 sq. miles; pleasing and varied scenery; towards S. rise Moorfoot (2136 ft.) and Pentland Hills (1898 ft.); chief streams, Esk and Water of Leith; several small lakes and reservoirs among hills; interesting geological structure. There are extensive coal-fields in E., rich oil-shale beds in W., plentiful building-stone, excellent limestone; other industries, paper-making, brewing and distilling, flour-milling, fisheries, shipping, carpets, tweeds, gunpowder, potteries, rope-making, etc. Since Union of 1707, M. has become important agricultural county; soil fertile; much good pasture-land. Lothians were definitely won for Scotland by defeat of Northumbrians at *Carham*, 1018; frequently invaded by Eng. forces, XIV.–XVII. cent's; many battlefields and hist. castles. Pop. (1911) 507,662. See EDINBURGH and LEITH. M'Callum, *Midlothian* (1912).

MIDNAPORE (22° 25′ N., 87° 21′ E.), town, capital of Midnapore district, Bardwan, Bengal, India; copper and brass manufactures. Pop. 33,000.

MIDRASH (Hebrew for 'interpretation'), name given to a body of Jewish writings on the Old Testament. After the final codification of the law under Ezra exposition was still necessary. These expositions and adaptations were called Halacha and Haggada (the Halacha is the legal part of Midrashic lit., the Haggada a miscellaneous collection of material and general exposition), and were for long handed down orally, being only written down in III. cent. A.D. The Halakic M. contains the *Mekilta* ('measure') on Exodus, and the *Sifra* ('book') on Leviticus and Numbers—these go back to about the time of Christ; their exposition is in parts very similar to that of the Fourth Gospel. They are Halacha mingled with Haggada. Of the Haggadic M. there is the *Bereshith Rabbah* on Genesis and on the Megilloth, *i.e.* Lamentations, Canticles, Ruth, Ecclesiastes, and Esther. There are also Haggadic M. on the prophets and later collections. The M. contains parables which supply parallels to those of the New Testament.

Abraham, *Short History of Jewish Lit.*

MIDRIFF, see DIAPHRAGM.

MIDSHIPMAN, naval cadet in process of training; known familiarly as 'snottie' from tradition dating back to Nelson, never called 'middie.'

MIDSOMER NORTON (51° 18′ N., 2° 27′ W.), town, Somersetshire, England; coal-fields. Pop. (1911) 7300.

MIDWIFE, a woman who attends other women in childbirth; in England, by the Midwives Act (1902), no woman may act as a midwife for gain without a certificate, a Central Midwives' Board being created to regulate the issue of certificates and the condition of admission to the roll of midwives, to supervise the training, examinations, and practice of midwives; local authorities exercise supervision over midwives in their district, investigate misconduct, and supply the Central Board with names and addresses of midwives practising in their area. This Act does not, however, apply to Scotland or Ireland.

MIDWIFERY, see OBSTETRICS.

MIERES (43° 15′ N., 5° 48′ W.), town, Oviedo, Spain; coal and iron mines. Pop. 18,000.

MIERIS, FRANS VAN (1635–81), Dutch artist; painted genre pictures and portraits, mostly of small size. His son WILLEM (1662–1747) and his grandson FRANS (1689–1763) were also painters.

MIFFLIN, THOMAS (1744–1800), Amer. soldier and politician; leader of Conway Cabal to substitute Gates for Washington as commander-in-chief, 1777; governor of Pennsylvania, 1790–99; put down Whisky Insurrection.

MIGNET, FRANÇOIS AUGUSTE ALEXIS (1796–1884), Fr. political writer, archivist, and historian; associated as journalist with Adolphe Thiers; his hist. works and editions of MSS. are important contributions to research.

MIGNONETTE (*Reseda odorata*), a plant largely grown in gardens for its exquisitely fragrant flowers. These are zygomorphic and possess a large posterior honey disc. The plant was originally introduced from Egypt.

MIGRATION (Lat. *migrāre*, to wander), the wanderings of animals, of mankind, or even of plants, from one area to another. The most extensive, most thoroughly studied, and most purposeful of such wanderings are the annual migrations of **Birds**; for almost all birds which live outside tropical regions make an autumn retreat from, and a spring advance to, their breeding quarters. But the m's vary greatly in range, and this range in no wise depends upon the apparent capabilities of flight of the species concerned. Some movements are merely parochial, but the extent of others is almost beyond belief; the frail Goldcrest braves the passage of the North Sea, a small New Zealand Cuckoo (*Chalcococcyx*) crosses a 1200-miles stretch of ocean to winter in Australia, and several migrants travel from the Arctic regions to the southern limits of America and Africa, of Australia, and even of New Zealand. During their m's the great streams of birds keep to fairly well-defined routes, following, where possible, a coast-line, or the trend of valleys or

great rivers. Usually they move during the night, and, when the weather is favourable, they pass overhead at great altitudes, sometimes of 20,000 feet, attaining on occasion a speed of 100 miles an hour.

The primary cause of bird m. appears to lie in the necessity of finding more abundant food when cold weather cuts off the supply of insects, or shortening days curtail the feeding hours. But the real journeying has become instinctive, and the causes which drive birds to warmer climes in autumn, the growth of reproductive organs which seems to offer a stimulus to the spring return to breeding haunts, are only the means of setting instinct free. No sufficient reason has ever been advanced to explain the pathless and guideless wanderings of young, untravelled birds, which cross countless miles of land and sea alone, direct to their winter haunts, or the extraordinary accuracy which lands an individual year after year in the very wood it had frequented in preceding summers. To speak of a special sense of direction or an inherited tradition based on experience illumines the mystery only for a moment. See BIRDS, ORNITHOLOGY.

M. among **Mammals** is a rare phenomenon, but two examples may be noted. Most remarkable are the periodic seaward movements of the small vole-like Lemmings, which at uncertain times leave the highlands of Scandinavia, and march in vast hordes, by night, towards the lowlands. During their march, lasting from one to three years, they hold tenaciously to the general direction in which they set out, ceasing not until they reach the sea, and are buried beneath its waves. The European Reindeer, too, though it winters on the highlands of Scandinavia, migrates in summer to the seacoast, as also does the American Caribou, which in warmer weather moves northwards to the shores of the Arctic Ocean.

Many **Insects**, such as the larval 'Army-Worms,' Ants, Locusts, a few Dragon Flies, and several Butterflies, 'migrate,' but the movements are generally uncertain and desultory, although a few of the last-named group, such as the Amer. Monarch (*Anosia plexippus*), have regular seasonal to-and-fro m's along more or less definite courses.

The m's of **Mankind** form a subject too extensive for more than mention. In ancient times they were regulated by the necessity of finding fresh pasture for flocks; this by gradual stages led to the peopling of the habitable earth. Later m's, such as those of the Spaniards to America, or of the Crusaders to Palestine, were dominated by motives varying from the desire for gain to religious fervour, although the former is clearly the predominant influence in most human movements. In our own day over-crowding and its evils accounts mainly for the extraordinary tide of m. which has set in from the older countries to newer, less-congested lands.

MIKADO, see JAPAN, MUTSU HITO.

MIKULOV, see NICOLSBURG.

MILAN, MILANO (45° 28′ N., 9° 11′ E.), city, N. Italy (Lombardy); capital of M. province on Olona, in fertile plain; important industrial, commercial, and railway centre, and chief financial city of Italy. M. is partly enclosed by walls and entered by several gates. Notable features are magnificent Gothic cathedral of white marble (founded, 1386; completed, 1805–13), accommodating 40,000 people; exterior with innumerable pinnacles and statues; San Lorenzo, the oldest church. Sant' Ambrogio, Sant' Eustorgio (founded IV. cent.), Santa Maria delle Grazie (refectory with Leonardo da Vinci's *Last Supper*), San Satiro, Santa Maria della Passione, etc.; Reale, Archiepiscopal, Marino (now Municipio), Ragione (now Corn Exchange), Borromeo, and other palaces; Brera contains picture gallery (with paintings by Raphael, Luini, da Vinci, Mantegna, etc.), library, and museum; Castello Sforzesco (with municipal art collection); Museo Poldi-Pezzoli, and other museums, Ambrosian library, La Scala (famous opera-house), conservatoire of music, Arch of Peace, etc. M. is a centre of silk industry; also makes velvets, woollens, cotton goods, ironware, carriages, motor-cars, jewellery, glass, paper, porcelain, etc.

M. (*Mediolanum*) was conquered by Romans, 222 B.C.; sacked by Huns and Goths; passed to Longobards, Franks, and Holy Rom. Empire. In VII. cent. M. became leader of the federated Lombard cities against Frederick Barbarossa and the Ghibellines; ruled by Visconti (*q.v.*) family (dukes of M.) from 1277–1450; followed by the Sforzas till 1535; annexed to Spain, 1540; ceded to Austria, 1714; capital of Kingdom of Italy, established by Napoleon, 1805–14; united to modern Italy, 1859. Pop. (1911) 599,200.

Ady, *Milan under the Sforza*; Baedeker, *N. Italy*.

MILAN OBRENOVICH (1854–1901), king of Servia; succeeded, 1868; obtained Turk. recognition of Servian independence, and assumed title of king, 1882; defeated in wars, and resigned, 1869; returned, 1894, and controlled government of his son, King Alexander, who banished him, 1900; able general, liberal ruler, immoral privately.

MILAZZO, ancient *Mylæ* (38° 16′ N., 15° 14′ E.), seaport, Messina, Sicily; wine, fruit. Pop. 16,000.

MILDENHALL (52° 21′ N., 0° 31′ E.), market town, on Lark, Suffolk, England.

MILDEW, fungi forming white patches on plants. See FUNGI.

MILE, see WEIGHTS AND MEASURES.

MILES, NELSON APPLETON (1839–), Amer. soldier; general-in-chief of army, 1895–1903.

MILETUS, city of ancient Asia Minor; situated in Caria on W. coast near mouth of Meander; passed successively under names of LELEGIS, PITYUSSA, and ANACTORIA; colonised by Cretans under prehistoric leader M. in Minoan age; birthplace of Thales, Anaximander, Timotheus, Aspasia.

MILFOIL, plant of order Compositæ; used instead of hops in Sweden.

MILFORD.—(1) (41° 11′ N., 73° 7′ W.) town, Connecticut, U.S.A.; first settled in 1639; incorporated in Connecticut, 1664. Pop. 4366. (2) (42° 8′ N., 71° 31′ W.) town, Massachusetts, U.S.A.; boots and shoes. Pop. (1910) 13,055.

MILFORD (51° 42′ N., 5° 7 W.), port, Pembrokeshire, Wales; fish trade; situated on Milford Haven; excellent harbour. Pop. (1911) 6399.

MILIARY FEVER, see SWEATING SICKNESS.

MILICZ (d. 1374), Bohemian preacher.

MILITARY FRONTIER, name formerly applied to a strip of territory extending along the borders of Turkey, from Adriatic to Transylvania.

MILITARY LAW.—Special code by which army and navy are governed, in accordance with Army Act, 1881, Articles of War, King's Regulations and Army Orders, by virtue of annual Army Act. Crown control of army, disputed under Charles I., was established at Restoration; by Statute 13, Chas. II.; old custom was confirmed of king, advised by army officials, issuing orders to be observed during actual war; Mutiny Act, 1689, authorised courts-martial to pass death-sentence in cases of mutiny, desertion, and sedition; Mutiny Act, 1715, granted to Crown power of making Articles of War for army at home and abroad; these Acts had time-limit, and were re-enacted annually; Mutiny Act and Articles of War were consolidated into military code by Army Discipline and Regulation Act, 1879, superseded by Army Act, 1881, which is re-enacted, with any necessary amendments, annually; Army Act, 1906, substitutes 'detention' for 'imprisonment' for slight offences. Reserve Forces are subject to code during training and service.

Navy is governed by Navy Discipline Acts, 1866 and 1884. King's Regulations and Orders for the army are delivered to commander-in-chief, and have force of law if they come into conflict with no right or liberty. King's Regulations for the navy are issued by Order in Council to lords of admiralty. Military law does not supersede ordinary codes, except that a soldier cannot be charged with desertion or non-maintenance of his family, and has certain exemptions as

to arrest for debt, service on juries, etc. Offences under common law are not tried by courts-martial when civil court is at hand, and this rule obtains in U.S.A., France, Italy, Sweden. In Britain and U.S.A. court-martial sentences are reviewed by the officer commanding and by the judge advocate-general. Ger. soldiers and sailors have no appeal.

MILITIA, part of 'auxiliary forces' of Brit. regular army until conversion into Special Reserve, 1908. Its descent can be traced back to Saxon *fyrd* or national army of non-professional soldiers, forced to appear in arms when summoned by lord; military service after Conquest depended on terms of tenure of fief until abolition of feudal services at Restoration, 1660; but ancient system by which every man served in home service had never been abandoned, and is still an obligation. National force was collected in Middle Ages by commissioners of array, superseded in early XVI. cent. by lord-lieutenants, who exercised military authority of Crown in each shire until *Army Regulation Act*, 1871. Name 'militia' first appears in disputes of Charles I. and Parliament as to control of trained bands; Acts 13 & 14 Chas. II. regulated m. system; *Militia Act*, 1882, which abolished power of compulsory enlistment, contained clause authorising its revival after issue of Order in Council. In 1908, the m. was changed into a Special Reserve for service abroad.

MILK, an emulsion of fatty globules (cream) in an aqueous, slightly alkaline solution of casein, albumin, and milk sugar (lactose), secreted by the mammary glands of mammals. Described as a perfect food, because it contains all essential food constituents:—

	Cow's.	*Human.*
Water	86·9	88·0
Fat	3·5	2·9
Casein and albumin	4·8	1·6
Lactose	4·0	7·0
Ash	0·7	0·3
S.G.	1·032	1·029

See DAIRYING.

MILKWORT, plant of order Polygalaceæ; Common M. (*Polygala vulgaris*) grows in pasture, has blue, pink, or white flowers growing in a raceme; a tonic medicinally.

MILKY WAY, see GALAXY.

MILL, apparatus for grinding substances like corn; simplest form, two stones, one hollowed; later, two heavy circular stones; discarded for modern machinery, *c.* 1790.

MILL, JAMES (1773–1836), Scot. philosopher; b. Forfarshire; ed. Edinburgh; held important post under East India Co.; a political writer, whose 'philosophic radicalism' led to demand for security for good government through extension of franchise (Reform Bill); attempted to analyse complex affections, æsthetic emotions, moral sentiments into simple, pleasurable, and painful sensations, from which they are derived by repeated association (Associationism).

Stephen, *English Utilitarians.*

MILL, JOHN (1645–1707), Anglican divine; pub. Gk. New Testament, 1707 (important for textual criticism).

MILL, JOHN STUART (1806–73), philosopher and political economist; b. London; son of James Mill (*q.v.*), who directed his education; served East India Co., 1823–58; chief conductor, *Westminster Review*, 1835–40; M.P., 1865; author of *Logic* (1843), *Principles of Political Economy* (1848), *Liberty* (1859), *Representative Government* (1860), *Utilitarianism* (1863), *Examination of Hamilton's Philosophy* (1865).

M. is influenced by Hume and Comte. Knowledge is derived from experience, and deals with facts and their relations. Our belief in an external world is an illusion due to laws of association; his 'mental chemistry' seeks to explain problems unsolved by previous Associationists. Mind is 'a series of feelings with a background of possibilities of feeling'; matter, permanent possibilities of sensation. 'Intuitions' are wholly due to frequent impressions made on us in childhood, and come to seem innate. Even mathematics, excepted by Hume, is a generalisation from experience; its propositions are not necessary truths arising from *a priori* intuitions, but are true only by association. All inference is from particular to particular, and the major premise of the syllogism is a summary of such particulars. Causation derives its apparent necessity from frequent association of phenomena. The uniformity of nature is not certain, but only extremely probable.

He lays down four 'Canons of Induction.' In economics Mill affirms that the conditions of production are subject to physical law; yet the distribution of products among the different classes is under human control, governed by customs and institutions. In ethics M. holds that judgments must be passed only on the effects of actions; these are good as producing pleasure. Man by nature seeks his own pleasure, whence Mill's proof that general happiness is desirable. The moral feeling is compounded of sympathy, fear, self-esteem, experienced effects of action, and religious feelings, unified by association. A difference also is admitted in the quality of pleasures.

Life, by Bain (1882), Courtney (1889); Douglas, *J. S. Mill: A Study of his Philosophy* (1895).

MILLAIS, SIR JOHN EVERETT (1829–96), Eng. painter; b. Southampton; studied at the Academy schools and at seventeen exhibited his first picture. Joining the Pre-Raphaelites, he was influenced towards imagination and symbolism, and for many years painted under the Brotherhood's methods. With *The Gambler's Wife* of 1869 he broke into a more original style, and his later pictures are remarkable for their technical qualities. The finest specimen of his landscapes is *Chill October*, and as a figure-piece *The North-West Passage* is well known. He was elected Pres. of the Royal Academy, 1896.

Life and Letters, by his son, J. G. M. (1905).

MILLAU (44° 7′ N., 3° 6′ E.), town, ancient *Æmilianum*, on Tarn, Aveyron, France; kid gloves. Pop. 19,000.

MILLBURY (42° 13′ N., 71° 50′ W.), town, on Blackstone, Massachusetts, U.S.A.; cotton and woollen goods. Pop. (1910) 4740.

MILLEDGEVILLE (33° 3′ N., 84° 13′ W.), city, on Oconee, Georgia, U.S.A.; seat of Georgia Military Coll.; cotton industries. Pop. (1910) 4385.

MILLENNIUM (Lat. 'a thousand years'), the name given to the Christian belief that Christ would return to reign for a thousand years (used more loosely, besides, to express the coming of the Kingdom of God on earth when all evil will be done away). The belief is part of early Christian eschatology, but it was for ever, not only for a thousand years, that Christ was expected to reign. In *Revelation* 20, however, Christ reigns for a thousand years before the resurrection of the dead and the last judgment. These millennarial ideas had great hold in the early Church. But a reaction against them came, especially in the East. Speculations as to an impending reign of Christ and his saints on earth have appeared at various times, among the heretical mystics of the Middle Ages, the Anabaptists at Münster, the Pietistic movement in Germany, and among individual zealots.

See Charles, *Doctrine of a Future Life.*

MILLEPORA and **MILLEPORINA**, see under HYDROMEDUSÆ.

MILLEPORE, see CORAL.

MILLER, HUGH (1802–56), Scot. geologist; b. Cromarty; from 1820–22 apprenticed to a stonemason; wrote verses in spare time and pub. some poems in 1829; accountant in Bank of Scotland, 1834; editor of *Witness*, 1839, in which paper appeared his famous articles on 'The Old Red Sandstone,' 1840, reprinted in book form, 1841; wrote *My Schools and Schoolmasters* (1852); committed suicide at Portobello.

Mackenzie, *Hugh Miller: A Critical Study* (1905).

MILLER'S THUMB, see BULLHEADS.

MILLET includes two species of gramineous plant, *Sorghum vulgare*, and *Panicum miliaceum*, both cultivated in Mediterranean countries, India, etc., as cereals.

MILLET, JEAN FRANÇOIS (1814–75), Fr. painter; studied in Paris, executed signboards in his early struggles, settled at Barbizon, and there painted the rustic life of France as no other has done. His most famous picture is *The Angelus*, sold in Paris in 1889 for £23,226.

MILLIGAN, WILLIAM (1821–92), Scot. Presbyterian divine; wrote several works.

MILLIPEDE, see MYRIAPODA.

MILLOM (54° 13′ N., 3° 16′ W.), town, Cumberland, England; iron-mines and ironworks. Pop. (1911) 8612.

MILLPORT, see CUMBRAES, THE.

MILLSTONE GRIT, in geology a series of sandstone grits, conglomerates, and shales, which rest on the Carboniferous deposits; used for building purposes and also as grindstones.

MILLVILLE (39° 24′ N., 75° W.), city, on Maurice, New Jersey, U.S.A.; manufactures glass, iron, cotton. Pop. (1910) 12,451.

MILMAN, HENRY HART (1791–1868), Eng. historian; dean of St. Paul's; chief works, *History of Christianity* (1840) and its continuation, *History of Latin Christianity* (1855); important as leader of Latitudinarian movement.

A. Milman, *Life* (1900).

MILNE-EDWARDS, HENRI (1800–85), Fr. zoologist, student of invertebrates, and of comparative anatomy and physiology.

MILNER, ALFRED MILNER, VISCOUNT (1854–), Brit. colonial gov.; under-sec. of finance in Egypt, 1889–92; wrote *England in Egypt*, pub. 1892; chairman of Board of Inland Revenue, 1892–97; gov. of Cape of Good Hope, 1897–1901; High Commissioner for S. Africa, 1897–1905; opposed Kruger's treatment of Uitlanders in Transvaal; at conference of Bloemfontein, 1899, insisted on enfranchisement of British; gov. of Transvaal and Orange River Colony, 1901–5; cr. baron, 1901, on short visit to England where before and during the South African War he had raised greatest enthusiasm among imperialists on the one hand and violent opposition from Liberal left; viscount, 1902; showed good qualities as administrator, settling country after war and reorganising agricultural and other departments, but roused storm at home by consenting to importation of Chin. coolies for work in mines, 1904; faithfully supported by Brit. Government; retired, 1905.

Luke, *Lord Milner* (1901); Müller, *Lord Milner and South Africa* (1902).

MILNES, RICHARD MONCKTON, see HOUGHTON, LORD.

MILNGAVIE (55° 55′ N., 4° 19′ W.), town, Dumbartonshire, Scotland; bleach-fields, dye-works. Pop. (1911) 4530.

MILO, see MELOS.

MILOSH OBRENOVICH I. (1780–1860), prince of Servia; founder of house of Obrenovich; rose from herdsman to be ruler of his district; opposed Turk. occupation, obtained home rule, and was elected prince, 1817; recognised by Turkey as hereditary ruler, 1829–30.

MILTIADES (d. c. 488 B.C.), Athenian general; ruler of Chersonese; fled to Athens on approach of Persians, but later advised marching to Marathon where he defeated Persians, 490.

MILTON.—(1) (41° N., 76° 50′ W.) town, on Susquehanna, Pennsylvania, U.S.A.; ironworks. Pop. (1910) 7400. (2) (42° 15′ N., 71° 5′ W.) town, Massachusetts, U.S.A.; has meteorological station and observatory; granite is quarried. Pop. (1910) 7924.

MILTON, JOHN (1608–74), Eng. poet; b. Bread Street, Cheapside, London; s. of a scrivener; ed. St. Paul's School, 1620–25, Christ's Coll., Cambridge (from which he was rusticated for insubordination), 1625–32; M.A., 1632; lived and studied at Horton, Bucks, 1632–38; went to Italy, 1638, and remained for 2 years, and while there visited Galileo; returning, he resided in St. Bride's Churchyard, Fleet Street, and then in Aldersgate Street, where he acted as tutor to his nephews Edward and John Phillips; m. Mary Powell, of Royalist family, 1643; she was only 17 and after a few weeks she returned to her parents. She returned, 1645, and, mother of three daughters, d. the year in which M. became blind, 1652. M.'s *Tenure of Kings and Magistrates* (1649) brought him into prominence, and he was app. Sec. of Foreign Tongues to the Commonwealth; m. Catherine Woodcock, dau. of a Puritan officer, 1656; she died in childbirth, 1658. Catherine is the 'late espoused saint' of his great sonnet. When the Restoration was approaching, M. wrote *The Ready and Easy Way to Establish a Free Commonwealth*, advocating republic without established Church. Arrested, 1660, he was released possibly through Marvell's influence; his *Eikonoklastes* and *Defensio* were burnt by the common hangman. Disappointed in his dau's, who seem to have neglected him, he m. Elizabeth Minshull, a lady of 25, in 1663. He d. and was buried at St. Giles's, Cripplegate, Bucks.

In character M. was highly moral, but intolerant and arrogant. He had no humour; his nearest approach to humour in *Paradise Lost* are harsh and unlovely jibes. Religion to him was real and sincere, but it did not prevent his becoming bitter in pamphlet controversies.

His Poetry.—Eng. poetry of the period had spent itself. The great Elizabethan outburst was over, and there remained a few writers of exquisite lyric and those dramatists who had allowed blank verse to become decadent. M. with his great themes rescued lyric poetry from mere prettiness, with his cultured ear for music he rescued dramatic poetry from unrhythmical hobbling.

His early poems, e.g. *Ode on the Nativity* (1629), show Spenserian influence, but the new Miltonic music is there. *L'Allegro* and *Il Penseroso* show his thorough command of measure. *Comus* (1634), a masque, is full of beautiful poetry, but only in parts does it show the great organ music of *Paradise Lost*. *Lycidas*, an elegy on the death of Edward King, who was drowned in the Irish Sea, is one of the greatest elegies ever written in any tongue. During the years 1640–60 M. wrote no verse except sonnets; well-known ones are those to Cromwell, to Vane, to Fairfax, On his Blindness, On Chapman's Homer; some are frankly bad.

His greatest poem is the epic *Paradise Lost*, which deals with the Fall of Man, while *Paradise Regained* treats of Man's Redemption. The latter is less great than the former. In *Paradise Lost* can be seen all that is best in his poetry—the beautiful word music, the gorgeous imagery, the magnificent pageantry. The vehicle of both poems is blank verse, the greatest non-dramatic blank verse ever written. In a preface M. condemns rhyme as a medium, but in his last great work, *Samson Agonistes*, he occasionally seeks the aid of rhyme. This poem is in imitation of Gk. tragedy. These last three works were written after M.'s blindness.

His Prose.—M.'s prose was mainly controversial; he wrote polemical tirades against Episcopacy, 1641 and 1642. In 1643, incensed at his first wife's leaving him, he wrote the *Doctrine and Discipline of Divorce*, and, while teaching his nephews, the *Tractate of Education*, 1644. In the same year he wrote *Areopagitica*, a plea for the freedom of the press, the Presbyterians having objected to his heretical views on divorce. In his *Tenure of Kings and Magistrates* he defended the right to kill a 'wicked king.' *Eikonoklastes* (1649) and *Defensio Populi Anglicani* (1651) were bitter replies to Royalist pamphlets—the latter being directed against Salmasius.

His prose is great in parts. He wrote musically, but his sentences do not hang together. He had no idea of structure of prose paragraph; and the result is that his sentences ramble on for great lengths, making an ugly jumble. Much of the matter of the pamphlets

is worthless; they are full of ill-nature and vulgar abuse.

Life of M., by Masson, Johnson, Firth, Mark Pattison (Eng. Men of Letters), Sir Walter Raleigh; Bridges and Stone, *M.'s Prosody*.

MILVUS, Kites, see HAWK FAMILY.

MILWAUKEE (43° 2′ N., 87° 51′ W.), town, Wisconsin, U.S.A.; founded, 1835; became city, 1846; greatly increased towards close of XIX. cent.; suffered from great fire originating at oil-works, 1892. M. stands on W. shore of Lake Michigan, at mouth of M. River; great centre of railways and lake shipping; largest ships navigating in lakes can enter quays in centre of town; exports oats and other cereals, flour; manufactures machinery, brass and iron ware, agricultural implements; has flour-mills, breweries, meat-packing and sausage establishments, railway works. Archiepiscopal see of R.C. Church, episcopal see of Prot. Episcopal Church. M. has two cathedrals. Public buildings include government building, city hall, public museum and library, art gallery, Marquette Univ., many educational establishments. Fine system of parks. Pop., largely of German origin (1910), 373,857.

MIMICRY, the resemblance in shape, coloration, or both, between two species not closely allied, with the object of protecting one or both. The phenomenon is best known amongst Butterflies, where it has been observed that in an area where certain distasteful or protected species occur, there are also found species, lacking the protective qualities, but resembling the distasteful species in shape and colour. It has been assumed that the unprotected Butterflies, by flaunting the colours of their distasteful neighbours, escaped the persecution to which they would naturally have been subjected by birds. But many difficulties stand in the way of the whole-hearted acceptation of this theory of *Batesian Mimicry*, chief being that birds seldom eat even unprotected butterflies, and that they were unlikely to have exercised the minute discrimination in the early stages of the mimic variation, which the theory demands. It has been discovered also that two or more specially protected species of different families of Butterflies sometimes resemble each other closely, and this *Müllerian Mimicry* is said to be advantageous to all the parties concerned, since it makes easier the general recognition of distasteful forms, and so limits the necessity of indiscriminate experimental tasting on the part of young uneducated birds.

In groups other than Butterflies, resemblances occur, the model generally being some species of Hymenoptera, characterised by its powers of defence, such as a sting, while the mimics may belong to groups as different as Flies and Moths. Thus Humble-Bees are closely imitated by the two-winged *Volucella*, as well as by the Bee Hawk Moths; Ichneumons by the Diptera *Conops* and *Ceria*.

Other resemblances, sometimes accounted mimetic, are probably due to the influence of the same habits of life or the same environment, or simply to accident. Examples of such are the likeness in shape between limbless Lizards, *e.g.* the Blind or Slow-Worm, and Snakes; and the resemblance of an Assam caterpillar, when irritated, to a Shrew.

MIMULUS, genus of plants, order Scrophulariaceæ; has bell-shaped corolla; Musk Plant (*M. moschatus*), a small yellow flower, is a common Brit. garden flower.

MIMUS, MOCKING-BIRD (*q.v.*).

MINA, FRANCISCO ESPOZ Y (1781–1836), Span. general and politician; rose from ranks in Fr. war against Spain, 1808–12, to be commander-in-chief; afterwards, as politician, led Liberals.

MINARET, see under ARCHITECTURE.

MINAS GERAES (*c.* 18° 50′ S., 46° W.), one of interior states, Brazil; first settled by Portuguese in XV. cent.; threw off Portug. yoke with rest of Brazil in 1889, and became member of Brazilian republic. M. G. has area 221,951 sq. miles; surface consists of plateau in W., elsewhere mountainous, reaching height of *c.* 5900 ft.; watered by São Francisco, Grande, Parana; capital, Minas (Bello Horizonte). State has valuable mineral deposits and many mines; gold, diamonds, iron, lead. Coffee and sugar-cane are cultivated and cattle raised. Pop. 4,000,000.

MINBU (20° 10′ N., 95° E.), town, capital of Minbu district, Upper Burma, on Irrawadi. Pop. 6000; district, 235,000; division, 1,100,000.

MINCHINHAMPTON (51° 42′ N., 2° 12′ W.), town, Gloucestershire, England; woollens. Pop. (1911) 3702.

MIND, see PSYCHOLOGY.

MINDEN (52° 17′ N., 8° 55′ E.), town, Westphalia, Prussia; cathedral dates in part from XI. cent.; formerly fortified. Here Ger. and Brit. allies defeated French, 1759. Pop. (1910) 26,455.

MINE, see MINING.

MINEHEAD (51° 12′ N., 3° 29′ W.), town, Somersetshire, England; summer resort; parliamentary borough from XVI. cent. to 1832. Pop. (1911) 3459.

MINEO (37° 14′ N., 14° 43′ E.), town, ancient *Menænum*, Catania, Sicily, Italy. Pop. 10,000.

MINERAL.—Any homogeneous inorganic substance, whether element or compound, forming part of the earth's crust, is termed a m. Two m's only—water and mercury—are liquid at the ordinary temperature and pressure. M's occur as deposits of virgin or unpolluted m., such as coal, gold, lead, or far more commonly as deposits of m. ores—m's associated with other substances, called *gangue*. M. ore deposits are generally divided into three kinds—metalliferous, non-metalliferous, and earthy. Metalliferous ores are supposed to have two origins—igneous outbursts and accumulations of m. particles by water. In the case of igneous ores, quantities of molten rock would be forced through other rock in a state of solidity. No doubt certain metals, *e.g.* iron, aluminium, etc., were carried in vapour to pockets or crevices, where, owing to the lowered temperature, they solidified, all taking place at vast depths below the earth's surface.

Non-metalliferous deposits afford stones used and quarried for building purposes, as the granites and syenites, which occur in intrusive masses. Other m. deposits—the earthy—no doubt would be precipitated from solution, *e.g.* bog-ore, which is rich in iron, but mixed with sand and clay. If buried at great depth below the surface, bog-ore becomes changed to red hæmatite (*q.v.*). Non-metalliferous deposits from solution are the salines, *e.g.* rock-salt, gypsum. Some m. deposits are the result of vegetation existing on the earth ages ago—coal, peat, etc., while others may be due to metamorphic action on existing deposits, as in graphite.

Mineralogy, the science of m's, differentiating and classifying them according to their properties. Mineralogy includes the study of all inorganic substances, and while geology (*q.v.*) studies m's in their massive state, mineralogy deals with them as separate substances and individual components of the earth's crust.

The history of mineralogy is of little importance. Beautiful m's were used and described by the ancients. No serious attempt at a study of mineralogy as a science was made until the XVI. cent., when George Agricola took it up. Wallerius and Cronstedt commenced a classification of m's, and their work was continued by Werner. Hauy investigated crystallography (*q.v.*), and the great advances in chemical knowledge soon obtained mineralogy a secure footing as a science.

Minerals are classified according to their chemical composition and physical properties. Of these the chief headings are: specific gravity and action of moderate and blowpipe heat upon them; their crystalline forms, measurements of angles of crystals, and their cleavage; peculiarities of touch, taste, and smell; fracture, the character of their newly broken surface, as even, conchoidal, and splintery; lustre, as metallic, semi-metallic, pearly, vitreous, adamantine, greasy, and silky; appearance, as opaque, trans-

parent, and translucent; structure, as laminated, fibrous, and granular; streak, the appearance of a cut in the mineral by a knife. Hardness is determined by Mohs' table, which is: (1) talc, (2) gypsum, (3) calcite, (4) fluorspar, (5) apatite, (6) potash-felspar, (7) quartz, (8) topaz, (9) corundum, (10) diamond. No. 1 is the softest, and No. 10 the hardest, mineral in this table. Hardness of a mineral is tested by scratching; a hard mineral scratches, but cannot be scratched by a softer mineral. If a mineral will scratch (3) calcite, but will not scratch (4) fluorspar, though (4) fluorspar will scratch it, then its hardness is 3/4.

Hatch, *Petrology* (1909); Iddings, *Rock Minerals* (1906).

MINERAL OILS, see OILS.

MINERAL WATERS are spring waters possessing characteristic or medicinal properties. They are widely diffused, chiefly in mountainous and volcanic districts. They may be cold or hot. Boiling springs, found in Iceland, etc., are called *geysers*. Many mineral springs were known to, and used by, the Romans. Rom. work remains, *e.g.* at Bath. The waters may be used externally or internally; they are valued for their cleansing power upon the system (see BATHS, HYDROPATHY). Where these springs exist, health-resorts have been established, and are visited during the summer months by those seeking a 'cure.'

The therapeutic value of the waters depends chiefly upon the presence in solution of salts of sodium, magnesium and iron, and carbon dioxide and hydrogen sulphide gases. Mineral waters may be classified as thermal, carbonated, alkaline, saline, chalybeate, sulphuretted, siliceous.

Thermal springs occur at Buxton (82° F.), Vichy (113° F.), Bath (117° F.), Leuk (124° F.), Wiesbaden (150° F.). *Carbonated waters* (Seltzer, Apollinaris) are aerated by carbon dioxide, besides containing alkaline carbonates, chlorides, etc. *Alkaline waters* (Vichy, Ems) contain much sodium bicarbonate and chloride. *Saline waters* contain Glauber's salt, Na_2SO_4 (Carlsbad, Marienbad), Epsom salt, $MgSO_4$ (Epsom, Friedrichshall, Seidlitz, Hunyadi Janos), common salt (Droitwich, Woodhall). *Chalybeate waters* contain ferrous bicarbonate, and become rusty on exposure to air (Spa, Tunbridge Wells). *Sulphuretted waters* contain hydrogen and other sulphides, and have an offensive smell (Aachen, Harrogate, Llandrindod). *Siliceous springs* contain much silicic acid, which they deposit round their mouths.

In Dürkheim mineral water Bunsen discovered the alkali metals rubidium and casium. Other mineral waters, *e.g.* those at Bath and Buxton, are radioactive; the Bath water contains dissolved helium. Artificial imitations of natural mineral waters are manufactured, or the solid salts, *e.g.* Carlsbad salt, from which the waters can be made. Certain effervescing drinks are called 'mineral waters.' They should be made from distilled water, and are saturated with carbon dioxide under pressure. Salts, and flavouring essences, sugar and colouring are added, and the water is impregnated with the purified gas in special forms of apparatus. The necessary pressure—about 5 atmospheres—may be produced by pumping, by the evaporation of liquid carbon dioxide, or by the generation of the gas from chalk or marble within a confined space.

MINES, *Military Mines* are underground passages made by besiegers; the defenders sink *counter-mines*, which the attacking force tries to destroy by explosives.

Submarine Mines explode (1) when fired from a control station by electricity (*Observation Mines*); (2) when struck by a vessel (*Contact* or *Uncontrolled Mines*). See COAST DEFENCE, FORTIFICATIONS.

MINERVA, see ATHENA.

MINGHETTI, MARCO (1818–86), Ital. statesman; premier, 1863; resigned, 1864, because of attacks on his compromise with France; premier, 1873–76; his policy was opposition to France.

MINGRELIA (42° 30′ N., 42° 10′ E.), ancient *Colchis*, former principality of Transcaucasia; now included in Kutais.

MINIATURE (Lat. *minium*, red lead), small painting, generally a portrait; originally signified picture on manuscript, many examples of which have been preserved in Byzantine and mediæval MSS. The modern form of m. dates from the XIII. cent., as may be seen from the minuteness of drawings in illuminated MSS.; attained independence in XIV. cent. The Eng. and Flemish schools produced painters like Holbein, Schute, Oliver, and Betts, who, while generally executing large canvases, also painted m's. Nicolas Hilliard (1547–1619) is first famous painter of m's. During the XVII. and XVIII. cent's England produced many famous miniaturists, including Alexander and Samuel Cooper, Crosse, Spencer, Hone, Meyer, Cosway, Engleheart, and John Smart, while Lawrence, Raeburn, and Landseer occasionally executed m's. France contributed many m. artists, many of whom worked in enamel, as well as on vellum or ivory.

Though m. painting declined in the XIX. cent., it has of late years received a marked stimulus. Famous collections of m's are to be seen in the Pierpont Morgan Collection, Oxford, Wallace Collection, Louvre, and St. Petersburg.

MINING, engineering processes by means of which minerals are extracted from below the ground and raised to the surface. Mining was known to the ancients, and is referred to in the Book of Job. It is mentioned on an Egyptian papyrus dated 1400 B.C.

In England the tin mines of the Scilly Isles were worked by the Phœnicians, but the m. was not very important until coal came to be used for fuel. In 1259 a charter was granted by Henry III. to the freemen of Newcastle-on-Tyne to 'dig for coals,' while others were granted by Henry VII. and Elizabeth. Before the invention of gunpowder in 1620 m. on a large scale was unknown; it was impossible to sink shafts to any depth, owing to the inrush of water and also the difficulties of haulage and ventilation. The use of explosives overcame the difficulty of sinking through obstacles such as solid rock, which previously could only be negotiated by pick and crowbar. The invention of the steam-engine furthered the advance of m., and overcame not only the difficulty of haulage, but also the inrush of water.

Mineral deposits are of two classes: **Beds or seams**, as iron ore, coal, or salt. These may be of either mineral or vegetable origin, but are generally of the former. **Veins or lodes** (see ORE), where the mineral fills what was formerly a fissure in the earth's surface. In the Colonies lodes are called reefs, a misleading term.

Before the sinking of a shaft is commenced, the locality has to be *prospected* by men who study the geological conditions under which minerals occur; a surface exploration is carried out, and boring is resorted to. If minerals exist in a bed or seam below the surface, shafts are sunk; this operation may cost anything from £10,000 to £50,000. Two shafts are generally used, one for haulage purposes and the other for ventilation. From the shafts numerous galleries are driven. The mineral, after having been dug out, is hoisted to the surface by mechanical devices which derive their power from a steam-engine on the surface at the mouth of the shaft. The miners descend in a cage, also driven by the steam-engine.

When the mineral exists in veins or lodes, shafts are sunk similar to those above mentioned, the operations being practically identical. In the diamond mines of Kimberley, South Africa, the earth is dug out and sent to the surface, where it is exposed to the elements for some weeks. This causes disintegration, which is furthered by its being stirred into vats of water. The remaining débris is sorted and passed over a greased surface which, while allowing stones and rubble to pass, retains the diamonds.

In gold-mining the sand and earth is shovelled into a trough or pan and sluiced with water. The metal,

being heavy, sinks to the bottom of the pan, while the earth is carried off.

Sometimes mines of mineral wealth are discovered accidentally, as in the case of the Potosi silver mines, found by an Indian clutching at a bush to save himself from falling down a hillside. Marshall discovered gold in California in 1848 while making a race for the waterwheel of his mill. See COAL, *Coal-mining*.

MINISTER.—(1) In ecclesiastical usage, originally signified a deacon, whose duties included attendance on priest; now more loosely used, especially in Presbyterian and Free Churches, to mean officiating person. (2) In parliamentary language, the chief servants of the State, *e.g.* Prime Minister. See also CABINET, PARLIAMENT, etc.

MINISTRY, in theological sense, the Christian m., the Church as a calling, ministers of religion as a body; in political sense in Britain, the Prime Minister and the colleagues he chooses to act along with him as responsible executive of the country. The m. includes not only members of the Cabinet (*q.v.*), but other officers, such as Parliamentary Under-Sec's, Sea Lords, Junior Lords of the Treasury, military members of Army Council, Solicitors-Gen., Lord-Advocate of Scotland, Lord-Lieut. of Ireland, etc. The m. numbers about sixty members in all.

The 'era of m's,' says Macaulay, 'may most properly be reckoned from the day of the meeting of the Parliament after the General Election of 1698.' Originally the king appointed and dismissed ministers as he chose; out of Privy Council (*q.v.*), king's body of advisers, grew 'Cabinet' in Stewart times, and after Restoration and Revolution, power passed from Crown to Parliament; not till XIX. cent. did corporate unanimity replace former independence and disagreement of individual members of m. Two main principles of Brit. Constitution are irresponsibility of king and responsibility of m. as a body.

MINK, see WEASEL FAMILY.

MINNEAPOLIS (45° 3′ N., 93° 11′ W.), town, Minnesota, U.S.A.; lies on both sides of Mississippi River, at falls of St. Anthony, water-power of which has enabled town, situated in midst of great wheat and timber-producing region, to become centre of immense trade in flour and lumber products; has great number of flour- and saw-mills; manufactures machinery, iron goods, furniture. M. is seat of State Univ., founded 1868, and has many other educational institutions; public buildings include city hall and court-house, lumber exchange; many beautiful parks, including Minnehaha Park. M. is episcopal see of Prot. Episcopal Church. Damaged by fire in 1889, 1893, 1904. Pop. (1910) 301,408.

MINNESINGERS (fl. XII. and XIII. cent's), Ger. lyric poets; were mostly of aristocratic descent. They sang of love (*Minne*) and their language was Middle High German. Originally they surpassed the Troubadours; they had high ideals and sang of higher, more noble, love; they sang of nature, of joy, of sorrow. Sometimes their songs were didactic. Each poet composed his own verses and set them to music, thus great variety of poetical style arose. Contests were frequent; Walther von der Vogelweide outsung Heinrich von Ofterdingen, Wolfram von Eschenbach outsung Klingsor of Hungary (cf. also the contest in Wagner's *Tannhäuser*). In time the M. degenerated and their subjects became gross. The knights ceased to write, and the **Meistersingers**, singers drawn from the craftsmen, flourished — the greatest being Hans Sachs of Nuremburg. They codified rules, and spontaneity was lost. Wagner in his opera *The Meistersingers* pours ridicule upon their 'rule-of-thumb' methods.

Lyon, *Minne- und Meister-sang* (1882); Bithell, *Minnesingers* (1909).

MINNESOTA (43° 30′ to 49° 22′ N., 89° 30′ to 97° 15′ W.), state of U.S.A. in centre of N. border; is bounded on N. by Manitoba, Ontario; E. by Lake Superior, Wisconsin; S. by Iowa; W. by S. and N. Dakota; area, 83,365 sq. miles; surface flat or undulating, rising from 650 ft. on S. to *c.* 2200 ft. on N.E.; drained by Mississippi, Minnesota, Red R., and other streams; many large lakes, including Mille Lacs, Red Lake, Lake Winnibigashiah. Capital, St. Paul; large towns, Minneapolis, Duluth, Winona, Stillwater.

European knowledge of M. dates from 1659, when it was reached by Fr. explorers; others followed, and in 1688 the district was annexed to France. Eastern part passed from France to Britain in 1763, and after War of Amer. Independence was transferred to U.S. Western part was ceded to Spain in 1762, but was restored to France in 1803, from whom it was bought in same year by U.S., as part of Louisiana Purchase. M. formed part of Wisconsin Territory for a time, and in 1838 part of it was incorporated with Iowa Territory; organised as separate territory, 1849; admitted as state to Union, 1858; sent large force to field on Federal side during Civil War. In 1862 there was a rising among Indians, who massacred great number of whites; they were eventually defeated, and a number were put to death. A financial crisis occurred in 1873.

Executive power is vested in governor, assisted by lieut.-gov. and other officials; legislative authority held by Senate of 63 members and House of Representatives of 119 members, elected for four and two years respectively. Principal religious denominations, R.C., Lutheran, Methodist. Education is free and obligatory; state univ. at Minneapolis. Inhabitants include whites, negroes, Indians.

Agriculture is chief industry; M. produces large quantities of wheat and other cereals; great pine forests in N., maple, oak, ash farther S.; lumbering important; large quantities of iron produced; manufactures flour, leather, boots, etc. Railway mileage is over 9000. Pop. (1910) 2,075,708.

Folwill, *Minnesota* (1907); Neill, *History of M.*

MINNOW, see under CARPS.

MINORCA (39° 56′ N., 4° 5′ E.), one of Balearic Islands, Mediterranean; held by Britain, 1713–56, and again in 1763–82, when restored to Spain. Pop. 40,000.

MINORITES, see FRANCISCANS.

MINOS, a semi-legendary king of Crete; the celebrated laws of Minos are attributed to him.

MINOTAUR (classical myth.), a monster, partly man, partly bull, with a bull's head. He was ultimately slain by Theseus and Ariadne.

MINSK.—(1) (*c.* 53° N., 28° E.) government, W. Russia; area, 35,220 sq. miles; much of surface occupied by forests and swamps; capital, M.; principal industries, shipping, timber trade, fishing, distilling, agriculture. Pop. (1910) 2,813,400. (2) (53° 53′ N., 27° 33′ E.) town, capital of above, on Svisloch; seat of Gk. Orthodox and R.C. bp's; tobacco and leather manufactures. Pop. (1910) 109,300.

MINSTER-IN-SHEPPEY (51° 25′ N., 0° 52′ E.), village, Kent, England.

MINSTER-IN-THANET (51° 20′ N., 1° 19′ E.), village, Kent, England.

MINSTREL (Lat. *minister*, a servant), a wandering singer who was held in high honour during the Middle Ages; also known as *minnesinger* (*q.v.*) and *jongleur*; in the XIII. cent. the m. became the household entertainer.

MINT, the factory of a nation's currency. Barter was employed during early periods of Egyptian, Assyrian, and Chaldean civilisations, and in prehistoric Greece; there are traces, however, in all of different commodities forming standard of value. Fines in Sparta at close of VII. cent. were made payable in cattle, and earliest Gk. coins were traced with head of cattle and called oxen; so in Italy, where *pecus* gave *pecunia*, and among Germanic races. Cattle, etc., were replaced everywhere by metal, often open rings; shekels appear in *Genesis*, talents in Homer; earliest coins had marks of private merchants who issued them.

Private money always disappeared before spread of social order. Lydians of Asia Minor were, according to Herodotus, first persons to strike gold and silver coins;

their tyrant Crœsus (561–546 B.C.) abolished electrum as medium of exchange; this seems to have been beginning of state control of coinage; multitude of Gk. m's sprang up.

Ancient coins fill almost same place towards study of ancient history as heraldry does towards study of mediæval history. Servius Tullius (VI. cent. B.C.) is said to have established Rom. state m., abolishing other standards; Pippin the Short and Charlemagne in Capitularies ordered that no coin should be struck except at royal court, and that the *denarius palatinus* should be legal tender. Right of keeping private m. was, however, occasionally granted and often usurped by subjects throughout Middle Ages. Romans cast their copper coins, but method of striking is alone used in modern coinage. It is curious that ancient Britons had acquired art of coining before arrival of Romans, as is proved both by Cæsar's testimony and survival of coins; character of these coins points to trade connection with Greece; A.-S. England had many m's with, until c. 1000, independent dies; m. was established in Tower of London by 1329, and probably much earlier; private money was gradually driven out by royal money, and by middle of XVI. cent. the m. in Tower was the sole one, as it ultimately remained. Scotland ceased to issue money 1709, Ireland at about same time.

MINT (*Mentha viridis*), a Labiate commonly cultivated for table purposes; propagates freely by means of suckers and from cuttings.

MINTO, SIR GILBERT ELLIOT, 1ST EARL (1751–1814), b. Edinburgh; ed. Edinburgh and Oxford; viceroy at Corsica, 1794–96; cr. Baron Minto, 1797; app. Gov.-Gen. of India, 1807, and made notable frontier treaties; cr. Earl of M. and Viscount Melgund, 1813. Countess of Minto, *Life and Letters of Earl Minto* (4 vols., 1874–80).

MINTO, GILBERT JOHN MURRAY KYNYNMOND ELLIOT, 4TH EARL (1847–), ed. Eton and Cambridge; served as soldier in Turk. army, 1877; in Afghan War, 1879; as volunteer in Egypt, 1882; military sec. to Gov.-Gen. of Canada (Lord Lansdowne), 1883–85; chief of staff in N.W. Canadian rebellion; Gov.-Gen. of Canada, 1898–1904; Viceroy of India, 1905–10.

MINTURNÆ, modern MINTURNO, ancient city, on Liris, Latium.

MINUCIUS FELIX, MARCUS (fl. III. cent.), Christian apologist, traditionally a brilliant Rom. pleader; wrote earliest known Lat. apology, *Octavius*, a dialogue between Christian and heathen, modelled on Cicero.

MINUSCULES, see PALÆOGRAPHY.

MINUSINSK (53° 42′ N., 91° 30′ E.), town, on Yenisei, Yeniseisk, Russia-in-Asia; in vicinity are coal- and iron-fields. Pop. 10,000.

MIOCENE (in geology), name proposed by Sir Charles Lyell for a subdivison for the Tertiary strata; no examples are found in Britain; it is best developed in Vienna basin; rich in fossils, including dinotherium, mastodon, deer, monkeys; remains of such plants as palms and conifers show that the conditions then existing were tropical.

MIQUEL, JOHANN VON (1829–1901), Ger. statesman; helped to found *Nationalverein*; aided reorganisation of National Liberal party, 1887; Minister of Finance, 1890–1900; attempted social and financial reforms.

MIRABEAU, HONORÉ GABRIEL RIQUETI, COMTE DE (1749–91), Fr. statesman; descendant of bourgeois family who bought lordship of M., 1570, and attained rank of marquis, 1685; had several notorious *liaisons*, one of which led to imprisonment in isle of Ré by his f.'s procurement; imprisoned for rape, 1777–82, and condemned to death; pub. *Lettres de cachet*, 1782, protesting against usage to which he owed his confinements, *Considérations sur l'ordre de Cincinnatus*, 1785, and other political pamphlets; employed by government on mission to Prussia, 1786–87, but failed, and alienated ministry by attack on corruptions; returned to states-general, 1789, took foremost place, and sought to establish constitutional monarchy; thorough knowledge of history, and study of constitutional development in England and America, united with statesmanlike instincts which now showed themselves; till his death prevented Assembly breaking with foreign powers, insisted on Crown retaining veto, and generally sought to mould constitution on known and tried models, but met with growing opposition of *doctrinaire* and fanatical politicians; Assembly decreed, 1789, that none of its members could become minister, thus defeating scheme of M.'s for introducing this characteristic of Brit. constitution; d. prematurely worn out. Without common share of prudence in conduct of private life, but uncommonly well fitted to guide others, of uncompromising honesty and striking eloquence, he inspired tremendous loyalty.

Warwick, *M. and the Fr. Revolution* (1905); Trowbridge, *M., the Demigod* (1907).

MIRABEAU, VICTOR RIQUETI, MARQUIS DE (1715–89), Fr. author and father of the famous statesman of the Revolution; b. Provence; tyrant at home, but a philanthropist abroad; wrote *Ami des Hommes* and *La Philosophie Rurale*.

MIRACLE is generally held to be the violation of the law of nature by the intervention of a higher power. Christianity makes the miracles in the life of Christ fundamental in Christian theology, *e.g.* the Virgin Birth and the Resurrection. Miracles are often regarded as a proof of Christianity; but this method of apologetic is not now so much relied on. Some critics would deny all New Testament miracles except the cures which are put down to the undeniable fact of faith-healing.

Trench, *Miracles of Our Lord*; Thompson, *Miracles in the New Testament*.

MIRACLE PLAYS, see DRAMA.

MIRAGE, an optical illusion seen in hot climates. Images of distant objects appear inverted either below the ground or in the atmosphere. The phenomenon is due to variations in density of successive layers of air.

MIRAJ (16° 50′ N., 74° 41′ E.), native state, Deccan, Bombay, India; area, 564 sq. miles. Pop. 125,000. **Miraj**, capital of state. Pop. 20,000.

MIRANDA, FRANCESCO (*c.* 1754–1816), Span.-Amer. soldier; sought to liberate S. America from Spain; fought for Fr. Revolution; with Brit. aid established Colombian republic, 1806; Venezuelan republic established, 1810; captured, he died in prison.

MIRANDE (43° 32′ N., 0° 23′ E.), town, on Grande Baise, Gers, France. Pop. 4000.

MIRANDOLA (44° 53′ N., 11° 3′ E.), town, Emilia, Italy; cathedral and ducal palace. Pop. 20,000.

MIRANZAI (HANGU) VALLEY (33° 32′ N., 71° 6′ E.), mountain valley, N.W. Frontier, India.

MIRFIELD (53° 40′ N., 1° 43′ W.), town, on Calder, Yorkshire, England; woollen and cotton industries, collieries. Pop. (1911) 11,712.

MIRKHOND (1433–98), Afghan-Turkestan writer and scholar; b. Balkh; great work was a universal history—*The Garden of Purity*, on the biography of prophets, kings, and caliphs.

MIRROR, a glass or polished surface which shows images of objects by reflection. The Etruscans had m's of decorated thin metal discs, generally bronze; small metal m's were used by the Greeks and Romans, and such have been found in Cornwall. Glass m's coated with tin also appear to have been known to the Romans. Glass m's silvered with amalgam, mercury, and tin were made by the Venetians, and in 1665 twenty m. makers were sent from Venice to Paris. In 1835 J. von Liebig discovered a method of silvering glass by heating aldehyde in a glass vessel with an ammoniacal solution of nitre of silver.

Distorting (or comical) m's are concave or convex, and reflect a person as a short stout figure or a long thin one.

MIRZAPUR (25° 10′ N., 82° 38′ E.), town, on

Ganges, Mirzapur, United Provinces, India; carpets, brassware. Pop. 50,000. District has area of 5223 sq. miles. Pop. 1,100,000.

MISCARRIAGE, see ABORTION.

MISDEMEANOUR (law term), a crime which is not a felony and which did not carry the penalty attached to felony before 1870 of loss or forfeiture of goods. Private persons may arrest for felony but not for misdemeanour.

MISHAWAKA (41° 40′ N., 86° 10′ W.), city, Indiana, U.S.A., on St. Joseph River; flour, machinery. Pop. (1910) 11,886.

MISHNA, see HEBREW LITERATURE.

MISIONES (c. 27° S., 55° W.), territory, N. Argentina, between rivers Paraná and Uruguay, S. America; surface uneven and forest-covered; chief production, Paraguay tea; capital, Posadas. Area, 11,282 sq. miles. Pop. 45,000.

MISKOLCZ (48° 6′ N., 20° 49′ E.), town, Borsod, Hungary; flour, porcelain. Pop. (1910) 51,459.

MISPRISION, in law, the knowledge that some other person has committed treason or felony, and the wilful concealment of the fact, or the refraining from giving information to the law.

MISSAL, the Mass book of the Rom. Church, until about 750 A.D. generally called *Sacramentary*. The m. now in use is that ordered to be compiled by the *Council of Trent*, and officially declared the only one lawful by Pius V. in 1570. It superseded in some places older local rites (where the Rom. liturgy had not already superseded them) except in a few cases (see LITURGY). The present Rom. m. gives first a calendar, with all the feasts, etc., in the ecclesiastical year, then full directions as to times of celebration, vestments. This is followed by devotional exercises and then the 'proper of the season,' that is, the parts of Mass, collect, epistle, gospel, etc., which are different for each Sunday; then information as to special Masses, etc. 'High Mass' differs from 'Low Mass' in being celebrated with more pomp and at least three priests.

A priest must not celebrate alone; he must have a server. Different liturgical colours are used for the vestments, according to the season.

MISSEL THRUSH, see under THRUSH FAMILY.

MISSI DOMINICI, the special representatives of Charles the Great, sent every year into the various districts of the empire to administer justice and report to the emperor.

MISSIONS have been an integral part of Christian activity from the beginnings of the Church. Until the conquest of the Rom. Empire the Church could be hardly other than missionary, and the overthrow of that Empire by barbarians brought her face to face with new problems. The conquest of Europe by Christianity was gradual, though it became the official religion under Constantine the Great more than a thousand years before the conquest of Europe was even nominally achieved.

The conversion of the countries on the outskirts of the Empire was largely due to a few great individuals. Thus Ireland greatly owes her conversion to St. Patrick, Scotland to St. Columba, Scandinavia to Olaf Tryggvessön, and Germany to the English Boniface, while the Slavonic Churches look back to Cyril and Methodius as their fathers; Russia, however, was Christianised from Constantinople. On the shores of the Baltic paganism lingered long; the great heathen idol in the isle of Rügen was not demolished till the XII. cent., while Lithuania was only just becoming Christian at the Reformation. But the Eastern Churches had not been idle. Recent research has made manifest the triumphs of missionary zeal in the Nestorian Church (see NESTORIANS), but its work was swept away by Mongol hordes of Central Asia. They had, however, established churches as far as Siberia in the N. and India in the S.

Modern missionary activity begins some time after the Reformation, for the internecine struggles in W. Europe absorbed for the time all the energy of the churches, though something was done by R.C. missionaries under the influence of the Jesuit, Francis Xavier, in India and Japan. On the Eng. conquest of N. America something was done to Christianise the natives by Sir Walter Raleigh, but there was a tendency there and elsewhere not to make much serious effort. The Society for the Propagation of the Gospel was founded in 1701. About 1731, however, the Moravian Church, then exiled from its Austrian birthplace, though numerically quite small, took up missionary work, and within a few years established churches in the far north of America, in Africa, and in Ceylon. About 1792 William Carey, a Baptist, became active, and in 1795 the London Missionary Soc. (interdenominational) was established. Numerous other societies followed: the Church Missionary Soc. and the Religious Tract Soc., 1799; the Brit. and Foreign Bible Soc., 1804; the Brit. Soc. for the Propagation of the Gospel among the Jews, 1843; the Central Africa Mission of the Eng. Univ's, 1860.

A great revival of interest in missions took place in England about 1880, particularly among Univ. men. The 'Student Volunteer Missionary Movement' was started in America in 1886, and in England in 1892. Medical missions are very important and there are now nearly one thousand doctors in the mission field. Missionary activity is more developed among Nonconformists than in the Anglican Church. Canadian and Australian missionary work is very important, indeed, in Canada, in remoter districts, there can hardly as yet be said to be regularly established churches. There are several societies in U.S.A., and one of the most important of recent developments is that of the World's Student Christian Movement. The number of converted Jews both in England and elsewhere is larger than is often supposed. The R.C. Church has been active in missionary work, and is remarkable for the number of Women's Orders which it employs. The Russ. Church carries on work in Siberia, Alaska, China, and Japan, and is helped by the Brit. and Foreign Bible Soc. in the distribution of copies of the Scriptures.

Missionary activity has made great strides during the XIX. cent., but certain generalisations can fairly be made about the mission field at the present time. The outstanding factor is the power of Muhammadanism, hence in many countries, particularly parts of Africa, the whole question resolves itself into a battle between Christianity and Islam.

While African missions have made great strides, special difficulties are felt most. The natives, often owing to European ill-treatment, are far from friendly, and are both morally and intellectually at a low level, possessing, with the minds of children, an ability to copy the worst vices of their conquerors. Christian missions exist in almost every part of the continent. The work of the Univ.'s Mission to Central Africa deserves special mention.

In India, ancient civilisation and religions present their own difficulties. Hinduism, though noble, is often unable to free itself from idolatry and immorality; the tendency of the Hindu mind is meditative rather than practical, and incapable of response in the same way as the Western. There have, however, been certain tendencies in India towards theism (partly owing to Muhammadan influence). The rigid family system forbids initiative, and the caste system is strict to a degree far exceeding class distinctions in Europe. To better the position of women and combine educational and philanthropic with religious work is part of the missionary's task. Here, as in Africa, native civilisation tends to pick up Western vices.

Chin. Christianity did not progress much for long, but since the Boxer massacres it has made great strides. A strong native church flourishes in Korea, but so far Christianity is not very strong in Japan. In other parts of the world, especially in the Pacific islands, where noble work has been done, m's are developing, but the missionaries are coming to realise

that the main work is the building up of strong native churches.

Smith, *Short History of Christian Missions* (1890); Dennis, *Christian Missions and Social Progress* (1897); Speers, *Missions and Modern History* (1905).

MISSISSIPPI (29° N., 89° 7′ W.), great river of N. America; second largest river in world; rises in Lake Itasca, in Minnesota, some 1560 ft. above sea-level, and flows southward over 2600 miles to Gulf of Mexico, roughly parallel to Alleghanies on E. and Rookies on W. Divides Minnesota from Wisconsin, Iowa from Wisconsin and Illinois, Missouri from Illinois and Kentucky, Arkansas from Tennessee and Mississippi, Louisiana from Mississippi; has drainage basin of nearly 1,240,000 sq. miles, or over 40% of whole area of U.S. Its distance from Rookies is considerably greater than that from Alleghanies, which accounts for greater size of western affluents, among which Missouri (*q.v.*) is a much larger stream than the M. itself when they unite at St. Louis; other western affluents are Minnesota, Des Moines, St. Francis, White, Arkansas, and Red Rivers. Eastern tributaries are Wisconsin, Illinois, Ohio (with tributaries Cumberland and Tennessee), Yazoo.

On either side of river are rich alluvial bottoms of large extent, at many points underlying ordinary level of stream, which is prevented from overflowing them by strong embankments; at mouth is large delta with many passages; river valley suffers from frequent floods, to prevent which government is extending and improving system of levées on embankments. There is great river traffic carried on by specially constructed steamers; chief trading towns, Minneapolis, St. Paul, St. Louis, Memphis, New Orleans. M. was explored by de Soto, 1541, and by Fr. travellers, 1673; source discovered by Glazier, 1884.

Spears and Clark, *History of the M. Valley* (1903); Chambers, *The M. River and its Wonderful Valley* (1910).

MISSISSIPPI (30° 14′ to 35° N., 88° 7′ to 91° 40′ W.), one of southern states of U.S.A.; is bounded N. by Tennessee, E. by Alabama, S. by M. Sound, Louisiana, W. by Louisiana and Arkansas; area, 46,810 sq. miles; surface flat along coast, rising to low hills never over 800 ft. in height; drained by Mississippi, Yazoo, Big Black, Pearl, Pascagoula, Tombigbee, Tennessee, and other streams. Capital, Jackson; large towns, Meridian, Vicksburg, Natchez.

M. was visited by Span. explorers in XVI. cent., but was first permanently settled by French early in XVIII. cent., first Fr. colony being founded by Iberville at Biloxi; remained under Fr. control till 1763, when it was transferred to Britain, from whom it passed to U.S. at close of War of Independence. Organised as territory, 1798, M. was admitted as state to Union, 1817; seceded from Union, 1861, and was scene of various battles during Civil War; submitted to Federal government, 1865, and was readmitted to Union, 1870. M. has several times suffered from devastating floods.

Government executive: power is vested in governor, assisted by lieut.-gov. and other officials; legislative authority vested in Senate of 45 members and House of Representatives of 145 members, elected for four years by popular vote; M. is divided for purposes of local administration into 79 counties, and is represented in Congress by two Senators and eight Representatives. Principal religious denominations are Baptist, Methodist, R.C., Presbyterian. Education is free, but is not compulsory; there are six univ's and coll's within the state, including M. Univ. at Oxford. Inhabitants include whites, negroes, Indians, Asiatics; whites of foreign birth are chiefly German and Irish. Climate is semi-tropical; soil fertile; chief industry is agriculture; produces great quantities of rice, maize, wheat, and other cereals; cattle, horses, sheep, and pigs raised; great crops of cotton grown. Lumbering is important industry. Manufactures include cottons, cotton-seed oil, etc. Railway mileage exceeds 4500. Pop. (1910) 1,797,114.

Encyclopædia of Mississippi History, edit. by Rowland (1907).

MISSOLONGHI, MESOLONGHI (38° 21′ N., 21° 25′ E.), fortified town, Acarnania and Ætolia, Greece, on Gulf of Patras; Byron died here in 1824. Pop. 8600.

MISSOULA (47° N., 114° W.), city, on Missoula, Montana, U.S.A.; seat of state univ.; agricultural and fruit-growing region. Pop. (1910) 12,869.

MISSOURI (38° 50′ N., 90° 7′ W.), river, U.S.; chief tributary of Mississippi; rises in Rockies; formed by union of Jefferson, Gallatin, Madison; receives Dakota from N., Yellowstone, Little M., Cheyenne, White, Platte, Kansas, Osage from S.; length, *c.* 3000 miles; navigation difficult; joins Mississippi near St. Louis; discovered by Fr. explorers, 1673.

MISSOURI (36° to 40° 35′ N., 89° 6′ to 95° 43′ W.), one of E. central states of U.S.A.; is bounded N. by Iowa, E. by Illinois, Kentucky, Tennessee, S. by Arkansas, W. by Oklahoma, Kansas, Nebraska; area, 69,415 sq. miles; surface flat or undulating in N., with wide stretches of prairie in N.W.; to S. of M. River the Ozark Mountains reach height of *c.* 3000 ft. Rivers are the Mississippi, which has course of over 550 miles along E. border; Missouri, which divides state a little to N. of centre; Grand, Chariton, Osage, Meramec, and other streams. Capital, Jefferson; large towns, St. Louis, Kansas City, St. Joseph, Joplin.

M. was visited by de Soto in 1542, but was not permanently settled until XVIII. cent., Ste Geneviève being founded in 1755, St. Louis in 1764; in 1762 it was ceded by France to Spain as part of 'Louisiana'; and was included in the Louisiana Purchase of 1803, thus coming into possession of U.S.A. Its admission to the Union was subject of long and acrimonious dispute, which resulted in the MISSOURI COMPROMISE of 1820, whereby slavery was forbidden north of lat. 36° 30′. Admitted as state to Union, 1821, in Civil War M. was divided, providing forces for both sides, and was scene of great number of engagements. Since conclusion of war, history of M. has been one of increasing prosperity.

Government executive: power is held by governor, who is assisted by other state officials; legislative authority vested in Senate of 34 members and House of Representatives of 142 members, elected respectively for four and two years by popular vote. State is subdivided for purposes of local administration into 115 counties, and is represented in Federal Congress by 2 Senators and 16 Representatives. Principal religion is R.C.; other creeds, in order of numerical strength, are Baptist, Methodist, Disciples of Christ, Presbyterian, Lutheran, Episcopal, Congregational. Education is free and obligatory; there are many univ's and coll's, state univ. being at Columbia, while other towns containing important coll's are St. Louis, Liberty, Cameron, Springfield. Inhabitants include whites, negroes, Indians, Asiatics; whites of foreign birth include Germans, British, Canadians, Swiss, Russians, Scandinavians.

Principal industry is agriculture; M. produces heavy crops of maize, wheat, oats, hemp, flax, cotton, tobacco, fruit; cattle, pigs, and sheep reared; minerals include coal, zinc, lead, petroleum, copper. Important industries are meat-packing, flour-milling, lumbering, brewing, printing, iron-founding. Railway mileage exceeds 9000. Pop. (1910) 3,293,335.

Carr, *Missouri*.

MIST, transparent fog (*q.v.*).

MISTLETOE (*Viscum album*), a semiparasite growing on apple, oak, and other trees, from which it absorbs nutriment by means of suckers. M. had an important place in the religious ceremonies of the Druids, to whom it was sacred, especially when found on the oak.

MISTRAL, see WIND.

MISTRAL, FRÉDÉRIC (1830–), Provençal poet; of peasant origin; started with six other *Provençal* poets the *Félibrige* movement (*q.v.*), 1854; pub. *Mirèio* (1859), which won him fame and has been

set to music, many other poems, a Provençal dictionary of about ten thousand words (1886), *Mémoires et Récits* (1906)—all translated into Fr., some of them by Alphonse Daudet; awarded Nobel prize (Literature), 1904.

MISTRETTA (37° 56′ N., 14° 22′ E.), town, Messina, Sicily. Pop. 1400.

MITAU (56° 39′ N., 23° 42′ E.), town, Courland, Russia, on Aa; residence of Dukes of Courland in XVI. cent.; trade in grain and timber. Pop. (1910) 38,840.

MITCHAM (51° 23′ N., 0° 12′ W.), suburb of London, in Surrey; market gardens. Pop. (1911) 63,218 (reg. dist.).

MITCHELL (43° 52′ N., 98° W.), city, S. Dakota, U.S.A.; seat of Dakota Univ.; machine shops; brickyards. Pop. (1910) 6515.

MITCHELL, SILAS WEIR (1829–), Amer. physician and author; served as medical officer in Civil War, afterwards becoming specialist in nervous diseases; commenced to write fiction in 1863, his historical novels, including *Hugh Wynn* and *The Red City*, being held in high esteem; also produced several volumes of verse, in addition to many works on medical subjects.

MITCHELSTOWN (52° 16′ N., 8° 16′ W.), market town, Cork, Ireland; in vicinity are limestone caverns.

MITES AND TICKS (*Acarina*, an order of *Arachnida*), small Arachnids, mostly degenerate and mostly parasitic, living on plants or animals or even on decaying organic matter. The body is fused to the thorax, and is often round, though in a few it is cylindrical; and there are usually present biting or piercing mouth-parts, and four legs armed with hairs or claws for attachment.

Examples of mites, which are usually very minute, are the Cheese-Mite (*Tyroglyphus*); the Follicle-Mite (*Demodex folliculorum*), in hair-follicles; the human Itch-Mite (*Sarcoptes scabiei*); and the minute so-called 'Red Spider' (*Tetranychus*), common on garden bushes.

Ticks, which are larger, and pea- or bean-like when swollen with blood, occur especially on birds and mammals, and even on snakes. They are often disease-carriers and dangerous pests. *Rhipicephalus* distributes the parasite of Red Water or Texas Fever amongst cattle; *Ornithodorus* spreads human 'tick-fever' in Central Africa; *Ixodes* is common on sheep and dogs in Britain.

MITFORD, MARY RUSSELL (1787–1855), Eng. novelist; wrote plays and verse and much miscellaneous prose, but had her greatest success with the sketches of homely life pub. under the title of *Our Village*.

MITFORD, WILLIAM (1744–1827), Eng. historian; pub. *History of Greece*, 1784–1810, marred by political bias and lacking style, for long a text-book, but now superseded.

MITHAN or **GAYAL**, see Ox Group.

MITHILA, ancient kingdom of India; greater part now included in Bihar.

MITHRADATES, name of several Oriental kings; Persian appellation signifying 'given by Mithras,' *i.e.* the sun god; most famous bearers, kings of Arsacid dynasty of Parthia and kings of Pontus.—**M. I.** (Arsaces VI.) conquered Media, Assyria, and several Gk. cities; defeated Demetrius II., Nicator, 138 B.C.; first great Parthian monarch.—**M. II.**, king of Parthia (c. 120–88 B.C.); called 'king of kings'; first to establish communications with Rome.—**M. VI.**, Eupator, king of Pontus (131–64 B.C.); dangerous enemy of Rome, with whom he waged two wars; hero of eastern romance.

MITHRAS, an Oriental deity regarding whom we know little, owing to the religious zeal of Muhammad and his followers. From monumental and scant documentary evidence, the following story is constructed: after a miraculous birth from a rock, witnessed only by some herdsmen, M. asserted dominion over the sun, and by its aid slew a bull sacred to Ormazd (god of light); and in spite of efforts to prevent it on the part of Ahriman (god of darkness), sacrificed it, thus creating the human race. He finally left the earth and became an immortal.

Mithraism was known both to Hindus and to Persians; spread rapidly, receiving additions from Chaldea and the various minor religions scattered over W. Asia; became exceedingly popular in Rome, especially among legionaries, towards end of I. cent.; thus coming into conflict with Christianity, which it withstood till V. cent., though broken in power by Constantine and Theodosius.

Mithraism was essentially mystic and occult. Its votaries, after passing through stages of initiation, met in grottos and partook of communion. Several marked resemblances to Christianity have been observed, but this is due to the Eastern origin of both and the fact that both were essentially moral religions.

MITRAL VALVE, see under Heart.

MITRE, a high, pointed cap with a cleft in the middle, worn as ecclesiastical head-dress by bp's and certain abbots. Until the X. cent. it was only a papal cap, worn out of doors, but later it became a regular ecclesiastical vestment. It was soon regarded as one of the special insignia of a bp., but the popes granted permission to wear it to important abbots. In the R.C. Church m's are often very tall, though originally shorter. They are of varying degree of richness of material and decoration according to the occasion when they are worn. Since the Oxford Movement m's have been worn (with copes) in the Anglican Church, though they had practically gone out with the Reformation. M's of different shape are worn by Gk. ecclesiastics. Lutheran bishops wear them, but not any other Protestants.

MITROVITZ, Mitrovitza (44° 59′ N., 19° 36′ E.), town, on Save, Croatia-Slavonia, Hungary; occupies site of ancient Sirmium. Pop. 11,600.

MITSCHERLICH, EILHARDT (1794–1863), Ger. chemist; prof. at Berlin; established law of Isomorphism connecting crystalline form with molecular structure and chemical composition (cf. the isomorphous salts $Na_2HPO_4+12H_2O$: $Na_2HAsO_4+12H_2O$), as a method for adjusting atomic weights.

MITTWEIDA (50° 58′ N., 12° 58′ E.), town, on Zschopau, Saxony; textile industries. Pop. (1910) 17,795.

MITYLENE, see Lesbos.

MIVART, ST. GEORGE (1827–1900), Eng. medical practitioner and biologist.

MIZRAIM, Old Testament name for Egypt; according to some the term is used of a district outside Egypt proper, near Gulf of Akaba; a Musri, which may have been in Arabia, is mentioned in Assyrian chronicles.

MNEMONICS.—(1) Art of aiding the memory; (2) devices for aiding the memory, *e.g.* mnemonic verses. The principle of these devices is to associate what is not easily remembered with the thought of something else which is easily learned and remembered, *e.g.* with verses which, even if nonsensical, are rhythmical, like the 'Barbara, Celarent,' etc., of formal logic, and which may have sense, rhythm, and rhyme, like 'Thirty days hath September,' etc. The composition of mnemonic devices was popular in ancient Greece and Rome, and in the XV. to XVII. cent's of our era.

MO'ALLAKAT, Al-Mo'allaqat, a collection of ancient Arabic poems written between 520 and 660 A.D., and compiled, probably by Hammād the Rhapsodist, during VIII. cent. The name signifies 'hung up,' and is explained by the legend that they were thus placed on the Ka'ba (shrine) at Mecca; simpler explanation is that they were a 'string' of poems. They are pre-Islamic in time, and only one of the writers, Labīd, became a follower of Muhammad. The collection consists of seven long poems by as many different writers, whose names and life-histories have been preserved. The poems, with the exception of that of 'Abīd, exhibit a strong metrical uniformity,

and give pictures of contemporary life. Most have lengthy preambles sometimes by another hand.

The poems have suffered slightly in their compilation, for Hammād (his title ar-Rāwiya shows him to be similar to the ancient Gk. rhapsodists) has, as the Gk. rhapsodists did with Homer, changed the order of several verses and occasionally interpolated.

MOA, see under RUNNING BIRDS.

MOABITES, a pastoral, Semitic race, formerly dwelling to the E. of the lower Jordan and the Dead Sea, but now extinct or merged with the Arabs. According to the Old Testament, they were the descendants of Lot, and were made tributary by Saul and David. Solomon married women of Moab. Mesha, king of Moab, subsequently revolted against Israel, recovered territories, and fortified cities, and regained independence, defeating Jehoram, king of Judah. Its later history is obscure. But in the IX. cent. B.C. Moab had a definite civilisation, with a similar language and culture to that of the Israelites. Its national god was Chemosh.

MOAWIYA, see CALIPH.

MOBERLY (39° 22′ N., 92° 29′ W.), city, Missouri, U.S.A.; machine and car shops. Pop. (1910) 10,923.

MOBERLY, GEORGE (1803–85), Anglican clergyman; headmaster of Winchester, 1835–66; bp. of Salisbury, 1869.

MOBERLY, ROBERT CAMPBELL (1845–1903), Anglican divine; author of *Atonement and Personality*.

MOBILE (30° 43′ N., 88° 3′ W.), town, Alabama, U.S.A.; colonised by French, 1702; Span. town from 1783 to 1813, when taken by U.S.A.; captured by Federals, 1865. M. is chief seaport of state; exports cotton, lumber, timber, meat products, live stock, maize, flour, vegetables; has R.C. episcopal see and cathedral; public buildings include custom-house, city hall. Pop. (1910) 51,521.

MOBILIER, CRÉDIT, see CRÉDIT MOBILIER.

MOÇAMBIQUE, see MOZAMBIQUE.

MOCHA, see MOKHA.

MOCKING-BIRD (*Mimus polyglottus*), an Amer. Perching Bird related to the Wrens; famous for its powers of song and imitation.

MODELS used for making metal casts are generally worked in wood, and from them a plaster or clay cast is made to form the mould into which the molten metal is poured. Before beginning to work in stone the sculptor makes a m. in wax or clay, and m's of various organs are used in teaching anatomy and physiology. M's are of great value in math's, particularly in the representation of geometrical figures, and in the teaching of physics m's assist the mind to grasp conditions which scarcely can be expressed in words. There are also working m's for demonstrating physical laws, the working of machinery, the inter-relation of geometrical figures, etc. Experimental m's are constructed by inventors in order to study the action of machines afterwards to be built on a large scale.

MODEL-YACHTING, regattas of miniature sailing-vessels up to *c.* 5 ft. 6 in. long; popular in Britain and U.S.A.; races are conducted under fixed rules; usual means of steering is weighted rudder which counteracts force of wind, but Americans prefer device by which tiller is connected with main-sail.

MODENA (44° 38′ N., 10° 55′ E.), town, N. Italy; belonged in turn to Etruscans, Romans, Goths, Lombards; held by Este family, with interruptions, from 1288 till 1860, when it was incorporated in Italy. M. is archiepiscopal see, has XII. cent. Romanesque cathedral; univ. dates from 1683; fine ducal palace, museums, art-galleries, observatory; formerly strongly fortified; has citadel. Manufactures include woollen and hemp fabrics, leather, silk, glass. Pop. (1911) 70,267.

MODICA (36° 52′ N., 14° 46′ E.), town, ancient *Mutica*, Syracuse, Sicily. Pop. (1911) 49,951.

MODJESKA, HELENA (1840–1909), Polish actress; real name Modrzejewski; famous in tragic and comedy rôles; settled in U.S.A.

MODLIN, see NOVOGEORGIEVSK.

MÖDLING (48° 6′ N., 16° 17′ E.), town, summer resort, Austria; iron manufactures. Pop. (1911) 18,067.

MODULATION, see HARMONY.

MOERIS, LAKE OF, old name of expanse of water, Fayum, Egypt; now a small lake named Birket el Kerūn.

MOESIA (*c.* 43° N., 22° E.), old Rom. province, S.E. Europe; now included in Servia and Bulgaria; settled by Goths in III. cent., subsequently by Slavs.

MOFAḌḌALĪYĀT, MUFAḌḌALĪYĀT, collection of ancient Arabic poems compiled during later part of VIII. cent., by al-Mufaḍḍal, a native of Kūfa who, pardoned by Caliph al-Mansūr for revolt, in 762, was appointed tutor to son of caliph, at whose suggestion he made his anthology. The poems are pre-Islamic and number 126; they are the work of 68 poets and show every phase of Arabian contemporary life; they contain little spirituality, but extol the virtues of hospitality and faithfulness to the tribe. The elegy of Abū Dhu'aib on the death of his sons is beautiful both in sentiment and in execution. Al-Mufaḍḍal has treated his collection with much greater care than Hammād has the *Mo'allakat* (q.v.).

Huart, *History of Arabic Literature* (1903).

MOFFAT (55° 21′ N., 3° 27′ W.), watering-place, Dumfriesshire, Scotland; mineral springs.

MOFFAT, ROBERT (1795–1883), Brit. missionary; sent to Africa, 1816; worked in Bechuanaland and Namaqualand; colleague of Livingstone (*q.v.*); translated Bible.

MOGADOR (31° 30′ N., 9° 15′ W.), seaport town, Morocco, on Atlantic; exports goat-skins, almonds, olive oil. Pop. 25,000.

MOGILEV, MOHILEV (*c.* 53° 30′ N., 31° E.), government, W. Russia; area, 18,514 sq. miles; cereals, honey, potatoes, hemp. Pop. (1910) 2,214,900.

MOGILEV, MOHILEV (53° 53′ N., 30° 22′ E.), town, on Dnieper; capital of Mogilev; manufactures leather, tobacco; seat of Gk. and R.C. abps. Pop. (1910) 51,040.

MOGILEV, MOHILEV (48° 30′ N., 27° 50′ E.), town; on Dniester; Podolia, Russia; distilleries, breweries, active trade. Pop. 23,000.

MOGUL, GREAT, title of emperor of Delhi; first was Baber. See INDIA (HISTORY).

MOHÁCS (45° 58′ N., 18° 37′ E.), town, on Danube, Baranya, Hungary; busy trade; noted in Hungarian history. Pop. 16,500.

MOHAIR, wool of Angora goat. See GOAT.

MOHAMMED, see MUHAMMAD.

MOHAMMERAH, see MUHAMRAH.

MOHAWKS, see INDIANS, *Red*; IROQUOIS.

MOHILEV, see MOGILEV.

MOHL, HUGO VON (1805–72), Ger. botanist; b. Stuttgart; ed. Tübingen; took medical degree; app. prof. of Bot. at Tübingen, 1832; author of several treatises, notably regarding palms and tree-ferns.

MOHL, JULIUS VON (1800–76), Ger. Orientalist; lived in Paris, where he was prof. of Persian at Collège de France; noted for monumental edition of *Shāh Nāmeh*.

MÖHLER, JOHANN ADAM (1796–1838), Ger. Catholic theologian; prof. at Tübingen.

MOHMAND, Pathan tribe, inhabiting hilly country North-West Frontier Province of India; Afghans by descent, and formerly under allegiance of Afghanistan, but placed under Brit. Government by agreement of 1893. The clans number about 65,000, with 18,000 fighting men, and were among the strongest and most troublesome frontier tribes before their outbreak and complete defeat in 1897.

MOHONK LAKE (41° 50′ N., 74° 10′ W.), summer resort, on Lake Mohonk, Shawangunk Mountains, New York, U.S.A.

MOHUN, CHARLES MOHUN, 5TH BARON (*c.* 1675–1712), Eng. duellist; at age of seventeen was tried for murder and acquitted; tried as accessory to murder of Mountjoy, the actor, by Captain Hill, and found not guilty (1693); fought duel with 4th Duke

of Hamilton, and both were killed. See Thackeray's *Esmond*.

MOIR, DAVID MACBETH (1798–1851), Scot. physician and author; practised med. at Musselburgh; author of the well-known story of Scottish life, *Mansie Waugh*, of works on the history of med., literary, and other subjects, of verses, and of many contributions (under name of *Delta*) to *Blackwood's* and other magazines.

MOISSAC (44° 7′ N., 1° 7′ E.), town, on Tarn, Tarn-et-Garonne, France; has an interesting abbey church. Pop. 8300.

MOJI (33° 55′ N., 131° E.), seaport town, N. of Kiushiu, Japan; coalfields. Pop. (1910) 55,682.

MOKHA, MOCHA (13° 20′ N., 43° 10′ E.), seaport town, Arabia, on Red Sea; formerly large trade in 'Mocha coffee.' Pop. 5200.

MOKSHANY, MOKSHANSK (53° 30′ N., 44° 30′ E.), town, Penza, Russia; flour, potash. Pop. 10,000.

MOLA DI BARI (41° 3′ N., 17° 6′ E.), town, Apulia, Italy; exports grain, fruit, wine. Pop. 15,000.

MOLA DI GAETA, see FORMIA.

MOLASSES, see SUGAR.

MOLAY, JACQUES DE (d. 1314), last of the Masters of the Templars; summoned by Pope Clement V. to undergo trial at Paris, and was sentenced to death by burning.

MOLD (53° 10′ N., 3° 9′ W.), town, Flint, N. Wales; centre of coal, lead, lime, and earthenware clay district; Rom. fort. Pop. (1911) 4875.

MOLDAVIA (46° 30′ N., 27° E.), a former principality of S.E. Europe; now the N.E. portion of Rumania.

MOLDE (62° 45′ N., 7° 9′ E.), seaport town, Romsdal, Norway; tourist centre.

MOLE FAMILY, TALPIDÆ, family of Insectivora containing about 35 species, all confined to northern hemisphere. Most have small eyes and ears, long skulls, and short limbs with flattened spade-like hands and feet for digging. The tunnels and 'mole-hills' of the common MOLE (*Talpa*) are familiar throughout Europe and most of Asia, but the creature is absent from Ireland. It feeds upon insects, larvæ, and earth-worms, as also do the STAR-NOSED MOLE (*Condylura*) of N. America, and the true MOLE SHREWS (*Urotrichus*) of N. America and Japan, all of which resemble the common Mole in their burrowing habits.

MOLÉ, LOUIS MATHIEU, COMTE (1781–1855), Fr. statesman; held office under Napoleon and at restoration; Prime Minister, 1836; a moderate Liberal, he was supported by the king against Guizot and Thiers.

MOLÉ, MATHIEU (1584–1656), Fr. statesman; pres. of *parlement*, 1641; and sought to reconcile Anne of Austria to its privileges; obtained Peace of Ruel, 1651.

MOLE RATS (*Spalax*), a genus of peculiar Rodents, the eyes of which are covered by skin. They live in underground tunnels like those of Moles, in a limited area about the Black Sea, Caspian, and Western Mediterranean.

MOLE SHREWS, see MOLE FAMILY.

MOLECH, see MOLOCH.

MOLECULE.—A molecule is the smallest particle of a substance that can exist alone. It is the unit of physical as distinguished from chemical phenomena. That matter is ultimately discontinuous has long been held, and the properties of thin films support this belief; nevertheless, the nature and behaviour of gases furnish the most convincing evidence of molecular structure. The simple volume proportions in which gases combine (Gay-Lussac's law), and consequently the simple relations between the densities and combining weights of gases led to Avogadro's hypothesis that equal volumes of all gases at equal temperatures and pressures contain the same number of molecules. This hypothesis has been confirmed by the kinetic theory of gases which gives a satisfactory account of such phenomena as gaseous pressure, expansion, and diffusion. Thus the physical condition of a gas is referred to the mass and velocity of its individual molecules, and the study of its behaviour becomes a problem in dynamics.

The sizes of m's have been estimated in various ways, with fairly concordant results. An idea of their size may be gained from the statement that if a single drop of water were magnified to the size of the earth, the size of the m's within it would be between that of small shot and cricket balls. The following mean values for molecular diameters have been calculated:—

Hydrogen .	$2{\cdot}03\times10^{-8}$	centimetres.
Nitrogen .	$2{\cdot}92\times10^{-8}$	,,
Oxygen .	$2{\cdot}70\times10^{-8}$	,,
Carbon dioxide .	$3{\cdot}33\times10^{-8}$	,,

More complex m's are larger, though equal numbers always occupy the same volume in the gaseous state, owing to the large interspaces. The properties of gases, liquids, and solids depend upon the freedom of their m's. The m's of a perfect gas are free to move, but constantly collide with other m's or the walls of the containing vessel. On account of this molecular freedom, gases are capable of indefinite expansion. The m's of a liquid, whilst free to move about within its mass, must keep the same mean distance from each other. Consequently, a liquid has a volume, but not a shape of its own. The m's of a solid possess vibratory power only, and keep the same mean position, so that a solid retains its own shape. The force that holds m's together is called Cohesion.

MOLESKIN, a twilled FUSTIAN (*q.v.*).

MOLFETTA (41° 12′ N., 16° 36′ E.), seaport, Bari, Italy; cathedral; active trade. Pop. (1911) 40,641.

MOLGE, see NEWTS.

MOLIDÆ, see SUN-FISHES.

MOLIÈRE, pseudonym of JEAN-BAPTISTE POQUELIN (1622 (?)–73), Fr. dramatist; b. in Paris, s. of upholsterer to Louis XIII., and himself inherited that post; well educated, first at *Collège de Clermont*, afterwards at Orleans, where he studied law and was called to Bar; studied philosophy under Gassendi; at twenty-three joined troupe of actors and soon took lead; acted for twelve years, first in Paris with indifferent success and more successfully in provinces, changing his name from Poquelin to M.; began to write his own plays, and initiated modern comedy with his first studies of manners, *l'Étourdi*, his *essais d'écrire*, acted in Lyons (1653), and epoch-making *Le Dépit Amoureux* (Béziers, 1656). In 1658 he returned to Paris, and under protection of king began literary campaign against extravagances, vices, and foibles of his time, brought from Italy and Spain.

Boileau described M. as a contemplator; his excellence consists in detached observation of manners and passions, a terrible power of mockery beneath an assumed air of moral tolerance, and in serious moments the classical faculty of 'understatement': the Misanthrope in his masterpiece thus declares his devotion:—

'Je fais de vous, madame, un cas extrême.'

Monotony of heroic couplet as used by M. is scarcely felt when play is seen, not read; and it is the form *par excellence* for the epigram, in which M. excelled. Another complaint of the reader—that M.'s characters are types, not people—is again not felt when plays are represented on stage, where exaggeration is necessary. In the provinces, M. used to sit in the market-place listening and noting; in Paris, he studied the court, the court tailors' and hairdressers' shops, etc., and found there his *Bourgeois Gentilhomme* (1670) and many other of his types. During first night of the *Précieuses Ridicules* (1659) a voice called out from the pit: 'Courage, Molière; that is true comedy!' *L'École des Maris* (1661), *L'École des Femmes* (1663), *Le Mariage forcé* (1664), *Don Juan* (1665), were comedies of his first manner. He borrowed some subjects from Terence and other classical writers; this borrowing, as in the *Fourberies de Scapin* (1671)—from Terence—was more than adaptation, but

the original element was never overpowered. The *Femmes Savantes* (1672) continued the attack commenced in *Les Précieuses*; *Le Misanthrope* (1666) is the most perfect of comedies of the classical school, and perhaps the best picture of its author's philosophy of life. *Tartuffe* (1667) is satire against hypocrisy, especially in its religious form, on which ground it could not be played for four years and a half. *L'Avare* (1668) was taken from Plautus's *Aulularia*. Whilst acting the 'Malade' in the *Malade imaginaire*, a piece of pure and broad humour, in 1673, M. was taken ill and carried away from the stage dying.

His contemporaries did not place M. as high as do later critics; the *Gazette* of the time never mentioned his name in descriptions of court entertainments; he was praised as actor, not as writer; Academicians and *salons* reproached him with buffoonery and exaggeration, and even with the immoderate laughter that his plays called forth. His life was darkened by domestic troubles; he is supposed to have pictured himself in the character of his 'Misanthrope,' and he bitterly remarks in *Critique de l'École des Femmes* that it is easier to express your own noble sentiments than to upbraid other men's folly. His numerous works were produced in fifteen years, during which he had to be at once author, actor, and stage manager; yet he will always rank among the world's very greatest of writers.

Life, by Hatton (1905), Trollope (1906), Brander Matthews (1910).

MOLINA, LUIS (1535–1600), Jesuit theologian; prof. at Evora and Madrid; tried to modify Augustinian doctrine of grace.

MOLINA, TIRSO DE, see TIRSO DE MOLINA.

MOLINE (41° 30′ N., 90° 30′ W.), city, on Mississippi, Illinois, U.S.A.; agricultural implements, carriages. Pop. (1910) 24,199.

MOLINIER, AUGUSTE (1851–1904), distinguished Fr. hist. scholar; author of *Bibliographie du Languedoc*, *Sources de l'histoire de France au moyen âge*, and editor of many hist. texts.

MOLINOS, MIGUEL DE (1640–97), Span. theologian; exponent of 'Quietism,' *i.e.* the direct communion of the soul with God, dispensing first with the Church, then with Jesus; imprisoned for heresy by the Inquisition, 1687.

MOLISE, ancient name for CAMPOBASSO (*q.v.*).

MOLLIEN, NICOLAS-FRANÇOIS, COUNT (1758–1850), Fr. statesman; Minister of the Treasury under Napoleon, 1806, and mitigated huge deficit left by Barbé-Marbois; prominent figure in the Hundred Days.

MOLLUSCS, MOLLUSCA, 'SHELL-FISH,' a phylum or subkingdom of the Animal Kingdom. The popular name 'shell-fish' indicates one of the most salient features of this great phylum—the presence of a limy shell. But a shell is not always present, and even when present is sometimes concealed within the body, so that we must look for other features common to the group. M's are unsegmented animals with bilateral symmetry (which, however, is lost in adult Gasteropods); they have no jointed appendages, but possess a locomotory muscular 'foot' on the under surface; they generally breathe by gills as well as through the skin, have a simple nervous system, often tentacles which have the power of smell, simple auditory or balancing organs, a rasping 'radula' within the mouth, and complicated eyes. The body is usually soft and slimy, owing to secretions from numerous gland cells.

M's are usually sluggish creatures, although such forms as Cuttle-Fishes occasionally show considerable activity. They are especially fitted for aquatic life, are common in many freshwater ponds and abundant in the sea; but some (such as Slugs and Snails) live in moist places on land. Their habits are as varied as their structures; most are free-living, but some are fixed, and a few are parasitic on Echinoderms. The 25,000 molluscan species which have been recognised are scattered over all the world except on the shores of arctic and antarctic seas. To man they are of some value, for many are used as food, others are of ornamental value, furnishing the beautifully iridescent mother-of-pearl; from a few shell-cameos are made; and they supply the world with pearls.

M's fall into five great classes exceedingly different from each other, and these readers should consult for more detailed information:—

Class I. LAMELLIBRANCHIATA or BIVALVES—*e.g.* Oyster.

Class II. SCAPHOPODA—a small class, e.g. *Dentalium*.

Class III. SOLENOGASTRES—a small class of worm-like forms.

Class IV. GASTEROPODA or UNIVALVES—*e.g.* Whelks, Snails.

Class V. CEPHALOPODA—Cuttle-Fishes and Octopus.

MOLLUSCOIDEA, old term which included the Brachiopoda, Polyzoa or Bryozoa, and the Phoronoidea.

MOLLY MAGUIRES, Irish secret soc. founded (1843) to resist rent collectors; spread to Irish districts of Pennsylvania, where, however, it was suppressed, 1876, after commission of startling crimes.

MOLOCH, MOLECH, an ancient Canaanite deity worshipped by human sacrifice in Old Testament times. Children were slain and then offered as a burnt sacrifice in the Valley of Hinnom. This practice, probably a return to an ancient custom in times of special difficulty, was sternly denounced by Jeremiah and Ezekiel. The idea was to sacrifice what was dearest.

MOLOCH, see under LIZARDS.

MOLOKAI, see HAWAIIAN ISLANDS.

MOLSHEIM (48° 32′ N., 7° 30′ E.), town, Alsace-Lorraine, Germany; iron and steel manufactures. Pop. 3700.

MOLTKE, ADAM GOTTLOB, COUNT (1710–92), Dan. courtier; loaded with favours by Frederick V., who was entirely guided by him; privy councillor; supported policy of Schulin and Bernstorff.

MOLTKE, HELMUTH CARL BERNHARD, COUNT VON (1800–91), Ger. field-marshal; First Lieut. on general staff at Berlin, 1833; wrote on history and politics, 1831–32; served Turkey against Mehemet Ali, 1838–39, exploring Far East and writing acute and graphic account of Turkey; pub. maps and surveys of Asia Minor, etc., and account of Russo-Turk. campaign, 1845, map of Rome, 1852; chief of general staff, 1858; commenced publication of military books which revolutionised art of war; wrote history of Ital. campaign, 1862; furnished plan for Dan. campaign, 1864, and rescued it from failure by personal intervention. M. was sole controller of war against Austria, 1866, and so brought about great Pruss. victory of *Königgrätz* and supersession of Austrian by Ger. pre-eminence; edited history of the campaign, 1867; success largely helped by great railway system organised by M. He was chief of general staff in Franco-Ger. War, 1870–71, and again organised opposition to invasion; led advance on Paris, won battle of *Sedan*, and besieged Paris, 1870; capitulation of Paris, 1871; cr. field-marshal, 1871; edited history of Franco-Ger. War; member of Reichstag, 1871. Tall, slight, stern-featured, M. was noted for taciturnity, tact, and prudence.

Morris, *Life* (1903).

MOLUCCAS (*c.* 0° N., 127° 30′ E.), islands, E. Indies; belong to Holland; area, 43,864 sq. miles; capital, Amboyna, was destroyed by earthquake, 1898. Pop. 415,000.

MOLYBDENUM (Mo=96·0), metal reduced from ores electrolytically, or by aluminium; S.G. 9·01; used in making special steels. Oxides: Mo_2O_3, MoO_2, MoO_3. Molybdates, from MoO_3, are often complex, *e.g.* ammonium molybdate (test for phosphate) is $(NH_4)_6Mo_7O_{24}+4H_2O$.

MOMBASA (4° 3′ S., 39° 39′ E.), chief port, Brit. E. Africa; taken in 1505 by Portuguese, who held it intermittently till 1698; under Brit. protection since 1887. M. is seat of High Court; contains large fort, government school, various churches and temples;

excellent harbour; exports rubber, ivory, hides; M. is connected with Uganda by railway. Pop. 31,000.

MOMEIN (25° N., 98° 30′ E.), town, Yunnan, China. Pop. 6200.

MOMENT, in mechanics, signifies the tendency to movement about an axis or point. Is gauged by product of mass, etc., into perpendicular distance to axis. *M. of inertia* about a given axis is the sum of products of each minute portion of mass into square of distance from axis. *M. of momentum* about an axis or plane is the product of mass into m. of velocity respecting axis or plane. *M. of resistance* is the sum of all moments in minute layers of a mass under strain or stress taken from neutral axis; counterbalances bending movement. Most m's may be solved by Graphic Statics.

MOMMSEN, THEODOR (1817–1903), Ger. historian and politician; leader of modern school of research; spent early years in study of Ital. antiquities, and acquired enormous scholarship and political approval of Cæsarism. *Roman History* appeared, 1854–56; graphic in style, but disfigured by special pleading of a kind opposed to modern hist. spirit; through it he won a great following and imperial favour; author of many works on Rom. subjects; editor of great *Corpus inscriptionum*.

Bardt, *Life* (1903).

MOMOTIDÆ, see MOTMOTS.

MONA, Rom. name for Anglesey (*q.v.*).

MONA MONKEY, see under CERCOPITHECIDÆ.

MONACHANTHIDÆ, see FILE-FISHES.

MONACHISM, see MONASTICISM.

MONACO (43° 45′ N., 7° 24′ E.), smallest independent state in Europe, on Fr. Mediterranean coast; belonged to Grimaldi family till 1861, when Charles III. ceded greater part to France. M. has area 8 sq. miles; towns are M., Condamine, and Monte Carlo, famous for Casino; R.C. episcopal see. M. is ruled by hereditary sovereign princes under Fr. protection; has small Council of State and Governor-General. Pop. (1910) 19,121.

Mayne, *M. and its Rulers* (1910).

Albert, Prince of M. (1848–), succ. his father, Charles III., 1889; gave State a constitution, 1910; a noted scientist, he has done much oceanographical research.

MONAD, a being developed according to inward law, in pre-established harmony with others. See LEIBNITZ.

MONAGHAN.—(1) (*c.* 54° 12′ N., 7° W.) county, Ulster, Ireland; area, *c.* 495 sq. miles; surface hilly; crossed by Slievebeagh Mountains; trades in linen and agricultural produce. Pop. (1911) 71,395. (2) (54° 15′ N., 6° 58′ W.) town, capital of above; agricultural produce. Pop. 3000.

MONARCHIANISM, name given to faith of Christians in Early Church, who believed in a God in one person, either, therefore, denying (1) the Deity of Christ or (2) His distinction from the Father.

MONARCHY, etymologically the supreme sovereignty vested in a single person, but the term 'monarch' is applied loosely to sovereigns of kingdoms as opposed to presidents of republics.

MONASTERY is the generic name for all religious houses canonically erected. If governed by an abbot or an abbess, it was called an abbey; if by a prior or prioress, a priory. The primitive monks chose as the sites of their dwellings high hills or desolate valleys, though even in quite early times, cities like Alexandria, Carthage, Rome, Hippo had their monasteries. In many places, however, a town gradually grew up under the shadow of an abbey, as at Westminster and Bury St. Edmunds, and in this fashion transformed the nature of the site. But the friars in founding their convents chose deliberately the busy centres of trade, and built homes, as at Oxford, Bristol, etc., amid the poverty-stricken quarters of the growing cities.

In England the main object towards which building was directed (in opposition to the customs of S. Europe) was shelter from the storms and cold. Consequently the architects here, taking over the quadrangular form of edifice, usually (as at Westminster) placed the church on the north to meet the force of the gales. Of the other three sides, the refectory lay to the south, while the dormitory might communicate east or west with the church, so that for the midnight offices the monks might not have far to go. Then the other buildings, kitchen, parlour, guest-house, offices, library, calefactory, or common-room, sprang up at haphazard as convenience of site and expense demanded. The *Carthusian monastery* alone differed, for on the north lay church and refectory, and then rows of little houses, in each of which dwelt a hermit monk, made up the rest of the square. Outside the strict circuit of the buildings ran an outer wall, beyond which none might pass without permission, and within which might no woman come. Sometimes even the church was open only to men; or, as at Durham, the part provided for the women was of the smallest extent.

One peculiar feature of certain religious orders was the existence of *double monasteries*, i.e. for men and women, side by side, governed by a single superior. In Ireland we know of one only, at Kildare; but in England, Whitby, Ely, Barking, etc., were famous, and here, curiously, it was the abbess who ruled over both. In the English order of Sempringham, founded by St. Gilbert, double monasteries were part of its organisation, but the prior was to be the superior. Judging from excavations made at Watton Priory, Yorkshire, one would say that the church separated the two monasteries, and down its centre ran a high wall. So that even here, in their common place of worship, the two were kept apart.

The government, of course, depended on the religious rule of the community. Among the *Benedictines* the abbot held office for life and ruled practically as absolute monarch, while under him the cantor or precentor, sacrist, cellarer, guest-master, and novice-master saw to the various departments of the monastery. Among the *Dominicans*, however, the form of government was different. Superiors and officials were all elected, usually for a term of three years. Even when in office, they were simply an executive, and had no legislative powers, for these were reserved to the national and international chapters. The Monkish chapters, however, had no jurisdiction over the abbot, and could only appeal to the Holy See, if they found his laws or administration unbearable. As landowners and guardians of the poor their influence was the staying power of England; when this was suppressed, the breakdown of the Eng. economic system was rapid.

Gasquet, *English Monastic Life* (1904); Thompson, *Customary of Canterbury and Westminster* (1902–4); Gasquet, *Ancren Riwle* (1903); Bateson, *Origin and Early History of Double Monasteries*.

MONASTICISM is the general name given to an organised life of asceticism. It includes the further idea of a withdrawal from the world and a 'dwelling-apart.' The interruptions and distractions of social life are universally regarded as prejudicial to the spirit of contemplation, and numerous attempts have been made in every age and by almost every religious body to escape from them. The purpose is generally union with God by intelligence and will; the means, self-denial.

The practice of such a life has been very widely spread. Among the Aztecs, Incas, and in the sects of Pythagoreans, Essenes, etc., there is abundant evidence of its existence. But the chief religions in which it has flourished are Buddhism and Catholic Christianity. From the doctrine of Gotama Buddha, that salvation can only come by a complete separation from attachment to conscious existence, it is easy to see how Buddhism became essentially monastic. When carried over to Tibet and mixed with Siva-worship, it was incarnated in the great lamaseries,

which, with the famous monastery of Lhasa at their head, are the most perfectly organised form of Buddhistic monasticism.

In Christianity, Eastern and Western, the expression of this ideal, as a counsel of perfection, has been more varied and healthier. Its two forms have been either the solitary life of the hermit, expressed in the N. Egypt establishments, or the more social existence of the monastery, as in the abbeys under St. Benedict's rule. The main purpose has always been the love of God and desire to serve Him as perfectly as this life permits by leaving all things to follow Christ. But manual labour was enjoined as a necessary corrective to the over-development of spiritual meditation, and other results in architecture, agriculture, history, missionary work, etc., have followed. These, however, are not essential, for the life itself of contemplation and the direct results of contemplation are alone the proper concern of the monk.

Hannay, *Spirit and Origin of Christian M.* (1903); Borlage, *The Age of the Saints* (1893).

MONASTIR, Bitolia (41° 1′ N., 21° 18′ E.), city, Macedonia, European Turkey; gold and silver filigree; near ruins of ancient Heraklea. Captured by Servians and Greeks, Nov. 18, 1912. Pop. 62,000.

MONAZITE, anhydrous phosphate of cerium, widely distributed, small amounts being found in gneisses and granites; obtained chiefly from N. Carolina and Brazil; used in making thoria for manufacture of incandescent gas mantles.

MONCEY, BON ADRIEN JEANNOT DE (1754–1842), marshal of France, 1801; Duke of Conegliano, 1808; fought in wars of Fr. Revolution, rising to be commander-in-chief in Spain, 1793–94; commanded in Peninsular War and invasion of France, 1814.

MONCHIQUE (37° 19′ N., 8° 32′ W.), town, Fars, Portugal; hot sulphur springs. Pop. 7600.

MONCK, see Albemarle.

MONCTON (46° 5′ N., 64° 10′ W.), city, on Petitcodiac, New Brunswick, Canada; stoves, cotton and woollen goods. Pop. (1911) 12,260.

MONDOÑEDO (43° 25′ N., 7° 25′ W.), town, Lugo, Spain; cathedral; linen goods. Pop. 11,100.

MONDOVI (44° 22′ N., 7° 48′ E.), town, Cuneo, Italy; bp.'s see and cathedral; silk, pottery. Pop. 20,000.

MONEMVASIA, see Malvasia.

MONET, CLAUDE (1840–), Fr. impressionistic painter.

MONETARY CONFERENCES, see under Currency Conferences.

MONEY, commodity used by the sanction of law or custom in any community as the medium of exchange. Only tribes in a very primitive state of existence engage in barter; with civilisation comes in the need of some product that will serve as a common instrument of exchange. Cattle and sheep were quite early used as money by Greeks and Romans. Corn and other cereals have been widely employed. Shells, oil, rock-salt, and a host of articles could be named which have at various times and places proved acceptable as money. But metals have long and most widely been recognised as the most satisfactory medium of exchange. Iron, copper, tin, and lead have been thus used, and copper, though it is now in civilised countries only 'token-money,' was in general use in Europe in the Middle Ages. Silver and gold, commonly called the Precious Metals, have won the first place in the world as money, chiefly through their many properties—their highly concentrated value, their durability, and their numerous uses in art and industry.

It is of the essence of money that it should be accepted by buyers and sellers without doubt or hesitation. If there is uncertainty as to disposing of it freely for goods or services, man returns to barter. Money is taken by the seller in the knowledge that it will at once be accepted when he becomes a purchaser. And this confidence that it is acceptable by all constitutes any article in use as money. The fact that cheques and postal orders cannot always be so accepted prevents their inclusion as money. Bank notes, on the other hand, are included as long as there is confidence in the government or bank which issues them.

If the first and most important function of money is to be a common medium of exchange, its second use is to furnish a price list of all commodities for sale, and its use in this way depends on its acceptance as the medium of exchange.

The value of money depends, as in the case of other commodities, on the law of supply and demand—for gold and silver as mediums of exchange and as common denominators of value are themselves commodities of intrinsic value. When gold is plentiful the prices of other goods are high, and when gold is scarce, prices are low—that is, in countries where gold is in constant demand as a medium of exchange.

With the introduction of credit, money also becomes the standard of deferred payments. It has been maintained by certain economists that bills of exchange are money, but the objection still holds, as in the case of cheques, that such instruments cannot find general acceptance, and it would, perhaps, be truer to say that bank drafts and bills of exchange limit the operation of money, and partake, by the mutual cancelling of debt they accomplish, of barter. (See F. A. Walker in *Dictionary of Political Economy* for a full examination of this point.)

As its common acceptance is essential, the coining of money is always kept in the hands of the government in civilised countries, and the manufacture of coins by private persons is a criminal offence that only in comparatively recent years has ceased to be punished by death. The gravity of coining can easily be understood. Not only is it an infringement of the rights of government, injurious to the revenue, but when once any serious number of bad coins are in current use, confidence is shaken. Possession of such coins inflicts serious harm on innocent persons who have taken them without detecting the alloy and cannot dispose of them, and the knowledge that bad money is in circulation breeds mutual suspicion, destroys freedom in exchange, and sheds uncertainty on the prices of all commodities. When credit is general it is of utmost importance that money should have a stable value, and though gold and silver may escape the operations of the coiner, there is a danger that government itself may work mischief by the issue of paper money, as in the case of the 'greenbacks' of the American government from 1863 to 1879. These 'greenbacks' were readily accepted as a medium of exchange, they furnished a price list, and were the standard of deferred payments. But they were issued in excess, and prices were forced up, with the result that wealth passed from the industrial classes to speculators—to the lasting injury of the country. As gold and silver are each under their own laws of supply and demand, it has been proposed that they shall have a fixed ratio to one another. Bimetallism is the name given to this proposal for fixing the gold-price of silver and the silver-price of gold.

Jevons, *M. and the Mechanism of Exchange*; J. S. Nicholson, *Money and Monetary Problems.*

BRITISH IMPERIAL COINAGE.

In the Middle Ages in England, the standard measure of value was the pound-weight of silver, but the actual medium of exchange consisted of silver pennies. Since the primary object of coinage was to affix a stamp to certify a certain weight and fineness, all metallic money was at first what it professed to be. Thus a pound of silver was coined into 240 pennies, whose aggregate weight, accordingly, was actually a pound. This fact is preserved in the table of Troy Weight: 20 pennyweights (*i.e.* the weight of 20 pennies = 1 oz.; 12 oz. = 1 pound). Hence originally 240 silver pennies weighed one pound, and from this fact has arisen

the present relation between a penny and a pound sterling.

The following table gives the weights of the coins when issued, the amount of variation allowed to the Mint (called the 'Remedy'), and the least a gold coin can weigh without being withdrawn from circulation:—

Coin.	Standard Weight.	Least Current Weight.	Remedy.
	Grains.	Grains.	Grains.
GOLD—			
Sovereign	123·27447	122·50000	0·20000
Half-Sovereign	61·63723	61·12500	0·10000
SILVER—			
Crown	436·36363	..	2·000
Half-Crown	218·18181	..	1·264
Florin	174·54545	..	0·997
Shilling	87·27272	..	0·578
Sixpence	43·63636	..	0·346
Threepence	21·81818	..	0·212
BRONZE—			
Penny	145·83333	..	2·91666
Halfpenny	87·50000	..	1·75000
Farthing	43·75000	..	0·87500

There are also two gold coins, of the value of 5 sovereigns (£5) and 2 sovereigns (£2) respectively, issued on special occasions, *e.g.* coronations.

The gold coins are made of metal composed of $\frac{11}{12}$ths pure gold and $\frac{1}{12}$th alloy.

The silver coins are made of metal composed of $\frac{37}{40}$ths of fine metal and $\frac{3}{40}$ths of alloy.

The bronze coins are made of metal composed of 95 % of copper, 4 % of tin, and 1 % of zinc.

Bank of England notes are issued for £5, £10, £20, £50, £100, £200, £500, and £1000, and can be exchanged for gold at the Bank of England at any time during the legal banking hours. They are legal tender in England and Wales.

Old English coins—

Joannes (gold)	36s. 0d.	Half-guinea (gold)	10s. 6d.
Moidore ,,	27s. 0d.	Angel ,,	10s. 0d.
Jacobus ,,	25s. 0d.	Noble ,,	6s. 8d.
Carolus ,,	23s. 0d.	Dollar ,,	4s. 6d.
Guinea ,,	21s. 0d.	Tester (silver) ..	.. 6d.
Mark ,,	13s. 4d.	Groat ,, ..	.. 4d.

Old Scots coins—

	Scots.	Sterling.
Bodle	= 2 pennies	$\frac{1}{6}$th penny
Plack or groat	= 2 bodles	$\frac{1}{3}$rd penny
Bawbee	= 6 pennies	1 penny
Shilling	= 12 pennies	1 penny
Pound	= 20 shillings	1s. 8d.
Merk	= 13s. 4d.	1s. 1$\frac{1}{2}$d.

FOREIGN AND COLONIAL MONEY.

From the following table it will be seen that many colonies and dependencies of the Empire have their own system of coinage, although British money is current in most of them. In Hong-Kong and Labuan, the Mexican, British, and Hong-Kong silver dollars (2s. 0$\frac{1}{2}$d.) are current. In the Straits Settlements the Straits Settlements silver dollar (2s. 4d.) is the standard coin of the colony. Since August 31, 1904, the Mexican and British silver dollars have ceased to be legal tender there.

In countries where silver is legal tender to any amount the exchange varies greatly, as in Central America, where the 'peso,' about 1s. 5d. at the present date (1913), is the standard coin. In China, the only coins in use are a British, Hong-Kong, or Mexican silver dollar, and a native coin called 'cash' (made of copper, iron, and tin), about twenty-five of which are only worth a penny. In the Exchange Rates relating to China the value of the tael is quoted. The 'tael' is a weight of silver, 2s. 10$\frac{3}{4}$d. in value, and it is equivalent to 10 'mace' or 100 'candareens.' In Persia, the standard coin is a 'kran,' the intrinsic value of which, at the average price of silver, is only 4d.

Countries.	Chief Coins.	Approximate Value in British Money.
		s. d.
Argentina	Peso (paper)* = 100 centisimos	1 9
,,	(gold)	4 0
Austria-Hungary	Krone or crown = 100 heller	0 10

United States	Dollar (gold) = 100 cents	4 1
Uruguay	Peso (gold) = 100 centimos	4 2

* The exchange value of paper money fluctuates considerably in countries where it is not readily convertible, at its face value, into gold.

MONEY-LENDING, under the Act of 1900, is a recognised business in Britain, and the money-lender is required to register his trading name at an Inland Revenue office every three years. When proceedings are taken by money-lenders for the recovery of money lent, if the judge is satisfied that the rate of interest is excessive, or that the office charges are too high, he can relieve the debtor. No money lent to infants, *i.e.* persons under twenty-one years of age, can be recovered at law unless the infant has represented himself falsely to be of age.

MONFORTE (42° 35′ N., 7° 27′ W.), town, Lugo, Spain. Pop. 13,200.

MONGE, GASPARD (1746–1818), Fr. mathematician; b. Beaune; ed. there, and at Lyons; invented descriptive geometry, dealing with the representation of 3-dimensional objects by drawings in one plane; prof. of Math's (1768) and of Physics (1771) at Mézières; prof. of Hydraulics (1780) at the Lyceum in Paris; held several important government posts.

MONGHYR.—(1) (*c.* 25° N., 86° 15′ E.) district, Bihar and Orissa, India; area, 3920 sq. miles. Pop. 2,075,000. (2) (25° 22′ N., 86° 30′ E.) town, capital of above; manufactures iron goods. Pop. 36,000.

MONGOLIA (*c.* 37° 30′ to 53° 30′ N., 82° 30′ to 126° 30′ E.), region, Central Asia, nominally subject to China; bounded N. by Siberia, E. by Manchuria, S.E. and S.W. by China proper, N.W. by Siberia; area, *c.* 1,250,000 sq. miles; surface generally consists of vast plateau, with Desert of Gobi occupying much of southern half; in W. are various mountain ranges, including Tannu, Khanghai, and Great Altai Mountains, while the Khinghan range runs across the eastern portion; principal rivers are Black Irtish, Yenesei, Selenga, Orkhon, Kerulan, all in northern half;

Hwang-ho drains a corner of S. Lakes include Kossogul, Ubsa Nor, Durga Nor. Live stock is raised. M. produces salt, graphite, silver lead, sulphates. M. is inhabited chiefly by Mongols, who for most part profess Buddhist religion. Pop. *c.* 5,000,000.

Gilmour, *Among the Mongols* (1883), *More about the Mongols* (1893).

MONGOLS, a great division of mankind, which, from its original home in Asia, has spread into Europe, Africa, and the Pacific Islands. Straight, coarse hair (plentiful on the head and scanty on the body), yellowish skin, brachycephalous headform, prominent cheek-bones, roundish face, and small black eyes are characteristic of the Mongolian. The stature is medium, and in the matter of intellectual development there is as much variety as amongst the white peoples; on the one hand there are the lowest tribes of Siberia and the semi-civilised inhabitants of Central Asia, and on the other the great and ancient civilisation of China.

The word Mongol is now by general consent derived from *mong*, meaning 'brave' or 'bold.' All the early history of the race is at present hopelessly mixed up with myth. But we know that in the plains watered by the Kerulon, the Argun, and the Upper Nonni, the M. merge into history as strenuous and intrepid fighters, and that Jenghiz Khan was born and made his capital at Karakorum in that region. In the XII. cent. A.D. a confederacy of Mongol tribes, ruled by an ancestor of Jenghiz, existed, but it was Jenghiz Khan who established the supremacy of the M. in Central Asia. Then came the conquest of China by his sons, 1234 A.D., and the overrunning of Russia, Hungary, and Armenia by grandsons. But the M. had no capacity for settlement or colonisation, and their conquests were conspicuous for savage atrocities. Kublai Khan established a dynasty in China, which ruled from 1294 to 1368 A.D., and then the M. were expelled from China and crushed by the Chinese, and their country was absorbed. At the same time, in the west of Asia and Eastern Europe the M. formed the Kipchak states, whose chief was Toktamish. He in his turn was overthrown by a greater Tartar chief, Tamerlane, and in 1550 the Russians conquered their Mongol enemies.

The Mogul (or Mongol) Empire in India was founded *c.* 1520 by Baber, a descendant of Jenghiz Khan. Another large area of Mongol conquest—Persia, Georgia, Armenia, and much of Asia Minor—was ruled by the descendants of Jenghiz Khan, from 1253 till 1335 A.D., when the Mongol monarchy in Persia passed away with the death of Abu Said. Some of these Persian monarchs were friendly to Christianity, anxious for European culture, and gave considerable encouragement to learning and to the arts.

The total population of M. under Chin. rule is now estimated at 2,000,000, and is divided into tribes governed by military chieftains. Buddhism, introduced by Kublai Khan, is the common religion, and the *Kutuktu*, or Living Buddha of Mongolia, ranks next in importance to the Grand Lama of Tibet. The language of the M., first reduced to writing by Jenghiz Khan, belongs to the Ural-Altaic family, and is akin to the Manchu and Korean tongues. Horse-breeding and cattle-raising are the chief industries of the people, and hunting produces furs, skins, and deer horns for trading purposes. There are no manufactures, but the large transit trade from Peking to Siberia gives considerable employment, for the caravans have to be conducted and the roads maintained. The M. possess few towns or cities, for they are still in the main a race of tent-dwellers. Travellers find them a cheerful, good-natured, and hospitable people.

Sir H. Howorth, *History of the Mongols*; Gilmour, *Among the Mongols*.

MONGOOSE, a carnivore; see under CIVET FAMILY.

MONGREL, properly a hybrid between two varieties of a species.

MONGREL SKATE, see ANGEL-FISH.

MONICA, see under AUGUSTINE, ST., OF HIPPO.

MONIER-WILLIAMS, SIR MONIER (1819–99), Sanskrit scholar; b. Bombay; Boden prof. of Sanskrit at Oxford; wrote several notable works.

MONISM, strictly, any system which regards the universe as the expression of a single principle (cf. Pluralism); but recently applied to the doctrine of the material interaction between brain and nervous system as the outer expression of an inner unity of consciousness. See METAPHYSICS.

MONITOR, see under LIZARDS.

MONK, see MONASTICISM.

MONK, or **MONCK, GENERAL**, see ALBEMARLE.

MONKEYS, see under PRIMATES.

MONK-FISH, see ANGEL-FISH.

MONK'S HOOD, see ACONITE.

MONMOUTH.—(1) (51° 49′ N., 2° 43′ W.) town, Monmouthshire, England; has smelting and tinplate works; contains ruined castle, birthplace of Henry V., 1388. Pop. (1911) 5269. (2) (40° 52′ N., 90° 42′ W.) city, Illinois, U.S.A.; agricultural implements, earthenware. Pop. (1910) 9128.

MONMOUTH, JAMES SCOTT, DUKE OF (1649–85), putative s. of Charles II.; or. duke, 1663; m. heiress of Buccleuchs, and became Duke of Buccleuch, 1665; already noted *roué*; began to claim succession as Prot. heir in opposition to James, Duke of York, but king always firmly denied his legitimacy; antipopery agitation became so strong that York secured M.'s exile, 1679; he returned and refused to quit England, 1679; openly supported by exclusionists headed by Shaftesbury; imprisoned, 1682; released, took part in Rye House Plot, and escaped to Holland, 1683; invaded England, 1685, conjointly with Argyll's invasion of Scotland; defeated at *Sedgemoor*, and executed by James II.

Fea, *King Monmouth* (1901).

MONMOUTH, ROBERT CAREY, EARL OF (*c.* 1560–1639), s. of Lord Hunsdon and kinsman of Queen Elizabeth; Warden of the Marches towards Scotland, and wrote valuable *Memoirs*; or. earl, 1625.

MONMOUTHSHIRE (51° 43′ N., 3° W.), small county, S.W. England; suffered from Danish invasions, IX.–X. cent's; included in Wales till 1536; during Great Civil War Raglan Castle was successfully besieged by Roundheads. M. has area *c.* 600 sq. miles; surface flat along coast, elsewhere hilly, rising in N. and N.W. to heights of nearly 2000 ft.; drained by Usk, Wye, and other streams; county town, Monmouth. Rich deposits of coal and iron are found about Newport, Pontypool, Nantyglo, Tredegar, and Ebbw Vale; grazing, wheat, orchards. M. contains ruins of many Norman castles, and of Tintern and Llanthony Abbeys. Pop. of administrative county (1911), 312,078.

Bradney, *History of M.* (1911).

MONNIKENDAM (52° 27′ N., 5° 2′ E.), village, on Zuider Zee, N. Holland, Netherlands.

MONOCOTYLEDONS, see BOTANY.

MONODELPHIA, see under MAMMALS.

MONODON, the Narwhal, see DOLPHIN FAMILY.

MONOGENEA, a group of TREMATODE WORMS (*q.v.*).

MONOGENESIS, the direct development of an embryo similar to the adult; descent from a single (hermaphrodite) parent; the theory of the origin of all organisms from a single cell.

MONOGENIST, in anthropology, opposed to *polygenist*, indicates a believer in the theory of *monogeny*—that all races of mankind have arisen from one primitive stock, and primarily from a single pair; or in a general way, one who holds the theory of *monogenesis* (*q.v.*).

MONOGRAM, a device by which two or more alphabet letters are interlaced, usually for the abbreviation of a name.

MONOLATRY, see RELIGION.

MONOLITH, see STANDING STONES.

MONOMANIA, see under INSANITY.

MONOMETALLISM, see BIMETALLISM.

MONOMOTAPA, title of independent potentates of S.E. Africa in early times; sole accounts of these rulers given by Dutch and Portuguese traders; disputes as to extent of territory and race, but probably negroes; their capital in XVII. cent. was near Masapa, south of Zambesi. See also ZIMBABWE.

MONONGAHELA (40° 14′ N., 79° 57′ W.), city, on Monongahela, Pennsylvania, U.S.A.; coal-fields. Pop. (1910) 7598.

MONOPHYSITES (Gk. 'one nature'), term applied to those who believed that because Christ was one person He must therefore have had only one nature, though a composite one. The M. sect arose after the Council of Chalcedon, 451, and played an important part in the ecclesiastical, and even the political, struggles of the time.

MONOPLANE, see FLIGHT.

MONOPOLI (40° 57′ N., 17° 18′ E.), seaport town, on Adriatic, Bari, Italy; exports wine, fruits. Pop. 23,500.

MONOPOLY, the exclusive privilege granted or guarded by the Crown of selling any commodity, or making, using, or working anything; granted frequently by Elizabeth and found very injurious; abolished, 1623, by Statute of Monopolies; exists now by Letters Patent.

The modern form of m. is the *Trust* system, in which a group of capitalists contrive to acquire partial or complete control of an industry. The U.S.A. Congress has attempted to check the movement by Anti-Trust legislation (see also Roosevelt). There are a few foreign government m's, such as the tobacco and match industry in France.

Modern Socialists affirm that by creating government m's out of all the leading industries profits would be increased, a great amount of waste obviated, and a surplus thus produced which might be devoted to social amelioration.

MONO-RAIL, see RAILWAYS.

MONOTHEISM, see THEISM.

MONOTHELITES, term given in theology to those who held that Christ had one will, in distinction to the orthodox position that He had two. The controversy arose in the VII. cent. after that of the Monophysites (*q.v.*).

MONOTREMATA, see under MAMMALS.

MONREALE (38° 5′ N., 13° 17′ E.), town, Palermo, Sicily; near M. occurred the great massacre of Fr. settlers, the Sicilian Vespers, 1282. Chiefly famous for wonderful Norman cruciform cathedral, dating from 1170; has remains of Benedictine monastery. Archiepiscopal see. Pop. 24,500.

MONROE.—(1) (32° 30′ N., 92° 29′ W.) city, on Ouachita, Louisiana, U.S.A.; cotton and lumber industries. Pop. (1910) 10,209. (2) (41° 52′ N., 83° 26′ W.) city, on Raisin, Michigan, U.S.A.; flour-mills, foundries. Pop. (1910) 6893.

MONROE, JAMES (1758–1831), fifth Pres. of U.S.A.; b. in Virginia; officer in War of Independence; Virginian councillor, 1782; member of U.S.A. Congress, 1783–86, and influenced foreign policy; U.S.A. senator, 1790; minister to France, 1794–96; wrote pamphlet criticising Washington, 1797; gov. of Virginia, 1799–1802, 1810–11; carried out purchase of Louisiana from France, 1803; failed in missions to England and Spain, 1804–6; Sec. of State, 1811–17; of War, 1814–15; Pres., 1816 and 1820, and pursued path of successful compromise as to burning questions, *e.g.* states' rights, slavery; promulgated 'Monroe Doctrine' (*q.v.*), 1823.

Gilman, *Life* (1883).

Monroe Doctrine, enunciated by Pres. Monroe, had as its principle to prevent European interference or future colonisation in America; called forth by fear of European aid to Spain for recovery of South American colonies; by Clayton-Bulwer Treaty, 1850, Great Britain and U.S.A. agreed not to colonise Central America; doctrine several times applied in South America.

Book on M. D. by Sir F. Pollock (1903).

MONS (50° 27′ N., 3° 56′ E.), town, Hainault, Belgium; formerly fortified; Gothic cathedral; often taken by French; manufactures textiles. Pop. (1910) 27,828.

MONSON, SIR WILLIAM (*c.* 1569–1643), Eng. admiral; served against Spain under Elizabeth; admiral of Narrow Seas, 1604; vice-admiral, 1635; author of *Tracts*; historically important. Elder bro., Sir Thomas (1564–1641), prominent under James I., and ancestor of viscounts and barons Monson.

MONSTER, see under TERATOLOGY.

MONSTRANCE, a kind of glass and metal frame, used in R.C. Church for displaying the Host.

MONT BLANC, see BLANC, MONT.

MONT CENIS, see CENIS, MT.

MONT GENÈVRE (44° 55′ N., 6° 50′ E.), pass, Cottian Alps, between Italy and France.

MONT ST. MICHEL (48° 40′ N., 1° 30′ W.), granite island off coast of Normandy, in Bay of St. Michel; rises 240 ft. above surrounding sands, and is reached by causeway; summit crowned by old town and Benedictine monastery, originally founded, 966. Pop. 240.

MONTAGU, CHARLES, see HALIFAX, 1ST EARL OF.

MONTAGU, EDWARD, see MANCHESTER, EARLDOM AND DUKEDOM OF.

MONTAGU, EDWARD, see SANDWICH, EARL OF.

MONTAGU FAMILY, ancestors of earls of Salisbury; Dru de Montaigu (Montacute) was tenant in Somersetshire at time of Domesday Book; probably from Montaigu in Normandy; barons by writ from 1299 onwards. William M., cr. Earl of Salisbury, 1337; marshal, 1338; conquered Man, 1340–42. William, 2nd earl, fought at Crécy and Poitiers; Thomas, 4th earl, distinguished at Agincourt.

MONTAGU, LADY MARY WORTLEY (1689–1762), Eng. letter-writer; pioneer advocate of inoculation for smallpox; b. Thoresby, Nottinghamshire; e. dau. of Earl of Kingston, who introduced her at a very early age into the best literary circles; m. Edward Wortley Montagu, and accompanied him on an embassy to Constantinople. During her travels Lady Mary wrote her celebrated *Letters* descriptive of Eastern life. See Paston's *Life and Times* (1907).

MONTAGU, RALPH, 1ST DUKE OF (*c.* 1638–1709), Eng. diplomatist; s. of Baron M. of Boughton; promoted Revolution, 1688; cr. earl, 1689, Marquess of Monthermer and Duke of Montagu, 1705. These honours became extinct on his son's death, 1749.

MONTAGU, RICHARD (1577–1641), bp. of Chichester, 1628, Norwich, 1638.

MONTAGU'S SUCKER, see LUMPSUCKERS.

MONTAIGNE, MICHEL DE (1533–92), Fr. essayist; b. in castle of Montaigne between Castillon and Bergerac; eccentric education; as a child, wakened by sound of music to make his life happy and easy; all his attendants learned Latin to speak it with him until he was seven, so that he should learn it naturally; after schooling at Bordeaux studied law, and in 1554 was made Councillor in Parliament of Bordeaux, where he made the acquaintance of La Boétie (*q.v.*), who contributed greatly towards forming M.'s mind; model friendship only ended when La Boétie died, 1563; M. never forgot loss; resigned his post *c.* 1572, and retired to Montaigne, where he began to write his *Essais*; travelled through Switzerland, Germany, Italy, whence he was recalled to be Mayor of Bordeaux (1582–86); received much attention on visit to court. He was quite adequate as municipal official, and although a Protestant, just to both parties; perhaps for that reason he was blamed by both.

The *Essais* are a fine piece of moral philosophy, which showed new spaciousness of mental outlook. '*Que sais-je?*' was motto assigned after his death to M. Essays take form of jottings in diary of thoughts and feelings, often without order or plan, as fancy or

circumstances moved him; titles of chapters do not even always correspond to contents; style characterised by freedom and ease of the Renaissance.

Dowden, *Montaigne* (1905); Norton, *Studies in M.* (1905); Sichel, *Montaigne* (1911).

MONTALEMBERT, CHARLES FORBES RENÉ DE (1810–70), Fr. orator and historian; b. in London during Fr. Revolution; ed. in Eng. Liberal ideas by maternal grandfather, Lord Forbes, but remained Catholic; commenced to contribute to *l'Avenir*, 1830, but ceased in obedience to Rome; sought to unite Liberalism and Catholicism until 1857, when he retired from politics; his *St. Elizabeth of Hungary* (1836) and *Monks of the West* (1860–67) did great service to Church.

MONTALEMBERT, MARC RENÉ, MARQUIS DE (1714–1800), Fr. military engineer and author; b. Angoulême; served in campaigns in Germany, Italy, and Bohemia; wrote on fortifications, and elected to Academy of Sciences. See FORTIFICATION.

MONTANA (44° 20′ to 49° N., 104° 17′ to 115° 53′ W.), one of N.W. states of U.S.A.; bounded N. by Canada, E. by N. and S. Dakota, S. by Wyoming, W. by Idaho; area, 146,752 sq. miles; surface generally consists of undulating prairie, rising westward to Rocky Mts., main ridge of which reaches nearly 12,000 ft.; drained by Columbia and its tributaries in W., Missouri and its affluents, most important of which are Milk and Yellowstone, in E. Capital is Helena; large towns, Butte, Great Falls, Missoula, Anaconda.

M. was visited by Fr. explorers in 1742, and by the Americans Lewis and Clark in 1804–6, after which trading stations and missions were established; western portion was at different dates included in Oregon, Washington, and Idaho; eastern portion was part of Louisiana Purchase (*q.v.*), and was subsequently included in Missouri, Nebraska, Dakota, and Idaho in succession. In 1861 discovery of gold led to great influx of miners, and M. was organised as separate territory in 1864; early years marked by frequent hostilities with Indians, who were ultimately subdued in 1877; admitted as state to Union, 1889.

Executive power is vested in gov., assisted by six state officials; legislative authority vested in Senate of 31 members and House of Representatives of 85 members, elected by popular vote. M. is divided for local administrative purposes into 31 counties, and is represented in Federal Congress by two Senators and two Representatives.

Agriculture is rendered possible by means of irrigation; live stock raised; cereals grown. R. has important deposits of copper, gold, silver, lead—output of copper especially being very large; coal, iron, antimony also found. Slopes of Rockies yield timber. Chief industries are flour-milling, lumbering, copper-smelting. Railway mileage is nearly 5000.

Principal religion is Roman Catholicism; other denominations, in order of numerical importance, are Methodist, Presbyterian, Episcopalian, Lutheran. Education is free and obligatory; state has a univ. at Missoula, and technical colleges. Inhabitants include whites, Indians, Asiatics, negroes; whites of foreign birth are Canadians, British, Germans. Pop. (1910) 376,053.

Miller, *Illustrated History of State of Montana* (1894).

MONTANISM, the name given to a religious movement of the second Christian cent., after its founder, **Montanus**. The centre of his activity was Phrygia, in Asia Minor, and he believed himself to have a prophetic calling. The cause of the movement was the secularism of the Church and the laxity, in some places, of Church discipline. A violent dispute arose over the new movement, and it met with strong opposition from the bishops. Some Montanists were excommunicated, others voluntarily separated from the Church. Among converts was Tertullian, before his change one of the staunchest defenders of Catholic Christianity. Church government, however, in Rome and Carthage had reached a more developed phase, and M. could not face such a powerful organisation. M. became narrow and bitter, and lost influence. In Phrygia it lasted till after 300 A.D. The main authority for M. is Tertullian, but allowance must always be made for his violence.

Cunningham, *Churches of Asia*.

MONTARGIS (48° N., 2° 43′ E.), town, Loiret, France, at junction of Loing and Vernisson; ruined castle. In Charles VI.'s reign, the 'dog of M.' picked out and overcame in combat Macaire, its master's assassin. Pop. 13,500.

MONTAUBAN (44° 1′ N., 1° 22′ E.), town, Tarn-et-Garonne, France; Prot. stronghold; Huguenots were besieged here in 1562 and 1621; possesses Prot. Theological Coll.; formerly fortified; episcopal see, fine cathedral; manufactures woollens. Pop. 28,900.

MONTAUSIER, CHARLES DE SAINT-MAURE, DUC DE (1610–90), Fr. soldier; general in Thirty Years War; m. Julie, dau. of Mme de Rambouillet, 1645; in her honour the greatest writers of the day contributed to the *Guirlande de Julie*.

MONTBÉLIARD (47° 21′ N., 6° 46′ E.), town, Doubs, France; has belonged to France since 1801; strongly fortified; contains old castle. Pop. 10,600.

MONTBRISON (45° 35′ N., 4° 5′ E.), town, Loire, France; manufactures flour, silk. Pop. 7700.

MONTCALM, LOUIS JOSEPH, MARQUIS DE (1712–59), Fr. soldier; commander in Canada, 1756; captured Fort William Henry; held Ticonderoga against General Abercrombie's siege; commander at Quebec, he fell fighting against Wolfe on the Plains of Abraham.

MONTCEAU-LES-MINES (46° 38′ N., 4° 20′ E.), town, Saône-et-Loire, France; coal mines, ironworks. Pop. 27,000.

MONTCLAIR (40° 50′ N., 74° 18′ W.), residential town, on Orange Mts., New Jersey, U.S.A. Pop. (1910) 21,550.

MONT-DE-MARSAN (43° 56′ N., 0° 29′ W.), town, Landes, France, at confluence of Midou and Douze; resin, oil. Pop. 12,200.

MONTDIDIER (49° 39′ N., 2° 33′ E.), town, on Don, Somme, France.

MONT-DORE-LES-BAINS (45° 34′ N., 2° 48′ E.), watering-place, on Dordogne, Puy-de-Dôme, France; mineral springs.

MONTE CARLO, see under MONACO.

MONTE CASSINO (41° 31′ N., 13° 48′ E.), monastery, on hill near Cassinum, Italy; founded by St. Benedict in VI. cent.

MONTE CORVINO, GIOVANNI DI (1247–1328), R.C. abp. of Peking, 1307; a Franciscan, he did much missionary work in India and China.

MONTE CRISTO (42° 21′ N., 10° 17′ E.), small island of Italy in Mediterranean; ancient *Oglasa*. See also DUMAS, ALEXANDRE.

MONTE SAN SAVINO (43° 18′ N., 11° 46′ E.), small town, Arezzo, Tuscany, Italy. Pop. (commune) 8500.

MONTE SANT' ANGELO (41° 43′ N., 15° 57′ E.), town, Foggia, Italy; place of pilgrimage. Pop. 23,000.

MONTE VULTURE (41° N., 15° 43′ E.), extinct volcano, Potenza, Italy; ancient *Vulture Mons*.

MONTECATINI, MONTECATINI DI VAL DI CECINA (43° 20′ N., 10° 45′ E.), watering-place, Pisa, Italy. Pop. 5100.

MONTECATINI, MONTECATINI DI VAL DI NIEVOLE (43° 54′ N., 10° 48′ E.), watering-place, Lucca, Italy; hot springs. Pop. 9200.

MONTECUCCOLI, RAIMONDO, COUNT OF (1609–80), Austrian soldier; brilliant commander in Thirty Years War; shared in protection of Poland and obtained Treaty of Oliva, 1660; inflicted great defeat on Turks at *St. Gotthard*, 1664; defeated Turenne, 1673; great general and author of important works on military history, tactics, etc.

MONTEFALCO (42° 53′ N., 12° 40′ E.), town, Perugia, Italy. Pop. 3400.

MONTEFIASCONE (42° 32′ N., 12° 3′ E.),

town, Rome province, Italy; muscat wine. Pop. 9600.

MONTEFIORE, SIR MOSES HAIM (1784–1885), Jewish philanthropist; made fortune on Stock Exchange; sheriff of London, 1837; baronet, 1846; secured better treatment for Jews in Turkey, Russia, Moldavia, and Morocco, and raised various funds for Jewish refugees.

MONTEFRIO (37° 17′ N., 4° W.), town, on Bilana, Granada, Spain; Moorish relics; cotton goods. Pop. 11,500.

MONTELEONE CALABRO (38° 43′ N., 16° 8′ E.), town, Catanzaro, Italy; ancient *Hipponium*; old castle.

MONTÉLIMAR (44° 35′ N., 4° 45′ E.), town, Drôme, France, near Rhône; silk industries. Pop. 13,700.

MONTENEGRO, kingdom, Balkan Peninsula, between Herzegovina and Albania; almost entirely cut off from Adriatic by Dalmatia; bounded on N.E. by Servia. M. is smallest independent kingdom in Europe; greatest length, *c.* 100 miles; width, 78 miles; area, 3630 sq. miles. Surface is mountainous, rising in centre, W., and N. to barren stony plateau, 5000 ft. above sea-level, and reaching greatest elevation in peaks Durmitor (*c.* 8150 ft.) and Kom Kuchi (*c.* 8030 ft.). Average elevation is lower on E., and there is a narrow coastal strip with valleys opening off it. M. is drained by Zeta, Moratcha, Lim, and other streams; in S. is Lake Scutari, of which eastern half is in Albania. Largest towns are Podgoritza, Niksic; Dulcigno and Antivari (ports); and Cettinjé (capital). Antivari is a free port and (like the river Boyana) may not be fortified under Treaty of Berlin (1878). Climate varies with elevation—warm on coast, cold in mountainous districts.

M. was dependent on Servia from middle of XIII. cent. till defeat of that country by Turkey at *Kossovo*, 1389; henceforth carried on long struggle against Turks, until reign of Danilo Petrović, who became prince-bp. in 1697, freed his realm from the aggressors, and formed alliance with Russia; several of his descendants supported Russia against Turks, on whom both Peter I. and Danilo II. inflicted defeat; Danilo II. was succeeded in 1860 by Nicholas I. (b. 1841), present ruler, whose reign also was marked by wars which ended in 1878 in defeat of Turkey and recognition by the powers of Montenegrin independence. Nicholas adopted kingly title in 1910; declared war on Turkey, 1912, and invaded Albania. See TURCO-BALKAN WAR.

Government is a limited monarchy; legislative powers vested in national assembly, called *Skupshtina* (instituted 1905); members elected by manhood suffrage; also several *ex officio* members. M. receives an annual subsidy from Russia (for military, educational, and other purposes), also a contribution from Austria. Elementary education is free and obligatory, but ignorance is still widespread. There is no State religion; great majority of population belong to Gk. Church; some Roman Catholics and Muhammadans. Inhabitants are warlike race of Slavonic origin. Their occupations are chiefly pastoral and agricultural. The men are tall and of great strength; all liable to military service; women are downtrodden.

Large tracts are uncultivable. In E. are extensive forests of beech, oak, pine; sheltered valleys produce tobacco, maize, apples, and other fruits; while along coastal strip and adjoining valleys, grain, grapes, olives, figs, mulberries are grown. Large numbers of sheep, goats, cattle, swine, and horses are raised. Petroleum occurs; minerals little developed. Exports include live stock, sumach, cheese, wool, tobacco, hides, olive oil, wine, honey. Railway from Antivari to Lake Scutari was opened in 1908; few roads, and civilisation generally is in backward condition. Pop. 285,000. See BALKAN PENINSULA.

Wyon and Prance, *The Land of the Black Mountain* (1903).

MONTEPULCIANO (43° 5′ N., 11° 47′ E.), city, Siena, Italy; wine. Pop. 6500.

MONTEREAU (48° 23′ N., 2° 57′ E.), town, Seine-et-Marne, France, at confluence of Yonne and Seine; here Napoleon defeated Allies, 1814; porcelain; machinery. Pop. 8300.

MONTEREY (36° 35′ N., 121° 51′ W.), town, California, U.S.A.; formerly capital of state; seaside resort; trades in fish, exports oil. Pop. (1910) 4923.

MONTERREY (25° 34′ N., 100° 20′ W.), town, Mexico; taken by Americans, 1846; episcopal see, has cathedral and episcopal palace; silver mines. Pop. (1910) 81,006.

MONTE-SAN-GIULIANO (38° 3′ N., 12° 35′ E.), town, Trapani, Sicily; cathedral; ancient *Eryx*. Pop. 3600.

MONTESPAN, FRANÇOISE-ATHÉNAÏS DE PARDAILLAN, MARQUISE DE (1641–1707), mistress of Louis XIV.; dau. of Duc de Mortemart; m. Montespan, 1663; had seven children by king, legitimatised in 1673; soon after lost affection of king; suspected of poisoning rivals; beautiful, witty, patron of letters.

MONTESQUIEU, CHARLES LOUIS DE SECONDAT, BARON DE LA BRÈDE ET DE (1689–1755), Fr. jurisconsult, historian, philosopher; by birth member of *noblesse de la robe*; succ. uncle as *président à mortier* at Bordeaux, 1716; timid, retiring character; belonged to no school; uneventful life. The *Lettres persanes* (1721), audacious, shocking, and amusing, went like wildfire. After M. had consented to publish expurgated edition, he was admitted to Academy, 1728. The *Grandeur et décadence des Romains* (1734) contained brilliant generalisations on Roman character, but famous *Esprit des lois* (1748), besides showing maturity brought by years, was marked by deep studies and wide travelling, which M. had undertaken since earlier work. Twenty-two editions were published in eighteen months, but M. was fiercely attacked by Church; hence his *Défense* (1750). M. was blamed by Voltaire and later critics for lack of order and sacrifices to the *bon mot*, but acclaimed as 'a profound and felicitous genius.'

Ilbert, *Montesquieu* (Romanes Lecture, 1904).

MONTESSORI SYSTEM, see EDUCATION: *Infant Schools*.

MONTEVIDEO, SAN FELIPE Y SANTIAGO DE (34° 53′ S., 56° 10′ W.), capital, Uruguay; settled by Spaniards, 1726; seized by Britain, 1807, but evacuated same year; transferred to Uruguay, 1828, becoming capital of republic; unsuccessfully besieged by Argentines, 1843. Public buildings include Senate House, Exchange, town hall, opera-house, univ., various philanthropic establishments. M. is archiepiscopal see, and has a modern cathedral. M. is outlet for all chief productions of Uruguay, and main inlet for imported goods; harbour has exposed and somewhat dangerous roadstead; exports jerked beef, wool, skins, grease, horns, cereals; beef-salting an important industry. Pop. 308,710.

MONTEZ, LOLA, see GILBERT, MARIE.

MONTEZUMA, name of two Mexican emperors: **Montezuma I.** (1390–1471) ruled from Atlantic to Pacific. **Montezuma II.** (1466–1520), the last emperor, by heavy taxation alienated his subjects; tried to buy off Cortes, and became a Span. prisoner; the capital rebelled, Cortes brought out M. to pacify the citizens; a stone wounded the emperor, and soon afterwards he died broken-hearted. See MEXICO.

MONTFERRAT, family of Lombardy; renowned in Middle Ages. William III., Marquis of M., went on Second Crusade, 1147; five sons prominent figures in Holy Land; rivals of Visconti and house of Savoy in Italy.

MONTFORT, SIMON DE, EARL OF LEICESTER (d. 1265), statesman and soldier; a Fr. noble; came to England, 1230, becoming Earl of Leicester, and receiving Eng. lands of his f.'s first wife, co-heir of Earl of Leicester; m. Eleanor, sister of Henry III., 1238; had several quarrels with king; opposed demand for subsidy, 1254; joined baronial opposition at Parlia-

ment of Oxford, 1258; went to war with Henry, 1263; won battle of *Lewes*, 1264, and established baronial control; slain at *Evesham*.

Life, by Prothero.

MONTGAILLARD, JEAN GABRIEL MAURICE ROQUES, COMTE DE (1761–1841), Fr. political agent; spy of first rank, employed by Louis XVIII., the Directory, and Napoleon; showed great ability in unravelling Pichegru's plot.

MONTGELAS, MAXIMILIAN JOSEF GARNERIN, COUNT VON (1759–1838), Bavarian statesman; chief adviser of Maximilian Joseph, elector of Bavaria; co-operated in Napoleonic reorganisation of Germany; enemy to Ger. unity, but Bavarian patriot.

MONTGOLFIER, JOSEPH (1740–1810) and **ETIENNE** (1745–1799), inventors of the balloon (*q.v.*).

MONTGOMERIE, ALEXANDER (*c.* 1550–*c.* 1610), Scot. poet; related to the house of Eglinton; wrote much miscellaneous verse, but is remembered only for *The Cherrie and the Slae*.

MONTGOMERY.—(1) (52° 34′ N., 3° 10′ W.) county town, near Severn, Montgomeryshire, Wales; ruined fortress. (2) (32° 21′ N., 86° 23′ W.) capital, Alabama, U.S.A.; founded, 1817; here Confederate states were inaugurated, 1861; railway centre; manufactures cottons, flour, hardware. Pop. (1910) 38,136. (3) (30° 42′ N., 73° 11′ E.) town and district, Lahore division, Punjab, India. Area of district *c.* 4800 sq. miles; pop. *c.* 464,000. Pop. of town *c.* 6700. (4) (30° 22′ N., 95° 36′ W.), post village, Texas, U.S.A.

MONTGOMERY, ROBERT (1807–55), Eng. poet and cleric; minister of Percy Street Chapel, London, 1843–55; immortalised by Macaulay's *Edinburgh Review* criticism of his poems.

MONTGOMERYSHIRE (52° 8′ N., 3° 30′ W.), county, N. Wales; area, 797 sq. miles; hilly on borders, rising to nearly 2500 ft.; produces lead, zinc, slate; manufactures woollens; sheep-grazing on higher ground. Pop. (1911) 53,147.

MONTH, see CALENDAR, CHRONOLOGY.

MONTHOLON, CHARLES TRISTAN, MARQUIS DE (1782–1853), Fr. commander; b. Paris; served with Napoleon and accompanied him to St. Helena; subsequently imprisoned with Louis Napoleon at Ham; wrote *Récits de la Captivité de Napoléon*.

MONTILLA (37° 45′ N., 4° 46′ W.), town, Cordova, Spain; wine. Pop. 14,000.

MONTLUÇON (46° 19′ N., 2° 37′ E.), town, on Cher, Allier, France; manufactures glass, iron, chemicals. Pop. (1911) 33,799.

MONTMARTRE, hill, church, and bohemian quarter in north of Paris (*q.v.*).

MONTMORENCY (48° 59′ N., 2° 18′ E.), town, Seine-et-Oise, France; seat of Montmorency family. Pop. (commune) 6100.

MONTMORENCY, famous Fr. family.—**Anne** (1493–1567), 1st Duc de M., Marshal and Constable of France; taken prisoner at *Pavia*, 1525, *St. Quentin*, 1557; put down Huguenots. Grandson, **Henri** (1595–1632), Duc de M.; Fr. general; captured Ré from Huguenots and defeated Spaniards; executed for supporting Orleans.

MONTMORILLON (46° 25′ N., 0° 52′ E.), town, on Gartempe, Vienne, France. Pop. (commune) 5100.

MONTMORIN DE SAINT HÉREM, ARMAND MARC, COMTE DE (1745–92), Fr. statesman; Minister of Foreign Affairs, 1787; forced to resign, 1791; proscribed; killed in Sept. massacres, 1792; loyal royalist, but weak and incapable.

MONTONE, ANDREA DA (1368–1424), called BRACCIO, or FORTEBRACCIO; Ital. mercenary leader; important in Neapolitan history.

MONTORO (38° 1′ N., 4° 26′ W.), town, Cordova, Spain; olive oil. Pop, 15,500.

MONTPELIER (44° 15′ N., 72° 35′ W.), city, capital of Vermont, U.S.A.; marble and granite works; flour-mills. Pop. (1910) 7856.

MONTPELLIER (43° 36′ N., 3° 54′ E.), town, S. France; belonged in turn to Aragon, Majorca, France, Navarre; French since 1392; episcopal see; has XIV.-cent. cathedral, famous univ. (dating from 1289), old botanic gardens. Pop. (1911) 80,230.

MONTPENSIER, DUCHESSE DE, ANNE MARIE LOUISE D'ORLÉANS (1627–93), Fr. memoir-writer; actively supported Frondeurs; interesting *Mémoires* were pub., 1729.

MONTREAL (45° 31′ N., 73° 35′ W.), town, Quebec, Canada; situated on E. side of M. island, at junction of Ottawa River and St. Lawrence; has many old Fr. buildings, giving picturesque appearance; seat of M'Gill Univ. (founded, 1821); has also branch of Laval Univ. of Quebec, fine libraries, many educational and charitable establishments; great Victoria Railway Bridge across St. Lawrence. M. is episcopal see, has R.C. and Anglican cathedrals and many churches. M. was founded by French, 1642; taken by British, 1760; held by Americans, 1775–76, when recaptured by British; has suffered from fire in 1852, 1901, 1906, 1907. M. is chief port and largest town in Canada; good harbour open to largest steamers; extensive canal communication with principal towns of Great Lakes; headquarters of all important railways; railway works, manufactures of boots, clothing, textiles, tobacco, rubber goods, hardware. Pop. (1911) 470,480.

MONTREUIL-SOUS-BOIS (48° 50′ N., 2° 25′ E.), town, Seine, France; peach orchards. Pop. (1911) 43,217.

MONTREUIL-SUR-MER (50° 24′ N., 1° 43′ E.), town, Pas-de-Calais, France. Pop. 4000.

MONTREUX (46° 26′ N., 6° 55′ E.), health-resort, canton Vaud, Switzerland; includes Clarens, Vernex, Glion, Veytaux, and other villages. Pop. (1912) 19,500.

MONTROSE (56° 42′ N., 2° 28′ W.), royal burgh and port, Forfarshire, Scotland, at mouth of South Esk; fine harbour; trades in timber, fish; flax-spinning, rope-making. Pop. (1911) 10,973.

MONTROSE, MARQUESSATE AND DUKEDOM OF.—David, Earl of Crawford, was cr. duke, 1488–89; the Grahams of Kincardine and Old Montrose obtained earldom, 1505, marquessate, 1644.

MONTROSE, JAMES GRAHAM, MARQUESS OF (1612–50), Scot. Jacobite leader; signed Solemn League and Covenant, but believed in subordination of Church to State; joined Royalists, 1640; cr. marquess, 1644 (previously earl by creation, 1505); won many victories as commander against Covenanters, 1644–45; defeated at *Philiphaugh*, 1645, and retired abroad; invaded Scotland, 1650; defeated at *Invercarron*, betrayed, and hanged.

MONTSERRAT (16° 42′ N., 62° 13′ W.), one of Leeward Islands, Brit. W. Indies; volcanic; discovered by Columbus, 1493; settled by British, 1632; chief products, sugar and lime juice. Pop. (1911) 5562.

MONTSERRAT, mountain, Catalonia, Spain, on side of which is Benedictine monastery dating from IX. cent., and containing wooden image of Virgin, to which miraculous powers are ascribed. There are also remains of several hermitages.

MONTYON, ANTOINE JEAN BAPTISTE ROBERT AUGET, BARON DE (1733–1820), Fr. philanthropist; chancellor of Comte d'Artois (later Charles X.), 1780–91; founded various prizes for virtue and for literary and scientific work, to be awarded by Fr. Academy; lived in England from Revolution till 1814.

MONUMENT, anything erected as a reminder of persons and events, standing as a survival of the work of man in an earlier age. The Commissioners of Works were made the guardians of sixty-eight prehistoric m's in Great Britain and Ireland by the Ancient Monuments Protection Act, 1882, and were empowered to purchase and take over the care of others from time to time. The owners still retain all rights of possession, but may not injure or deface the m's so protected, and must allow full access to the

inspector and officials app. by the Commissioners. The penalty for wilfully damaging a protected m. is £5 fine or a month's imprisonment. Amongst these national m's in the care of the Commissioners are Stonehenge, Kit's Coty House, Hadrian's Wall, Offa's Dyke, and certain barrows, cairns, ancient ruins, and round towers. Further Acts were passed in 1892, 1900, and 1910, extending the authority of the Commissioners over buildings of national and artistic interest. The Society for the Preservation of Ancient Buildings (founded, 1877) and the National Trust (1894) also exist to save m's from destruction.

In France the *Commission des monuments historiques* (established, 1837) is responsible, under the Minister of Public Instruction, for deciding what m's, ancient buildings, or portions of the same, are to be safeguarded against defacement, and by an Act of 1887 has legal powers to enforce its decisions. In Germany conservators, state decrees, and administrative orders are the chief instruments of protection. Italy for the past five hundred years has had in different places rules for the preservation of its m's, but not till 1902 was an Act passed for the whole of Italy. The later and more stringent Acts, 1907 and 1909, and the Regulations of 1910 cover every kind of antiquity.

MONUMENTAL BRASSES, see BRASSES, MONUMENTAL.

MONZA (45° 34′ N., 9° 17′ E.), town, Italy; former capital of Lombardy; often besieged; has cathedral, dating in part from VI. cent. Pop. 45,000.

MONZONITE, group of rocks well seen at Monzoni, Tyrol; dark grey; fine and coarse grained; contain plagioclase, orthoclase, felspar, augite, biotite, hypersthene, olivine, or bronzite.

MOODKEE, MUDKI (30° 47′ N., 74° 55′ E.), town, Punjab, India; Sikhs defeated here by British, Dec. 1845. Pop. 3300.

MOODY, DWIGHT LYMAN (1837–99), Amer. preacher; associated with Ira D. Sankey in evangelistic work; also social and educational work.

MOOLTAN, see MULTAN.

MOON (Anglo-Saxon, *mona*, from root *ma*, 'to measure'), the measurer of time, the earth's satellite, and the nearest of all the heavenly bodies; diameter, 2·163 miles; shines by reflected light of the sun; revolves around the earth in 27⅓ days (*i.e.* a lunar mo(o)n-th); mean distance from earth, about 238,817 miles, though this constantly varies owing to ellipticity of m.'s orbit (inclined to plane of ecliptic at angle of 5°). The m. is supposed to have been thrown off by the earth from where the Pacific Ocean now is, far back in earth's history—according to Prof. Pickering, 50 to 500 million years ago. To the naked eye, dusky markings are visible on m.'s surface; with the telescope these are seen to be high mountain ranges, craters, walled plains, and dried-up seas. The heights of the lunar mts. have been ascertained by measuring the length of their shadow, and finding the sun's altitude as seen from the m. at that particular time. Some of the mts. are 25,000 ft., while one peak in the Dörfel range is over 5 miles in height. The m.'s surface has been accurately surveyed by telescopists, and each mountain is named, some after famous astronomers (*e.g.* Gassendi, Copernicus), mythological characters (*e.g.* Atlas, Hercules), and terrestrial mts. (*e.g.* Alps, Apennines). The m.'s day and night are each a fortnight in duration. It always presents the same side to the earth.

Harvest Moon.—On Sept. 22 the sun crosses the celestial equator, and the moon (if full) rises exactly at sunset and sets at sunrise. See ECLIPSE, TIDES.

MOON-FISH, see OPAH.

MOOR- or WATER-HEN, see RAIL FAMILY.

MOORE, GEORGE (1853–), Irish novelist, dramatist, and art critic; novels marked by realism.

MOORE, JOHN (1729–1802), Scot. physician and author; wrote interesting sketches of contemporary life in England and on the Continent, giving, among other things, an account of scenes in the Fr. Revolution; author of novel, *Zeluco*, on which Byron's *Childe Harold* was based.

MOORE, SIR JOHN (1761–1809), Brit. general; b. Glasgow; officer in American War, 1778–83; M.P., 1784; wounded in Corsican campaign, 1792; served in W. Indies and Ireland, Holland campaign, and Egypt; noted military trainer; commander-in-chief in Mediterranean; famous conduct of Span. resistance to France; march of Light Brigade and battle of *Corunna*, 1809; slain and buried, by dying wish, in ramparts of Corunna; verses, *Burial of Sir John Moore*, are by Rev. Charles Wolfe (*q.v.*).

MOORE, THOMAS (1779–1852), Irish poet; b. Dublin; ed. Dublin Univ., and went to London to study law. App. Admiralty registrar at Bermudas, M. tired of the work, left a substitute, and came home; substitute embezzled £6000, M. was held responsible, and to avoid arrest lived abroad; cleared off debt in time; was pensioned and d. insane. Chief poetical works—*Irish Melodies* (1807), *Lalla Rookh* (1817); prose works are *The Epicurean* (1827), a romance, *History of Ireland* (1834–46), *Life of Sheridan* (1825), and his great *Life of Byron* (1830). As a song-writer M. is of the greatest; no one approaches him in light music; he is excellent alike in verse, romance, and satire.

S. Gynn, *Life of M.* (1905).

MOORHEAD (46° 48′ N., 96° 50′ W.), city, Minnesota, U.S.A., on Red River; flour-mills, machine shops. Pop. (1910) 4840.

MOORS (from Lat. *Mauri*, dark men), natives of Morocco; an independent people till conquered by Augustus, 25 B.C., and made part of the kingdom of Numidia; became Muhammadan after the Arab invasion in VII. cent., and now are more Arab than African; term applied to N. African invaders and conquerors of Spain, VIII.–XV. cent. (see SPAIN: History); a *white* race, though sunburnt.

MOORSHEDABAD, see MURSHIDABAD.

MOOSE, see under DEER FAMILY.

MOPLAH, Malabar Muhammadan community.

MOQUEGUA (17° 10′ S., 70° 53′ W.), maritime province, Southern Peru; capital, MOQUEGUA; subject to earthquakes. Pop. 40,000; (town) 7000.

MORACEÆ, trees or shrubs, possessing latex and mostly tropical in distribution; includes mulberry, fig, hemp, hop, and other economically important plants.

MORADABAD (28° 51′ N., 78° 49′ E.), city (and district), United Provinces, India; on Ramganga; trading centre; brassware. Pop. (1911) 81,168; (dist.) 1,200,000.

MORAL PHILOSOPHY, see ETHICS.

MORALITY PLAYS, see DRAMA.

MORAR (26° 14′ N., 78° 17′ E.), town, Gwalior, Central India. Pop. 21,000.

MORAT, MURTEN (46° 55′ N., 7° 5′ E.), small town, canton Fribourg, Switzerland, on Lake Morat; scene of defeat of Charles the Bold by Swiss, 1476.

MORATALLA (38° 19′ N., 1° 49′ W.), town, Murcia, Spain; wine, soap. Pop. 13,500.

MORATIN, LEANDRO ANTONIO EULOGIO MELITON FERNANDEZ DE (1760–1828), Span. poet and dramatist; chief librarian to Joseph Bonaparte, and enjoyed several ecclesiastical benefices.

MORAVIA, MÄHREN (49° 20′ N., 16° 30′ E.), crownland, Austria; between Bohemia and Hungary; area, 8583 sq. miles; surface generally mountainous; capital, Brünn. M. came into possession of Austria, 1526; constituted a separate province, 1849; overrun by Prussians, 1866; sends 49 representatives to Reichsrath; has provincial Diet of 151 members. M. has extensive forests; produces cereals, coal, iron, graphite; manufactures textiles. Pop. (1911) 2,620,914.

MORAVIAN BRETHREN, HERRENHUTERS, religious society, *Unitas Fratrum*; founded in Moravia in XV. cent.; in 1467 they chose by lot their first bp.; Lucas of Prague increased their numbers, and by 1500 there were 400 churches; persecution almost destroyed them, 1600–27. In 1722 Christian David led a small

band to Silesia, where Count Zinzendorf gave them a settlement—Herrnhut ('The Lord's Watch'); in 1727 their first church was founded. To-day the society flourishes in Germany, Britain, America; it was the pioneer of, and is zealous in, missionary work; it is Protestant, believes greatly in hymn praise, discipline, and education.

Hutton, *History of Moravian Church* (1909).

MORAY, 1ST EARL OF, see RANDOLPH, THOMAS.

MORAY EEL, see under EELS.

MORAY, JAMES STEWART, EARL OF, see MURRAY.

MORAYSHIRE, MORAY, see ELGINSHIRE.

MORBHANJ (22° N., 86° 30′ E.), native state, Bihar and Orissa, India. Pop. 625,000.

MORBIHAN (47° 50′ N., 2° 40′ W.), coast department, N.W. France; area, 2738 sq. miles; coast much indented; surface generally undulating plateau; chief towns—Vannes (capital), Lorient. M. produces apples, cereals, honey, salt; important fisheries; manufactures cider. Pop. (1911) 578,400.

MORDANT, see DYEING.

MORE, HANNAH (1745–1833), Eng. author; first pub. plays in 1762, and soon became friend of Johnson and Garrick; gradually she became more religious and wrote moral books. In *Village Politics* she opposed revolutionary tendencies. Her later life was largely devoted to philanthropy and the encouragement of popular education.

MORE, HENRY (1614–87), Eng. philosopher and divine; spent most of his life in Cambridge, firmly declining all preferment; next to Cudworth, the most important of the Cambridge Platonists. His early philosophical writings were poetical. His most important works are *The Immortality of the Soul* (1659), *Enchiridion Ethicum* (1667), *Divine Dialogues* (1668), and *Enchiridion Metaphysicum* (1671), a criticism of Cartesianism.

MORE, SIR THOMAS (1478–1535), Eng. writer and statesman; b. London; s. of Justice of King's Bench, who placed him as page in household of Archbishop Morton; ed. at Oxford under John Colet and Linacre; became M.P.; Speaker of Commons, 1523. After Wolsey's disgrace, M., much against his will, was made Lord Chancellor of England in 1529; he filled this office admirably. In 1532 M. resigned, because of Henry VIII.'s breach with Rome; refused to acknowledge Henry's claim to title of head of Church, and was imprisoned; tried for high treason and executed, 1535.

M.'s chief work was *Utopia* (1516), a XVI.-cent. picture of an ideal country governed by perfect laws; written in Latin, it met with the instant approval of continental humanists. His *History of King Richard III.* is an excellent example of XVI.-cent. 'classical' prose. M. was a friend of Erasmus, from whose letters we glean many details concerning M.'s life; married twice; beatified by R.C. Church, 1886.

Life, by Roper, his son-in-law, 1626 (ed. 1902); by Father Bridgett (1891); by Hutton (1895).

MOREA, see under GREECE.

MOREAU, JEAN VICTOR MARIE (1763–1813), Fr. general; won distinction at *Tourcoing*, 1795, under Pichegru; led invasion of Germany, 1795, and skilful retreat; implicated in Pichegru's plot though innocent, and displaced; reinstated, 1799, and commanded in Italy; assisted Napoleon in revolution of 1799; app. commander of Army of the Rhine; won battle of *Hohenlinden*, 1800; intrigued against Napoleon; banished.

MORECAMBE (54° 5′ N., 2° 52′ W.), watering-place, on Morecambe Bay, Lancashire, England. Pop. (1911) 12,133.

MORELIA (19° 40′ N., 100° 55′ W.), chief town, Michoacán, Mexico; centre of sugar-producing district; manufactures textiles; has cathedral. Pop. (1910) 39,116.

MORELLI, GIOVANNI (1816–91), Ital. patriot and art critic; b. Verona; studied science at Munich; joined patriotic movement against Austria, 1840, in Florence, and took part in war of 1848; elected deputy for Bergamo, in first free Ital. Parliament, 1860; pres. of Government Commission concerning all works of art in the country, and responsible for law prohibiting sale of works of art from public and religious institutions; Senator, 1873; pub. criticisms on art—*Critical Studies* (two vols., Eng. trans.).

MORELOS (18° 35′ N., 99° 6′ W.), inland state, Mexico; area, 2773 sq. miles; surface generally mountainous; chief town, Cuernavaca; produces cereals, fruit, sugar, coffee. Pop. (1910) 179,814.

MORESNET (50° 43′ N., 5° 59′ E.), small neutral territory on borders of Prussia and Belgium; formed in 1816; governed by a burgomaster; zinc mines. Pop. 3700.

MORGAGNI, GIOVANNI BATTISTA (1682–1771), Ital. anatomist; a careful observer, who from being a general student of chem., of pharmacy, and of the structures of man and of fishes, became prof. of Anat. in Padua. His work on the characteristics of diseased organs, *De Sedibus et Causis Morborum per Anatomem indagatis*, fixed attention on local symptoms rather than on general indications of disease, and laid the foundations of the study of pathological anatomy.

MORGAN, AUGUSTUS DE, see DE MORGAN.

MORGAN, JOHN H. (1826–64), Amer. confederate soldier; led series of cavalry raids, destroying Union military stores, bridges, railways, etc.; captured in daring attack, 1863; killed in raid, 1864.

MORGAN, JOHN PIERPONT (1837–1913), Amer. millionaire financier; organised Steel Trust and Atlantic Shipping Trust; his banks financed many national enterprises; well known as art collector.

MORGAN, LADY, *née* SYDNEY OWENSON (c. 1780–1859), Irish authoress; m. Dr. Morgan, knighted by the Lord-Lieutenant. She wrote novels, verse, books of travel, and two vol's of *Memoirs*.

MORGAN, MOUNT, see MOUNT MORGAN.

MORGAN, SIR HENRY (c. 1635–88), Welsh buccaneer; b. in Glamorganshire. In 1666 he became leader of the West Ind. buccaneers, sacked Porto Bello, and put the inhabitants to atrocious torture. He was subsequently sent to England in chains, but was pardoned by Charles II.

MORGANA, FATA, see FATA MORGANA.

MORGANATIC MARRIAGE, marriage which does not involve the children's succession to the property or rank of the father; many instances of such marriages occur in history of royal families.

MORGANTOWN (39° 40′ N., 79° 57′ W.), city, on Monongahela, W. Virginia, U.S.A.; glass-works; seat of W. Virginia Univ. Pop. (1910) 9150.

MORGARTEN (47° 6′ N., 8° 40′ E.), mountain, Switzerland; scene of Swiss victory over Austrians, 1315.

MORIER, SIR ROBERT BURNETT DAVID (1826–93), Brit. diplomatist; entered Ger. service; opposed Bismarck with success; Brit. ambassador to Russia, 1884; popular, but blamed by Bismarck; cleared from suspicion of treachery.

MORIN, JEAN, MORINUS (1591–1659), Catholic theologian; convert from Protestantism; wrote on ecclesiastical history, but his most important work is on the Hebrew text of the Old Testament.

MORION, see HELMET.

MORISCOS, Span. name for converts from Islam to Christianity. After Span. conquest of Granada, Muhammadanism was gradually crushed out about 1525. The M's were expelled from Spain, 1609.

MORLAIX (48° 36′ N., 3° 49′ W.), town, on Eng. Channel, Finistère, France. Pop. 16,200.

MORLAND, GEORGE (1763–1804), Eng. painter; led an irregular life, and d. in a London spunging-house. He turned out a vast number of paintings and drawings; many of his canvases deal with the sea, but he excelled in rural subjects.

MORLANWELZ (50° 27′ N., 4° 13′ E.), town, Hainault, Belgium; coal mines; ironworks. Pop. 8600.

MORLEY (53° 45′ N., 1° 38′ W.), town, Yorkshire, England; woollen mills. Pop. (1911) 24,285.

MORLEY, GEORGE (1597–1684), bp. of Worcester, 1660, Winchester, 1662.

MORLEY, HENRY (1822–94), Brit. author; for many years prof. of Eng. Language and Lit. at Univ. Coll., London. His numerous works include the well-known *First Sketch of Eng. Lit.*

MORLEY OF BLACKBURN, 1ST VISCOUNT, JOHN MORLEY (1838–), Eng. Liberal statesman and littérateur; ed. Cheltenham and Oxford; called to Bar, 1873; edit. *Fortnightly Review*, 1867–83; subsequently *Pall Mall Gazette* (1880–83) and *Macmillan's Magazine* (1883–85); Sec. for Ireland, 1886, and again, 1892; Sec. for India, 1905–10; cr. Viscount M., 1908; Lord-Pres. of Council, 1910; an honest and fearless politician; consistent upholder of Home Rule; often regarded as doctrinaire. His *Life of Gladstone* (1903) was a masterpiece of biography; other works include able studies of Burke, Voltaire, Rousseau, Diderot, Cobden, Walpole, Cromwell, and brilliant essay, *On Compromise*. He presented Acton Library (a gift from Mr. Carnegie) to Cambridge Univ.; O.M. (1902).

MORLEY, THOMAS (1557–1604), Eng. composer; celebrated for his canzonets and madrigals, and for *A Plaine and Easie Introduction to Practicall Musike* (1597).

MORMONS, 'The Church of Jesus Christ of **Latter-Day Saints,**' an Amer. sect known chiefly for their polygamy; owe their origin to Joseph Smith (1805–44), a religious fanatic of immoral character and unbalanced mind. An angel, so he believed, appeared to him in a vision, telling him that he would find a sacred book written on gold plates buried in a certain spot. What exactly happened is obscure, but he seems to have possessed gold plates with mysterious writing. These formed the *Book of Mormon*, giving the history of America. There was then a certain amount of religious ferment in America, of which Smith took advantage, and a church was founded in 1830. His immorality gave rise to various scandals, and a secret society was founded by the M's to assassinate their opponents. Smith and others were imprisoned in 1838. In 1843 he had a 'revelation' which definitely enjoined polygamy, and on this becoming known the popular fury was aroused and Smith and his bro. were killed in an armed revolt against them in the M. city of Nauvoo where they then lived.

In 1846 the M's had to leave Nauvoo, and emigrated to the Great Salt Lake Valley in Utah, where they founded *Salt Lake City*. In 1850 Utah became a 'territory' of the U.S.A., with Young, Smith's successor, as gov. The M's made continued attacks on the Gentiles, and there was much violent feeling against them. In 1852 a 'Reorganised Church of Latter-Day Saints' was founded, which rejected polygamy. Young, an extremely able, but unscrupulous man, died in 1877, leaving many wives and numerous children. Utah became a state in 1896, polygamy being legally abolished. M's still flourish in the U.S.A., where there are more than 300,000 now. They have also made some efforts to evangelise other countries, notably Britain. They have an elaborate system of Church government, with a large number of different offices, a pres., councillors, patriarchs, apostles, elders, priests, teachers, deacons, etc. Their theology is polytheism, Adam being their chief deity; Christ, Muhammad, and their own founder they also invest with divine attributes.

Linn, *Story of the Mormons* (1902).

MORMYR (*Mormyrus*), or AFRICAN BEAKED FISHES (*Mormyridæ*), longish, compressed, primitive bony fishes, with scaleless skin enveloping the head. Live amongst mud only in the fresh waters of Africa, mainly within the tropics.

MORNAY, PHILIPPE DE, SEIGNEUR DU PLESSIS (1549–1623), Fr. Huguenot leader; a profound scholar; won renown by Lat. treatise, 1571, on *The Visible Church*; Henry of Navarre's chief councillor.

MORNY, CHARLES AUGUSTE LOUIS JOSEPH, DUC DE (1811–65), Fr. statesman; illegitimate; half-bro. of Napoleon III.; obtained important position in financial world; became Minister of Interior on revolution, 1851; pres. of *Corps législatif*, 1854; held Liberal views; exercised great influence over Napoleon.

MOROCCO, MAROCCO (*c.* 28° to 35° 55′ N., 1° to 11° W.), empire in N.W. corner of Africa. M. is bounded N. by Atlantic and Mediterranean, N.E., S.E., and S. by Algeria and Fr. Africa, N.W. by Atlantic, and is separated from Europe by Strait of Gibraltar; area, *c.* 219,000 sq. miles. Country is traversed from N.E. to S.W. by Atlas Mountains (*q.v.*), which reach an extreme height of from 13,000 to 15,000 ft.; parallel chains of these with their foothills and offshoots spread out so widely as to render surface hilly almost everywhere, but especially so in N. Climate in districts N.W. of Atlas is healthy and pleasant; to S.E. of Atlas there is little rain and sometimes long-continued drought. M. is drained by Muluya and many smaller streams flowing to Mediterranean; and by Sebu, Bu Regreg, Um er Rebia, Tensift, Sus, and other streams flowing to Atlantic. Rivers flowing S. from Atlas are lost in marshes in desert.

History.—In ancient times M. was a Rom. province; it was invaded and conquered by Arabs in VII. cent., and from late VIII. cent. onwards held an independent position under various native dynasties. First of these was Edrisite dynasty founded by a descendant of the Prophet, *c.* 789, which endured until late X. cent. and was followed by many others, among which Zeirides, Almoravidis, Almohadis, Beni Marinis, and Watasi may be mentioned. The present dynasty, Alides, was established in 1649 by Muhammad XIV., whose bro., Mulai Ismail (1672–1727), after a career of conquest, made himself master of whole country. Under one of his successors, Mulai Sidi Muhammad (Muhammad XVI.), who reigned 1757–90, an attempt was made to introduce European civilisation in M. His death was signal for struggle between several of his sons, three of whom reigned in turn. War with France twice occurred in reign of Abd-er-Rahman II., 1822–59; and in following reign Muhammad XVII. was defeated by Spain, 1859–60. He was succeeded in 1873 by his s. Mulai-el-Hassan III., in whose reign occurred the Conference of Madrid (1880), when regulations were made concerning protective rights of various European powers in M. Hassan's son and successor, Abd-el-Aziz IV., reigned 1894–1907; in his reign occurred rebellion caused by his introduction of foreign customs. In 1904 an Anglo-French agreement was made whereby France and Britain recognised each other's interests in Morocco and Egypt. Germany being dissatisfied, an international conference was held at Algeçiras in 1906, all members of which signed agreement, *inter alia* entrusting policing of M. to France and Spain jointly. Abd-el-Aziz was deposed in 1907 by his bro., Mulai Hafid, who abdicated (1912) in favour of his bro., Mulai Yusef. Internal disorder necessitated constant Fr. operations. Spain sent expeditions to Melilla, 1909, and to Laraish, 1911; and claimed regions opposite Span. coast and adjoining Span. colony, Rio de Oro. In 1908 and 1911 occurred Franco-Ger. crises, marked by incidents at Casablanca and Agadir. Eventually by Agreement (1911) Germany practically recognised Fr. protectorate in M., in return for section of Fr. Congo; the sultan accepted Fr. protectorate, 1912.

GOVERNMENT, before Fr. régime began, was despotism, sultan being both temporal and spiritual head of State. There were six Ministers, whose functions were purely advisory. Fr. Government is now represented by Resident-General. Muhammadanism prevails, but freedom of religion has been proclaimed. Army

system is at present being reformed under Fr. supervision. Several ports and *presidios* on Mediterranean coast are under Span. Government—Melilla, Chaffarinas Is., Alhucemas; Ceuta, etc.; as also Ifni and Rio de Oro on Atlantic coast. French and Span. spheres of influence are being determined (1913).

RESOURCES.—Between northern hill-region, along Mediterranean and Atlas and extending westward to Atlantic, is the fertile Tell region, covering one-third of whole area and producing heavy crops of wheat, barley, maize, cotton, hemp, olives, dates, and other fruits. Pasture land covers about one-eighth of whole area, where numbers of cattle, sheep, goats, horses, and mules are raised. Minerals include gold, silver, manganese, copper, antimony, but these have not been fully developed. Industries are carpet, slipper, and leather manufactures. Chief exports are wool, hides, cereals, fruit, eggs, esparto, olive oil. There are no railways as yet (1913).

M. has three capitals—Fez, Morocco, and Mequinez. Coast towns open to foreign trade are Casablanca, Laraish, Mazagan, Mogador, Rabat, Saffi, Tangier, Tetuan. Certain other closed ports are to be opened. Inhabitants are Berbers, Arabs, Tuaregs, Jews, negroes, and half-breeds. Pop. (estimated) 5,000,000.

Kerr, *Morocco after Twenty-Five Years* (1912); Morel, *Morocco in Diplomacy* (1912).

MOROCCO, MARRAKESH (31° 30′ N., 7° 30′ W.), one of capitals of Sultanate of Morocco; founded, 1073; manufactures morocco leather. Pop. 60,034.

MORÓN, MORÓN DE LA FRONTERA (37° 7′ N., 5° 27′ W.), town, Seville, Spain; marble and chalk quarries. Pop. 15,500.

MORONOBU, HISHIGAWA (1625–62), Jap. artist; distinguished painter of the Ukioye, or popular, school. See JAPANESE ART.

MOROSINI, old patrician family of Venice which produced doges, diplomatists, soldiers, and writers. Chief members: DOMINIC (1080–1156), MARINO (d. 1252), ANDREA (1558–1618), and FRANCESCO (1618–94).

MORPETH (55° 11′ N., 1° 40′ W.), town, Northumberland, England; iron foundries, collieries. Pop. (1911) 7436.

MORPHEUS (classical myth.), son of Sleep; god of dreams.

MORPHINE, MORPHIA, $C_{17}H_{17}NO(OH)_2+H_2O$; chief alkaloid in opium (about 10 %); crystallises from alcohol in small prisms; a monacid, tertiary base, forming salts; *e.g.* hydrochloride; soporific; to relieve pain a solution of the acetate is injected hypodermically. See OPIUM.

MORPHOLOGY, the science of form, dealing with the structures of animals and plants, their arrangements, and the laws of their formation and grouping. In dealing with *animal structure*, two branches of m. are involved: (1) the study of the exterior of the organism, and (2) its internal construction. Under the first head comes symmetry, of which there are three kinds: (*a*) *Centro-symmetric*, when the parts are arranged round a *point* in the centre of the body, causing the latter to be spherical or stellate—*e.g.* Radiolaria; (*b*) *Axo-symmetric*, when the organs are grouped about a central *axis*, causing the body to be cylindric—*e.g.* Porifera, Cœlenterata; (*c*) *Plano-symmetric* (bilaterally symmetrical), when the organs are arranged round a longitudinal central *plane*, giving the animal dorsal and ventral surfaces, and right and left sides—*e.g.* nearly all animals above Cœlenterates.

The second branch of m. is the study of the morphological unit, the CELL (*q.v.*), and the combinations it forms. This is a definite mass of protoplasm, limited usually by a cell membrane and containing a nucleus. One group of animals only is unicellular, viz. Protozoa; all others are multicellular. Among the latter we find monoblastic or single-cell-layered animals, *e.g.* Volvox; diploblastic or two-cell-layered animals, *e.g.* Cœlenterates; and triploblastic, or three-cell-layered animals, *e.g.* all the higher animals. We find in general that these three types correspond with the three forms of symmetry. Form is in part dependent on function; therefore, according as function is growing, completed, or degenerating, the organ concerned is rudimentary, well-developed, or vestigial. But it must not be forgotten that form is also an essential of life, the expression in matter of an undefined vital force which aims at a sort of completion. The ascending grades of structure in the animal and vegetable kingdoms are due to the specialisation of parts arising from greater and greater division of labour in organs, and since these gradations are not continuous as we see them at present, the breaks in sequence permit of separation into groups, and make classification into species, genera, families, etc., a possibility.

Apart from its study of the cell as a cell, and of the cell combinations which form working units, i.e. organs, m. also investigates the minute structures of the cell combinations which go to the making of organs—the tissues. For organs altogether unlike in appearance and function may, nevertheless, be composed of similar tissues. The main tissue types are the surface epithelial tissue, the supporting connective tissue, the contractile muscular tissue, and the highly specialised sensitive nervous tissue. See ANIMALS; PLANTS (*Morphology*).

MORRILL, JUSTIN SMITH (1810–98), Amer. statesman; leader of republicans; brought in educational bill, 1857 and 1861, which became Land Grant Act of 1862; author of Tariff Act of 1861.

MORRIS (41° 20′ N., 88° 27′ W.), city, Illinois, U.S.A., on Illinois; various manufactures. Pop. (1910) 4563.

MORRIS, GOUVERNEUR (1752–1816), Amer. statesman; member of New York Provincial Congress (afterwards Convention), 1776–77; helped to draft constitution of U.S.A.; chairman of committee which refused negotiations till recognition of independence, 1778; wrote pamphlets on currency and taxation, advocating decimal system and 'dollar' and 'cent' as names for units; ambassador to France, 1792–94; advised separation of northern and southern States; *Life*, by Roosevelt.

MORRIS, ROBERT (1734–1806), Amer. financier and statesman; leader in movement against Britain; War of Independence and subsequent settlement owed much to his practical talents; founded Bank of N. America in Philadelphia, 1781.

MORRIS, THOMAS, 'OLD TOM' (1821–1908), Scot. golfer and club-maker; green-keeper at St. Andrews for many years; his skill and character made his name familiar wherever golf was played. His son, 'Young Tom,' was also a golf champion.

MORRIS TUBE, see RIFLE.

MORRIS, WILLIAM (1834–96), Eng. poet, artist, and Socialist; b. Walthamstow, Essex; ed. Oxford; became architect, painter, then partner in house-decoration firm, Morris, Marshall, Faulkner, & Co., 1861; associated in art with Burne-Jones, Ford Madox Brown, Rossetti. His first book, *The Defence of Guinevere* (1858), showed imagination and romance, and *The Life and Death of Jason* (1867) and *The Earthly Paradise* (1868–70) confirmed his greatness as poet. Other poetical works were *The Æneid of Vergil* (1876), *Sigurd the Volsung* (1876), *The Fall of the Niblungs* (1877), and, with E. Magnusson, many translations of Icelandic Sagas. M. excels as a writer of story-poetry; his lines go with a breezy swing, and there is the charm of mediævalism of spirit in them.

In prose M. wrote much; latterly his one essay in poetry was *Poems by the Way* (1891). He founded the Kelmscott Press, and pub. beautifully decorated translations of Sagas, Fr. Romances, editions of Shakespeare, Shelley, etc. His own work includes *The Story of Grettir the Strong*, *The Volsunga Saga*. During years 1889–96 he wrote some beautiful romances—*The House of the Wolfings*, etc. His style is archaic, almost XV. cent. in style. He was a dreamer; he turned from industrialism to the romantic past. His

Socialism was æsthetic; poverty to him meant lack of pictures and artistic joys, hence his anger against a system that allowed poverty.

Life, by Mackail (1899); Noyes (1908); Drinkwater, *William Morris: A Critical Study* (1912).

MORRISON, ROBERT (1782–1834), Brit. missionary; translator to E. India Company at Canton (1809); established college at Malacca, 1818; wrote various etymological works on Chin. language.

MORRISTOWN (40° 48′ N., 74° 32′ W.), residential town on Whippany, New Jersey, U.S.A. Pop. (1910) 12,507.

MORSE, see WALRUSES.

MORSE, SAMUEL FINLEY BREESE (1791–1872), Amer. artist and inventor; devoting his leisure to electrical and galvanic experiments, he devised the **Morse System** of magnetic telegraph. See TELEGRAPH.

MORSHANSK (53° 27′ N., 41° 53′ E.), town, on Tsna, Tambov, Russia; manufactures flour, tallow. Pop. (1910) 30,200.

MORTAGNE (48° 30′ N., 0° 32′ E.), town, Orne, France; noted horse market. Pop. 4200.

MORTAIN (48° 37′ N., 0° 50′ W.), town, Manche, France.

MORTAR, a vessel in which substances are pounded or triturated by a *pestle*, used in preparing drugs. The piece of ordnance formerly used in sieges, etc., was called a m. from its resemblance to the druggist's m. Howitzers superseded m's. Building m. ordinarily consists of a mixture of slaked lime and sand; hardening is due principally to absorption of atmospheric carbonic acid, and the formation of silicate of lime. There are also hydraulic m's which set under water, and various cement m's. The adhesion becomes less as the proportion of sand increases. Portland cement m. is the strongest and most durable. See CEMENT.

MORTARA (45° 15′ N., 8° 44′ E.), town, Pavia, Italy; scene of victory of Austrians over Sardinians, 1849; ironworks.

MORTGAGE.—A mortgage arises when a person transfers the general property in his land or goods to another as security for a loan. As a rule, the *mortgagor*—the borrower—does not hand over possession of the land to the lender—the *mortgagee*—but remains in possession himself. Hence the distinction between a m. and a pledge. Failure to make the necessary payments of interest in return for the loan results in the mortgagee *foreclosing* on the property and taking possession.

MORTIFICATION, loss of vitality in a part of the body. See NECROSIS, GANGRENE.

MORTIMER, old Eng. family. Norman house was founded by ROGER, second s. of Hugh, bp. of Coutances in late X. cent.; Roger was lord of Mortemer-en-Brai until dispossessed by William the Conqueror; his sons fought at *Hastings*, and the youngest, Ralph, settled in the Welsh Marches, obtaining Wigmore. EDMUND de M. of Wigmore was summoned to Parliament as baron by writ, 1295; **Roger**, 2nd baron, was cr. Earl of March, 1328; paramour of Queen Isabella, Edward II.'s wife; rebelled and forced Edward to abdicate; attainted and executed, 1330. Honours were restored to his grandson, Roger, 1354; merged in Crown on accession of Edward IV., after victory of *Mortimer's Cross*, 1461.

MORTLAKE (51° 28′ N., 0° 16′ W.), village on Thames, Surrey, England; terminus of Oxford-Cambridge boat-race.

MORTON, JAMES DOUGLAS, 4TH EARL OF (*c.* 1525–81), Lord Chancellor of Scotland, 1562–72; one of Lords of the Congregation, but always willing to temper religion with policy; chief agent in murder of Rizzio; implicated in murder of Darnley; commanded at *Langside* against queen, 1568; regent, 1572–78, and was considered ablest man in Scotland; admiral, 1578–81; executed.

MORTON, JOHN (*c.* 1420–1500), abp. of Canterbury (1486); advanced to great honours by Henry VII.; cardinal, 1493; remembered for *Morton's Dyke*, in Fens, *Morton's Fork* (infallible means of exacting money for king's use), and as patron of Sir Thomas More.

MORTON, OLIVER PERRY (1823–77), Amer. politician; gov. of Indiana, 1861, and vigorously upheld national cause in war; U.S. Senator, 1867, and took part in impeaching Pres. Johnson.

MORTON, THOMAS (*c.* 1590–1646), Eng. adventurer and self-elected gov. of a settlement in Massachusetts; wrote the *New English Canaan*.

MORVAN (*c.* 47° N., 4° E.), mountainous region, Yonne and Nièvre, France.

MORVI (22° 49′ N., 70° 54′ E.), native state, Kathiawar, Bombay, India. Pop. 110,000. Capital, **Morvi**. Pop. 19,000.

MOSAIC THEORY of organic development, see under EMBRYOLOGY.

MOSCHELES, IGNAZ (1794–1870), Bohemian composer and pianist; settled in London, 1826; teacher at Leipzig Conservatoire, 1846; studies, sonatas, concertos, etc.

MOSCHUS, a genus of DEER (*q.v.*).

MOSCOW (56° N., 37° E.), government, Russia; surface undulating; belongs to basin of Volga; chief manufacturing province of Russia. Pop. (1910) 3,215,400.

MOSCOW (55° 42′ N., 37° 39′ E.), town, former capital of Russia, and second city of empire. M. was inhabited at an early date by Finnish peoples, and was settled by Great Russians in XII. cent.; became seat of metropolitan of Central Russia, 1325; capital of united principality of M. and Vladimir, 1328; pillaged by Mongols, 1382; by Tartars twice in XV. cent.; became capital of all Russia under Ivan III. in 1480; superseded as capital by St. Petersburg, 1711; several times damaged by fire in XVIII. cent.; occupied by French under Napoleon, Sep. 15, 1812; burned down by inhabitants, Sep. 16–19; evacuated by French, who began 'retreat from Moscow,' Oct. 19; recent events include riots among students on various occasions. In middle of city is the *Kremlin* or citadel, which is surrounded by walls and is most sacred spot in country to a Russian; it contains old and new imperial palaces, arsenal, monasteries, famous Tsar Kolokol bell (see BELL), and three cathedrals, of which the Cathedral of the Assumption (rebuilt XV. cent.) is most important. Other public buildings include univ., founded by Catharine in 1755, observatory, museum, St. Basil's Cathedral; seat of metropolitan of M. M. has great transit trade and is important industrial centre; manufactures cotton, woollens, silks, leather, machinery, tobacco, etc. Pop. (1910) 1,481,240.

Gerrare, *Moscow*.

MOSELLE, MOSEL (50° 10′ N., 7° 12′ E.), river, which, rising in Vosges mts., France, flows northward through France, Luxemburg, and Prussian Rhineland, and joins Rhine at Coblenz; length, 314 miles; valley noted for wines.

MOSES, Old Testament character; leader of the Hebrews out of Egypt, and legislator; traditionally the author of first five books of Bible, but many parts of these must be much later. The narratives have been much modified by tradition, and it is impossible to say what is known for certain about him, though it cannot be doubted that he exercised considerable influence.

MOSES, ASSUMPTION OF, apocalyptic and pseudonymous book, rediscovered in 1861, perhaps identical with lost 'Testament of Moses'; probably written by a Pharisee about the time of Christ. It exists in Greek, which is perhaps translated from a Hebrew original.

MOSES OF CHORENE (fl. V. or VIII. cent. A.D.), Armenian historian; author of *Genealogical Account of Great Armenia*, down to 440—valuable as preserving ballads or traditions, but otherwise inaccurate; probably wrote the *Geography*, valuable for ancient Eastern names, etc., *Rhetoric*, and religious treatises.

MOSHEIM, JOHANN LORENZ VON (1694–1755), Ger. Lutheran historian.

MOSLEM, see MUHAMMADAN RELIGION.

MOSQUE (word ultimately of Arabic derivation), term for a Muhammadan place of worship. A m. generally has an open space surrounded by colonnades. In the middle is a fountain, for Muslims must always pray ceremonially clean. There is likewise a niche to point the direction to Mecca, for thither a Muslim faces while praying. Though there is no sacerdotal caste in Islam, certain officials are appointed to supervise the m's. There are many famous m's now in existence, some built of the materials of ruined Christian Churches. An Indian m. always has a dome.

MOSQUITOES, flies grouped with Gnats in family Culicidæ, having complex mouth parts for piercing and sucking blood in female, and thickly plumed antennæ in male. The larvæ are aquatic. Found over all the world except in polar regions; m's are of interest to man because some species are known to spread disease, *e.g.* the common Brit. form (*Anopheles maculipennis*) may carry the organism of malaria.

MOSQUITO COAST AND RESERVE (*c.* 13° N., 83° 50′ W.), district, Nicaragua, Central America; formerly a separate state under Brit. protection; now a department of Nicaragua, named ZELAYA; surface mountainous in interior, low-lying near coast; capital, Bluefields. Pop. *c.* 15,000.

MOSS (59° 26′ N., 10° 45′ E.), seaport, Norway, on Christiania Fjord; exports timber. Pop. 9200.

MOSSAMEDES (15° 7′ S., 12° 15′ E.), seaport, chief town, Mossamedes district, Portug. W. Africa, on Little Fish (Mossamedes) Bay; exports cured fish. Pop. 5100; (dist.) 185,000.

MOSSEL BAY (34° 3′ S., 22° 15′ E.), seaport, bay, and division on S. coast, Cape Province, S. Africa. Pop. 4900.

MOSSES, see BRYOPHYTA.

MOSSLEY (53° 31′ N., 2° 3′ W.), market town, Lancashire, England; cotton-mills, iron foundries. Pop. (1911) 13,205.

MOSTAGANEM (35° 56′ N., 0° 10′ E.), seaport, Oran, Algeria, Africa, near Mediterranean; trade in horses, cereals. Pop. 22,000.

MOSTAR (43° 25′ N., 17° 58′ E.), chief town, Herzegovina, Austria-Hungary, on Narenta; seat of Gk. and R.C. bishopric; tobacco. Pop. (1910) 16,392.

MOSUL (36° 19′ N., 43° 9′ E.), town, Turkey-in-Asia; flourished under caliphs; held in turn by Hamdanids, Okailids, Seljuks, Persians, Turks; encircled by partly ruined walls; contains great mosque; formerly noted for manufacture of muslin; exports gall-nuts. Pop. *c.* 85,000. M. vilayet has area of 35,130 sq. miles. Pop. *c.* 500,000.

MOTALA (58° 30′ N., 15° E.), town, Ostergötland, Sweden, on Lake Vetter; ironworks.

MOTET, a term long applied to a composition, usually of a sacred character, for several voices. The form is now obsolete.

MOTHER CAREY'S CHICKEN, sailors' name for Stormy Petrel.

MOTHER OF PEARL, nacreous deposit with which molluscs coat interior of their shells; obtained by splitting shells into layers; largely used for inlaying, making buttons, pen-knife handles, etc.

MOTHERWELL (55° 48′ N., 4° W.), town, Scotland; iron- and steel-works; collieries. Pop. (1911) 40,378.

MOTHS, see LEPIDOPTERA.

MOTION, LAWS OF, see DYNAMICS.

MOTION, PERPETUAL, see PERPETUAL MOTION.

MOTIVE, any feeling or thought which helps to determine volition; sometimes, more particularly, the aim or end of action as determining volition. Thus fear may be called the m. which impels a man to run away, or his m. may be said to be to save his life.

MOTLEY, JOHN LOTHROP (1814–77), Amer. historian; best-known book, *Rise of the Dutch Republic,* 1856, has Prot. bias, but based on original sources.

MOTMOTS (*Momotidæ*), **beautiful Picarian Birds** with saw-edged bills found near the rivers and streams of Central and S. America, in the banks of which they excavate tunnels for their nests.

MOTONOBU, KANO (1476–1559), Jap. artist s. of Masanobu (*q.v.*); amongst the foremost artists of his country; painted everything superbly; excelled in landscape; esteemed for his universality.

MOTOR AREA, see MUSCLE.

MOTOR-CARS, mechanically propelled vehicles carrying their own power unit; carriages which run on the high road without rails. The term is generally applied to private automobiles as distinct from motor-buses or motor-cabs. Petrol-driven cars are commonest; steam m.-c's require special knowledge of engineering, and electric m.-c's are restricted to short runs owing to difficulty in carrying stored electricity.

History. — Early experiments were directed to applying the steam-engine to road traction. The first steam car was probably that made by Argnot, a Frenchman, in 1769. The first practical vehicle was Trevethick's steam car (1802). In 1824 several m.-c's were constructed similar to stage coaches and weighing 3 or 4 tons. A regular passenger service ran between Cheltenham and Gloucester, and the average speed was 10 miles per hour. Further development in m.-c's was arrested in Britain by the passing of a bill in 1865 requiring three drivers to be on each car, and for a man with a red flag to walk in front of each vehicle, while a speed limit of 4 miles per hour was imposed and no blowing off of steam was allowed.

Motor-Cycles.—The introduction of the internal combustion engine awakened new interest, and in 1885 Butler constructed a *motor-tricycle*; he was soon followed by Roots and Knight in the application of the idea to road work. In 1885 Daimler invented an engine using petrol as a fuel, and fitted one to a *motor-bicycle.* No commercial prospects occurred until about 1901, and even then the motor-bicycle trade was in an unsatisfactory condition. This was mainly due to the unreliability of the machines, and to the fact that they were fitted with surface carburettors, a contrivance by which petrol vapour was drawn from a wick which hung in a tank containing the supply. This arrangement, together with accumulator ignition, proved unsatisfactory; the jolting of the machine caused the plates of the accumulator to snap, often leaving the motorist stranded by the roadside. The introduction of the float-feed carburettor and the high-tension magneto (1906) revolutionised the industry.

The standard motor-cycle of 1913 has air-cooled cylinders, although a few makers have adopted water-cooling. Cylinders are one, two, or four in number, developing from 1 to 8 h.p. Ignition is by high-tension magneto; float-feed carburettor, chain, shaft, or india-rubber and canvas belt drive. *Side-cars* are used when it is desired to carry a second person.

Later Developments.—At the Paris Exhibition of 1887 *motor-boats* were running on the Seine. Levassor and Panhard added improvements, and in 1894 a trial run of motor-cars (using the internal combustion engine), between Paris and Rouen, was organised. The following year the trial was from Paris to Bordeaux and back, a distance of 744 miles; the winner's average speed was 15 miles per hour. In 1895 the clauses of the 1865 Bill were repealed, and Brit. firms again commenced to give close attention to the development of the new industry. Rapid strides were made in the attainment of speed, efficiency, and reliability, and in July 1902 the Paris-Vienna trial was won by S. F. Edge on a 50 h.p. Napier. He won the Gordon-Bennett Cup, an important trophy in the history of the m.-c. In 1903 trials were run in Ireland and won by a Mercédès car, made by the Ger. firm of Daimler. Greater attention was now paid to a study of steel and its alloys, while both the reciprocating parts of engines and integral parts of the chassis were made much lighter and of improved design.

As an example of the efficiency of these improvements, the case of a 4-cylinder engine may be quoted.

In 1899 such an engine, the cylinders of which were each 4" bore, developed 20 h.p. or less, while the same sized engine of 1910 developed something over 60 h.p. Such inventions as the multiple-disc clutch, detachable wheels, and the 6-cylinder engine, brought out by Eng. firms, as well as improvements in the silencing of cars, added greatly to the popularity of the automobile, which now began to displace horse-drawn vehicles. The first taxi-cabs appeared in London in 1903, but were not a commercial success. It was not until 1906 that the Renault Co. placed successful cabs on the streets. The number of motor-cabs registered in London increased from 19 in 1905 to 4941 in 1910. The chief advantages of motor-cabs are the increased speed and comfort of travel, while a device called a *taximeter* registers the correct fare.

In 1903 the speed-limit in Great Britain was raised to 20 miles per hour, but Local Government Boards were given authority to close roads to motor traffic, or to fix 10 miles per hour or lower speed-limits in dangerous places. Police traps were instituted to prevent motorists exceeding the limit, and as a result of these measures (and of the increase in efficiency of low horse-powered cars) high horse-powered cars decreased in number.

In the early days of the internal combustion engine the charge was ignited by the heating of a tube connected with the cylinder, and later by electricity, an accumulator and sparking coil being used, in conjunction with a contact-breaker, to give the spark at the correct instant. On modern cars the ignition system is by high-tension magneto, invented by F. R. Simms and Herr Bosch, with accumulator ignition for easy starting.

Water-cooling is standard, and various types of radiators are in use, each having its peculiar claims. Starting up is by handle at the front of the car, although some 1912–13 cars are fitted with self-starters. Improvements in the design of clutches allow the car to start without jerking. Gears have been improved and strengthened, and shaft drive is standard. Wire wheels save weight, and detachable (*Stepney*) wheels and rims render the incapacity of the car through tyre troubles a matter of moments only.

Heavy commercial vehicles may be propelled either by steam or petrol. Steam is particularly suitable for heavy lorries, trucks, etc. In some steam wagons vertical compound engines are used, fixed behind the driver; with others, the position is with the boiler in front of the driver. Steam tractors are generally used by showmen and builders.

Internal combustion petrol engines have been applied to mechanical traction with great success. The engines are of the same type as that described under Oil Engine, except that they are of a heavier build in order to withstand rough usage (see ENGINES). Two of the best-known vehicles of this type are the Leyland petrol wagon and the 70-h.p. 6-cylinder Dennis delivery wagon. **Motor fire-engines** are now common; an engine such as 60-h.p. 6-cylinder Halley can transport a far greater amount of tackle than a horse-drawn vehicle. Motor-cars, cycles, and wagons are now extensively employed in military manœuvres and operations.

Licences and Regulations.—In the U.K. motor-car licences are as follows:—

Motor-bicycles and tricycles, £1; motor-cars under 6½ h.p., £2 2s.; under 12 h.p., £3 3s.; under 16 h.p., £4 4s.; under 26 h.p., £6 6s.; under 33 h.p., £8 8s.; under 40 h.p., £10 10s.; under 60 h.p., £21; over 60 h.p., £42. Doctors pay half-duty.

The advent of the motor-car has put an enormous extra strain upon roads. In order to maintain and improve these, a grant is made each year out of the Consolidated Fund equal to the proceeds of the duties imposed upon motor-cars and motor-spirit (c. £1,000,000 in 1911–12).

A motor-car or cycle must not be driven on a public highway at a speed exceeding 20 miles per hour. No person must drive a motor who is not licensed to do so; and no one may be licensed to drive a motor-car under 17 years of age, or a motor-cycle under 14. Licence to drive a motor-car, 5s. A car can be *registered* under any authority, but a *Driver's Licence* must be taken in the district in which the driver resides; registration fee for a car, £1; for a motor-cycle, 5s. Lamps must be alight from one hour after sunset until one hour before sunrise.

Each car must exhibit the distinguishing letters of the authority registered under and the number allotted to the car by the authority on both the front and rear of the car.

The **Registration Letters** are: a., London; a.a., Hampshire; a.b., Worcestershire; a.c., Warwickshire; a.d., Gloucestershire; a.e., Bristol; a.f., Cornwall; a.h., Norfolk; a.i., Meath; a.j., Yorkshire (N. Riding); a.k., Bradford; a.l., Nottinghamshire; a.m., Wiltshire; a.n., West Ham; a.o., Cumberland; a.p., East Sussex; a.r., Hertfordshire; a.s., Nairnshire; a.t., Kingston-upon-Hull; a.u., Nottingham; a.w., Shropshire; a.x., Monmouthshire; a.y., Leicestershire; b., Lancashire; b.a., Salford; b.b., Newcastle-on-Tyne; b.c., Leicester; b.d., Northamptonshire; b.e., Lincolnshire (Lindsey); b.h., Buckinghamshire; b.i., Co. Monaghan; b.j., East Suffolk; b.k., Portsmouth; b.l., Berkshire; b.m., Bedfordshire; b.n., Bolton; b.o., Cardiff; b.p., West Sussex; b.r., Sunderland; b.s., Orkney; b.t., Yorkshire (E. Riding); b.u., Oldham; b.w., Oxfordshire; b.x., Carmarthenshire; b.y., Croydon; c., Yorkshire (W. Riding); c.a., Denbighshire; c.b., Blackburn; c.c., Carnarvonshire; c.d., Brighton; c.e., Cambridgeshire; c.f., West Suffolk; c.h., Derby; c.i., Queen's County; c.j., Herefordshire; c.k., Preston; c.l., Norwich; c.m., Birkenhead; c.n., Gateshead; c.o., Plymouth; c.p., Halifax; c.r., Southampton; c.t., Lincolnshire (Kesteven); c.u., South Shields; c.w., Burnley; c.x., Huddersfield; c.y., Swansea; d., Kent; d.a., Wolverhampton; d.b., Stockport; d.c., Middlesborough; d.e., Pembrokeshire; d.h., Walsall; d.i., Co. Roscommon; d.j., St. Helens; d.k., Rochdale; d.l., Isle of Wight; d.m., Flintshire; d.n., York; d.o., Lincolnshire (Holland); d.p., Reading; d.r., Devonport; d.s., Peebles; d.u., Coventry; d.w., Newport (Mon.); d.x., Ipswich; d.y., Hastings; e., Staffordshire; e.a., West Bromwich; e.b., Isle of Ely; e.c., Westmoreland; e.d., Warrington; e.e., Grimsby; e.f., West Hartlepool; e.h., Hanley; e.i., Co. Sligo; e.j., Cardiganshire; e.k., Wigan; e.l., Bournemouth; e.m., Bootle; e.n., Bury; e.o., Barrow-in-Furness; e.p., Montgomeryshire; e.s., Perthshire; e.t., Rotherham; e.u., Brecknockshire; e.w., Huntingdonshire; e.x., Great Yarmouth; e.y., Anglesey; f., Essex; f.a., Burton-upon-Trent; f.b., Bath; f.c., Oxford; f.d., Dudley; f.e., Lincoln; f.f., Merionethshire; f.h., Gloucester; f.i., Tipperary (N. Riding); f.j., Exeter; f.k., Worcester; f.l., Soke of Peterboro'; f.m., Chester; f.n., Canterbury; f.o., Radnorshire; f.p., Rutland; f.r., Blackpool; f.t., Tynemouth; f.x., Dorsetshire; f.y., Southport; g., Glasgow; h., Middlesex; h.i., Tipperary (S. Riding); h.s., Renfrewshire; i.a., Co. Antrim; i.b., Co. Armagh; i.c., Co. Carlow; i.d., Co. Cavan; i.e., Co. Clare; i.f., Co. Cork; i.h., Co. Donegal; i.j., Co. Down; i.k., Co. Dublin; i.l., Co. Cork; **p.s.**, Shetland; **r.**, Derbyshire; **r.i.**, Dublin; **r.s.**, Aberdeen; **s.**, Edinburgh; **s.a.**, Aberdeenshire; **s.b.**, Argyllshire; **s.d.**, Ayrshire; **s.e.**, Banffshire; **s.h.**, Berwickshire; **s.j.**, Bute; **s.k.**, Caithness; **s.l.**, Clackmannanshire; **s.m.**, Dumfriesshire; **s.n.**, Dumbartonshire; **s.o.**, Elginshire; **s.p.**, Fifeshire; **s.r.**, Forfarshire; **s.s.**, Haddingtonshire; **s.t.**, Inverness-shire; **s.u.**, Kincardine; **s.v.**, Kinross-shire; **s.w.**, Kirkcudbrightshire; **s.x.**, Linlithgowshire; **s.y.**, Midlothian; **t.**, Devonshire; **t.i.**, Limerick; **t.s.**, Dundee; **u.**, Leeds; **u.i.**, Londonderry; **u.s.**, Govan; **v.**, Lanarkshire; **v.s.**, Greenock; **w.**, Sheffield; **w.i.**, Waterford; **w.s.**, Leith; **x.**, Northumberland; **x.s.**, Paisley; **y.**, Somersetshire; **y.s.**, Partick.

Motor Sign-Posts.—(1) A white circle—speed-limit given on plate below; (2) a red circle means road closed to motorists; (3) a red triangle means caution; (4) a diamond-shaped board for any other notice.

Spooner, *Motors and Motoring* (1912).

MOTORS.—In a dynamo (*q.v.*) a coil of wire rotates between the poles of an electromagnet so that the number of lines of magnetic force (see MAGNETISM) passing through the coil is continually changing. In consequence, an electric current is produced in the coil. Conversely, if a current be sent round the coil from an external source, the coil will rotate, and this arrangement is termed an **electromotor**. Mechanically, the design of an electromotor is almost exactly similar to that of a dynamo. Electrically, the difference is that in the dynamo mechanical energy is supplied to the machine and produces energy in the form of an electric current, which may be employed for lighting or power; whereas, in the electromotor, energy is supplied to the machine in the form of an electric current, which produces mechanical energy capable of doing work. This current is generally obtained from the public supply, and is therefore at a nearly constant electromotive force. Let this be E. When the motor begins to revolve it acts like a dynamo and produces a reverse, or *back* electromotive force. Let this be *e*. If R is the resistance of the whole circuit, then the current C supplied by the mains is equal to $(E-e)\div R$. At starting, the back electromotive force *e* is zero, and hence the current from the mains tends to be large. In order to avoid this heavy current, which might damage the machine, an extra resistance is inserted into the circuit by means of a starting switch, and after the speed of the motor has risen sufficiently to develop the back electromotive force, this resistance is cut out.

Motors, like dynamos, may be *series*, *shunt*, or *compound* wound, according to the purpose for which they are used. Series wound motors are employed where great starting power is required, but develop very high speed with light loads. Shunt wound motors may, within certain limits, adjust their speed according to the work imposed on them. Compound wound motors may be constructed to run at constant speeds with all loads. The *electrical efficiency* of a motor is the ratio of the energy output of the machine to the total energy supplied to it, and is represented by $\frac{e}{E}$. The *mechanical efficiency* is the ratio $\frac{H}{eC}$ where H is the brake horse-power of the motor.

Water-Motors are instruments for the application of water-power to machinery. This is done by means of water-wheels and turbines. Water-wheels are adapted so as to utilise either the weight of water (*e.g.* a fall) or its momentum (*e.g.* a swift stream). In either case the wheel is rotated and the power transmitted by shafts and driving-belts. The turbine is practically a horizontal water-wheel.

MOTOR-CAR ENGINE, see ENGINE.

MOTRIL (36° 53′ N., 3° 37′ W.), town, Granada, Spain, near Mediterranean; sugar. Pop. 20,000.

MOTT, LUCRETIA (1793–1880), Amer. Quaker reformer; preached as member of Society of Friends, denouncing slavery and urging peace; took an active part in anti-slavery and women's suffrage conventions.

MOTT, VALENTINE (1785–1865), Amer. surgeon; prof. of Surgery at Columbia Coll., 1809; after seven years in Europe founded Univ. Medical College of New York, 1841; famed as a brilliant operator.

MOTTO, see under HERALDRY.

MOUFLON, MUFLON (*Ovis musimon*), wild sheep of Central Asia; in Europe found only in Corsica and Sardinia.

MOUKDEN, see MUKDEN.

MOULDING, see FOUNDING.

MOULINS (46° 33′ N., 3° 20′ E.), town, Allier, France, on Allier; cathedral; bp.'s see; machinery, furniture; was ancient capital of Bourbonnais. Pop. 23,000.

MOULMEIN, see MAULMAIN.

MOULT, the casting of an external coat; most often used of the shedding of feathers, but also of hair, or scales, of the Carapace in crustacea, or of various cuticles in other Arthropods.

MOULTAN, see MULTAN.

MOUND-BUILDERS, primitive inhabitants of N. America. Among remains of Neolithic Age in N. America there are found, south of Canada, barrows, some of which are grave-mounds, some apparently not so, containing skeletons, implements, rude sculptures, ashes, charcoal.

MOUNDSVILLE (39° 55′ N., 80° 45′ W.), city, W. Virginia, U.S.A., on Ohio; prehistoric mounds in vicinity; glass-works. Pop. (1910) 8918.

MOUNT BARKER (35° 5′ S., 138° 58′ E.), town, S. Australia, at foot of Mount Barker; agricultural and fruit-growing district.

MOUNT CARMEL (40° 48′ N., 76° 25′ W.), town, Pennsylvania, U.S.A., on Shamokin Creek; anthracite coal-fields. Pop. (1910) 17,532.

MOUNT CLEMENS (42° 35′ N., 82° 55′ W.), city, health-resort, Michigan, U.S.A., on Clinton; mineral springs. Pop. (1910) 7707.

MOUNT DESERT (44° 20′ N., 68° 20′ W.), island, Maine, U.S.A.; area, *c.* 110 sq. miles; surface mountainous; summer resort; largest village, Bar Harbor. Pop. 8100.

MOUNT GAMBIER (37° 50′ S., 140° 50′ E.), town, S. Australia; agricultural centre.

MOUNT MORGAN (23° 45′ S., 150° 30′ E.), town, Queensland, Australia; gold mines. Pop. 6500.

MOUNT SORREL (52° 44′ N., 1° 9′ W.), market town, on Soar, Leicestershire, England.

MOUNT VERNON.—(1) (40° 52′ N., 73° 50′ W.) residential city, on Bronx River, New York State, U.S.A. Pop. (1910) 30,919. (2) (41° 55′ N., 91° 28′ W.) town, Iowa, U.S.A.; seat of Cornell Coll. (Methodist Episcopal). Pop. (1910) 1532. (3) (38° 20′ N., 88° 55′ W.) city, Illinois, U.S.A.; trade in lumber and flour. Pop. (1910) 8007. (4) (40° 20′ N., 82° 30′ W.) city, Ohio, U.S.A., on Koko-sing; engine-works; flour-mills. Pop. (1910) 9087. (5) (37° 55′ N., 88° W.) town, Indiana, U.S.A., on Ohio; flour- and saw-mills. Pop. (1910) 5503. (6) (38° 44′ N., 77° 13′ W.) home and burial-place of George Washington, Virginia, U.S.A.; estate was presented to the nation in 1856.

MOUNTAIN ASH (51° 40′ N., 3° 28′ W.), town, Glamorganshire, Wales; collieries; ironworks. Pop. (1911) 42,256.

MOUNTAINEERING is a comparatively modern sport, although celebrated climbs have been recorded since the XIII. cent., and Gesner and Simler (XVI. cent.) showed that there were some who took keen pleasure in climbing. It did not become popular till about 1750; Mont Blanc was first ascended by Balmat, 1786, who guided De Saussure on his famous ascent in the following year. Colonel Beaufoy was the first Englishman to achieve this feat, 1787. In 1800 some peasants climbed Gross-Glockner. The Alpine Club was formed in 1857 and the *Alpine Journal* first published, 1863. Among famous climbers may be mentioned, Whymper, who climbed the Matterhorn

(1865) and various peaks of the Andes, Mackinder, who scaled Mt. Kenya (1899), and the Duke of Abruzzi, who has made several celebrated climbs in E. Africa. M. is practised to a limited extent in Britain, but Switzerland is by far the most popular country for mountaineers. It is a sport that involves considerable risk, *e.g.* from falling rocks or snow, from sudden storms, from falling down a crevasse, but the majority of accidents are due to foolhardiness or lack of due precaution.

Dent and others, *Mountaineering* (1901); C. E. Benson, *British Mountaineering* (1909); Abraham, *British Mountain Climbs* (1909); and the *Publications of the Alpine Club.*

MOUNTAINS.—The following are the chief mountains, with heights in feet: *Europe*, Mont Blanc (15,732); *Asia*, EVEREST, Himalayas (29,002), Dapsang, Karakorum Mts. (28,700); Tagarma, Pamir (25,800); *Africa*, Kilima-Njaro (19,680), Kenya (19,000), Ruwenzori (18,000); *America*—(1) N., Mt. M'Kinley (20,464), Mt. Logan (19,500), Origaba (18,205); (2) S., Aconcagua (22,427), Mercedario (22,302), Gualtieri, (22,000); *Oceania*, Mt. Charles-Louis, New Guinea (20,000), Mauna Kea, Hawaii (13,805), Mt. Cook, New Zealand (12,349), Mt. Townsend, New South Wales (7350); *Antarctic Regions*, Mt. Erebus (15,000).

MOUNTED INFANTRY, see INFANTRY.

MOUNTJOY, BARONY AND VISCOUNTCY.—Sir Walter Blount of Elvaston, Derbyshire, fought for Edward IV. at *Towton*; received forfeited estates of Lancastrians, and, 1465, was created Baron M. from surname of maternal ancestor. Barony was held by Blounts until 1681; by Viscounts Windsor, descended from Blounts, 1712–58; viscountcy held by Earls and Marquesses of Bute, similarly descended, 1796 to present time. Stewarts of Ramalton were Viscounts M., 1683–1769; descendants, Gardiners of Dublin, Barons M., 1789–1820.

MOUNTMELLICK (53° 7′ N., 7° 20′ W.), market town, Queen's County, Ireland; woollen manufactures, foundries.

MOURNE MOUNTAINS, see DOWN.

MOUSE FAMILY, MURIDÆ, a vast assemblage of Rodents comprising almost 1500 species, recorded from practically all parts of the world. They have slender skeletons, four and five toes on the fore and hind feet respectively, sharp flattened lower incisors, and a long scaly tail generally almost devoid of hairs. Most familiar are Rats and Mice (*Mus*), five of which occur in Britain, leading nocturnal lives and sheltering in holes; the disappearing BLACK RAT or RATTON (*M. rattus*), almost exterminated by the spread of the larger and fiercer BROWN RAT (*M. decumanus*); the common HOUSE-MOUSE (*M. musculus*) and its country relatives, the HARVEST-MOUSE and LONG-TAILED FIELD-MOUSE (*M. minutus* and *sylvaticus*), the former of which builds a nest amongst corn stalks. The VOLES (*Arvicola*) are more clumsy than Rats and Mice, have shorter tails and ears, are entirely vegetarian, and are even more destructive to crops; although five species are found in Britain, Ireland has none. Non-Brit. representatives of the Mouse Family are the vole-like LEMMINGS (*Lemmus*), found burrowing in the mts. of northern Europe, Asia, and America. The disastrous migrations of the Norwegian Lemming are referred to in the article on MIGRATION. The MUSK-RAT or MUSQUASH (*Fiber*) is an aquatic inhabitant of N. America, with a musky odour, and fur of commercial value; while the graceful, bushy-tailed GERBILS live in burrows on the sandy deserts of Europe, Asia, and Africa, resembling in habit the Old World cheek-pouched HAMSTERS (*Cricetus*).

MOUSE HARES, see PICAS.

MOUTH (including salivary glands), see DIGESTION.

MOUTHPIECE, that part of a wind instrument which the player puts into his mouth or against his lips. To the first class belong the single reed of the clarinet and the double reeds of the oboe and bassoon; to the second, the cupped m's of such instruments as the horn and trombone. Individual instruments of the latter class have slightly different forms of cup, and in some cases a different material is used from that of the instrument itself. Instruments like the flute cannot strictly be said to have a m.

MOVABLES, see under INHERITANCE.

MOWBRAY, name of Eng. baronial family. Roger de M., descendant of lords of Montbray, Normandy, and his descendants were summoned to Parliament as barons from 1283 or 1295. Sixth baron was Earl Marshal and Duke of Norfolk, 1397, a title which descended to the Howards.

MOZAMBIQUE, MOÇAMBIQUE (15° 2′ S., 40° 48′ E.), seaport, Portug. E. Africa, on island in Mossoril Bay; exports ground-nuts, rubber. Pop. 5000. The name is also given to a district of Portug. E. Africa and to Portug. E. Africa itself. See PORTUGUESE EAST AFRICA.

MOZART, WOLFGANG AMADEUS (1756–91), Austrian composer; b. at Salzburg; d. in Vienna. His musical precocity was phenomenal, and when, at the age of six, he started on a three years' artistic tour with his sister, he excited astonishment everywhere as the 'wonder-child.' At Paris, in 1763, during this tour, his first compositions were published. Returning to Salzburg he wrote, when only ten, an oratorio, and soon after an opera, performed in 1769. A brilliant Ital. tour, again as a prodigy, followed; and after various wanderings, and an engagement with the abp. of Salzburg, which ultimately proved untenable, he settled in Vienna. There he wrote, among others, the three great operas by which he will always be remembered, *The Marriage of Figaro* (1786), *Don Giovanni* (1787), and *The Magic Flute* (1791). In 1789 he was appointed imperial private composer, but he failed to obtain any of the more lucrative posts, and as only small sums were paid for his works, he was in constant pecuniary straits. This was tragically emphasised at his death when, just after finishing his famous *Requiem*, he was carried to a pauper's grave. During his brief life M. wrote no fewer than 769 compositions, ranging from the very largest to the simplest forms. His genius might be described as universal, for he shone alike in opera, in orchestral and chamber music, and in sacred composition. His style has been aptly characterised as a happy mixture of Ital. joyfulness of melody, with Ger. thoroughness and depth.

Cowen, *Mozart* (Masterpieces of Music Series, 1912).

MOZDOK (43° 45′ N., 44° 30′ E.), town, Terek, Russia, on Terek. Pop. 15,500.

MOZLEY, JAMES BOWLING (1813–78), Anglican clergyman; wrote in defence of Oxford movement.

MOZLEY, THOMAS (1806–93), Anglican clergyman; upholder of Oxford movement.

MOZUFFERNUGGER, see MUZAFFARNAGAR.

MTZENSK, MZENSK (53° 17′ N., 36° 30′ E.), town, on Zusha, Orel, Russia; tallow, soap; active trade. Pop. 10,500.

MTZKHET (41° 50′ N., 44° 45′ E.), decayed town, Russ. Transcaucasia; ancient capital of Georgia.

MUCH WENLOCK (52° 37′ N., 2° 34′ W.), market town, Shropshire, England.

MUCKERS, a nickname for the sect which followed the dualistic views of John Henry Schönherr (1771–1826). Schönherr regarded the universe as a combination of spiritual and sensual elements.

MUDANIA (40° 20′ N., 28° 55′ E.), town, Asia Minor, on Sea of Marmora. Pop. 6000.

MUD-FISHES, see under FISHES.

MUDHOL (16° 20′ N., 75° 20′ E.), native state, S. Mahratta agency, Bombay, India. Pop. 70,000.

MUDKI, see MOODKEE.

MUEZZIN, see MUHAMMADANISM (INSTITUTIONS).

MUFFINS, see BREAD.

MUFFLING, FRIEDRICH KARL FERDINAND VON, WEISS (1775–1851), Pruss. field-marshal; chief of staff of Tolly and Nollendorf in invasion of France, 1814; chief of general staff at Berlin, 1821; reorganised staff and wrote important military works.

MUGGLETONIANS, Eng. religious sect, founded, 1652, by Lodowick Muggleton (1609–98) and John

Reeve; preached damnation of all outside the sect.

MUHAMMAD, MOHAMMED, MAHOMET (c. 575–632), the prophet and founder of Muhammadan religion, was born at Mecca. He belonged to the tribe Koreish, and was of good family. Arabia in his time was pagan, but various religions had exerted some influence. M. was married about 595, and his 'Call' took place about 610. He seems to have projected preaching against idolatry, restoring Judaism to its patriarchal purity by combining Jewish and Christian elements. He recognised the Old Testament prophets and Christ, and regarded himself as the last and greatest prophet. Only by degrees did he assert his claim. The Koran, of which the author, according to Muslim orthodoxy, was not M. but God, was delivered to the prophet in *Suras* (chapters), and written down by his followers. These were afterwards collected into the Koran as we have it. Meanwhile, M. was gathering round him a band of followers, including his wife, his cousin, and his successor as head of the new religion—Abû Bekr.

When M. began his public ministry he had a firm nucleus of supporters who may have urged him to keep in retirement no longer. The exact sequence of events from this time (about 613) to the Flight, in 622, is uncertain, but something may be gathered. He seems to have been involved in controversy about the Koran, in which he claims to have described events of which he had no ordinary means of knowledge, though his enemies said they knew a man who was his source of information. Although it became the standard for Arabia, some scholars think they can detect Ethiopic idioms in it. Meanwhile, M. had to face opposition in Mecca, and, while personally safe, was obliged to secure a refuge for some of his followers in Axum, in Abyssinia, making an alliance with the Abyssinian king. M. received an invitation from Yathrib (afterwards called Medina) to come to the assistance of one tribe which was at war with another. The Meccans were naturally roused against M., and the safe execution of his plan of escape taxed all his ability. He concealed himself in a cave south of Mecca, and finally arrived at Yathrib, Sep. 20, 622. From this time onwards M. wielded greater and greater power. He failed to bring about any understanding with the Jews in Yathrib, and he crushed them by force of arms. He forbade the drinking of wine by his followers—perhaps because of its associations with the Christian Eucharist.

The new faith spread beyond Medina, and all that was required of converts was to declare belief in God and in M. as His prophet, and to pay a certain sum as tribute. M. was naturally on bad terms with the Meccans, and he started making attacks on their caravans. A battle was fought at Badr, in which M. was victorious. This greatly increased his reputation throughout Arabia. Another battle, however, was fought, in which he was defeated. In the year 5 A.H. (of the new era, reckoning from the Flight), Mecca was invaded, a truce was made next year, and in 6 A.H. it was captured. Little change, however, was made in its internal government. The next step was the subjugation of Arabia. None but converts were allowed in his army. He sent messages to all monarchs he knew, urging them to embrace the new faith. In 9 A.H. the encroachment of Islam on the Byzantine Empire had begun, and before his death he had planned the reduction of Syria.

His career was certainly one of the most remarkable of history. His ability was enormous; his sincerity is questioned by some.

Margoliouth, *M. and the Rise of Islam*.

MUHAMMAD AHMED IBN SEYYID ABDULLAH (1848–85), Egyptian pretender; claimed to be the *Mahdi*, who was to free Egypt from foreign rule; organised revolt of Sudan against British and Turks; Sudan declared independent by Gordon, 1884, but Mahdists besieged and captured Khartum, 1885.

MUHAMMADANISM. — Religion. — The faith founded by Muhammad is often described as Islam, but is more familiar as Muhammadanism. It is a Christian heresy rather than like Buddhism or Confucianism, an entirely non-Christian or 'heathen' religion. It is the latest in time of the three great monotheistic faiths, the other two being Judaism and Christianity, and to them Muhammadanism owes its birth. The founder's idea seems to have been to revive early Judaism (see MUHAMMAD), but it owes no less to the special conditions of the land of its origin, Arabia, which, with its great deserts, was the source of successive waves of Semitic migration. Its social condition was tribal, and a fairly primitive Semitic paganism prevailed. There were a number of local deities and sacred spots, such as the black stone of Mecca. Reverence for these was sometimes so firmly rooted in the Arab mind that it was impossible to dislodge it, and certain heathen ideas were therefore taken over by Islam.

Muhammad belonged to the tribe Koreish, whose god was Allah, who accordingly became the god of the new religion. Though the Jews lived an isolated life, Judaism can fairly be called one of Muhammad's sources. Christianity existed in Arabia besides, but Muhammad derived most of his information of it from uncanonical sources. In addition, Zoroastrianism had some influence on the Persian frontier. But Islam had a simpler theology than Catholic Christianity. To the pious Muhammadan or *Muslim* the Koran is the source of revelation, and every word of it is absolute truth. There is, besides, a body of tradition, or *hadith*. What was not contained directly in either Koran or tradition could be inferred by analogy—*qiyas*. Much importance, too, was attached to the common belief of all believers. The devotional exercises of a Muslim consisted of saying the Creed, and certain other appointed prayers, and giving some amount in charity. Besides this, he had to fast between sunrise and sunset for one month, and (if possible) once in his life go on a pilgrimage to Mecca.

Moses and Jesus (according to Islam) were prophets, but Muhammad was the best and greatest. Various sects and religious movements arose, but there has been little theological development. The course of conquest can be followed in the history of various countries. See KORAN.

M. has been widely spread, almost entirely by conquest, over N. Africa, India, E. and S.E. Asia, and Turkey-in-Europe. In 1911 there were 66,623,000 Muslims in India, while the total number in the world is estimated (1913) at 180,000,000.

Arnold, *The Preaching of Islam* (1896); Sell, *Essays on Muhammadanism* (1901); Margoliouth, *Muhammad and the Rise of Islam* (1905).

Institutions.—Founded on ordinances of Muhammad, they have developed with expansion of Muslim Empire, chiefly under Omar I. Political and social life are inseparable from religious.

RELIGIOUS INSTITUTIONS.—(*a*) Prayer, five times daily, may be said anywhere, but on Friday every believer must pray in mosque. *Muezzin's* cry from minaret of mosque announces hours of prayer. Ablution is essential before prayers. (*b*) Fasting obligatory during month of Ramadan. (*c*) Alms-giving. (*d*) *Hajj*, pilgrimage to Mecca, to be made by Muslims at least once in lifetime.

POLITICAL AND ADMINISTRATIVE.—(*a*) *Khalîfa*, Caliph or 'successor' of Muhammad, originally elected by whole Muslim community and uniting temporal and spiritual powers; but after eventful history Caliphate became vested in Turk. Sultan, who is supreme religious head of Islam. (*b*) *Vazirs* or ministers. (*c*) *Qâdis*, judges appointed by Caliph or Vazir; women eligible. (*d*) *Imâms*, religious officials; duty to recite prayers in mosque; choose their own *muezzins*. (*e*) *Amir-al-Hajj*, Leader of Pilgrimage, generally held by Caliph himself, or near relative.

Law.—Muhammadan Law is part of Muhammadan religion. It arose from Arab customs and usages

as reformed and extended by Prophet Muhammad. History of Islamic legal system is divisible into four distinct periods: (1) Legislative, commencing with *Hijrat* or Prophet's Flight to Medina, 622 A.D., and with his death, 632 A.D.; laws divinely revealed, and promulgated in sacred book *Qurán* (Koran), and in *Hadíth* or Traditions, inspired precepts of Muhammad. (2) From 632 A.D. to VIII. cent. A.D.; period of collection and interpretation. (3) From VIII. to X. cent. A.D.; foundation of the four Sunni schools of jurisprudence, Hanifi, Máliki, Shafi'i, Hanbali, differing chiefly in details. (4) From X. cent. A.D. to present time; development of previous work. SOURCES: (*a*) *Qurán*; (*b*) *Hadíth*; (*c*) *Ijma'*, consensus of opinion of *Mujtahids*, jurists; (*d*) customs and usages; (*e*) juristic deduction. Islamic law regulates entire public and private relations of Muslims mutually and with non-Muslims. Among more interesting legal institutions are *waqf*, transference of usufructuary rights without property vesting in any individual; *jehád*, religious war declarable against hostile non-Muslim state; inheritance laws, highly scientific and equitable; marriage laws, permitting four wives, but entitling each to equal treatment, to separate property, to *mahr* or dower from husband on marriage, to paternity of all children born in wedlock, and to divorce.

Syed Amir Ali, *Muhammadan Law.*

MUHAMRAH, MOHAMMERAH (30° 30′ N., 48° 15′ E.), town, Persia, on canal between Shat-el-Arab and Karun; exports dates, opium, wheat. Pop. 10,500.

MUHLENBERG, JOHN PETER GABRIEL (1746–1807), Amer. preacher, general, and politician; b. at Trappe, Pennsylvania; in War of Independence served with distinction at *Charleston*, *Brandywine*, and *Yorktown*.

MUHLENBERG, WILLIAM AUGUSTUS (1796–1877), Amer. Episcopal clergyman and philanthropist; b. Philadelphia; founded many church schools and charity institutions, *e.g.* St. Luke's Hospital, N.Y., and the Church Industrial Community of St. Johnland.

MÜHLHAUSEN (51° 12′ N., 10° 30′ E.), town, on the Unstrut, Prussian Saxony; imperial free city and of great commercial importance in XIV. cent.; woollens, cotton, hosiery, beer, cycles, chemicals. Pop. (1900) 35,091.

MUIR, JOHN (1838–), Amer. naturalist and writer.

MUKDEN, MOUKDEN (41° 54′ N., 123° 58′ E.), capital Manchuria, on Hun-ho; scene of Jap. victory over Russians, 1905; commercial centre; furs. Pop. 165,000.

MUKDISHU, MAGADOXA (2° N., 45° 25′ E.), seaport town, Ital. Somaliland, E. Africa, on Ind. Ocean. Pop, 10,500.

MULA (38° N., 1° 30′ W.), town, Murcia, Spain; sulphur baths. Pop. 13,500.

MULBERRY (*Morus alba* and *M. nigra*), shrubs introduced from Asia and extensively cultivated in Southern Europe. The black m. is grown mostly for its fruit, the white m. for its leaves, which are used as food for silkworms (*q.v.*).

MULDE (51° N., 12° 38′ E.), river of Saxony, Prussia, and Anhalt; joins Elbe at Dessau.

MULE, see HYBRIDS.

MÜLHAUSEN, MULHOUSE (47° 40′ N., 7° 19′ E.), town, Alsace, Germany; belonged to France, 1797–1871, when transferred to Germany; industrial centre; manufactures woollens, cottons Pop. (1910) 95,041.

MÜLHEIM-AM-RHEIN (50° 57′ N., 7° E.), town, Rhine province, Prussia; velvet, silk, chemicals. Pop. (1910) 53,355.

MÜLHEIM-AN-DER-RUHR (51° 22′ N., 6° 10′ E.), town, Rhine province, Prussia; ironworks. Pop. (1910) 112,580.

MULL (56° 25′ N., 6° W.), island, Hebrides, Argyll, W. Scotland; area, *c.* 360 sq. miles; mountainous; town, Tobermory; cattle and sheep. Pop. 4350.

MÜLLER, FRIEDRICH MAX, see MAX MÜLLER.

MÜLLER, FRITZ (1822–97), Ger. botanist and explorer; spent greater part of his life studying habits and interrelations of animals and plants in Brazil; made many contributions to Darwinism, and was dubbed by Darwin the 'prince of observers.'

MÜLLER, JOHANNES (1801–58), distinguished Ger. physiologist, whose work added to our knowledge of the mechanism of the sense-organs and the physical and chemical properties of the body fluids; prof. of Physiology at Berlin, he exercised great influence on modern physiologists.

MÜLLER, JOHANNES VON (1752–1809), Swiss historian; pub. *Geschichte der Schweizer*, 1780–1808, long since superseded, but stimulus to study of Swiss history; met with a good deal of religious persecution, but received patronage of Austria and Napoleon.

MÜLLER, KARL OTFRIED (1797–1840), Ger. archæologist; devoted himself mainly to Gk. antiquities, and wrote many important works in connection therewith.

MULLETS.—This name has been applied to two very distinct types of fishes: (*a*) RED MULLETS, GOAT-FISHES, or SARMULLETS (*Mullidæ*), brightly coloured red or golden bony fishes distinguished by the presence of two long barbels at the chin; carnivorous fishes, esteemed as food; found on shores of tropical and temperate seas.

(*b*) GREY MULLETS (*Mugilidæ*), long, large-scaled, bony fishes which feed on the organic matter in mud, and have a muscular gizzard-like stomach; excellent food fishes; some inhabit fresh water, but most temperate and tropical seas.

MUL-LIL, see BABYLONIA (Religion).

MULLINGAR (53° 32′ N., 7° 19′ W.), county town, Westmeath, Ireland. Pop. 4500.

MULREADY, WILLIAM (1786–1863), Irish subject painter; designed the famous *Mulready Envelope* for Sir Rowland Hill.

MULTAN, MOOLTAN.—(1) (*c.* 30° 56′ N., 72° 50′ E.) district, Punjab, India; area, 6080 sq. miles. Pop. 715,000. (2) (30° 13′ N., 71° 26′ E.) town, Punjab; besieged and captured by British, 1848–49, during second Sikh War; manufactures carpets, textiles, pottery, enamel work. Pop. (1911) 99,243.

MUMBLES, THE, see OYSTERMOUTH.

MUMMY, an embalmed dead body. Embalming was practised by Persians, Assyrians, Hebrews, Romans, and Mexicans, but the Egyptians were most expert, and m's are found in their tombs in great numbers. These include human beings, bulls, apes, ibises, crocodiles, and fish. Corpses of poor people were dried with salt or natron, and wrapped in coarse cloth and placed in the catacombs. Those of the rich underwent a series of complicated preparations, after which the body was enclosed in a wooden or stone shell, often ornamented with a series of pictures and hieroglyphics. See EMBALMING.

MUMPS, acute infectious disease characterised by inflammation of the salivary glands, especially the parotid, with pain and swelling, and a rise of temperature, and with a tendency, in convalescence, to pain and swelling in the testes in the male, and in the breasts and ovaries in the female. Children above the age of four and young adults are most commonly attacked; the disease is infectious before the glands begin to swell. The treatment is simply a saline purge, hot fomentations to the affected part, and rest.

MÜNCHAUSEN, HIERONIMUS KARL FRIEDRICH, BARON VON (1720–97), Ger. noble, who suggested to Rudolf Erich Raspe the character in *Adventures of Baron Münchausen*; now proverbial braggart.

MUNCIE (40° 10′ N., 85° 19′ W.), city, Indiana, U.S.A.; iron and glass manufactures. Pop. (1910) 24,005.

MUNDÁ, speech of India; name given by Max Müller to Turanian dialects spoken in jungles of Central Provinces and Madras and by inhabitants of neighbouring hills; considered speech of extinct people. Modern Mundás are Dravidian race who adopted M. speech and were afterwards driven into

wilds by Aryan invaders; it comprises these dialects: Asurī, Bhumij, Birhar, Gadabā, Hō, Juāng, Khariā, Kōdā, Korkū, Korwā, Mundari, Santālī, Savara.

MUNDAY, ANTHONY, MONDAY (*c.* 1553–1633), Eng. dramatist and writer; b. in London; visited Rome (1578) and on his return pub. anti-popery pamphlets. His plays are *Death of Robert, Earl of Huntingdon*, *Downfall of Robert, Earl of Huntingdon*, *Two Italian Gentlemen*, and *Sir John Oldcastle* (in collaboration).

MUNDELLA, ANTHONY JOHN (1825–97), Eng. Liberal politician; introduced Bill to make school attendance compulsory in England and Wales, 1881; Pres. of Board of Trade, 1886, and 1892–95; reformer of conditions of labour.

MÜNDEN (51° 25′ N., 9° 39′ E.), town, Hanover, Prussia, at confluence of Fulda and Werra; chemicals; trade in timber. Pop. (1910) 11,455.

MUNGO, ST., see KENTIGERN.

MUNGOOSE, a carnivore; see under CIVET FAMILY.

MUNI RIVER SETTLEMENT, RIO MUNI, SPAN. GUINEA (*c.* 1° 40′ N., 10° E.), Span. colonial possession, W. Africa; area, *c.* 10,000 sq. miles; enclosed since 1912 in S.W. corner of Ger. Kamerun; stretches along Bight of Biafra from Campo River to Muni River; much of surface covered by forests and marshes; produces rubber, timber, palm oil, coffee. Spanish since 1900. Pop. *c.* 200,000.

MUNICH, MÜNCHEN (48° 8′ N., 11° 36′ E.), capital of Bavaria, on Isar, near Alps; one of finest and most interesting cities in Europe, with handsome streets and striking architecture; greatly beautified by Ludwig I. Among notable features are Royal Palace, National Theatre, Old Rathaus, Ruhmeshalle (with busts of celebrities), colossal statue of Bavaria, Maximilianeum (civil service college), Isartor and Karlstor (gateways), museums, rich libraries, distinguished univ.; many fine churches: St. Peter's (XII. cent.), Theatiner (with royal burial vault), St. Boniface, St. Michael's Cathedral (1468), Frauenkirche, etc. M. is a famous art centre; celebrated school of painting; Old and New Pinakothek, Schack, and other picture galleries and Glyptothek (sculptures). Chief industries are noted breweries, scientific instruments, lithography and allied trades, leather, paper, rubber goods, furniture, machinery, etc. History dates from XII. cent.; great fire, 1372; taken by Austrians, 1742. Pop. (1910) 608,375.

Wadleigh, *M.: History, Monuments, and Art* (1910).

MUNICIPAL TRADING, many undertakings, formerly in the hands of private individuals, are now conducted by municipal and other local authorities, *e.g.* tramways, waterworks, electrical supply, etc. Capital for these is supplied from the public funds, and while every endeavour is made to provide any cheap and efficient service or supply, an effort is also made to run the concern in question at a profit for the public benefit (reduction of rates, etc.). While little exception is taken to the principle in so far as such matters as water supply and lighting are concerned, objection is often raised to municipalities entering the field in competition with private enterprise, and running, with public money (at the risk of loss), such concerns as working-class houses or places of entertainment. Continental towns enjoy and exercise far greater freedom in m. t. than Brit. municipalities, and Collectivist experiments of greater or less success have been carried out on an extensive scale by towns in Germany and other parts of Europe.

Darwin, *Municipal Trade*; Shaw, *Common Sense of Municipal Trading*.

MUNICIPIUM, town of which citizens, while self-governing, had privileges and duties of Rom. citizens. Rome was obliged, as she extended her rule, to allow increasing amount of autonomy; instead of annexing Tusculum, 381, or incorporating it in Lat. confederation, it was made first of new order of *municipia*, its inhabitants receiving civil, but not political, rights of Romans, and having no Rom. prefect placed over them; by *lex Julia*, 90 B.C., the municipals received full rights of Rom. citizens; system spread throughout empire; relation of m. to Rome was fixed by charter. M. was composed of citizens (similar to burgesses of borough) and mere inhabitants (*incolæ*); constitutions copied Rome; relationship to mediæval communes much disputed.

MUNKACS (48° 26′ N., 22° 41′ E.), town, on Latorcza, Hungary; noted in Hungarian history. Pop. 16,000.

MUNKACSY, MICHAEL VON (1844–1900), Hungarian painter; settled in Paris and produced chiefly genre-pictures; insane from 1898.

MUNNIPORE, see MANIPUR.

MUNRO, ROBERT, MONRO, MONROE (d. *c.* 1680), Scot. general; became parliamentary general in Ireland, 1644; defeated by Owen Roe O'Neill at Blackwater, 1646; refused to be superseded by Monk, 1647; captured, 1648.

MUNSTER (*c.* 52° 18′ N., 8° 30′ W.) province, S.W. Ireland, containing counties Tipperary, Clare, Limerick, Kerry, Cork, and Waterford. Pop. (1911) 1,033,085.

MÜNSTER.—(1) (51° 57′ N., 7° 37′ E.) town, Prussia; capital of Westphalia; with cathedral (XII. cent.) and other fine churches; castle, univ., etc.; Peace of Westphalia signed here, 1648; manufactures cotton, linen, machinery, leather. Pop. (1910) 90,283. (2) (48° 3′ N., 7° 10′ E.) town, Alsace, Germany; textiles. Pop. (1910) 5975.

MÜNSTER AM STEIN (49° 50′ N., 7° 50′ E.), watering-place, Rhineland, Prussia; mineral springs.

MÜNSTERBERG (50° 37′ N., 17° 3′ E.), town, on Ohlau, Silesia, Prussia; brick-works. Pop. (1910) 8640.

MUNTJAC, see under DEER FAMILY.

MÜNZER, THOMAS (1489–1525), Ger. religious teacher; held extreme views, religious and political, advocating communism; caught and executed by Philip of Hesse.

MURAD, AMURATH, see TURKEY.

MURÆNA, see EELS.

MURAL DECORATION.—The oldest form of m. d. known is to be found in the caves of prehistoric man, and consists of rude outlines of men, beasts, and episodes of the chase drawn or scratched on the rock. This is curious, because in the early historic ages m. d. took an entirely different form, that of sculptured bas-reliefs. The tombs and other monuments of Egypt, Nineveh, and Babylon abound in these, and show that the practice was a popular one for a period of 4000 or 5000 years. The wall slabs were usually of marble or sandstone, the outlines touched with red, and the whole relief painted. This kind of d., found also among certain peoples of South and Central America, has now almost completely lapsed, though the figureless d's of even modern Muslim buildings exhibit traces of similar methods. The usual d. of Muslim mosques is on somewhat different lines, being stone panels of elaborate tracery, usually of geometrical patterns. In Western European work of the XV. cent. similar decorative methods were frequently used.

Glazed bricks or tiles, and slabs of thin coloured marbles, form another important group, favoured particularly by Muslims and architects under their influence—Byzantine and Spanish; the method is of Assyrian origin and was adopted by the Romans. Closely akin to this is the mosaic d., which reached its highest degree of perfection in the later Rom. Empire, and is still the favourite method in Eastern churches.

Stucco coverings and borders, moulded in relief, were in use among the Greeks and have endured to the present day, sometimes with, sometimes without, colour scheme. This is mainly used for interior d., but the Alcazar at Seville, for instance, is a brilliant example of the successful use of stucco for the external walls. There are many variations of this kind of work, such as the *Sgraffito*, a black-and-white effect which

was started in Italy in the XVI. cent., being conspicuous for its effectiveness, especially at a distance. Stucco work was in high favour during the Rococo period in architecture.

Hangings of stamped leather, tapestry, embossed paper, or *papier maché* began to come into use in the XVI. cent., the idea being probably imported by merchants from the Far East, as the Chinese are known to have used wallpapers long before that. The first papers used were imitations either of leather, stucco, or tapestry. In France the tapestry hangings, fostered by such artists as the Gobelins, made great strides, but modern ideas of hygiene appear to militate against their frequent use. Modern Eng. wallpapers owe much to the efforts of William Morris and his followers in the second half of last cent.

Wood-carving and oak panels more or less elaborately carved were in great vogue in the Stewart period, in England and throughout Europe. Some of these panels from Malines are among the finest m. d's known, and fine specimens abound in old Eng. country houses.

The most decorative method, however, is undoubtedly that which uses colour. Fresco- and panel-painting were popular from the earliest times, though in our own day they are generally restricted to public and ecclesiastical buildings. The advent of Christianity appears to have given a notable impetus to decorative painting of this kind, which indeed formed the great bulk of mediæval pictorial art. The Renaissance led to the finest fresco and decorative painting known. The names of almost every great artist of the Renaissance is associated with this kind of work. After them it largely fell into disuse, though in most European countries an attempt has been noticeable of late to revive the art of fresco-painting.

MURANO (45° 27′ N., 12° 20′ E.), town, on island of Venetian lagoon; long noted for manufacture of Venetian glass; has fine cathedral. Pop. 5600.

MURAT, JOACHIM (1767–1815), king of Naples; b. La Bastide; s. of innkeeper; rose in army, and became one of constitutional guard of Louis XVI., 1791; lost command, 1795, on fall of Jacobins; aided Napoleon to subdue revolts against Convention, became his first *aide-de-camp*, and won fame as commander in Italy and Egypt; general of division, 1799; commander of consular guard, 1799; m. Caroline, Napoleon's sister, 1800; led cavalry at battle of *Marengo*, 1800, and compelled Naples to agree to *Treaty of Florence*, 1801; gov. of Paris, marshal of empire, prince, and grand admiral, 1805. M. commanded cavalry at *Austerlitz*, 1805 (receiving as reward grand-duchy of Berg and Cloves), at *Jena*, *Eylau*, and *Friedland*; suppressed Span. insurrection, 1808; became king of Naples by Napoleon's grant, 1808; tried to make Naples strong modern independent state, and incurred Napoleon's anger; led cavalry in invasion of Russia, 1812, and subsequent invasion of Germany, and then deserted Napoleon. Austria guaranteed his possession of Naples, 1814, in return for alliance against Napoleon, but allowed his claims to be neglected at Treaty of Vienna. M. thereupon re-established relations with Napoleon, and there seemed prospect of Ital. rising in his favour, but he was defeated by Austrians, who replaced Bourbon sovereign. He was executed at Pizzo after an attempt to recover his kingdom. A dashing cavalry officer, M. was of inordinate ambition and unstatesmanlike.

A. H. Atteridge, *Life*.

MURATORI, LUDOVICO ANTONIO (1672–1750), Ital. historian; b. Vignola, Modena; librarian of the Ambrosian Library, Milan, 1695; of the D'Este Library at Modena, 1700; wrote the *Rerum Italicarum Scriptores*; also a history of Italy.

MURCHISON, SIR RODERICK IMPEY (1792–1871), Brit. geologist; b. Tarradale, Ross-shire, Scotland; ed. Durham Grammar School, then Military Coll., Gt. Marlow; gazetted ensign, 1807; studied art and antiquities and later took up geol., specialising in continental geol. In 1831 he studied rocks underlying Old Red Sandstone in Wales and established Silurian system; later carried on researches in Scot. Highlands.

Sir Archibald Geikie, *Life of M.* (1875).

MURCIA.—(1) (37° 55′ N., 1° 30′ W.) S.E. coast province, and former kingdom, Spain; area, 4453 sq. miles; produces esparto grass, cereals, fruit; lead, zinc, coal, sulphur, copper. Pop. (1910) 600,744. (2) (37° 59′ N., 1° 10′ W.) capital of above; seat of bishopric; has cathedral; manufactures silk, gunpowder, saltpetre, glass; produces olive-oil. M. passed into Moorish possession VIII. cent; taken by Alphonso X. of Castile, 1263; assaulted by French, 1810, 1812. Pop. (1910) 124,985.

MURDER is the killing of a human being by another human being either by violence or by an omission, and with *malice aforethought*. The absence of malice reduces the crime to *manslaughter*, and if the killing is done in self-defence then it is *homicide* and may be *justifiable homicide*. Every person who kills another is presumed to have committed wilful murder, unless the circumstances are such as to raise another presumption. Capital punishment is now observed only for those convicted of wilful murder, though the capital sentence is still read out against those convicted of high treason.

The attempt to commit murder is a felony, and on conviction the offender is liable to penal servitude for life. Administering poison, or any other destructive matter; wounding, or causing serious bodily harm; shooting at any person; attempting to drown, strangle, or suffocate any person; destroying or damaging any building by means of explosive substances—are all regarded as attempts to commit murder and may bring upon the offender a life-sentence.

MUREX, a Mollusc, see under GASTEROPODA.

MURFREESBORO (35° 51′ N., 86° 25′ W.), city, Tennessee, U.S.A.; several mills; scene of Federalist victory over Confederates, 1862–63. Pop. (1910) 4679.

MURGHAB (36° 30′ N., 62° 28′ E.), river, rises in Afghanistan, and after a N.W. course of over 400 miles is lost in the desert of Merv.

MURI (10° 17′ N., 11° 40′ W.), province, N. Nigeria; area, *c.* 25,850 miles; produces timber, cotton; silver occurs in galena reefs. Pop. *c.* 828,000.

MURIATIC ACID, HYDROCHLORIC ACID (*q.v.*).

MURIDÆ, see MOUSE FAMILY.

MURILLO, BARTHOLOMÉ ESTEBAN (1617–82), Span. painter; studied first with Juan del Castillo; went in 1641 to Madrid, and there received encouragement and practical help from Velazquez. Returning in 1645 to his native Seville, he soon became famous and had numerous important commissions. He founded the Academy of Seville in 1660. His pictures fall into two distinct classes—scenes from low life, and Biblical and religious subjects. Experts distinguish three styles in his work—the 'cold,' the 'warm,' and the 'vaporous.' One of his favourite subjects was the Immaculate Conception of the Virgin, and the famous *Conception*, now in the Louvre, was sold in 1852 for £24,000.

Bonsusan, *Murillo* (Masterpieces in Colour).

MUROM (55° 38′ N., 42° 6′ E.), town, on Oka, Vladimir, Russia; flour-mills, distilleries. Pop. 13,700.

MURPHYSBORO (37° 37′ N., 89° 20′ W.), city, on Big Muddy, Illinois, U.S.A.; flour-mills, foundries. Pop. (1910) 7485.

MURRAIN, general term for various infective diseases of cattle; hence used as a curse. See ANTHRAX, FOOT-AND-MOUTH DISEASE, PLEURO-PNEUMONIA, RINDERPEST, also VETERINARY SCIENCE.

MURRAY (34° 10′ S., 140° E.), largest river, Australia; rises in the Australian Alps; flows into Encounter Bay by Lake Alexandrina; length, 1300 miles.

MURRAY COD, see under BASSES.

MURRAY, JOHN, the name of four generations of London publishers, who, from the founder (1745–93) onwards, have been associated with some of the greatest names in contemporaneous Eng. lit.

MURRAY, LORD GEORGE (1694–1760), Scot. Jacobite; fought for Pretender, 1715 and 1719; pardoned 1725; joined Charles Edward, 1745, and showed skilful leadership at *Prestonpans* and siege of Carlisle; resigned because badly treated, but consented to conduct forces southwards, though he considered policy unwise; insisted on retreat at Derby and conducted it skilfully; advice rejected as to position at *Culloden*, 1746; unjustly suspected of treachery and dismissed.

MURRAY, or MORAY, JAMES STEWART, EARL OF (c. 1531–70), Regent of Scotland; illegitimate s. of James V.; joined Lords of Congregation, 1559; cr. earl, 1562; opposed Darnley marriage; became regent on Mary's abdication, 1567; defeated her army at *Langside*, 1568, and produced *Casket Letters*; murdered; political rather than ardent Protestant.

MURRAY, WILLIAM, see MANSFIELD.

MURREE (33° 50′ N., 73° 20′ E.), town, sanatorium, Rawal Pindi, Punjab, India.

MURRY EEL, see under EELS.

MURSHIDABAD, MOORSHEEDABAD (24° 11′ N., 88° 19′ E.), chief town, district of M., Bengal, India; ivory-carving and silk-weaving industries; capital of Bengal in XVIII. cent. Pop. (with Azimganj) 30,000; (dist.) 1,345,000.

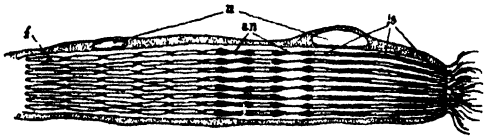
MURTEN, see MORAT.

MURVIEDRO, see SAGUNTUM.

MURZUK (25° 49′ N., 14° 12′ E.), capital, Fezzan (*q.v.*); hottest town in the world.

MUS, see MOUSE FAMILY.

MUSCAT, MASKAT, MUSKAT (23° 29′ N., 58° 33′ E.), town, Oman, Arabia; important seaport; centre of trade between India, Persia, Arabia, and African coast; surrounded by wall. Pop. 20,000.



MUSCATINE (41° 24′ N., 91° 5′ W.), city, Iowa, U.S.A., on Mississippi; lumber manufactures. Pop. (1910) 16,178.

MUSCHELKALK, the middle member of Triassic system in Germany; no examples in Britain; consists of grey limestones 500–1000 ft. thick.

MUSCI, see BRYOPHYTA.

MUSCIDÆ, see HOUSE FLY.

MUSCLE, tissue composed of elongated cells, or m. fibres, and consisting of three kinds: striated or voluntary m., non-striated or involuntary m., and heart m. The fibres in *striated* or *voluntary m.* are arranged in bundles enclosed in delicate membranous sheaths, and each fibre has alternately layers of dark and light material, giving it a transversely striated appearance. M. of this type constitutes the fleshy part of the body, its principal functions being movement and the exertion of force, both of which are under the control of the mind. The fibres of *non-striated* or *involuntary m.* have fine longitudinal but no transverse markings, and they are extremely long and narrow; non-striated m. constitutes a great part of the walls of the alimentary canal, blood-vessels, uterus, bladder, and is also found in the skin; m. of this type is not under the control of the mind. *Heart m.* also is independent of the control

PART OF A CROSS-STRIPED MUSCLE FIBRE. *an*, anisotropic substance; *is*, isotropic substance in a single fibril; *f*, a fibril; *n*, nuclei.

of the mind, and is composed of somewhat rectangular cells, branching at the ends, with transverse markings hardly so distinct as those of voluntary m. fibres. A voluntary m. is usually made up of a central fleshy part with a tendinous part, of fibrous tissue, at each extremity, by which it is attached at each end to a bone, or, less commonly, to cartilage, fascia, or skin. Each m. is supplied by one or more nerves through which it is controlled by the brain, and by blood-vessels and lymphatics, while it is enveloped by a fine membrane, offshoots from which separate the smaller muscular bundles composing the body of the muscle. The number of m's in each side of the body is about 400, so that it is impossible to describe them here; they are named in various ways: from their position, e.g. *temporal*; from their direction, e.g. *external oblique*; from their attachments, e.g. *sterno-cleido-mastoid*; from their shape, e.g. *deltoid* (*i.e.* from the Gk. letter *delta*, Δ); or from their uses, e.g. *extensor longus digitorum*.

The most characteristic property of m. is its power of shortening when stimulated, or its contractibility. When a m. is stimulated there is a change in the elasticity in the component m. cells, and the points of attachment of each cell to its neighbouring tissue elements yield to the strain put upon them, the diameter of the cell between these points diminishing while the other diameter is increased, the volume of the cell thus remaining the same. There is also a chemical change in the m., marked chiefly by the production of sarcolactic acid, while carbon dioxide is also produced. The exhaustion which follows prolonged activity on the part of a m. is due to the accumulation of these waste products, which are eventually removed by the lymph. The stimulus which causes muscular contraction may be mechanical, chemical, or electrical, but normally contraction is due to the influence of the nerves which are distributed to the m's and which are controlled by the brain.

Movements of the voluntary m's may be made involuntarily when certain impressions are made either internally or externally on the surface of the body, as, for instance, when the foot is moved involuntarily in response to the stimulus of tickling the sole. The stimulus given by the impression travels up the afferent nerve fibres to their nerve cells in the anterior horn of grey matter in the spinal cord, and they in return transmit an impulse along the efferent nerve fibres to the m's, which then contract. This process is termed *reflex action*. In voluntary action the stimulus comes from the nerve cells of the brain which control the action of the m's, and is sent down their nerve fibres to the nerve cells in the spinal cord, whence the impulse is transmitted to the m's. The spinal *nerves* are attached to the spinal cord by two roots, of which the anterior contains the nerve fibres which convey impulses to the m's, termed the motor nerve fibres, while the posterior contains the nerve fibres which carry the stimuli of impressions upon the sense-organs, termed the sensory nerve fibres. The nerve cells controlling the m's are situated in a particular area of the grey matter in the external layer, or cortex, of the brain, termed the *motor area*. This motor area occupies practically the præcentral convolution of the brain, which lies immediately in front of the fissure of Rolando. Its position can be gauged by mapping out the fissure of Rolando on the head, a point being taken half an inch behind the mid-point between the root of the nose (nasion) and the occipital protuberance at the back of the skull (inion), and drawing from it a line at an angle of 67½° (¾ of a right angle) to the mid-line of the skull towards the front of the ear. The leg area is at the upper end of the præcentral convolution, then comes the trunk area, the arm area lower, but still above the middle, then the neck area, the face area lower still, and the tongue area lowest. Disease of any part of the motor area causes paralysis of the corresponding m's.

See BRAIN, NERVOUS SYSTEM, SPINAL CORD.

MUSCOVITE, a rock-forming mineral belonging to same group as mica; widely distributed; occurring in igneous rocks, but never in volcanic rocks. See also MICA.

MUSCULAR ATROPHY, PROGRESSIVE, see PARALYSIS.

MUSES (classical myth.), nymphs, children of Zeus and Mnemosyne or of Ouranos and Gaia; nine in number; patronesses of art. Their names and attri-

butes are as follows: Calliope (epic poetry), Erato (erotic poetry), Euterpe (lyric poetry), Melpomene (tragedy), Thalia (comedy), Polyhymnia (sacred music), Terpsichore (dance and choral ode), Clio (history), and Urania (astronomy). The Romans confused them with the *Camenæ*. Their haunts in Greece were Pieria, Thespiæ, and Mt. Helicon.

MUSEUMS (Gk. *Mouseion*, Temple of the Muses), buildings consecrated to the preservation and exhibition of valuable and interesting objects of art (in its widest sense) and science. M's may be very comprehensive in their contents, embracing practically every branch of study, or they may be highly specialised, such as the Shakespeare M. at Stratford or the M. of Paris Opera-House. The finest example of a purely *civic* m. is the Musée Carnavalet of Paris. *National* and *Provincial* m's each serve different ends. In itself a *National* m. has two very distinct objects in view. Its galleries and public exhibits are for the general education of the people; but in its storerooms are to be found valuable collections of, say, animals or plants, brought together from all parts of the world, awaiting the scrutiny and determination of the scientist. Such a m., too, provides a safe place of refuge for unique specimens, the disappearance of which would hamper scientific progress. Typical national m's are the British M. in London, the National M. in Washington, or the great Natural History M's of Berlin and Vienna. On the other hand, the function of the *Provincial* m. is rather to supply local wants, to illustrate in a general way the various types of, let us say, animals, but more particularly to exhibit the fauna, flora, historical and other objects of the particular area in which it is stationed. See also ART: *Art Galleries*.

Flower, *Essays on Museums* (1898); Murray, *Museums* (3 vols., 1904).

MUSH (38° 47′ N., 40° 29′ E.), town, Armenia, Asiatic Turkey. Pop. 30,000.

MUSHROOM (*Agaricus* or *Psalliota campestris*), a basidiomycetous fungus, commonly found on fields which have been grazed over, and thus contain organic food material. The edible portion represents the fructification only of the plant, the vegetative parts consisting of a tangled web of whitish strands, or hyphæ, termed the mycelium. The spores are chocolate brown and are borne on gills, which radiate from the central stalk. They are protected by an umbrella-shapod upper portion. When immature, the gills are covered in by a veil-like flap—the plant being termed a 'button.' The veil is ruptured at maturity by the expansion of the upper parts. The m. is usually cultivated from spawn,—that is, soil containing mycelium,—plentiful manure and a warm situation being essential.

MUSIC, as we understand it, has a comparatively short history. M. of a kind must have existed from the earliest ages, and we know that it was practised in the days of the Egyptian, Grecian, and Rom. empires. The musical scales of the Greeks have formed a theme for learned discussion among the experts, and it is generally agreed that no melody or harmony in the least resembling modern types could have been produced from these scales. References to m. by ancient writers are numerous, but it is impossible, in the absence of specimens, to form any exact idea of what this m. was like. 'There can be no history of m. as an art where no musical works of art exist,' is the obvious remark of a historian. The first works of art date from long after the beginning of the Christian era. It could not be otherwise. As yet, melody was only a sort of extemporaneous product which could not be set down for want of a musical notation or system of writing; and harmony (*q.v.*), the ordered combination of sounds, had not been invented.

It was not until about the year A.D. 330, when Pope Sylvester instituted a singing school at Rome, that m. began to assume something of a definite shape. Later in the same cent., St. Ambrose, abp. of Milan, did much for its reform in the Church; and further advance was made by Gregory the Great (590–604), whose system of musical scales is known as *Gregorian modes*. *Gregorians*, so called, are still in ecclesiastical use where purity of tradition is sought to be preserved. About this time a primitive kind of harmony began to be employed, although even as late as the end of the IX. cent. the single part which Hucbald added to his melodies consisted chiefly of bare fourths and fifths.

Guido of Arezzo (990–1050) and Franco of Cologne (*c.* 1200) between them laid the foundations of musical notation. Guido (*q.v.*) may fairly be called the inventor of Sol-fa, being the first to employ the syllables *ut* (now *doh*), *re*, *mi*, *fa*, *sol*, *la*: the syllable *si*, for the seventh of the scale, was not introduced till the XVII. cent. Franco's part in the advance lay mainly in the devising of differently shaped notes to express different time lengths. He also invented 'rests,' and was the first to divide time into 'dual' and 'triple.'

Still, there had been, so far, no composers, strictly so called. It was not until the rise of the Netherlands school in the XIV. cent. that m. as an art had its real beginning. Josquin des Prés (1440–1521) is described by some historians as 'the first composer of modern m.' He was certainly a pioneer, and greatly influenced the trend and history of the art. One or two of his pupils became leading figures in musical history, notably Adrian Willaert (1490–1563), who is credited with the invention of the madrigal. A distinguished contemporary of Willaert was Orlando Lasso (1520–94), b. at Mons, in Belgium. He was named the 'Prince of M.,' and was celebrated all over Europe, employed and honoured by kings and nobles. But the real glory of that early period was Palestrina (1514–94), who was born to effect a complete revolution in the style of Church m. Palestrina (*q.v.*) is the first composer who is treated seriously by musical historians, though he is rather a herald of the really great composers than one of the greatest in his own person. Though perhaps not actively and directly, Palestrina continues to influence and correct the art of all serious-minded Church composers.

Following him there were no masters of the first rank until the advent of Händel (*q.v.*) and Bach (*q.v.*), both born in 1685, though it was within this period that the great forms of opera and oratorio came into being. The first opera ever written was, in fact, produced on the day of Palestrina's death. About this time England had a number of more or less talented composers, including John Bull, reputed by some the composer of 'God save the King'; John Dowland, subject of a Shakespearean sonnet; and Henry Lawes, celebrated by Milton. The one really great name in Eng. m. was, however, that of Henry Purcell (*q.v.*), who died ten years after Händel and Bach were born. With these outstanding names, musical history and composition started on a course which has gradually led on, by devious and varied evolutionary processes, to the modern school of Wagner (*q.v.*) and his successors. Haydn, Mozart, Beethoven, Schubert, Schumann, Mendelssohn, Chopin, Brahms, Tschaikowsky (see separate articles)—these are among the immortal names in the history of the art. With the XX. cent. came developments in the impressionist manner, of. the compositions of Richard Strauss, Debussy, Max Reger, Maurice Ravel.

The Oxford History of Music (1901–5); Walker, *History of Music in England* (1907); Grove, *Dictionary of Music and Musicians* (new ed., 1909).

MUSIC HALLS, houses of amusement where the programme consists of separate 'variety turns'; a development of 'salon theatres,' in which the audience smoked and drank while listening to the performance. Legitimate drama was restricted to theatres such as Covent Garden and Drury Lane, which possessed 'patent' rights, and as late as 1834 the whole staff of a saloon theatre in Shoreditch was locked up for the night because it attempted to play *Othello*. The *Theatres Act*, 1843, distinguished between theatres proper and saloon theatres, placing latter under local authority. Gounod's *Faust* was first

sung (not produced in costume and with scenery) at the Canterbury; prosecutions under *Stage-Play Act* were common till after 1866, when they lapsed. To meet with increasing demand for 'sketches' on music-hall stage, the Lord Chamberlain in January 1912 licensed stage-plays for music halls.

Titterton, *From Theatre to Music Hall* (1912).

MUSICAL BOX.—A small instrument which renders tunes automatically when wound up; the sounds are produced by vibrating steel teeth, cut in a comb or flat steel plate.

MUSICAL GLASSES, see HARMONICA.

MUSICAL NOTATION is the expression of sounds by writing. It has long been fixed by the use of the five-line staves, with their treble and bass-clef signs, sharps and flats, and varying time-length, note forms—semibreves, minims, crotchets, quavers, etc. This modern notation is the result of a combination of a letter-notation of the early Middle Ages.

C. F. Abdy Williams, *The Story of Notation*, 1903.

MUSICAL PITCH, see PITCH.

MUSK SHREW, see SHREW FAMILY.

MUSK DEER, see DEER FAMILY.

MUSK OX, see SHEEP GROUP.

MUSK RAT, see under MOUSE FAMILY.

MUSKEGON (43° 12′ N., 86° 17′ W.), city, on Muskegon Lake, Michigan, U.S.A.; lumber trade and manufactures. Pop. (1910) 24,062.

MUSKET, the 'smoothbore' firearm used by infantry before the introduction of the 'rifle.' In the Brit. army it was dubbed 'Brown Bess,' and discharged a bullet weighing 1 oz. The earliest type of musket (XV. cent.) took 15 minutes to charge and fire. See also GUN.

MUSKHOGEANS, see INDIANS, RED.

MUSKOGEE (35° 45′ N., 95° 25′ W.), city, Oklahoma, U.S.A.; cotton gins and compresses. Pop. (1910) 25,278.

MUSLIM, see MUHAMMADAN RELIGION.

MUSOPHAGIDÆ, see TURACOS.

MUSPRATT, JAMES (1793–1886), Irish chemist; applied scientific principles to chemical manufacture (at Dublin, Liverpool, St. Helens), especially alkalis and sulphuric acid. His s., **James Sheridan M.** (1821–71), was a pupil of Graham and Liebig; prepared toluidine and nitroaniline with Hofmann; founder and director of Liverpool College of Chemistry.

MUSQUASH, see under MOUSE FAMILY.

MUSSEL, see under LAMELLIBRANCHIATA.

MUSSELBURGH (55° 57′ N., 3° 3′ W.), town, Midlothian, Scotland; at mouth of Esk; Loretto School is built on site of famous shrine; race-meetings held annually. Pop. (1911) 15,938.

MUSSET, LOUIS CHARLES ALFRED DE (1810–57), Fr. poet; youngest and most poetical personality of first Romantic movement; acclaimed by Sainte-Beuve as a genius in 1828, but a few years passed before he obtained general recognition; wrote melodious poems, small, exquisite dramatic pieces, some of them amusing comedies, and polished harmonious prose; brought to perfection the *Proverbe*, a short play with few characters illustrating some maxim, as, for instance, his own famous *Il faut qu'une porte soit ouverte ou fermée*, and *On ne badine pas avec l'amour*; light, witty, graceful, piquant, both in verse and prose; excesses hastened his death; *Confessions d'un enfant du siècle* is subtle autobiographical analysis of *mal du siècle*; character and style also to be studied in *Espoir en Dieu, Stances à la Malibran, Le Treize Juillet, La Lettre à Lamartine*, and several poems called *La Nuit*, etc.

Oliphant, *Life* (1890).

MUSSOORIE, MASURI (30° 27′ N., 78° 6′ E.), town, sanatorium, Dehra Dun district, United Provinces, India, on lower Himalayas. Pop. 5600.

MUSTANG, wild horse of Amer. prairies. See HORSE FAMILY.

MUSTARD, a term which includes two species of Brassica—*B. alba*, the seedlings of which are used in salads, and *B. nigra*, the black m., the seeds of which, when ground, yield the well-known condiment. The seeds of this species also yield m. oil on distillation with water—a glucoside, allyl isothiocyanate, of pungent and irritant character.

MUSTELA, MARTEN, see WEASEL FAMILY.

MUSTELIDÆ, see WEASEL FAMILY.

MUTATIONS, see under EVOLUTION.

MUTILATION, the practice, widespread among savage and to some extent among civilised races, of inflicting injury (or ornamentation) on the human body for religious or other purposes. It has taken many different forms: thus the Chinese bind their girls' feet, some Amer. Indians flatten their children's skulls, savages knock teeth out, and tattooing is very largely practised even among civilised peoples. Many m's are inflicted in initiatory rites at puberty; others simply from fashion or custom.

MUTINY ACT, see under MILITARY LAW.

MUTSUHITO, known henceforth as MEIJI TENNO (1852–1912), Emperor (Mikado) of Japan; succ., 1867, and proceeded to abolish feudalism and establish strong central government; tremendous changes in Japan under his rule, heralded by transference of capital from Kioto to Yedo, henceforth called Tōkyō ('the eastern capital'); modern civilisation introduced; wonderful success of army and navy. See JAPAN.

MUTTRA, MUTHARA.—(1) (27° 30′ N., 77° 50′ E.) district, United Provinces, Brit. India; area, 1443 sq. miles. Pop. 770,000. (2) (27° 28′ N., 77° 41′ E.) capital of above; Hindu religious centre, has many mosques and temples. Pop. 62,000.

MUZAFFAR-ED-DIN (1853–1907), shah of Persia; succ., 1896; established great friendship with Russia and raised large loans there; revolution, 1906, on account of misgovernment; monarchy made constitutional.

MUZAFFARGARH (30° 5′ N., 71° 14′ E.), district, Punjab, India; chief town, M., on Chenab. Pop. of district, 410,000.

MUZAFFARNAGAR (29° 28′ N., 77° 44′ E.), district, Meerut, United Provinces, India; capital, M. Pop. of district, 890,000; of town, 25,000.

MUZAFFARPUR (26° 7′ N., 85° 27′ E.), district, Tirhut Division, Bihar and Orissa, India; chief town, M. Pop. of district, 2,755,000; of town, 48,000.

MWERU (9° S., 29° E.), lake, Central Africa, between N. Rhodesia and Belg. Congo; traversed by Luapula.

MYAUNGMYA (16° 40′ N., 94° 50′ E.), town, M. district, on Irawadi, Lower Burma. Pop. 5500.

MYCENÆ, ancient city of Greece, situated on a hill in Argolis; of great importance till its destruction by inhabitants of Argos in 468 B.C. Among remarkable ruins still to be seen are Lion Gate and Treasury of Atreus; important discoveries made by Schliemann. For prehistoric *Mycenæan civilisation*, see GREECE (*History*).

MYCENÆAN CIVILISATION, see GREECE (ANCIENT HISTORY).

MYCETOPHILIDÆ, see FUNGUS GNATS.

MYCETOZOA, MYXOMYCETES, an order of the simplest class (Sarcodina) of Protozoa. For long regarded as plants and placed among the Fungi, these simple Protozoa are distinguished by their plant-like mode of reproduction—by the formation of spores, and by the occurrence in their life-history of temporary or permanent colonies, known as plasmodia, which represent a vegetative stage in development. An individual mycetozoon is an exceedingly small amœboid body, but numbers unite to form a large aggregate which spreads over damp surfaces of wood, leaves, etc., to the extent sometimes of several square inches. This plasmodium may move slowly with a steady creeping motion, but it is less evident than the spore clusters to which it gives rise—small balls of bright colour, yellow, red, brown, or grey, often set on short stalks, upon damp bark, stems of corn, or indeed almost any decaying vegetable matter. Sometimes instead of

the globular 'fruits,' pincushion-shaped aggregates are formed, but in all cases those fruits or sporangia contain reproductive spores intermingled with a network of fine supporting threads—the capillitium. The spores resist drought for a considerable time, but when placed in water germinate and pass through a flagellate stage before degenerating into the plasmodium-forming amœbula.

A few Mycetozoa occur in fresh water or in the sea, and these, like the flagellate stages, feed upon bacteria. The majority, however, are found on dead wood or amongst rotting vegetable matter, and make use of the substances found in decaying vegetation as food.

The group is of some special interest to man, for one form (*Plasmodiophora*) attacks cells in the roots of turnips, cabbages, etc., causing the disease, characterised by split and knotty roots, which is known as 'Fingers and Toes.' Another and large form (*Fuligo*) is the tan-pit pest known as 'flowers of tan'; and *Acrasis* is found in beer yeast.

MYCONIUS, FRIEDRICH (1490–1546), Franciscan priest; became Prot., 1524; warm supporter of Reformation, of which he wrote the history.

MYCONIUS, OSWALD (1488–1552), Swiss Prot. theologian.

MYDDLETON, SIR HUGH, MIDDLETON (c. 1560–1631), Eng. contractor; executed the scheme for supplying London with water from Ware, Hertfordshire, by a canal opening into New River Head, Islington.

MYELAT (20° 30′ N., 96° 30′ E.), division, Southern Shan States, Burma, India.

MYELIN, see NERVOUS SYSTEM.

MYELITIS, inflammation of the substance—either the grey matter or white and grey matter—of the spinal cord, which may be *acute*, in which the nerve substance is softened, but repair may take place; or *chronic*, in which the change is slower and more in the nature of a degeneration, the nerve substance being replaced by connective tissue. The condition may follow exposure, may be caused by the organisms or toxins of various infectious diseases, or may arise after injury or disease of the spine and its membranes, and it may affect any part of the spinal cord. The symptoms will naturally vary with the different positions; but most commonly the lower part of the cord is affected, the condition being manifested by loss of muscular power, the gradual oncoming of paralysis in the lower limbs, and bladder and bowel derangements. Bed-sores, owing to interference with the nervous supply of the skin, are apt to form and are often very troublesome. Recovery sometimes takes place, quickly or slowly; many cases become chronic, the strength after a time fails, and death ensues from exhaustion or from some complication. Careful nursing, avoidance of fatigue, tonics, massage, electricity, if the muscles are wasted, hot douches to the back, are the modes of treatment.

MYERS, FREDERICK WILLIAM HENRY (1843–1901), Eng. scholar and thinker; known for his work in psychical research; wrote *Human Personality and its Survival of Bodily Death*.

MYGALE, see SPIDERS.

MYINGYAN (21° 30′ N., 95° 25′ E.), town, on Irrawadi, capital of Myingyan district, Upper Burma; area, 3140 sq. miles. Pop. 18,000; (dist.) 365,000.

MYITKYINA (25° 25′ N., 97° 25′ E.), district and town, Mandalay division, Upper Burma; area, 10,650 sq. miles. Pop. 75,000.

MYLIOBATIS, see under RAYS.

MYLODON, see under EDENTATES.

MYLONITE, a rock found in metamorphoric regions; fine grained and generally quartzose; consists of powdered rocks crushed by earth movements.

MYMENSINGH, MAIMANSINGH (24° 45′ N., 90° 30′ E.), district, Dacca division, Bengal, India. Pop. 4,000,000.

MYOMORPHA, a sub-order of RODENTS (*q.v.*).

MYOPIA, see EYE.

MYOSOTIS, see BORAGINACEÆ.

MYRA (36° 12′ N., 30° 1′ E.), ancient Lycian town, Asia Minor; declined after capture by Harun er Raschid, 808; has interesting remains, including rock tombs.

MYRIAPODA (Gk. *myria*, ten thousand; *pous, podos*, a foot), the class of Jointed Animals (*Arthropoda*) which includes the *Centipedes* and *Millipedes* and three less familiar orders. Its members are land animals, found almost all over the world, but owing to their shy habits and love of darkness they are comparatively little known. They possess many pairs of legs, a distinct head, and long bodies divided into many similar segments. The head bears one pair of jointed antennæ, eyes formed of groups of simple eye-spots, and two or three pairs of jaws. Myriapods occur as fossils as far back as in the Old Red Sandstone of Scotland, belonging to the Devonian age.

Centipedes (Lat. *centum*, a hundred; *pes, pedis*, a foot), order CHILOPODA; familiar worm-like creatures which lurk beneath stones and, when disturbed, glide along the ground with rapid motion by means of many pairs of feet. The body is flattened, and is divided into from fifteen to over a hundred segments, each of which evidently bears only one pair of legs. The antennæ are long and have many joints, and the animal, being carnivorous and poisonous, has the first pair of legs modified as poison claws. The habits vary considerably in different groups. The long-legged Centipedes (*Scutigera*) of tropical and subtropical regions are small (only a few inches in length) and feed on insects which they capture by chase, even in bright sunshine. The common Eng. Centipedes (*Lithobius*) and their allies live under stones and loose wood, and are found in temperate and tropical lands. By means of their poison claws they kill insects and worms as food. Most to be dreaded, however, are the *Scolopendra* and its kind, some forms of which, from the East Indies and S. America, reach a length of 1 foot. This group inhabits warmer climates, sheltering under stones and logs, in bedding and clothes, and although its members feed chiefly on insects and worms, their bite is fatal to many small animals and is very painful and even dangerous to man. Lastly, *Geophilus* and its allies, found all the world over, burrow under ground, where they capture and feed chiefly upon worms. Some emit a phosphorescent fluid at certain seasons. The carnivorous habits of Centipedes render them of value to agriculturists, for they rid cultivated land of many injurious insects.

Millipedes (Lat. *mille*, a thousand; *pes, pedis*, a foot), order DIPLOPODA (Gk. *diploos*, double; *pous, podos*, a foot), are distinguished from Centipedes in certain respects. The body is cylindrical and is divided into many segments, each of which, behind the third, apparently bears two pairs of legs inserted close together. The antennæ are comparatively short, and are divided into only seven or eight joints. The creatures are vegetarian and have no poison claws, but many defend themselves by the emission of a poisonous and unpleasant-smelling fluid, which contains prussic acid.

There are eight families, the representatives of some of which are well known. The Bristly Millipede (*Polyxenus*) and its relatives are minute and are defended by many stiff projecting bristles. The Pill-Millipedes (*Glomeris, Sphærotherium*, etc.) can, at will, roll their short, broad bodies into a ball, the upper convex surface, protected by horny plates, remaining outermost. The smaller forms (*Glomeridæ*) are common in Europe and range into India and the W. Indies; while the large forms (*Sphærotheridæ*) occur in the tropical regions of the Old World and Australasia. The Slug-like Millipedes and the more familiar Worm-like Millipedes, to which the common *Julus* belongs, roll themselves into a watch-spring spiral when danger threatens. The former are tropical, but the worm-like forms are cosmopolitan.

Millipedes are to be found under stones, logs of wood, or under damp bark. They feed chiefly on vegetable

matter and decaying wood and plants, the larvæ of some species, known as 'Wire-Worms' (*q.v.*), doing much damage to crops by devouring the growing roots. Unlike Centipedes, Millipedes are perfectly harmless creatures, and, apart from the destructive 'Wire-Worms' or 'Galley-Worms,' act as allies of the farmer and gardener.

MYRISTICACEÆ, see NUTMEG.

MYRMECOPHAGA, see ANT-EATER.

MYRON (V. cent. B.C.), Gk. sculptor; fellow-pupil with Phidias; worked chiefly in bronze, and chose for subjects athletes, animals, and figures in motion.

MYRRH, gum-resin from *Balsamodendron myrrha*, tree of order Amyridaceæ; occurs chiefly in Arabia; used as tonic in medicine, and by ancient Egyptians for embalming.

MYRTLE (*Myrtus communis*), a shrub commonly cultivated in Europe for its fragrant, evergreen foliage; a native of Western Asia.

MYSIA, ancient district, N.W. Asia Minor; belonged in turn to Lydia, Persia, Syria, Pergamum, Rome; traversed by Temnus and Olympus mountains.

MYSIDACEA, see under MALACOSTRACA.

MYSLOWITZ (50° 15′ N., 19° 8′ E.), town, Silesia, on Przemsa, Prussia; collieries; flax-mills. Pop. (1910) 17,838.

MYSORE (13° N., 76° 40′ E.), native state in Southern India, almost entirely enclosed by Madras Presidency; area, 29,444 sq. miles; capital, Mysore. Region consists of tableland broken by hill ranges and valleys; chief rivers, Kistna and Cauvery. State is healthy and prosperous and possesses extensive irrigation system; administration taken over by Brit. Government in 1831, but native dynasty restored, 1881; inhabitants, Hindus; productions include coffee, cotton, rice, silk, sandal-wood, and ivory; gold is mined at Kolar. Pop. (1911) 5,806,193.

MYSORE (12° 18′ N., 76° 40′ E.), capital, Mysore, India; contains the maharajah's palace and the residency; carpet-weaving. Pop. (1911) 71,306.

MYSTACOCETI, a sub-order of WHALES (*q.v.*).

MYSTERIES, and MIRACLE PLAYS, see DRAMA.

MYSTERIES, ELEUSINIAN, a secret worship of highest antiquity, celebrated annually at Eleusis, a small town 14 miles N.W. of Athens. They were connected with the legends of Demeter and Persephone (always styled *Kore* at this festival), Pluto and Dionysus, while less important characters played accessory parts; the abduction of Kore by Pluto and the sorrow of the mother were specially emphasised.

The celebrations at Eleusis were held independently till the V. cent. B.C., when Athens undertook their conduct, and, on the site, Periclean buildings and inscriptions have been unearthed.

Pagan writers are naturally silent regarding the mysteries, and early Christian authorities are of much greater value, although their testimony is frequently coloured by bigotry and intolerance. From this insufficient data we gather the following facts: there were four degrees — a preliminary purification, a communion followed by the exhibition of certain sacred objects, and the crowning of the initiated. The festival took place in Sept. (the 13th of Bœdromion), when a procession of young men (Ephebi) marched to Eleusis along the Sacred Road and brought back to Athens the 'holy things,' which appear to have been ancient images or symbols. The ceremony took place in the Eleusinion. We know nothing for certain, but it is probable that some mystic pageant was celebrated and a solemn communion indulged in by the initiate. The introduction of Dionysus may have been of later origin; he is called Iacchus, 'the son of Semele, the wealth-giver.'

Although the mysteries did not inculcate any higher moral teaching than the ordinary religions of the time, it is probable that by their nature they had an influence for good upon the initiate. Other mysteries were celebrated in various parts of Greece, notably at Athens and Ægina. The later mysteries of Samothrace are not Hellenic in spirit.

Jevons, *Introduction to the Study of Religion*; Dyer, *The Gods of Greece* (1891); Lang, *Myth, Ritual, and Religion* (1887).

MYSTICISM.—A mystic is best defined as one who has intimate spiritual experience of God, so that spiritual realities are so intense that he cannot describe them to others. The two enemies of m. are, it has been said, selfishness and sensuality. Some of the great mystics have been mediæval saints, *e.g.* St. Thomas à Kempis, St. Catherine of Siena, some modern, *e.g.* St. Theresa, some among Protestants. Sometimes mystics see visions and fall into trances, and the mystical temperament is one that is likely to be also emotional.

M. often goes with intellectual ability and with great practical or administrative power, cf. St. Theresa. Mystics have often been mistrusted and despised as deluded visionaries by 'practical' people, but the evidence seems to show that m. is only religion intensified, and the mystics have been the real leaders of religion. It is possible that m. has occasionally degenerated into neurotic emotionalism, but its loftiest forms show that the mystics have been the noblest and the best people. The term m. is used too loosely as the opposite of rationalism, of the symbolic and supernatural, but its use is better restricted.

Inge, *Christian Mysticism, Studies in the English Mystics*; Baron von Hügel, *Studies in Mystical Religion*.

MYTHOLOGY is a science which investigates the myths or legends of races. The myth proper belongs to a stage in human history when the language is without abstractions, when the mind turns rarely on itself, and outside phenomena are regarded sympathetically and subjectively. In such a stage of development external nature is conceived as endowed with human passions—joys and sorrows, pleasures and pains. Thus the sun would be regarded as issuing from the womb of night, as being bathed in the eastern ocean, as ascending the ladder of heaven, as loosening his golden hair down the sky, as hurling arrows of death, as subduing great cloud-monsters, as sinking in bloody death in the distant west. The wind is a fleet-footed messenger of the gods, a subtle thief, or a moaning spirit in pain. So rains and storms, thunder and lightning, drought and dew, famine and plague, mist and shadow were endowed with all the diverse human attributes and pictured with a wealth of image to which was no limit. According to the character of the people and according to climatic conditions such attributes and such images would vary in beauty and terror, in refinement and crudity, in gladness and sorrow. The insight, therefore, to be derived from the study of a people's myths is great. But *comparative m.* is a recent branch of investigation, the study being previously restricted almost exclusively to the myths of Greece and Rome.

The resemblance in the main body of mythological material of all intelligent peoples is striking in spite of local and tribal diversity of expression and development. Moreover, the m. of most peoples is complex and consists of several strata which mark the progress of migration and conquest. The conquering peoples seldom sweep away the entire body of the aboriginal beliefs, but adopt them as a new inheritance or else transform them to correspond with existing legends. Thus Rome, which was intellectually conquered by Greece, accepted Apollo as a new deity, while other gods of the Gk. pantheon, such as Zeus and Hera, she identified with the native deities Jupiter and Juno, though in character and attributes they were in reality widely dissimilar.

Of myths the SOURCES are various. The most fertile source of myth is natural phenomena, and of natural phenomena the most conspicuous and impressive is the sun. The chief characteristics of the hero of the *solar myths* are benevolence amid severity of

fate, and a life spent in great service and toil; the sun being the great day-labourer. But the simplicity of reduction to solar myth has itself been fruitful of error, and whole legends have been classed as purely solar which recent investigation has proved to be quite erroneous. Thus Orpheus was regarded as nothing but a solar hero, though there is good reason to believe that he was a hist. person, a Thracian religious reformer. An extreme example of the solar interpretation was the theory formulated that Christ and His twelve apostles were the characters of a solar myth. History frequently does degenerate into myth. Euhemerus in the latter half of the IV. cent. B.C. carried the reduction of myths to a hist. basis to an extreme. Zeus, he thus tried to prove, was a historical personage whose tomb was still extant in Crete. But the hist. source of some myths is undoubted. Thus in Gk. legend the myth of the daughters of Danaus and the sons of Ægyptus and the legend of the rape of Europa are the fanciful interpretations of traditional migrations. Myths, too, are apt to cluster round ceremonies and ritual whose true significance has become lost. Thus taboos are usually given a mythical foundation, though their origin was originally utilitarian and not sentimental. Allegory is a fertile source of myth, especially where culture has reached some degree of advancement. But though the complex allegorical myth belongs to the literary age the simple allegory is common stock among all peoples. Thus Sleep, Dreams, and Death appear as mythological personages in the legends of all peoples, though their characters and manner of portrayal may be vastly different.

Cosmologies, or the ideas of peoples with regard to the origin and nature of the universe, and theogonies, or ideas of peoples with regard to the origin and functions of the gods, are an interesting body of legend to the comparative mythologist. A seated idea among most peoples is the birth of the world out of original chaos. Of primitive cosmologies the ancient Hebrew is the most simple and the most impressive. The Gk. cosmologies were more complex. The first steps of creation are thus related by Hesiod (*Theogony*, 120 f.): 'First, indeed, was created Chaos and then the wide-bosomed Earth, which the deathless gods dwelling on the peaks of snowy Olympus inhabit unshaken for ever, and misty Tartarus beneath the broad-wayed Earth, and Love which is the fairest among the deathless gods: which looseth the limbs and overcometh the heart's thought and wise counsel of all gods and men.' Then the phenomenon of the rain falling on the earth has suggested to almost every people that Heaven descends in showers to the bosom of the earth, and from such wedlock comes her increase.

Again, the myth of the Deluge is almost universal. According to the Gk. myth Deukalion and his wife Pyrrha escaped the flood in an ark, and on the ninth day the waters abated and the ark rested on Mount Parnassus. From the stones of the earth these two survivors created a new race of men and women. The Macusi Indians of S. America have a similar legend, but only one man survives the flood and repeoples the earth with men from stones; while according to the Tamanaks of Orinoko a man and woman surviving the flood repeople the world from the kernels of a certain palm. The flood of Xisuthrus in the Babylonian m. spares all the righteous. In the Hindu version the deluge is universal, but Manu, accompanied by the seven sages, enters the ark and lands on the Mount Naubandhana (the place of the ship's binding).

The resemblances between these stories and the account of the Noachian deluge in the Pentateuch are obvious. Thus m. is no longer regarded by the learned as a treasure-house of profitless delights for poets and children, but as a serious field for science and the indisputable handmaiden to the study of Religion, Philosophy, History, Archæology, and Philology. See also FOLKLORE.

Keightley, *Mythology*; Frazer, *Golden Bough*; Sonnenschein, *Mythology and Folklore*; *Dictionary of Mythology* (Whittaker); Baring Gould, *Curious Myths of Middle Ages*.

MYTILINE, see LESBOS.

MYTILUS, MUSSEL, see under LAMELLIBRANCHIATA.

MYXŒDEMA, constitutional affection due to fibrous degeneration and loss of function of the thyroid gland, affecting women six or seven times as often as men. The onset of the condition is gradual, and the body is increased in bulk; the skin has a swollen and translucent appearance and usually contains an increased quantity of mucin, the cheeks are flushed and the features coarsened, the hair becomes scanty. In addition, there are mental changes: the intellect is slow, speech and action sluggish, the memory defective, and more serious mental symptoms may ensue. The treatment is the administration of thyroid extract, continued for some time after the symptoms of the condition have disappeared, and this usually prevents their recurrence.

MYXOMYCETES, see MYCETOZOA.

MYZOSTOMIDA, see under CHÆTOPODA.

MZENSK, see MTZENSK.

N, the 14th letter of the Eng. alphabet; in sound a nasal dental, produced by holding the mouth in a position required for a dental and forcing the breath to the nose.

NAAS (53° 13′ N., 6° 39′ W.), market town, Kildare, Ireland; formerly capital of kings of Leinster. Pop. 3850.

NABATÆANS, ancient race inhabiting Syrian-Arabian borderland from Euphrates to Red Sea, *c.* 300 B.C.; migrated to south Judea and Edom, and ruled Damascus; vassals and allies of Rome, 85 B.C.–105 A.D., when their nationality was destroyed by Trajan.

NABHA (30° 25′ N., 76° 9′ E.), native state, Punjab, India; capital, NABHA. Pop. of state, 310,000; of town, 19,000.

NABUA (13° 25′ N., 123° 30′ E.), town, Ambos Camarines, Luzon, Philippine Islands. Pop. 20,000.

NÁCHOD (50° 25′ N., 16° 5′ E.), town, on Metau, Bohemia; scene of Austrian defeat by Prussians in 1866. Pop. (1911) 11,812.

NADAILLAC, JEAN FRANÇOIS ALBERT DU POUGET, MARQUIS DE (1818–1904), Fr. archæologist.

NADIA, NADIYA, NUDDEA (23° 30′ N., 89° E.), district, Bengal, India. Pop. 1,710,000. Capital, Krishnagar.

NAEGELI, KARL WILHELM (1817–91), Ger.-Swiss botanist; b. in Zürich; prof. of Bot. in Zürich, Freiburg, and Munich; wrote valuable works on fungi, algæ, and microscopical research.

NÆSTVED (55° 14′ N., 11° 37′ E.), town, Præstö, on coast of Zealand, Denmark. Pop. (1911) 8326.

NÆVIUS, GNÆUS (*c.* 264–194 B.C.), Lat. poet; probably a native of Campania. In his plays he attacked the powerful Metelli, for which he was imprisoned. His great poem was an epic called *The Punic War*, written in Saturnian metre.

NÆVUS, tumour composed of dilated capillaries, usually congenital, most common in the skin, often disappearing spontaneously as the child grows up, or treated by electrolysis or application of radium or of carbon dioxide snow.

NAGA HILLS (26° N., 93° 50′ E.), district, Assam, India. Pop. 110,000.

NAGAR, BEDNUR (13° 50′ N., 75° 6′ E.), village, Mysore, India; formerly prosperous city.

NAGASAKI (32° 48′ N., 129° 57′ E.), seaport, W. coast Kiusiu, Japan; important shipbuilding centre and naval station; exports coal, rice. Pop. 178,000.

NAGAUR (27° 11′ N., 73° 46′ E.), town, Jodhpur state, Rajputana, India. Pop. 14,000.

NAGINA (29° 27′ N., 78° 29′ E.), town, Bijnaur, N.W. Province, Brit. India. Pop. 23,000.

NAGODE (24° 33′ N., 80° 37′ E.), native state, Baghelkhand, Central India. Pop. 77,000. Capital, Nagode. Pop. 6500.

NAGOYA (35° 7′ N., 136° 56′ E.), city, capital of Owari, on Owari Bay, Japan; XVII.-cent. castle; porcelain. Pop. 378,231.

NAGPUR.—(1) (20° 35′ N., 80° E.) district, Central Provinces, Brit. India; area, 3843 sq. miles; produces cereals, cotton. Pop. 760,000. (2) (21° 8′ N., 79° 5′ E.) chief town, has trade in grain, salt; manufactures cloth. Pop. (1911) 101,415. Division of N. has area 23,520 sq. miles. Pop. *c.* 3,728,000.

NAGYKANIZSA (46° 28′ N., 17° E.), town, Zala, Hungary; brick-works; formerly important fortress. Pop. (1910) 26,524.

NAGYKIKINDA (45° 50′ N., 20° 30′ E.), town, Torontal, Hungary; agricultural centre; flour. Pop. (1910) 26,795.

NAGY-SZEBEN, German **HERMANNSTADT** (45° 48′ N., 24° 8′ E.), town, capital Nagy-Szeben, Transylvania, Hungary; seat of Gk. abp.; cloth and leather manufactures. Pop. (1910) 33,489.

NAGY-SZOMBAT, German **TYRNAU** (48° 22′ N., 17° 36′ E.), town, on Trnava, Pozsony, Hungary; R.C. centre; trade in grain. Pop. 13,500.

NAGY-VARAD, German **GROSSWARDEIN** (47° 3′ N., 21° 53′ E.), town, on Swift Körös, capital of Bihar, Hungary; seat of R.C. and Gk. bp's; pottery. Pop. (1910) 64,169.

NAHE (49° 55′ N., 7° 52′ E.), river, Germany; joins Rhine at Bingen; length, 70 miles.

NAHUM, Old Testament prophet: his book describes judgment on Nineveh for her wickedness; N. is a stern prophet; exact date uncertain, probably *c.* 623 or 608 B.C.

Driver, *Minor Prophets* (Century Bible).

NAHR-EL-ASI, see ORONTES.

NAIAD(E)S, see NYMPHS.

NAIL, hand-made till beginning of XIX. cent.; iron, brass, zinc, etc., used; sometimes tinplate scrap utilised; Birmingham is Brit. centre of manufacture.

NAIL, see under SKIN.

NAINI TAL (29° 22′ N., 79° 29′ E.), town, sanatorium, Kumaon, United Provinces, Brit. India. Pop. 8500.

NAIRN (57° 36′ N., 3° 52′ W.), seaport, summer resort, Nairnshire, Scotland, on Moray Firth; fisheries. Pop. (1911) 4661.

NAIRNE, CAROLINE, BARONESS (1766–1845), Scot. poet; wrote *The Land o' the Leal* and other Scot., especially Jacobite, songs.

NAIRNSHIRE (57° 30′ N., 3° 50′ W.), small county, N. of Scotland, bounded by Moray Firth, Elginshire, and Inverness-shire; near coast fertile and well-wooded, other parts principally moorland; chief town, Nairn; largest rivers, Findhorn and Nairn; only industries besides agriculture and fishing, sandstone and granite quarries. Pop. (1911) 9319.

NAIROBI (1° 20′ S., 37° E.), capital of Ukamba Province, and Government headquarters, Brit. East Africa. Pop. 14,700.

NAIVASHA (0° 40′ S., 36° 24′ E.), lake, Brit. East Africa; no outlet.

NAJIBABAD (29° 36′ N., 78° 23′ E.), town, Bijnor, United Provinces, India; metal-ware. Pop 21,000.

NAKHICHEVAN, NAKHJEVAN (39° 12′ N., 45° 25′ E.), town, Erivan, Russ. Transcaucasia; an ancient Armenian city. Pop. 9500.

NAKHICHEVAN-ON-THE-DON (47° 12′ N., 39° 42′ E.), town, Don Cossacks, Russia, on Don; tobacco, tallow. Pop. 29,500.

NAKHON SRI TAMMARAT, LAKHON, LAGONG (8° 20′ N., 100° 10′ E.), town, capital of Nakhon, S. Siam. Pop. 7500.

NAKSKOV (54° 50′ N., 11° 8′ E.), seaport, island of Laaland, Denmark; sugar factory. Pop. 8500.

NALAGARH, see HINDUR.

NAMAQUALAND, GREAT (25° S., 17° E.), region, Africa, comprising S. parts of Ger. S.W. Africa, N. of Orange River.

NAMAQUALAND, LITTLE (30° S., 18° E.), division, N.W. part of Cape Province, S. Africa. Pop. 20,000.

NAMES, designations bestowed for convenience upon persons or localities. **Personal.**—A primitive tribe generally takes as its emblem some animal or bird to distinguish it from other clans, hence the members of the tribe which has for its *totem* a beaver

are known as *Beavers* or *Beavermen* (see also TOTEMISM). Within the tribe itself some appellation is necessary to distinguish each individual member. This leads to the personal name, which may be taken from some natural object, *e.g.* 'Daughter of the Sun,' some deed of prowess, *e.g.* 'The Elephant-Slayer,' or personal attribute, *e.g.* 'The Lame One.' In course of time these epithets grew specialised from their original significance into ordinary names, *e.g.* Demosthenes and many other classical names.

An ancient Greek was distinguished from his fellows by his ordinary name, the name of his father and of his *deme*, and sometimes of his country, *e.g.* Demosthenes, the son of Demosthenes, the Pæanian, the Athenian. Roman nomenclature was more rigid, generally consisting of the *prænomen* (the predecessor of the 'Christian' name), the *nomen gentile* (which indicated the *gens*), the *cognomen* (which designated the family); sometimes a *cognomen secundum* was added in commemoration of some event or in the case of adoption, *e.g.* Publius Cornelius Scipio *Africanus*.

Modern *surnames* are frequently derived from the occupations or personal descriptions of remote ancestors, *e.g.* Smith, Brown; or are patronymics, Johnson, MacBeth, O'Neill, Fitzgerald. The *Christian name* grew out of the Jewish practice of giving a personal name to a child on circumcision.

Place Names frequently arose from the nature of the locality, *e.g.* Big Water, Black Mountain, Springsure. In Britain they are frequently Celtic or translations of the Celtic. In modern times place names have often been taken from names of persons, *e.g.* Pennsylvania, Brisbane, Port Arthur. There still remains a large number of local names, many of them monosyllabic, for which no satisfactory derivation has yet been found.

Rhys, *Lectures on Celtic Philology*; Wagner, *Names and their Meaning* (1892); Dudgeon, *Origin of Surnames* (1890).

NAMTAR, see BABYLONIA (Religion).

NAMUR.—(1) (50° 28′ N., 5° E.) hilly and fertile province, Belgium; rich in minerals. Pop. (1910) 362,846. (2) (50° 28′ N., 4° 27′ E.) capital of above; strongly fortified; has XVIII.-cent. cathedral; manufactures iron and steel, cutlery, firearms. Taken by French, 1692 and 1702. Pop. (1910) 32,362.

NANA SAHIB (c. 1820–1859 ?), stirred up feeling in India against British *raj*; perpetrated Cawnpore massacre in Mutiny; took refuge in Nepal, 1859, where he was probably killed.

NANAIMO (49° 30′ N., 124° W.), city, E. coast of Vancouver Island, Brit. Columbia; exports coal. Pop. 7300.

NANCY (48° 41′ N., 6° 11′ E.), town, on Meurthe, France; capital of Meurthe-et-Moselle; with fine churches, old gateways, ducal palace, picture-gallery, univ., etc.; capital of duchy of Lorraine from XII. cent.; Charles the Bold killed during siege, 1477; taken by France, 1766; chief manufactures, cottons, woollens, paper, iron, chemicals, musical and physical instruments; famed for embroidery. Pop. (1911) 119,949.

NANDAIR (19° 9′ N., 77° 23′ E.), town, on Godavari, Hyderabad, India. Pop. 14,500.

NANDGAON (20° 39′ N., 77° 51′ E.), state, Chhattisgarh, Central Provinces, India; capital, RAJ-NANDGAON. Pop. of state, 130,000.

NANDI, an East African negro tribe of Uganda. A Brit. expedition was dispatched in 1905 to put down their disturbances.

NANDIDRUG (13° 22′ N., 77° 43′ E.), hill fortress, Mysore, India. Pop. 3000.

NANKING (32° 3′ N., 118° 53′ E.), formerly capital of China, now of province of Kiang-su and S. China; situated on right bank of Yangtsze River; once famous for great walls and magnificent buildings destroyed by Taiping Rebels (1853–64); notably the Porcelain Tower, c. 260 feet high. Although recaptured by Imperialists, little progress has been made since; gave its name to *Nankeen* cotton stuffs and Nankeen porcelain; silk manufactures. Pop. (estimated in 1911) 267,000.

NANNING (22° 43′ N., 108° 3′ E.), city, treaty port, on Yu-kiang, Kwangsi, China. Pop. (estimated in 1911) 37,000.

NANSEN, FRIDTJOF (1861–), Norwegian scientist, statesman, and explorer; b. Fröen; ed. Christiania; organised first expedition to cross and explore Greenland (1888); Polar expedition (1893) in specially built ship (*Fram*), which reached latitude 86° 14′; in 1906 appointed minister to England by newly formed Norwegian government; professor of Oceanography at Christiania, 1908.

NANSEN, HANS (1598–1667), Dan. statesman; organised defence of Copenhagen against Swedes, 1658; inspired revolution of 1660 by which monarchy became hereditary and burgesses won equal rights with nobles.

NANTERRE (48° 55′ N., 2° 8′ E.), town, Seine, France; chemicals. Pop. 14,000.

NANTES (47° 13′ N., 1° 33′ W.), city, on Loire, France; capital of Loire-Inférieure, with unfinished cathedral (XV. cent. onwards), St. Jacques (XII cent.), St. Nicholas (1844), ducal castle (1466), Palais de Justice, Dobrée and other museums, etc.; Rom. *Portus Namnetum*; capital of Brittany in Middle Ages; Edict of Nantes signed here, 1598; scene of 'Noyades,' 1793; chief industries—machinery, leather, nets, hardware, sardines, sugar-refining, soap. Pop. (1911) 170,535.

NANTES, EDICT OF, proclamation of Henry IV. of France granting toleration to Huguenots; signed at Nantes, 1598. It removed all civil and political disabilities from Protestants, allowed Prot. services to be held under certain regulations, and provided for payment of pastors. Revoked, 1685. See HUGUENOTS.

NANTICOKE (41° 14′ N., 76° 4′ W.), town, on Susquehanna, Pennsylvania, U.S.A.; anthracite coal mines. Pop. (1910) 18,877.

NANTUCKET.—(1) (41° 14′ N., 70° 7′ W.) county, Massachusetts, U.S.A., consisting of several islands 20 miles from coast; largest, 15 miles long, contains towns of Nantucket on N. and Siasconset on S. coast; island is traversed by railway. Pop. (1910) 2962. (2) capital of county, is picturesque town with excellent harbour; once noted for whale fisheries, now known chiefly as popular summer resort.

NANTWICH (53° 4′ N., 2° 31′ W.), town, Cheshire, England; boot and shoe manufactures; brine baths; has cruciform church and old grammar school. Pop. (1911) 7816.

NAPHTHA, term applied to a group of hydrocarbons, obtained by distillation of shale oil, coal-tar, or petroleum; these differ in composition but are similar in properties; inflammable, volatile liquids used for illumination and as solvents for fats and oils. Wood n., or wood spirit, is methyl alcohol; the other n's are mixtures of benzene, toluene, naphthene, etc.

NAPHTHALENE ($C_{10}H_8$), a colourless, volatile substance, which crystallises in plates and has a peculiar tarry smell; obtained from coal-tar; M.P. 79° C., B.P. 218° C.; cause of stoppage of gas-pipes in cold weather; used as disinfectant and in manufacture of artificial indigo; yields α and β derivatives. Two mono-derivatives are the α and β **Naphthols** ($C_{10}H_7OH$), prepared from corresponding naphthylamines: $C_{10}H_7NH_2 \rightarrow C_{10}H_7N_2Cl \rightarrow C_{10}H_7OH$, or sulphonates; $C_{10}H_7SO_3Na + NaOH = C_{10}H_7OH + Na_2SO_3$ (soda fusion). α-N. is crystalline, volatile; soluble with difficulty; has S.G. 1·22, B.P. 279° C., M.P. 95° C.; and β-N., crystalline, volatile, freely soluble, antiseptic; with S.G. 1·217, B.P. 285° C., and M.P. 122° C. Used in colour industry. Two other derivatives are the **Naphthylamines** (α and β): α-naphthylamine, colourless, insoluble crystals, turning red in air; disagreeable smell; M.P. 50° C.—β-naphthylamine, colourless, soluble, odourless; M.P. 112° C. Both are used in dyeing.

NAPIER (39° 29′ S., 176° 55′ E.), seaport, N. Island,

New Zealand; exports tinned and frozen meat. Pop. 10,500.

NAPIER AND ETTRICK, FRANCIS NAPIER, BARON (1819–98), Brit. diplomatist; ambassador to Austria, Turkey, Italy, U.S.A., Holland, Russia, and Germany successively; gov. of Madras, 1866; viceroy of India, 1872.

NAPIER, JOHN (1550–1617), Scot. mathematician; b. Merchiston, Edinburgh; ed. St. Andrews; afterwards travelled on the Continent, probably studying at Paris; then settled down at Merchiston and Gartness, where he devoted himself to study. In 1614 he published *Mirifici Logarithmorum Canonis Descriptio*, which made him famous all over Europe. In this work he gave, among other things, a table of the logarithms of the sines of angles for every minute to 7 figures, but gave no account of how the logarithms were calculated. This was done in *Mirifici Logarithmorum Canonis Constructio*, pub. in 1619 by his s. Robert. In 1617 N. wrote a small treatise describing a method of performing multiplication and division by means of a number of small rods, which came to be known as *N.'s Bones*. The change to common logarithms appears to have been effected by both N. and Briggs. N. was probably the first to use the decimal point instead of the cumbersome decimal notation previously employed. He is also known for his work on spherical trigonometry, given in his work of 1614. For a right-angled spherical triangle ABC, omitting the right angle C, we have 5 circular parts, a, b, $\frac{\pi}{2}-A$, $\frac{\pi}{2}-c$, $\frac{\pi}{2}-B$. Suppose these ranged round a circle; then any one may be called the *middle part*; the two next it are called *adjacent parts*, and the other two the *opposite parts*. *Napier's Rules* then give—

Sine of middle part
= Product of tangents of adjacent parts.
= Product of cosines of opposite parts.

Napier's Analogies were also given in his *Mir. Log. Can. Descriptio*. See LOGARITHM.

Life, by Earl of Buchan (1787), Mark Napier (1834).

NAPIER OF MAGDALA AND OF CARYNTON, ROBERT CORNELIS NAPIER, 1ST BARON (1810–90), Brit. soldier; served in Sutlej campaigns, 1845–46, and at *Gujrat*, 1849; lieut.-col. of engineers at siege of Lucknow, and won victory at *Powre*, 1858; directed siege of Peking, 1860; commander-in-chief of Ind. forces, 1870–76; gov. of Gibraltar, 1876–82; field-marshal, 1882.

Maclagan, *Memoir*.

NAPIER, SIR CHARLES (1786–1860), Brit. admiral; became admiral of fleet of Portug. constitutionalists, 1829, and placed Donna Maria on throne; brilliant defeat of Ibrahim Pasha, 1840; his conduct of Baltic fleet in Crimean War was wise, but unpopular.

E. Napier, *Life* (1862).

NAPIER, SIR CHARLES JAMES (1782–1853), Brit. soldier and administrator; grandson of 6th baron N. of Merchiston; commanded in Irish rebellion and at retreat to Corunna; captured at battle of *Corunna*, 1809, but released; won fame in Peninsula, in Amer. War and storming of Cambrai; app. 1841 to command army of Bombay against Ameers of Sind; performed feat of destroying Emaun Ghur, 1843; won battle of *Meeanee* against fearful odds and decisive battle of *Hyderabad*, 1843, after which Sind was annexed and N. made gov.; remarkable personality; dashing, inspiring general.

Life, by Bruce (1885), Butler (1890).

NAPIER, SIR WILLIAM FRANCIS PATRICK (1785–1860), Brit. soldier and historian; took part in famous retreat to Corunna and march of Light Brigade to Talavera, 1809; distinguished himself throughout Peninsular War, and wrote its history, pub. 1828–40; greatest military historian of England; accurate descriptions and characterisation, clear, easy style, and great eloquence; wrote *History of the Conquest of Scinde*, 1845, *History of the Administration of Scinde*, 1851, etc. His bro., SIR GEORGE THOMAS N., was a distinguished general and colonial governor.

Lord Aberdare, *Life* (1864).

NAPLES, NAPOLI (40° 50′ N., 14° 15′ E.), city, southern Italy; largest town in kingdom; capital of province of Naples; beautifully situated on N. shore of Bay of Naples, at base of Vesuvius; claims to possess the finest site in Europe—witness proverb, 'See Naples and die.' Naples consists of old and new town, with numerous churches and palaces with paintings and sculptures, old gateways, handsome streets, and beautiful parks. Outstanding features are Cathedral of San Gennaro (1272), San Giovanni a Carbonara (1343), San Domenico Maggiore (XIII. cent.), Santa Chiara (XIV. cent), Santa Maria del Carmine, Monte Oliveto (XV. cent.), S. Severino, S. Angelo a Nilo (XV. cent.); Castel dell' Ovo, Castel Sant' Elmo (1343), Castel Nuova, Castel Capuano, Castel Carmine; royal palace, Gravino (now post office), Caracciolo, Santangelo, and other fine palaces; national museum, with good art collection; univ. (1224), national library, famous Teatro San Carlo; Porta Nolana, Porta Capuana, and other old gateways; Carthusian convent of San Martino (art museum), celebrated Campo Santo, and Catacombs of San Gennaro. The surroundings include Pompeii, Herculaneum, Sorrento, and the islands of Capri and Ischia.

Naples was founded by Gk. emigrants from Cumæ (*q.v.*) as *Parthenope*; taken by Romans, 328 B.C., and flourished under Rom. Empire; conquered by Normans, XI. cent.; long capital of the kingdom of Naples (*q.v.*) and of the Two Sicilies; leading seaport of Italy and great trading centre; chief industries—macaroni and vermicelli, wine, olive oil, chemicals, textiles, lace, leather, paper, furniture, majolica wares, musical instruments, shipbuilding, perfumery. Pop. (1911) 723,208. The province of Naples has area of 350 sq. miles. Pop. (1911) 1,364,896.

Arthur Norway, *Naples Past and Present* (1901).

NAPLES, KINGDOM OF.—After fall of Rom. Empire of West, 476, Naples ('Continental Sicily') was successively member of Ital. kingdom of Ostrogoths, Byzantine Empire, and exarchate of Ravenna; during Arab invasions she became independent republic; conquered, 1130, by Roger II., grandson of Norman, Tancred de Hauteville, already Count of Sicily; thus was formed future realm of N. or **The Two Sicilies**, Roger becoming King Roger I. by coronation of pope, 1130–54. This Norman kingdom prospered, its rulers showed characteristic Norman gifts of pliability and tact, and won loyalty of Ital. and Arab subjects.

In 1177 Constance, sister and heir of William II. (1166–89), married Henry VI., s. of Emperor Frederick I., and became mother of the Emperor Frederick II. Henry VI., first Hohenstaufen ruler, was succeeded, 1197, by this s., who made Palermo his residence and centre of most brilliant court in Europe, restored ruined city of Lucera, and with support of devoted Muhammadans turned feudal realm of Normans into strong monarchy. He destroyed nobles' castles, and promulgated new constitution and legal code. On death of his s., Conrad I., 1254, an illegitimate s. of Frederick II. seized crown from infant nephew Conradin; the pope took opportunity to bestow crown on Charles of Anjou, who slew both Manfred and Conradin, but failed to hold Sicily.

The massacre of the French at *Sicilian Vespers*, 1282, was followed by election of Peter III. of Aragon, son-in-law of Manfred, as king of Sicily; Sicily and Naples remained separate kingdoms under houses of Aragon and Anjou until 1442, when, after many wars, Alfonso V. of Castile overthrew René of Anjou and reunited the realms. On his death his s., Ferdinand I. (1458–94), succeeded to Naples, but John, bro. of Alfonso, received Aragon and Sicily. Charles VIII. of France revived claim of house of Anjou, invaded Naples, and was crowned king, 1495, but Ferdinand II. reconquered realm as soon as he retired. Ferdinand

of Aragon and Sicily then took Naples from younger branch of Span. house, and reunited realms, 1503.

Austria obtained Naples from Spain by Treaty of Utrecht, 1713, when Sicily was annexed to Savoy; Savoy gave Sicily in 1718 to Spain, who surrendered it to Austria, 1720; Austria granted Naples and Sicily in 1735 to Don Carlos on condition of his renouncing claim to Spain; Bourbons ruled till 1799, when Naples was conquered by Championnet, who set up the *Parthenopæan republic*. Bourbons were restored by revolt, 1799, but expelled and Joseph Bonaparte made king of Naples, 1806. He was succeeded by Murat, 1808. French were expelled by Ferdinand IV., 1815, who as Ferdinand I. again united Naples and Sicily; insurrections took place, 1848; conquest by Garibaldi, 1860. Naples was annexed to Piedmont, 1861. See SICILY.

NAPOLEON I. (1769–1821), Emperor of the French; b. of patrician family BONAPARTE (*q.v.*) of Ital. origin, at Ajaccio, Corsica; trained at military school, Brienne, he held aloof from schoolfellows and shone in history, geography, and math's, but not in *belles lettres*. He became lieut. in artillery regiment, 1785, and lived in great poverty, helping to maintain family on his pay. At outbreak of Revolution he showed republican but anti-democratic opinions. Sent as officer to Corsica, 1792, he unsuccessfully supported Revolution against General Paoli; as lieut.-colonel of artillery he brought about fall of Toulon, 1793, and became brigadier-general and head of artillery of southern army, 1794. As commander of troops for defence of Convention, 1795, he scattered National Guard of 30,000 men and became commander of Army of Interior, thus emerging from obscurity as hero of the hour; m. Joséphine (*q.v.*) de Beauharnais, 1796. As commander-in-chief in Italy he defeated Austrians at *Montenotte*, April 11, 1796; won battles of *Millesimo*, April 14, *Mondovi*, April 22, *Lodi*, May 10. Austrians retreated and chief cities of Lombardy submitted; he pillaged north and central Italy. Second Austrian army drove N. from Mantua, but was routed at battles of *Castiglione*, Aug. 5, and *Bassano*, Sept. 8. Third Austrian army found Napoleonic forces exhausted, and won some successes, but were decisively defeated at *Arcola*, Nov. 17. Fourth Austrian force was conquered at *Rivoli*, Jan. 14, 1797, and Mantua surrendered. Archduke Charles at head of fifth army retreated, followed by N.; alarmed by N.'s approach towards Vienna, Austria made Treaty of Campo-Formio, granting Lombardy, Netherlands, etc., to France, and receiving Venice; in these campaigns Napoleonic genius had at once appeared at its height, to terror of Europe.

Egyptian Campaign.—N. returned to Paris covered with glory, Dec. 1797, and was appointed commander-in-chief for invasion of England; Brit. Government imagined that descent would be made on Ireland, but real plan of Directory was to attack outlying possessions. N. sailed from Toulon, May 19, 1798, evaded Nelson, and although at peace with Turkey, landed in Egypt, captured Alexandria, and, after battle of the *Pyramids*, July 21, entered Cairo. Egypt was reorganised as Fr. province, but victory of Nelson in *Aboukir Bay*, Aug. 2, destroyed fleet and cut off oceanic communications. Cairo seethed with revolt and Turkey declared war, and it was necessary for N. to return to Europe through hostile territory. He led army of 10,000 men S. through desert, laid Jaffa low, March 7, 1799, but was turned back at *Acre*, where Brit. force under Sir Sidney Smith aided valiant Turk. pasha Djezzar. N. was back in Cairo, June 14, and repelled invasion by Sultan with great slaughter, July 25. At last he managed to escape by sea and arrived in France, Oct. 9. Fr. scholars made important discoveries of papyri during Napoleonic occupation of Egypt.

Consul and Emperor.—N. now came to front in politics; misrule of Directory proved fatal to republic, and Abbé Sieyès organised plan for establishing military dictatorship. *Coup d'état of 18 Brumaire* (Nov. 9) overthrew Directory and made N. First Consul for ten years, with appointment to all State offices, initiation of legislation, and supreme military command. He was established in Tuileries, Jan. 1800. His consulate was important as period of organisation of existing scheme of local government; Fr. democracy had shown no talent for self-government; local councils elected by universal suffrage had failed, and N. made prefects who had replaced old *intendants* supreme locally, thus restoring order. Religion was reinstated and finances repaired before N. returned to his great passion, war.

N. stole across the Alps, May 1800, took Austrians unawares, won battle of *Marengo*, June 12, recovered Lombardy, and acquired Piedmont. Moreau won victories in Germany, and Austria again submitted by Treaty of Lunéville, Feb. 1801; Britain also made peace. A Cisalpine republic was established, and N. became its pres., Jan. 1802; app. Consul for life, Aug. 2, he reorganised Fr. institutions.

He had restored the Church, but secured Gallican liberties by *Concordat*, 1801, with Pius VII. Trade regulations, military, criminal, and civil laws were codified by *Code Napoléon* (the *Code civil* still remains in force); technical education was promoted, and an attempt made to stamp out the philosophical school which had produced the Revolution. Republicanism lingered, and Pichegru's plot (1804) aimed at assassination of new Cæsar; conspirators were ruthlessly punished, and N. seized pretext for execution of Duc d'Enghien, his political rival. He was crowned emperor, May 18, 1804, the pope assisting, but N. himself assuming crown; and was crowned king of Italy, May 26. He had little access of power, but position became hereditary, and N. established splendid court and grand dignitaries; senate was retained, but of little importance; tribunate was reduced, and abolished, 1807; able ministers were employed.

Execution of Enghien and Ital. encroachments led to formation of Third Coalition against Napoleon by Britain, Russia, Austria, Sweden, Naples, and Sardinia.

Austrian Campaign commenced with Austrian invasion of Bavaria, Ulm being occupied by General Mack, and of Italy under Archduke Charles. N. at once set out for Danube and placed himself between Mack and Vienna. Battle of *Elchingen* preceded surrender of Ney, Oct. 20; Mack surrendered Ulm, key to Vienna, Oct. 22, and N. occupied Vienna. He crossed Danube and, with Murat at head of cavalry, defeated allied Austrians and Russians at *Austerlitz*, Dec. 2; 20,000 prisoners and 189 guns were taken by French, 15,000 were killed and wounded. Army of archduke was meanwhile annihilated by Eugène de Beauharnais, N.'s deeply loved stepson, and Masséna. On Oct. 21 Villeneuve was defeated by Nelson at *Trafalgar*, and Fr. and Span. fleets were destroyed. Peace of Pressburg was made between Austria and France, Dec. 26, by which Austria lost considerable territory and Germany was reorganised under Fr. influence. France conquered Naples, Feb. 1806; N. made his bro. Joseph king; Holland was formed into kingdom for youngest bro., Louis, in June.

Prussian and Polish Campaigns, 1806–7.—Prussia hung aloof from Coalition, and on news of *Austerlitz* made Treaty of Schönbrunn with N., receiving Hanover from him. Shortly afterwards N. offered Hanover as bribe to Britain, and Frederick William III. declared war with the object of driving French from Germany. He was defeated by N. at *Jena* and by Davout at *Auerstädt*, Oct. 1806. Berlin was occupied by French, Oct. 26, and the cowardly and unpatriotic behaviour of Pruss. civilians facilitated almost complete conquest of Prussia. The BERLIN DECREES made opposition to N. a life-and-death struggle for every European country.

N. then turned towards Russia, occupying Warsaw, Dec. 15; received with enthusiasm by Poles, and took up winter quarters on Polo-Russian frontiers. Russ. army went into winter quarters near, and suspecting Fr. surprise General Benningsen attacked

scattered division under Bernadotte; N. instantly brought up main army and besieged Russ. forces in *Eylau*, Feb. 1807. N. won, but there were enormous losses on both sides. Dantzig fell, May 1807, and after decisive defeat at *Friedland*, June 14, Tsar made Treaty of Tilsit, July 7, 1807, abandoning Allies. Prussian territories were formed by N. into kingdom of Westphalia, and Prussian Poland became his grand-duchy of Warsaw. These two campaigns involved marches unparalleled in modern history, and seriously weakened the marvellous Grand Army, which was never the same army again, but N. was at height of power. Pruss. Poland was formed into kingdom of Westphalia for Jerome Bonaparte; abolition of tribunate in France removed nominal limitation on N.'s power at home. N. was always unfortunate when he crossed swords with Britain; Nelson, victor of *Aboukir Bay* and of *Trafalgar*, now successfully opposed N. in Portugal, which had refused to recognise Continental Blockade. N. overthrew Span. throne and made his bro. Joseph king, replacing Joseph by Murat as king of Naples; Britain successfully defended Portugal, and Sir John Moore was sent to aid of Spain; N. paid a hurried visit to Peninsula and captured Madrid, Dec. 4, 1808, but was called away by attack of Austria in early 1809.

Second Austrian Campaign, 1809.—Austria had revived since 1805; people were angered by dismemberment of empire, and new chancellor, Stadion, encouraged patriotic outburst, while Archduke Charles, commander-in-chief, reorganised army. Russia had fallen away, but Britain promised large reinforcements for Austrian attack. Archduke Charles led army of 170,000 men into Bavaria, while Archduke John invaded Italy, 1809, but N. flew with picked troops from Spain, won battle of *Abensberg*, April 20, and battle of *Eckmühl*, April 22, captured Vienna, May 12, hamlets of Aspern and Essling, May 22; Eugène de Beauharnais hastened from Italy to his assistance, driving back John and defeating Hungarians, June 14. The joint army inflicted on Archduke Charles the crushing defeat of *Wagram*, July 6; N. was unable to follow up victory, but obtained large cession of Austrian territory at Treaty of Vienna, Oct. 14, 1809. N., ambitious of founding dynasty, divorced Joséphine, Dec. 16; Joséphine, to whom he had been deeply attached, had treated him with cruel coldness in early days of union, but for some years bitterly felt his indifference. His marriage in early 1810 with Marie Louise (*q.v.*), Archduchess of Austria, distasteful to Austria but recommended by Metternich, was important to N. as reception into historic ruling houses of Europe. N. in 1812 encroached still farther on European territory, blind to strong national feeling rising everywhere against his empire, and ruled France as benevolent despot. The beginning of the end came with the great misfortunes of 1812.

Russian Campaign, 1812.—N.'s power declined after Pruss. and Polish campaign, despite subsequent increase of territory; by his destruction of feudal principalities he made Ger. national feeling possible, and a great national movement took place in Prussia. The physique of Grand Army was destroyed; Russia disliked grand-duchy of Warsaw, Continental Blockade, N.'s Span. policy, and omission to enrich herself. Britain urged Russia to declare war, and aided in reorganisation of Russ. army on modern plan; N. determined to crush Russia and even expel Russians from Europe; large Fr. army, no longer a force of heroes, but over half foreign mercenaries, made long terrible march across Europe under N., occupied Lithuania, and captured Smolensk, August 18. Russians under Tolly and Bagration adopted skilful policy of retreat, luring enemy on into devastated country. At the battle of *Borodino*, Sept. 7, 50,000 Russians (including Bagration) and 30,000 French were slain. French captured *Moscow*, Sept. 14; and two days later it was destroyed by fire. N., in hope of submission of Tsar Alexander, delayed till Oct. 15, then was forced to commence retreat; a bitter march in snow, without supplies, exposed him to attacks of enemy. N. was forced to leave army and return speedily by sleigh to Paris; the survivors were led home by Murat. Contemporaneously France suffered great reverses in Peninsula.

German War of Liberation, 1813.—Prussia on news of retreat from Moscow at once declared war, March 16, 1813, having made Treaty of Kalisch with Russia, February 27. French were driven from Berlin by Russians; two Prussian armies were formed, under Bülow and Blücher, the first to co-operate with Swedes, second with Russians under Tolly. N. marched at head of 300,000 men to restore Fr. power; won battle of *Lutzen*, May 2, reoccupied Saxony, and won battle of *Bautzen*, May 20, while Vandamme seized Hamburg. The armistice of Pleswitz was made, June 3, until attitude of Austria could be discovered; Metternich, now supreme in Austria, held Austria aloof and posed as mediator, fearing too great success of Russia, but ultimately nominally joined Allies, August 12. Moreau and General Jomini sketched plan of new campaign for Allies, but N. anticipated attack; his general, Oudinot, was defeated at *Gross Beeren* by Bernadotte, Macdonald at *Katzbach* by Blücher, August 23 and 25; destructive battle of *Dresden*, August 26 and 27, was won by French; Vandamme capitulated to Tolly at *Kulm*, after loss of 10,000 men; Ney was defeated by Bernadotte and Bülow at *Dennewitz*, Sept. 6. The Fr. army was decimated by fighting and desertion; and the Allies won the *Battle of the Nations*, at Leipzig, Oct. 16–19, destroying N.'s army; French secured retreat by victory of *Hanau* over Bavarians. Allies, by vote of Britain, Russia, and Prussia, pursued N.; Fr. armies scattered in foreign countries and engaged on southern frontier by Wellington; Blücher crossed Rhine, Dec. 31, 1813, with Prussian main army, Russians and Austrians entered from Switzerland. N. brilliantly repulsed each separately and almost completely annihilated Prussians. Britain, however, kept Coalition together and made new alliance by Treaty of Chaumont, March 1814; Blücher, reinforced by Swedes and Russians, and Austrian army, acting separately, again made for Paris; N. fought Blücher without success at *Craonne* and *Laon*, March 7 and 9, and Austrians won at *Arcis-sur-Aube*, March 20; while N. attempted to cut off their communications.

Napoleon's Downfall.—Paris at last was captured, March 30, by Russians and Prussians; N. abdicated, April 4, and was forced to retire to island of Elba, but allowed to rule it and retain title of emperor. He escaped, returned to France, March 1, 1815, and was welcomed by army, but not by majority of people. He established *Hundred Days* rule; marched into Belgium and defeated Blücher at *Ligny*; was completely conquered at *Waterloo* (q.v.), June 18; fled to Paris, abdicated in favour of son Napoleon, sought to escape to U.S.A., but surrendered to Capt. Maitland of *Bellerophon*, July 15, and was confined till death at St. Helena, a lonely rock in the Atlantic, under charge of Sir Hudson Lowe. His remains were removed to the *Invalides*, 1840.

N. was of spare form, massive head, high cheekbones, prominent jaw, large eyes with two deep lines between, piercing gaze, straight hair sweeping over brow; he spoke in abrupt, imperious tones. He was strikingly thin and pale in youth; loyal and self-sacrificing to ungrateful family, and constant in personal relationships. Among his mistresses, none of whom attained power in state, was faithful Mme Walewska, who, unlike the Empress Marie Louise, followed him to Elba. He was maligned in every way after his fall, but idolised at height of his fortune. There is a modern reaction against blackening of his character.

Lord Rosebery, *N. : The Last Phase* (1900); Browning, *N. : The First Phase* (1905); Holland Rose, *Life of N. I.* (4th ed., 1904); Hassall, *Napoleon* (1911); H. A. L. Fisher, *Bonapartism, and Napoleonic Statesmanship*; Kircheisen, *Bibliography of N.*

NAPOLEON II., Napoléon François Charles Joseph (1811–32), titular emperor of French; s. of N. I. by second wife, Marie Louise, Archduchess of Austria; called 'King of Rome' at birth; N. I. abdicated in his favour, 1814 and 1815; not allowed by Powers to possess even Parma; withdrew to Austrian court and lived as Duke of Reichstadt; feeble in health.

NAPOLEON III., Charles Louis Napoléon Bonaparte (1808–73), last emperor of the French; second surviving s. of Louis Bonaparte, bro. of N. I.; joined Carbonari movement in Papal States, 1831. On his bro.'s death shortly afterwards, although his father and uncle still lived, N. assumed headship of family, and sought Bonaparte restoration; failure of conspiracy, 1837; pub. *Des idées Napoléoniennes*, 1839; captured in attempted invasion of France, 1840, and condemned to perpetual captivity. He escaped, 1846, and lived a gay society life in London.

N. returned to France at revolution of 1848, became Pres. of republic, and set himself to revive empire. Freedom of speech and press was put down, and aid of Church was invoked to discredit republican teaching, while masses were gained over by *largesses*; the Ministry was composed of his creatures. Assembly refused to allow his re-election as Pres. as contrary to constitution, and angered populace by throwing out universal suffrage bill; Assembly was broken up, 1851, and France governed by proclamations.

N. was declared emperor, 1852. All threads of administration were collected in his hands, and popularity was obtained by showy court, handsome public works, lowering of price of food and hours of labour. N. married Eugénie (*q.v.*) de Montijo, 1853. His career was crowned by Franco-Brit. victories in Crimea. He supported Italy in its War of Liberation, and a successful campaign was waged against Austria in 1859, but the united influence of the empress and the Roman Catholics compelled N. to sign the armistice of Villafranca. By the Treaty of Turin, 1860, France gained Savoy and Nice, in return for her assistance. Russia was offended by N.'s Polish policy, 1863; failure of Mexican expeditions, 1863–67, brought further loss of prestige, and all hope of reviving glory of France was lost by Prussian defeat of Austria, 1866. The growing strength of republican and constitutional party at home extorted concessions. N.'s foreign policy, a fruitless attempt to endear his dynasty to the people by foreign conquest, brought on Franco-German War (*q.v.*), 1870. N. surrendered at Sedan, and was deposed, 1870. He lived in England till his death. His only son, the Prince Imperial, was killed in the Zulu War, 1879. Of indestructible, fixed ambition, but lacking firmness in policy, N.'s ideal was to make France the centre of a revived Rom. Empire. He wrote a brilliant *Histoire de Jules César*, etc.

Jerrold, *N. III.* (1874–82); Forbes, *N. III.* (1898); Victor Hugo, *Histoire d'un crime* (1877).

NAPOLEON FAMILY, see Bonapartes.

NAPOLEONITE, a stone sometimes called Corsite, because found in island of Corsica; a variety of dolerite (*q.v.*); often cut and polished for ornamental purposes.

NARA (34° 45′ N., 135° 45′ E.), town, Yamato, Japan; contains gigantic statue of Buddha, and many beautiful temples; formerly capital of Japan. Pop. 32,732.

NARA, Eastern and Western (*c.* 27° 20′ N., 68° E.), two water channels, Sind, Brit. India.

NARAINGANJ (23° 37′ N., 90° 32′ E.), town, Dacca, Bengal, India; entrepôt for jute. Pop. 26,000.

NARBADA, see Nerbudda.

NARBONNE (43° 11′ N., 3° E.), town, Aude, France; with cathedral, Church of St. Paul, and abp.'s palace; Rom. *Narbo Martius*; united to France, 1507; famous for white heather, honey, and red wine. Pop. *c.* 29,000.

NARBUDDA, see Nerbudda.

NARCISSUS (*Narcissus poeticus*), a favourite garden flower. The plant is bulbous, and the blooms resemble those of the *Liliaceæ*, except that the ovary is inferior, and that a portion of the perianth is modified to form a discoid corona. The fruit is a trilocular capsule.

NARCISSUS (classical myth.), beautiful youth, s. of Cephissus and Leiriope; fell in love with his own reflection and pined away; changed into flower bearing his name.

NARCOMEDUSÆ, see under Hydromedusæ.

NARCOTICS, drugs which, when administered in sufficient quantity, produce stupor which may go on to profound coma, paralysis, or convulsions, and even eventually death. In small doses, various n's act in different ways, some being stimulants, some producing delirium, some acting as intoxicants, some producing sleep, while the most evident property in some is their power to relieve pain. The chief n's are *opium* (and the most important alkaloid it contains, *morphine*), *cannabis indica*, *belladonna* (and its alkaloid, *atropine*), *stramonium*, *hyoscyamus*, *chloral hydrate*, and *alcohol*. See separate articles on those drugs.

NARCOTINE, see Opium.

NARNI (42° 32′ N., 12° 30′ E.), town, ancient *Narnia*, Perugia, Italy; bp.'s see; cathedral. Pop. 12,500.

NARRAGANSETT PIER (41° 25′ N., 71° 23′ W.), town, on N. Bay, Rhode Island, U.S.A.; favourite summer resort.

NARSES (*c.* 475–573), statesman and general of Byzantine Empire; native of Persarmenia; brought up in imperial household, a eunuch, and rose to be important official; in 'Nika' revolt, 532, N. saved Justinian by lavish distribution of bribes; sent to aid Belisarius in Italy, 538, and purposely hampered him; defeated Goths of Italy, 552, and Alamanni and Franks at great battle of *Capua*, 554; captured and hanged king of the Heruli, 565; made prefect of Italy, and rebuilt cities destroyed by barbarians, but was recalled on charge of extortion, 567, and in revenge delivered over Italy to Lombards of Pannonia.

NARSINGHGARH (23° 42′ N., 77° 5′ E.), native state, Bhopal Agency, India; capital, Narsinghgarh. Pop. of state, 120,000; of town, 9000.

NARSINGHPUR (23° N., 79° E.), district, Nerbudda, Central Province, Brit. India; capital, Narsinghpur. Pop. of district, 320,000; of town, 13,000.

NARVA, Narova (59° 22′ N., 28° 6′ E.), seaport, on Narva, St. Petersburg, Russia; cottons, woollens. Pop. 17,500.

NARVACAN (17° 30′ N., 120° 30′ E.), town, Ilocos Sur, Luzon, Philippine Islands. Pop. 17,000.

NARVIK, Victoriahavn (68° 30′ N., 17° 20′ E.), seaport, Nordland, Norway.

NARWHAL, see Dolphin Family.

NASALIS, see under Cercopithecidæ.

NASCIMENTO, FRANCISCO MANOEL DE (1734–1819), Portug. poet, commonly called Filinto Elysio, was the precursor of the Portug. Romantic movement; his friendship for Maria de Almeida inspired him to write his finest lyrics. His last days were darkened by exile, but his muse gained rather than lost thereby.

NASEBY (52° 24′ N., 0° 59′ W.), village, Northamptonshire, England, near which Roundheads under Cromwell and Fairfax gained decisive victory over Royalists in 1645.

NASH, RICHARD (fl. 1700), see Beau.

NASHE, THOMAS, Nash (1567–1601), Eng. writer; b. Lowestoft; extraordinary good-nature in face of misfortune made him universally beloved; wrote poetry, plays, and pamphlets; a pioneer novelist; works include *Anatomie of Absurditie*, *Pierce Penilesse*, and *The Unfortunate Traveller*.

NASHUA (42° 45′ N., 71° 53′ W.), city, on Merrimac, New Hampshire, U.S.A.; ironworks. Pop. (1910) 26,005.

NASHVILLE (36° 8′ N., 86° 47′ W.), city, capital of Tennessee, U.S.A., on Cumberland River; well-

laid-out city; most notable buildings, State Capitol, Court-House, Custom-House, and Federal Buildings; important educational centre; containing Nashville Univ., Vanderbilt Univ., Central Tennessee Coll., Fisk Univ., and Roger William Univ.; has extensive trade; manufactures include flour, cotton, saddlery, furniture, and timber produce; railway centre; founded 1780; scene of Confederate defeat, 1864. Pop. (1910) 110,364.

NASIK (20° N., 73° 49′ E.), town, on Godavari, Bombay, India; brassware. Pop. 23,000.

NĀSIR KHOSRAU (1004–88), first Persian poet; spent studious youth enlivened by much wine-drinking and revelry; converted *c.* 1050, and went on pilgrimage to Mecca; the journey he described in *Safarnama*. Later his energies were employed in propagating Shi'a doctrines.

NASIRABAD, MYMENSINGH (24° 45′ N., 90° 26′ E.), town, Mymensingh, Bengal, India. Pop. 16,000.

NASMYTH, JAMES (1808–90), Scot. engineer; b. Edinburgh; s. of Alexander N.; invented steam-hammer, 1839.

NASO, see OVID.

NASSARAWA (*c.* 8° E., 8° 40′ N.), province, Brit. N. Nigeria; area, *c.* 18,000 sq. miles; native insurrection in 1900 subdued by Brit. force; produces cotton, rubber. Pop. 1,400,000.

NASSAU (50° 30′ N., 9° E.), district in Pruss. province of Hesse-Nassau, Germany; bounded S. and W. by Rhine and Main, N. by Westphalia, E. by Hesse; area, 1830 sq. miles; surface mountainous; capital, Weisbaden. An independent duchy from 1806, N. was incorporated with Prussia, 1866; younger branch of N. family founded House of Orange-Nassau. N. has numerous mineral springs; famous wines.

NASTURTIUM, INDIAN CRESS, hardy annual, originally native of Peru; climbs by leaf-stalk; possesses five sepals and eight unequal stamens, while the flowers are yellow, with characteristic smell. Besides various varieties of *Tropæolum magnus*, there is the Watercress, *N. officinale*, which is used as a salad preparation.

NATAL (26° 30′ to 31° S., 29° to 33° E.), an original province of the Union of South Africa, on S.E. coast of Africa; bounded on S.W. by Cape of Good Hope Province (Pondoland and Griqualand East), W. by Basutoland and Orange Free State, N. by Transvaal and Portug. East Africa; area (including Zululand and Amatongaland), 35,371 sq. miles; seaboard (washed by Indian Ocean) over 350 miles. Zulu Coast has shallow lagoons; Durban, N.'s only important port. From coast, surface rises over 5000 ft. in series of ledges with many hills and valleys to lofty Drakensberg Mts. on western border; numerous rivers and streams (chief, Tugela), but not navigable. Climate is healthy; coast districts semi-tropical, but practically fever-free; more bracing farther north (during night temperature sometimes falls to freezing-point); heavy summer rains, Sept. to March; frequent thunderstorms; dry, sunny winter.

History.—N. was discovered, Christmas Day, 1497, by Portug. mariner, Vasco da Gama (*q.v.*), and accordingly christened by him *Terra Natalis* (land of the Nativity). European settlement, however, dates only from 1823–24, when Eng. explorers landed and obtained land-grant (where Durban now stands) from Zulu king Tchaka, whose military genius had made him master of all S.E. Africa, and whose relentless cruelty had transformed a once populous land into a desolate waste. This Eng. settlement protected tribes which fled from Tchaka's ruthless sway. In 1838 a body of Boers (under Retief) who had trekked inland from the Cape, entered Natal from the N., and were treacherously massacred at Weenen (*i.e.* 'weeping'), by Dingaan, Tchaka's bro., assassin, and successor. A punitive expedition from Durban was wiped out, but on Dec. 16 ('Dingaan's Day') the Zulu was routed by Dutch under Pretorius. A Dutch republic, 'Natalia,' was proclaimed, 1840; hostilities broke out between British and Boers; Natal was declared a British Colony, 1843, and Boers withdrew to north; Natal annexed to Cape, 1845, made separate colony, 1856. Cetewayo succeeded as Zulu king, 1872; on his refusal to disband forces, war declared, 1879. British were defeated at *Isandhlwana*, but gallantly held *Rorke's Drift* (Jan. 22, 1879), averting invasion of Natal; Brit. reinforcements crushed Zulu *impis* at *Ulundi* (July 4), and Cetewayo was captured and exiled. In Boer War (1880–81) fighting took place on Natal border. Native troubles continuing, Cetewayo was restored, 1883 (d. 1884); Zululand annexed as Crown Colony, 1887; Dinizulu, Cetewayo's son and successor, rebelled, but was exiled to St. Helena, 1889; responsible government granted, 1893; Ingwavuma between Swaziland and Amatongaland incorporated in Zululand, 1895; Zululand made part of Natal, 1897; Natal invaded by Boers during South African War, 1899–1900; portion of South African Republic south of Pongola River added to Natal, 1902; rising under Bambata and Siganandi, 1906, suppressed by Colonists; Natal merged in Union of South Africa, 1910. See SOUTH AFRICA, *History*.

Natal is divided into ten counties and Zululand; purely provincial affairs managed by Administrator and Provincial Council; provincial capital, Pietermaritzburg (*q.v.*); largest town and port, Durban (*q.v.*). Railways (mileage, *c.* 1100 miles) run along coast and inland across Drakensbergs to Johannesburg and Bloemfontein. N. long competed with Cape Ports and Lourenzo Marques for Rand carrying-trade; traffic finally apportioned by agreement, N. getting 25–30 %.

Resources.—N.'s most important industry is sheep-farming, in midland and upland districts. Cattle are reared everywhere, but have suffered badly from East Coast fever and lung-sickness. Angora goats and horses thrive in higher regions. Agricultural products vary according to situation; about 1,000,000 acres are cultivated, half by natives and Indians. On coastal belt (25 to 30 miles wide) sugar is chief product, plantations being worked by Indian coolies; tea is also extensively cultivated and exported; likewise coffee and cotton. Wattle-bark is grown largely in midlands. Maize grows everywhere, and is N.'s chief grain-crop, exports increasing rapidly. Nearly every fruit flourishes; orchards mostly on coast, where bananas, pine-apples, etc., grow; citrus fruits from coast and midlands are exported; other products include tobacco, Kaffir corn, lucerne, sweet potatoes, and vegetables. Forests are small, some blue-gum plantations. Locusts are troublesome, but active measures are being taken to exterminate them. Irrigation is easy and most profitable. There are several government and other irrigation settlements. Chief mineral is coal—principal mines at Dundee; a most promising industry; output 2–3 million tons; mostly exported and used for bunkers. Building-stone, marble (near Umzimkulu mouth), asbestos (Eshowe), and manganese ore are also worked. Manufactures are few and small (fruit-canning, sugar, tea factories, etc.). Fish abound in coastal waters; Durban has whaling-station.

Education is under provincial control till 1915; Government and Government-aided schools; separate schools for natives, Indians, and coloured children; Natal Univ. Coll., Maritzburg, under Union Gov. Natives outnumber Europeans by ten to one; many Indians, constituting serious economic problem (see ASIATIC QUESTION). Pop. (1904) 1,108,000; (1911) 1,192,000 (including Zululand, 219,000); white pop. (1904) 97,107; (1911) 98,582.

See also SOUTH AFRICA, ZULULAND.

Bird, *Annals of Natal, 1495–1845* (1888); Russell, *The Garden Colony: The Story of Natal* (1910); Tatlow, *N. Province* (1912).

NATAL (5° 48′ S., 35° 13′ W.), city, capital, Rio Grande do Norte, at mouth of Rio Grande, Brazil; exports cotton, sugar. Pop. 13,000.

NATCHEZ (31° 34′ N., 91° 20′ W.), town, Mississippi; busy river trade; exports cotton; has R.C.

cathedral, various educational and charitable institutions. Pop. (1910) 11,791.

NATENZ, NATANZ (33° 30′ N., 51° 50′ E.), province, Persia. Pop. *c.* 23,000. Chief town, **Natenz.** Pop. *c.* 3000.

NATICK (42° 25′ N., 71° 20′ W.), town, on Lake Cochituate, Massachusetts, U.S.A.; boots and shoes. Pop. (1910) 9866.

NATIONAL ANTHEMS.—The growth of patriotic songs or hymns, which have been specialised as the national tune of various nations, dates from the XVIII. cent. Chief among n. a's is *God Save the King* (*c.* 1745, attributed to John Bull and various other composers from 1620 to 1750), sung wherever Brit. subjects are gathered together. Other famous n. a's include *Hail, Columbia!* (1798) and the *Star-Spangled Banner* (1814) (U.S.A.); the *Marseillaise* (France); *Heil dir im Siegeskranz* (Germany). The tune of 'God Save the King' has been taken by several foreign countries for their n. a.

NATIONAL COVENANT, see COVENANTS, SCOTTISH.

NATIONAL DEBT OF BRITAIN, total debt of State to various lenders; originated under William III.; Revolution government was called upon to meet heavy war expenses and could not resort to financial expedients which had proved fatal to Stewarts. In Committee of Ways and Means, 1692, the skilful financier Montague proposed public loan; by Act of 1693 duties were appropriated to repayment of £1,000,000, to be raised by loan, in terminable annuities. Practice increased, repayment at fixed periods was largely abandoned, and in 1702 debt amounted to over 16 millions; steadily grew, and in 1815 amounted to 840 millions; in 1902, 780 millions.

It is chiefly repaid by life annuities, or annuities for term of years, but sometimes by instalments, or *in toto* at fixed date; investors can at any time sell out; tontine annuities (a method of repayment named after Ital. financier Tonti and abandoned in England, 1789) were settled on survivor among subscribers; they are still issued in U.S.A. Exchequer bills and treasury bills are loans raised for short period at low interest; exchequer bonds are form of usual loan. Loans are usually negotiated through bankers, who find great profit in transaction. Great differences of opinion exist among political economists as to advisability of N. D.; in time of war it is generally inevitable, and is by many considered smaller evil than increased taxation; treasury system of the ancients, to which Germany clings, considered wasteful, as money lies idle, and many modern economists approve of retention of system; when loans were first contracted, however, governments aimed at paying them off as quickly as possible, and great efforts at sinking were made in XVIII. cent.; Walpole reduced rate of interest from 6 % to 5 %, 1714, and made regulations for applying surplus income to reduction of principal; Act 1749 for reduction of interest to 3 %; variations in XIX. cent. caused by government's temporary needs; important reductions of interest by Goulburn, 1844, and Goschen, 1888. Brit. N. D. is managed by the Banks of England and Ireland, the Treasury, and the Commission for Reduction of N. D.

The following list shows the National Debt of the principal countries: United Kingdom (1912), £718,406,428; United States (1911), after deducting cash in treasury, $1,105,784,338; France (1911), £1,301,718,300; German Empire (1911), £269,844,390; Austria (1911), £510,418,000; Hungary (1910), £221,555,333; Italy (1911), £553,315,604; Russia (1909), £975,000,000.

NATIONAL INSURANCE, see INSURANCE (NATIONAL).

NATIONAL WORKSHOPS, see ATELIERS NATIONAUX.

NATURAL BRIDGE (37° 40′ N., 79° 35′ W.), village, Virginia, U.S.A.; remarkable natural arch of rock.

NATURAL SELECTION, see EVOLUTION.

NATURALISATION.—Persons of foreign nationality resident in Britain and desiring to become Brit. subjects must fulfil the following conditions: (1) residence in the United Kingdom or service under the Crown for not less than five years; (2) furnish evidence of intention to reside in the United Kingdom or to serve under the Crown; (3) pay a fee of £5 on the grant of certificate of naturalisation.

In the Brit. overseas dominions conditions of n. vary, but are generally less stringent than in the mother-country. A person naturalised in the U.K. does not require to be naturalised again in the Brit. Colonies; but one naturalised in a Brit. colony might find on removing to the U.K. that his n. was not recognised as applying to the mother-country as well. The subject has been discussed at several Colonial Conferences, and an effort is being made to secure uniformity and reciprocity in the law of n. in the different parts of the Empire.

In foreign countries, among other conditions, periods of residence ranging from 1 year upwards are required for n. In the U.S.A., 5 years' residence is necessary; applicants must renounce any claim to nobility and allegiance to any other land.

NATURALISM.—One form opposes the natural, as the essential, to the acquired or artificial; with Locke, sensations are real, relations are the work of the mind, therefore unreal. This form, which identifies the natural and the non-rational, finally becomes Sensationalism or Associationism. The rational, taken as the natural, may be opposed to what is above or contrary to reason, as by Eng. Deists.

NAUCRARY, a division of the people of Attica, based, most probably, on the provision of a ship by each. The Ionian tribes were divided into 48 n's.

NAUCRATIS, ruined Gk. town, at Canopic mouth of Nile, Egypt; had pottery factory and various temples; re-discovered by Flinders Petrie in 1884, and subsequently excavated.

NAUDÉ, GABRIEL (1600–53), Fr. scholar; physician to Louis XIII.; formed Mazarin's library (1642) and preserved it from destruction during the Fronde; wrote *Advis pour dresser une bibliothèque*, *Jugement de tout ce qui a été imprimé contre le Cardinal Mazarin* (1649), etc., all now rare.

NAUGATUCK (41° 28′ N., 73° 2′ W.), town on Naugatuck, Connecticut, U.S.A.; rubber goods. Pop. (1910) 12,722.

NAUHEIM, BAD NAUHEIM (50° 20′ N., 8° 42′ E.), watering-place, Hesse, Germany; salt springs. Pop. (1910) 5700.

NAUMBURG (51° 10′ N., 11° 44′ E.), town, on Saale, Saxony, Prussia; cathedral; woollens. Pop. (1910) 27,047.

NAUPACTUS (38° 23′ N., 21° 50′ E.), ancient city, now LEPANTO, on N. shore of entrance to Gulf of Corinth or Lepanto; near site of battle of Lepanto (*q.v.*).

NAUPLIA (37° 33′ N., 22° 48′ E.), fortified town, capital of Argolis, Greece; on Gulf of Nauplia. Pop. 10,700.

NAUPLIUS, unsegmented larval form of lower Crustaceans, with 3 pairs of appendages. See CRUSTACEA.

NAUSEA, feeling of inclination to vomit.

NAUSHAHR, town, India. See AJAIGARH.

NAUTCHIS, see BAYADERES.

NAUTILUS, a genus of Cephalopoda (*q.v.*).

NAUVOO (40° 35′ N., 91° 20′ W.), town, Illinois, U.S.A.; for some time a centre of Mormon religion; afterwards settled by Fr. Socialists. Pop. (1910) 1020.

NAVAN (53° 38′ N., 6° 42′ W.), market town, at junction of Blackwater and Boyne, Meath, Ireland; woollens.

NAVANAGAR, see NAWANAGAR.

NAVARINO, see PYLOS.

NAVARINO, BATTLE OF, naval battle, 1827, which secured independence of Greece. Brit., Fr., and Russ. fleets, under Sir Edward Codrington, engaged against Turk. and Egyptian fleets to almost total destruction of latter; results: Turks

obliged to abandon Greece; Turk. power fatally weakened.

NAVARRE, Navarra (42° 40′ N., 1° 50′ W.), province, Spain; bounded by France, Aragon, Castile, Alava, and Guipuzcoa; area, 4055 sq. miles; traversed by Pyrenees; chief rivers, Ebro, Arga, Ega, Aragon; capital, Pamplona. N. was an independent kingdom, X. cent.; joined to Aragon, 1076; Champagne, 1234; Spain, 1512; Fr. Navarre (part of Basses-Pyrénées) passed to France with Henry IV. (Henry of Navarre), 1589. Chief products, grain, olives, fruits, red wine; cattle-rearing; silver-lead and copper mines; iron-ore and salt found. Pop. (1910) 312,020.

NAVARRETE, MARTIN FERNANDEZ DE (1765–1844), Span. historian; wrote on discovery of America; author of *Life of Cervantes.*

NAVARRO, PEDRO (*c.* 1460–1528), Span. military engineer and general. Distinguished in defence of Canosa and Taranto, 1502–3; taken prisoner by French, and after three years' imprisonment joined Fr. army.

NAVE, that part between the side aisles of a cathedral or church, extending from western entrance to transept, on to choir or chancel, according to nature and extent of the building. See Architecture (*Gothic*).

NAVEL, Umbilicus, the depression on the front of the abdomen marking the point of attachment of the umbilical cord, by which the *fœtus* obtains nourishment from the mother.

NAVIES AND NAVAL POWER.—From the earliest historical times it has been recognised that a State which possesses any seaboard, must have, in addition to an adequate land-force, a fleet to protect its commerce and its colonies, to defend its coasts, and, should occasion arise, to carry war into hostile waters. As early civilisation centred round the Mediterranean, it is to that part of the world that one looks for the beginnings of sea-power.

Sea-Power.—The Phœnicians were probably the first rulers of the Eastern Mediterranean, and by their enterprise and maritime skill they dominated commerce in the Levant and established cities and trading posts in Sicily and along the African coast as far as the Pillars of Hercules (Gibraltar). Meanwhile the Greek States were increasing their mercantile marine and also planting colonies in Asia Minor, Magna Græcia, and Sicily, where they came into conflict with the Phœnicians, who, together with the Etruscans, a nation which possessed a considerable fleet, drove back in 537 B.C. a flotilla of Phocæan Greeks who were attempting to establish themselves in Corsica.

The rise of Persia reduced Phœnicia to a tributary state, and the 'Great King' frequently employed Phœnician ships in his military enterprises. Thus, when Xerxes planned his invasion of Greece, he collected an enormous fleet, largely composed of Phœnician and Ionian vessels. The victory of *Salamis* (480 B.C.) won for Greece (and particularly for Athens) not only freedom from Persia, but also the suzerainty of the Eastern and Central Mediterranean, while Phœnicia as a great factor in naval warfare did not reappear till mediæval times.

The downfall of Athens as a sea-power was due to the mismanagement of the ill-starred *Syracusan expedition* (415–413 B.C.), when the flower of the Athenian navy perished. The marvellous recuperative power which enabled her to conduct the subsequent Peloponnesian War was but a last effort, and upon the appearance of a fleet superior both in *morale* and tactics, Athens was finally crushed at *Ægospotami* (405 B.C.). Her victors were too short-sighted to make much use of their triumph.

Although Phœnicia's power had declined, her colony, Carthage, was in the Western and Central Mediterranean what Phœnicia had been in the Levant. Rome was excluded from maritime commerce, and her development was consequently hindered. She had no fleet to defeat her rivals, but with characteristic enterprise set about building one. Her naval tactics were original: by the *corvus* she succeeded in turning a naval engagement into something approaching a land-battle. The Punic Wars were won, not on land—Rome could produce no general equal to Hannibal—but by sea, for the Roman fleet could intercept reinforcements and supplies, and eventually was able to land troops on Carthaginian soil. From this period dates Rome's colonial expansion, which, had it not been for her sea-power, would never have been.

Mediæval Period.—On the decline of the Rom. Empire the next power on the Mediterranean was Muhammadan. The Saracens drew largely on the Phœnicians for their fleet, and twice subjected Constantinople to serious attacks (668–716). Their retiral and the change of capital from Damascus to Bagdad again left Greece a naval power, which proved of great value during the Crusades when combined with fleets from Italian cities.

During the later part of the X. cent. three powers appeared which were almost exclusively maritime, Venice, Genoa, and Pisa. They were constantly at war with each other till in the XV. cent. Venice was acknowledged victor, and as such remained till after the fall of Constantinople (1453), when the Turks began to threaten her. The decay of the Venetian sea-power dates from her defeat in 1470 by the Turks, who, till their defeat at *Lepanto*, 1571, seriously menaced Europe, while the Barbary corsairs constantly inflicted losses upon shipping till a much later date.

Modern Times.—The discovery of the compass and the introduction of gunpowder revolutionised naval warfare; above all, they did away with the galley. The *periplous, diecplous,* and other tactics which had existed since classical times were no longer possible under these new conditions, while by the compass longer voyages were rendered possible. To this period belong the rise of Portugal, the exploits of Prince Henry the Navigator, the discovery of the New World, and the growth of Spanish naval power.

England had before this time utilised naval force to a certain extent, as may be seen from her frequent inroads on France and the battles of *Sluys* and *Dover,* but it was in the XVI. cent. that her sea-power developed to an astonishing degree. The exploits of Hawkins, Drake, and others on the Spanish Main were a fitting prelude to the defeat of the *Armada* in 1588, when England, crushing Spain's fleet, took her place as the first sea-power in Europe. The almost inevitable tendency to presume on this new strength led to the mismanaged expedition to the *Ile de Ré,* 1627, and other failures, while the Dutch for a time seriously disputed Eng. sovereignty of the seas, and more than once defeated Eng. admirals and inflicted great havoc on Eng. merchant shipping (see Holland).

The disputes with Holland were largely due to England's claim to the command of the sea. The rapid rise of Holland as a sea-power was the direct outcome of the successful revolt of the United Provinces from Spain; some of her admirals, like many Elizabethan seamen, began their career as privateers.

During the Seven Years War Britain increased her territory at the expense of France, because the latter's fleet was not sufficiently developed, but, again presuming upon her prestige, Britain was worsted at sea in the Amer. War of Independence, and this, even more than the land disasters, lost for her most of her American possessions.

In the wars with France which terminated in *Waterloo,* the Brit. navy showed unquestionably its superiority in *morale* and in its admirals, though in organisation it was admittedly inferior. The wider experience of the British commanders was one of the chief factors in the defeats of the French. Indeed, experience is one of the most potent forces in naval warfare, as was admirably shown in the Crimean War (1854–56). Since the death of Peter the Great (q.v.),

Russia's navy had become disorganised and had but little work to do, hence it did not even attempt to engage her enemies' fleets, which were enabled to secure adequate communication for their land force.

Japan as a sea-power came into prominence with the Chinese War (1894–95), and her navy secured her ultimate victory. The series of defeats inflicted on the Russian fleet by Japanese commanders in the Russo-Japanese War (1904–5), culminating in the great Japanese victory of *Tsushima*, won for Japan her place as one of the Great Powers.

By its superior navy the United States were able to strip Spain of Cuba and the Philippines, 1898, and the Spanish fleet was destroyed.

German Expansion.—The most striking event in the history of sea-power in the XX. cent. is Germany's sudden rise to second place among the navies of the world. In 1898 the Ger. fleet consisted of 9 battleships (excluding coast-defence vessels), 3 large cruisers, 28 small cruisers, 113 torpedo-boats, and 25,000 men, maintained at an annual cost of £6,000,000. The Navy Act of 1900, amended in subsequent years, laid down a regular building programme for a period of years on so extensive a scale that in 1920 the Ger. fleet will comprise at least 41 battleships, 20 large cruisers, 40 small cruisers, 144 torpedo-boats, 72 submarines, and 101,500 men; estimated annual cost, £23,000,000. The number, power, and newness of these ships and the systematic policy of 'scrapping' and replacing older and smaller ships by powerful modern vessels, and of maintaining about ⅘ths of the entire navy in full permanent commission (*i.e.* instantly and constantly ready for war) in Ger. home waters—all these recent developments have had a most important bearing on Brit. naval affairs. Britain was forced to withdraw many ships from distant stations and concentrate her fleet in home waters. Even the Mediterranean had in some measure (1912) to be entrusted to the friendly care of France; and whereas in 1900 'the Brit. navy and Brit. flag were predominant in every ocean of the world and along the shores of every continent, to-day they are predominant nowhere except in the North Sea' (Prime Minister of Canada, Dec. 5, 1912). Disarmament overtures of the Brit. Government meeting with no response, great additions to the Brit. navy were rendered necessary in order to maintain the *Two-Power Standard*, long regarded as essential to Brit. naval supremacy and security. This standard has been subject to various interpretations, but generally demands that Britain should possess at least two ships for every one possessed by any combination of two Powers that might possibly be arrayed against it. Germany's extraordinary expansion as a naval Power led in 1912 to a modification of this standard by which Britain set herself to maintain a 60 % margin over the Ger. fleet, *i.e.* 16 Brit. battleships to every 10 Ger. battleships. This proportion Germany in 1913 gave indications of accepting.

Meanwhile the Brit. overseas dominions had awakened to the necessity of sharing the burden of imperial naval defence (*vide infra*), and other nations had also engaged in the naval armament race. The international situation was complicated by large increases in the naval programmes of Austria and Italy, the two powers who, with Germany, form the Triple Alliance. At the same time France undertook a reorganisation of her navy, which, owing to various causes—political, administrative, and a series of disastrous accidents—had fallen sadly from the proud position of second naval power, which she held till the end of the XIX. cent.; while the other member of the Triple Entente, Russia, began to build up a new navy to replace that destroyed in the war with Japan.

Japan, again, proceeded to enhance her naval prestige by still further improving the navy she had so rapidly and so efficiently equipped; while by the Anglo-Japanese Agreement of 1902 Britain was to a large extent able to leave to her ally the guarding of Far Eastern waters. In the U.S.A. Jap. naval development is watched with keener interest than European expansion; and although the Amer. building programme is now small in comparison with certain other Powers, the U.S. navy is a very formidable factor in naval affairs, and only Germany's extraordinary spirit has robbed it of the second place which for a time it held among naval Powers at the beginning of the XX. cent.

Expenditure.—Some idea of the scale and cost of the naval rivalry which has marked the *Dreadnought* era may be gathered from the naval expenditure of the leading powers of Europe and the U.S.A. for 1900–1 and 1912–13 respectively:—

	1900-1.	1912-13.
Britain	£29,998,529	£45,616,540
U.S.A.	13,385,574	26,540,019
Germany	7,643,781	22,609 540
France	12,511,053	18,090,758
Russia	8,662,801	17,681,207
Italy	4,903,129	8,566,505
Austria	1,821,284	6,400,000

Fleets of the World.—The following table, based on a Brit. Parliamentary White Paper (issued March 1913), shows the fleets of the world (omitting battleships and armoured cruisers over 20 years old) as on Jan. 1, 1913 (B.=Britain; F.=France; R.=Russia; G.=Germany; I.=Italy; A.=Austria; U.=United States; J.=Japan):—

	B.	F.	R.	G.	I.	A.	U.	J.
Ships Built—								
Battleships	55	21	9	33	9	13	33	17
Battle Cruisers	7	—	—	3	—	—	—	—

THE BRITISH NAVY.

History.—Alfred the Great's galleys, launched to repel the Dan. invaders, are generally held to be the forerunners of the Brit. Navy. Edward I., Edward III., and Henry V. made important advances in the organisation of fleets, and Henry VII. built the *Royal Harry*, the most notable ship-of-war up to that period. But it was not until the time of Henry VIII. that the navy began to assume the form of a permanent and organised unit of national defence. It was during his reign that an Admiralty Office was founded and dockyards established at Portsmouth, Deptford, and Woolwich. When Henry VIII. died the Navy con-

sisted of 50 ships, with a total tonnage of 12,000. That figure was increased to 17,000 tons in the reign of Elizabeth, and further growth was witnessed during the reigns of the Stewarts, who increased the tonnage to 100,000, with 7000 guns and 42,000 seamen. Queen Anne's fleet had a tonnage of 167,000. Thus when George I. came to the throne, his navy included 178 ships, the largest of which carried 100 guns. Additions were made by George II., and George III. brought the tonnage up to nearly half a million. During all these years Britain had waged many wars on land and sea, and her ships had been sailed to victory by gallant admirals whose names are household words. The repulse of the Armada and Nelson's crowning victory at *Trafalgar* are the outstanding events in cent's of stress and strain.

From Sail to Steam.—Before the advent of steam propulsion and armour-plating, the navies of Great Britain and other countries comprised two main types of ships. The most important were *Ships of the Line*, marked by great armaments of 100 guns or more, arranged on three decks, and capable of discharging devastating broadsides. Upon these ships fell the brunt of the fighting. The other chief type was the *frigate*, which was built and equipped for speed, handiness of manœuvring, and for scouring the seas on special missions. In the earlier portion of the XIX. cent. the Brit. fleet numbered about 100 first-class war vessels and 150 frigates.

The twenty years subsequent to 1841 saw the gradual abandonment of sailing warships and the substitution of steam-propelled vessels. This great change was followed by another important development. For cent's fighting seamen had sought a means of protecting ships' hulls from the fire of the enemy. In very early times both leather and lead were tried. The invention of the explosive shell, first used in 1854 in the action off *Sinope* between the Russ. and Turk. fleets, made the problem more urgent. France took the lead in 1858 by building *La Gloire*, a wooden ship whose sides were sheathed from end to end by iron plating 4½ in. thick. Great Britain replied by launching the *Warrior*, which, in addition to a sheathing of 4½-in. iron armour, had 18 in. of timber backing. While in the feverish competition which followed, France continued for some years to build ships of iron and wood, Great Britain adopted iron only for the hulls, and thereby obtained equal strength with less weight.

Guns and Armour.—This was the beginning of the contest between guns and armour, the end of which is not yet. As the ship designers adopted thicker and tougher plating, the gunmakers responded by producing guns of greater calibre and projectiles of higher velocity and greater penetration. So far, the advantage lies with the gunmakers, who have designed weapons that can pierce the strongest plating yet adopted.

The earlier ironclads were constructed on the broadside principle, but subsequently barbottes and turrets were adopted to protect the guns and their crew. Captain Coles of the Brit. Navy designed a turret ship in 1860, and about the same time Ericsson evolved a similar vessel in the U.S.A.

Size and Power.—In recent years, under the stimulus of foreign competition, particularly on the part of Germany, great developments have taken place in the size and power of warships. This may be illustrated by comparing the ships of to-day with the best that existed as recently as 1902. In that year the *London* was regarded as typical of a Brit. battleship of the highest class. She was 420 ft. in length, 75 ft. broad, 15,000 tonnage, had a speed of 18 knots, and was armed with four 12-in. and numerous smaller guns. The four vessels of the *George V.* class completed in 1913 are 596 ft. in length, 89 ft. beam, 23,000 tonnage, speed 21 knots, and are armed with ten 13·5-in. and twenty-four 4·7-in. guns. Four battleships to be completed for the Brit. Navy in 1914 will have the enormous tonnage of 26,000. Yet further advances will be made in four ships expected to be completed in the years 1914 and 1915. These latter vessels—the *Barham*, the *Queen Elizabeth*, the *Warspite*, and the *Valiant*—will be 620 ft. in length, 92 ft. beam, 29,000 tonnage, 60,000 horse-power, with a speed of 25 knots. The armament, it is stated unofficially, will be eight 15-in. guns, sixteen 6-in. guns, and five torpedo tubes.

The completion of the battleship *Dreadnought* in 1906 represented a new departure in the race for naval supremacy. Prior to the appearance of that epoch-making vessel, only four of the 12-in. guns were mounted in any battleship; the *Dreadnought* has ten of these powerful weapons besides smaller guns. The 12-in. gun remained the largest type of Brit. naval armament until 1912, when the four ships of the *Orion* class were equipped each with ten of the new 13·5-in. weapons. But even larger guns are in contemplation. The Vickers firm catalogues 14-in. and 15-in. guns, the latter weighing 96 tons and firing a projectile weighing 1950 lb. Krupp of Germany manufactures similar monsters.

Of the various types of 12-in. guns, the most powerful is that which weighs 69 tons, fires a 850-lb. shell at a muzzle velocity of 2960 ft. per second, can perforate 47 in. of wrought iron at a range of 2000 yds., and 20 in. of Krupp steel at a range of 3000 yds. The 13·5-in. gun weighs 76 tons, fires a projectile weighing 1250 lb., has a muzzle velocity of 2821 ft., and can perforate 51 in. of wrought iron at a range of 2000 yds. and 25½ in. of Krupp steel at a range of 3000 yds. There have been guns in the ships of the Brit. Navy larger and heavier than those now in use, but they were much less powerful. The old *Benbow* and *Sanspareil* each mounted two 16½-in. breech-loading guns, and the old *Inflexible* had 16-in. guns which represented the last of the now obsolete muzzle-loaders.

The armour plating in use varies with the class and in the various sections of each ship. In the vulnerable portions, such as the belt, gun stations, and conning tower, 12-in. steel is employed in the latest vessels. See ARMAMENT.

Types of Vessels.—A modern navy includes at least six types of vessels, viz. battleships, armoured cruisers, protected cruisers, unarmoured cruisers, torpedo craft, and submarines. In February 1913 it was announced that in future all cruisers would be officially classified as 'battle cruisers,' 'cruisers,' and 'light cruisers.'

There are about 80 submarines (built or building) in the Brit. Navy. The latest development is represented by submarine *E4*, which is described as a submarine cruiser. She is 176 feet in length, mounts two 12-pounder disappearing guns, and has a speed of 16 knots on the surface and 10 knots submerged. The Brit. Navy possesses about 190 torpedo-destroyers and about 100 torpedo boats. These vessels vary in speed from about 34 knots to 25 knots.

A new auxiliary to the warships is the *hydroplane*, a flying-machine fitted with 'floats' which enable the aeroplane to rest on the water when a descent is necessary. During the year 1912 Commander Sampson made several sensational and successful flights from a starting platform rigged up on the deck of H.M.S. *Hibernia*. The whole question of aeroplanes and airships for the navy is still in the experimental stage. By some it is claimed that such machines will render submarines obsolete, since by the fact that submarines can be seen from a height, they thereby lose the qualification of secrecy of movement, which is the chief reason of their existence.

Engines and Fuel.—By the adoption in recent years of the turbine engine instead of the ordinary piston-and-cylinder engine, greater efficiency and economy has been attained in propulsion. Experts, who are studying the question, expect further improvements from the use of oil fuel. The type of oil engine invented by Dr. Diesel of Munich has been adopted for

submarines and other small craft, and there have been suggestions that the Admiralty should apply the system to some of the larger. The *Hardy*, a torpedo-destroyer, the first of the Brit. ships to be equipped with Diesel engines, was completed in 1912. Should the system be found practicable, the appearance of all ships of war will be revolutionised, and their area of operations greatly enlarged. See ENGINES, FUEL.

Administration and Personnel.—The Brit. Navy is controlled by the Board of ADMIRALTY (*q.v.*).

The personnel of the Brit. Navy in the year 1912–13 was 137,500 officers and men, including 17,063 Royal Marines. If the reserves are needed, the grand total is 196,291.

The following are the principal *officers* of the fleet with their full pay per annum: Admiral of the Fleet, £2190; Admiral, £1825; Vice-Admiral, £1460; Rear-Admiral, £1095; Commodore (1st class), £1095; Captain of the Fleet, £1095; Captain, £410 12s. 6d., rising to £602 5s.; Staff-Captain, £511; Commander, £401 10s.; Lieutenant, £182 10s., rising to £292; Sub-Lieutenant, £91 5s.; Midshipman, £31 18s. 9d.; Cadet, £18 5s.; Chaplain, £219, rising to £401 10s.; Naval Instructor, £219, rising to £401 10s.; Engineer Rear-Admiral, £1095; Engineer Captain, £638 15s., rising to £730; Engineer Commander, £438, rising to £602 5s.; Engineer Lieutenant, £182 10s., rising to £365; Engineer Sub-Lieutenant, £136 17s. 6d.; Secretary, £273 15s., rising to £547 10s.; Paymaster-in-Chief, £693 10s.; Fleet Paymaster, £383 5s., rising to £602 5s.; Staff-Paymaster, £328 10s., rising to £346 15s.; Paymaster, £273 15s., rising to £310 5s.; Inspector-General of Hospitals, £1300; Deputy-Inspector-General of Hospitals, £766 10s.; Fleet Surgeon, £492 15s., rising to £657; Staff-Surgeon, £365, rising to £438; Surgeon, £255 10s., rising to £310 5s.; Royal Marines (Artillery)—Colonel Commandant, £730; Lieut.-Colonel, £383 5s., rising to £410 12s. 6d.; Major, £293 10s. 5d., rising to £337 12s. 6d.; Captain, £220 10s. 5d, rising to £266 2s. 11d.; Lieutenant, £115 11s. 8d., rising to £135 7s. 1d.; 2nd Lieutenant, £115 11s. 8d.; Royal Marines (Light Infantry)—Colonel Commandant, £702 12s. 6d.; Lieut.-Colonel, £383 5s., rising to £410 12s. 6d.; Major, £284 7s. 11d., rising to £337 12s. 6d.; Captain, £211 7s. 11d., rising to £257 0s. 5d.; Lieutenant, £107 10s. 7d., rising to £127 15s.; 2nd Lieutenant, £95 16s. 3d. By a recent memorandum a considerable improvement was made in rates of pay for men of non-commissioned rank.

The Naval Estimates.—In the years between 1870 and 1885 the estimates varied from £10,000,000 to £12,000,000; in 1890 they reached £14,500,000; in 1900, £30,000,000; in 1905, £35,000,000. The Estimates for 1913–14 total £46,309,000, being an increase of £1,233,900 on the previous year's Estimates (including supplementary Estimates). The new programme provides for the laying down of 5 battleships, 8 light cruisers, and 16 destroyers; cost of new programme, £15,958,525, an increase of £2,944,525 on the corresponding figure for 1912–13.

Colonies and Naval Defence.—In estimating the Brit. naval strength there must be added the ships owned by the Australian Commonwealth and contributed by New Zealand. Australia had at the end of 1912 the following ships in commission: the *Encounter*, cruiser; *Gayundah*, gunboat; *Paluma*, gunboat; *Protector*, cruiser; and *Tingira*, all employed in the training service. There are also three destroyers and two torpedo boats in active service. Ships in course of building for the AUSTRALIAN ROYAL NAVY are the *Australia*, a battle cruiser, and three second-class cruisers, three destroyers, and two submarines. The armoured cruiser *New Zealand*, presented to the Home Government by New Zealand, has been completed, and in Feb. 1913 started on a voyage to the Dominion. She will return to augment the cruiser squadron in home waters. The Malay Federated States in November 1912 offered to present a first-class armoured ship to the Home Government, and the offer was accepted. In regard to Canada, Mr. Borden's government proposed to contribute three first-class warships (to cost £7,000,000) towards Imperial defence; the motion was defeated in Canadian Parliament (June 1913). The first monetary contributions by a Brit. colony to Imperial naval defence came from South Africa; the Union of South Africa, like New Zealand and Newfoundland, continues to grant annual subsidies, pending the adoption of a definite colonial naval policy. India also makes annual appropriations in aid.

SHIPS OF THE NAVY.

With the completion of the *Dreadnought* in 1906, there commenced a new era in battleship construction. The phase, 'All big-gun ships,' describes the principal feature which distinguishes the modern battleship from her predecessors. The following is a list of the larger vessels in the Brit. Navy, including (with estimated date of completion) those now building or authorised. The armour given refers to the belt, but heavier plating is used for turrets and barbettes. Only the guns of the main armament are noted; each vessel is equipped with numerous smaller guns.

Battleships are easily recognised by their huge bulk. In common with all the larger vessels, they have two masts—one much shorter than the other—used for signalling, for observing and directing gun-fire, and for accommodating the wireless telegraphy installation. Two funnels are the rule. As battleships at a distance resemble each other, identification of individual ships is attained by bands painted round the funnels near the top. For example, the *King George* has a white band on each funnel, the *Orion* has two white bands on each funnel, and the *Conqueror* has two bands on the after funnel. A variation of these funnel-markings—white or red—distinguishes all the ships of the navy.

Dreadnought.—Completed, 1906; length, 490 feet; speed, 21 knots; armour, 11-inch; guns, ten 12-inch; cost, £1,813,100; crew, 800.

Bellerophon.—Completed, 1909; length, 490 feet; speed, 21 knots; armour, 11-inch; guns, ten 12-inch; cost, £1,765,342; crew, 870.

Téméraire.—Completed, 1909; length, 490 feet; speed, 21 knots; armour, 11-inch; guns, ten 12-inch; cost, £1,743,955; crew, 870.

Superb.—Completed, 1909; length, 490 feet; speed, 21 knots; armour, 11-inch; guns, ten 12-inch; cost, £1,660,446; crew, 870.

St. Vincent.—Completed, 1910; length, 500 feet; speed, 21 knots; armour, 9¾-inch; guns, ten 12-inch; cost, £1,754,615; crew, 724.

Collingwood.—Completed, 1910; length, 500 feet; speed, 21 knots; armour, 9¾-inch; guns, 9¾-inch; cost, £1,731,640; crew, 724.

Vanguard.—Completed, 1910; length, 500 feet; speed, 21 knots; armour, 9¾-inch; guns, ten 12-inch; cost, £1,607,781; crew, 724.

Neptune.—Completed, 1911; length, 570 feet; speed, 21 knots; armour, 10-inch; guns, ten 12-inch; cost, £1,715,258; crew, 800.

Colossus.—Completed, 1911; length, 510 feet; speed, 21 knots; armour, 10-inch; guns, ten 12-inch; cost, £1,540,963; crew, 800.

Hercules.—Completed, 1911; length, 510 feet; speed, 21 knots; armour, 10-inch; guns, ten 12-inch; cost, £1,529,250; crew, 800.

Orion.—Completed, 1912; length, 545 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,705,410; crew, 800.

Monarch.—Completed, 1912; length, 545 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,740,012; crew, 800.

Conqueror.—Completed, 1912; length, 545 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,713,748; crew, 800.

Thunderer.—Completed, 1912; length, 545 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,738,245; crew, 800.

King George V.—Completed, 1913; length, 555 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,816,796; crew, 900.

Centurion.—Completed, 1913; length, 555 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,806,371; crew, 900.

Ajax.—Completed, 1913; length, 555 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,745,087; crew, 900.

Audacious.—Completed, 1913; length, 555 feet; speed, 21 knots; armour, 12-inch; guns, ten 13·5-inch; cost, £1,774,513; crew, 900.

Iron Duke.—Completed, 1914, length, 580 feet; speed, 22·5 knots; armour, 12-inch; guns, ten 13·5-inch; cost (up to March 31, 1913), £1,224,181.

Marlborough.—Completed, 1914; length, 580 feet; speed, 22·5 knots; armour, 12-inch; guns, ten 13·5-inch; cost (up to March 31, 1913), £1,160,399.

Benbow.—Completed, 1914; length, 580 feet; speed, 22·5 knots; armour, 12-inch; guns, ten 13·5-inch; cost (up to March 31, 1913), £1,039,099.

Delhi.—Completed, 1914; length, 580 feet; speed, 22·5 knots; armour, 12-inch; guns, ten 13·5-inch; cost (up to March 31, 1913), £1,038,103.

Barham, Queen Elizabeth, Warspite, and *Valiant.*—The two first-named vessels are expected to be completed in 1914, the second two in 1915. It is understood that the *Queen Elizabeth* will be 620 feet in length, will be driven by oil, and attain 25 knots speed, and be armed with eight 16·25-inch guns as main armament.

Battle Cruisers.—It is the function of battle cruisers to search for the enemy's fleet, and hold it until the battleships come up. They may be distinguished from battleships by slightly greater length in some cases, finer lines, and their three funnels. The *Princess Royal,* an example of the latest type, has two funnels—one thick, the other thin—placed amidships, with a third funnel at some distance apart from the other two.

Inflexible.—Completed, 1908; length, 530 feet; speed, 25 knots; armour, 7-inch; guns, eight 12-inch; cost, £1,728,229; crew, 750.

Indomitable.—Completed, 1908; length, 530 feet; speed, 25 knots; armour, 7-inch; guns, eight 12-inch; cost, £1,761,080; crew, 750.

Invincible.—Completed, 1909; length, 530 feet; speed, 25 knots; armour, 7-inch; guns, eight 12-inch; cost, £1,768,995; crew, 750.

Indefatigable.—Completed, 1911; length, 555 feet; speed, 26 knots; armour, 7-inch; guns, eight 12-inch; cost, £1,536,769; crew, 800.

Lion.—Completed, 1912; length, 660 feet; speed, 31 knots; armour, 9¼-inch; guns, eight 13·5 inch; cost, £1,939,408.

Princess Royal.—Completed, 1912; length, 660 feet; speed, 31 knots; armour, 9¼-inch; guns, eight 13·5-inch; cost, £1,893,586.

Queen Mary.—Completed, 1913; length, 670 feet; speed, 31 knots; armour, 9¼-inch; guns, eight 13·5-inch; cost, £1,940,764.

Tiger.—Completed, 1914; length, 670 feet; speed, 31 knots; armour, 9¼-inch; guns, eight 13·5-inch; cost (up to March 31, 1913), £1,023,539.

New Zealand.—Completed, 1913; length, 567 feet; speed of 26 knots, and is armed with eight 12-inch guns; constructed at New Zealand's expense; crew, 750.

Australia.—Completed, 1913; length, 567 feet; speed, 26 knots; armour, 8-inch; guns, eight 12-inch. This vessel is built to the order of the Australian Government; crew, 750.

Second-Class Battleships.—Battleships built prior to the *Dreadnought* era may be identified by the disposition of the big guns, two of which are placed in a turret forward and two in a turret aft.

Lord Nelson and *Agamemnon.*—Completed, 1907; length, 420 feet; speed, 18 knots; armour, 12-inch; guns, four 12-inch, ten 9·2-inch; crew, 747.

King Edward (1904), *Zealandia* (1905), *Hindustan* (1905), *Commonwealth* (1905), *Dominion* (1905), *Africa* (1906), *Britannia* (1906), and *Hibernia* (1906).—Each 453 feet in length; speed, 18 knots; armour, 9-inch; guns, four 12-inch, four 9·2-inch, and ten 6-inch; crew, 780.

Third-Class Battleships.—*Formidable* (1901), *Implacable* (1901), *Bulwark* (1902), *Irresistible* (1902), *London* (1902), *Venerable* (1902), *Prince of Wales* (1904), *Queen* (1904), *Swiftsure* (1904), *Triumph* (1904), *Duncan* (1903), *Albemarle* (1903), *Exmouth* (1903), *Russell* (1903), *Cornwallis* (1904), *Canopus* (1899), *Glory* (1900), *Goliath* (1900), *Ocean* (1900).

Armoured Cruisers.—Owing to the immense boiler capacity necessary to secure high speed, most of the armoured and protected cruisers possess four funnels—the *Monmouth* with three, and the *Edgar* and *Blake* classes with two, are among the exceptions.

Minotaur (1908), *Defence* (1908), *Shannon* (1908).—Length, 520 feet; speed, 23 knots; armour, 6-inch; guns, four 9·2-inch, ten 7·5-inch; crew, 755.

Warrior (1906), *Achilles* (1907), *Cochrane* (1907), *Natal* (1907).—Length, 480 feet; speed, 23 knots; armour, 6-inch; guns, six 9·2, four 7·5; crew, 720.

Protected Cruisers.—*Powerful* (1898) and *Terrible* (1898).—Length, 520 feet; speed, 22 knots; armour, 6-inch; guns, two 9·2-inch, sixteen 6-inch; crew, 900.

The 'protected cruiser' class includes seven vessels of the *Diadem* class (21 knots), nine vessels of the *Edgar* class (19 knots), and two vessels of the *Challenger* class (21 knots). Smaller cruisers number about seventy. The *Boadicea* class, of seven vessels, all built since 1910, has a speed of 27 knots.

Destroyers and Torpedo-Boats cannot be mistaken for any other craft. They lie low in the water, are narrow compared with their length, and have a platform near the centre for the navigation of the vessel. The different classes have two, three, or four funnels, with one mast each for signalling. Twenty destroyers are being added to the navy every year; there are at present about 190 of them. Torpedo-boats proper number about 100.

The **Submarines,** numbering about 60, are easily recognisable; only a small portion of the hull, the conning tower, and the periscope are visible when the vessels are on the surface. The periscope, remaining out of the water when the vessel is submerged, is a contrivance which gives a view of the surface of the sea and enables the crew to navigate the vessel and locate the target.

Sloops and *Gunboats* were largely 'scrapped' some years ago, and such of them as were retained are employed chiefly for police work.

The U.S. Navy is controlled by a Secretary of the Navy, and an Assistant-Secretary appointed by the President; these supervise the eight departments, similar to those of the Brit. Admiralty, which are directed by naval officers. The officers are the same as in the Brit. Navy, except that two grades, Lieutenant (junior grade), and Ensign, correspond to the Brit. Sub-Lieutenant. Pay is as follows: Admiral, $13,500; Rear-Admiral, $8000; Commodore, $6000; Captain, $4000; Commander, $3500; Lieutenant-Commander, (Brit. Navy Lieutenant Commanding), $3000; Lieutenant, $2400; Lieutenant (junior grade), $2000; Ensign, $1700; Midshipman, $600. All staff-officers, such as doctors, paymasters, and chaplains, receive the pay of their class.

NAVIGATION, the art of directing a ship along any desired course, and of accurately determining its position at any time. The actual management of a vessel comes under *seamanship* (*q.v.* under SHIPS). In the early days of ships, mariners were mostly obliged to keep within sight of land, for otherwise their only guides were the sun and the stars, which could only avail them in clear weather. In Eastern waters, such as the Indian Ocean and the China Sea, the monsoons provided a means of guidance, their constant uniformity of direction enabling vessels running directly before them to keep a steady course.

The application of the magnetic compass to navigation opened up a new era. Given a chart to indicate the relative positions of places, the navigator could now direct his course. But a chart would be comparatively useless without some means of ascertaining exactly the position of the ship at any moment. On a spherical body the position of any point is determined by two co-ordinates, and on the surface of the earth these co-ordinates are called meridians and parallels. The *meridians* are circles passing through the poles, and the *parallels* are circles parallel to the equator, and each meridian intersects each parallel. The angular distance of any meridian from a fixed meridian gives the longitude of all points upon it, the parallels similarly giving the latitude, and if the latitude and longitude of any point are known the position of that point is definitely fixed. The navigator therefore requires a method of determining these co-ordinates, in order that he may direct his course by chart and compass.

In whichever hemisphere an observer may be, the *latitude* equals the altitude of the celestial pole above the horizon. If the distance of any celestial body from the pole is known, the meridian altitude of that body gives, by a simple calculation, the latitude. The altitudes are taken by means of the *sextant*, and the required polar distances are given in the *Nautical Almanac*. In the northern hemisphere the Pole star is very close to the pole, and an observation of it gives from a table in the Nautical Almanac the altitude of the pole itself, and hence the required latitude. The *longitude* is determined by comparison of the local time with the corresponding Greenwich time. At sea, the observatory method of ascertaining local time, by noting the exact moment when some known celestial body crosses the meridian, is impracticable, and the local time must be obtained by calculation. The altitude of a known celestial body is taken when that body is out of the meridian, and from the already determined latitude the greatest altitude of the body is calculated. The local time may then be ascertained from the difference between the greatest and the observed altitudes. Greenwich time is usually taken from a chronometer, but also may be obtained by 'lunars.' In the Nautical Almanac are given the positions of the moon amongst the stars for every third hour of Greenwich time, and from comparison of these with the observed positions Greenwich time is obtained.

Latitude and longitude both may be found at once by *Sumner's method*. This method is based upon the fact that at any particular moment every celestial body is in the zenith of, or directly over, some part of the earth. Given the Nautical Almanac and the correct Greenwich time, the position of any known heavenly body—sun, moon, or star—at the moment of observation is known. If we take as centre the point in the zenith of which the observed body is at the moment of observation, and the difference between the zenith altitude, 90°, and the observed altitude as radius, and describe a circle on the globe, the vessel must lie somewhere on that circle. If, now, a similar circle is described for another celestial body, or for the same body after an interval of time, the ship's position will be at one of the points of intersection of the circles, and dead reckoning will indicate which is the required point. In practice, all that is necessary is a small portion of each of these circles drawn upon Mercator's projection. This method and a more recent modification of it are superseding all other methods of finding latitude and longitude.

Dead reckoning is the calculation of the ship's position without recourse to astronomical observations. The principal data are the latitude and longitude of the place of departure, or, as last determined, the course followed, the rate of sailing, and the time which has elapsed. Owing to its great liability to serious errors due to various causes dead reckoning is not to be depended upon unless frequently checked by astronomical observations, and it is chiefly used when weather conditions make such observations impossible.

Hall, *Navigation* (1912).

Navigation Acts, laws regulating n. and shipping. Principle of early statutes was protection: Acts of Richard II. (1381 and 1390) forbade exportation of goods except in Eng. ships; Acts of 1650–51 and 1660 to confine import trade of England and its possessions to Eng. bottoms were directed against Dutch, provoked Dutch wars, struck at attempted commercial independence of colonies, and played important rôle in negotiations for Union of Scotland and England, 1707; Act of 1660 was repealed, under influence of Free Trade ideas, 1826; foreigners admitted to coasting trade, 1854; merchant service is regulated by 'Sailing Acts.'

NAVIGATOR'S ISLANDS, see SAMOA.

NAVSARI, see NOSARI.

NAVY DISCIPLINE ACT, see MILITARY LAW.

NAWABGANJ.—(1) (26° 55′ N., 81° 14′ E.) town, Bara Banki, United Provinces, India; exports sugar, cotton. Pop. 7500. (2) town, Rajshahi Division, Bengal, India. Pop. 17,000.

NAWANAGAR (22° 26′ N., 70° 16′ E.), native state, Kathiawar, Bombay, India; capital, N.; silk and gold embroidery. Pop. 340,000; town, 53,000.

NAXOS.—(1) (37° 5′ N., 25° 30′ E.) island, Grecian Archipelago; largest of the Cyclades; wine, fruits. Pop. 2000. (2) (37° 3′ N., 25° 25′ E.) ancient seaport, Sicily; earliest Gk. colony in the island; destroyed by Dionysius, 403 B.C.

NAYAGARH (20° N., 85° E.), native state, Bihar and Orissa, India. Pop. 145,000.

NAZARETH (32° 42′ N., 35° 20′ E.), town, Galilee; in ancient times residence of Joseph and Mary. Pop. 10,500.

NAZARITES, NAZIRITES, Old Testament ascetics, who abstained from certain things for a time, under vows, *e.g.* Samuel and Samson; unshorn hair was one characteristic.

NAZIANZEN, see GREGORY, ST., OF NAZIANZUS.

NEAGH, LOUGH (54° 50′ N., 6° 25′ W.), lake, Ulster, Ireland; largest in Brit. Isles; 17 by 11 miles; area, 153 sq. miles.

NEALE, EDWARD VANSITTART (1810–92), Eng. Socialist; M.A., Oxford, and barrister; assisted formation of various co-operative productive societies and Fund of Co-operative Congress; sec. of Co-operative Congress, 1875–91.

NEAMTZU, NEAMTU (47° 17′ N., 26° 20′ E.), town, Moldavia, Rumania. Pop. 8500.

NEANDER, JOHANN AUGUST WILHELM (1789–1850), Ger. ecclesiastical historian; of Jewish origin; called before baptism, 1806, DAVID MENDEL; prof. of Ecclesiastical History at Heidelberg, 1812, at Berlin, 1813; pub. numerous widely read theological books, but great work, *Allgemeine Geschichte der christlichen Religion und Kirche*, was not finished; united great scholarship with popular style.

NEANDERTHAL (51° 15′ N., 7° E.), valley, Rhine province, Prussia; prehistoric skeleton discovered (1856).

NEAPOLIS, ancient name for NAPLES (*q.v.*).

NEARCTIC, see ANIMALS (DISTRIBUTION).

NEATH (51° 39′ N., 3° 48′ W.), port, Glamorganshire, Wales; has copper, tin-plate, engineering, chemical, and ironfounding works; site of ruined abbey and castle. Pop. (1911) 17,590.

NEAT'S-FOOT OIL, see under OIL.

NEBALIA, see under MALACOSTRACA.

NEBO, NABU ('The Proclaimer'), a Babylonian deity inferior in power only to Marduk, his reputed father; essentially a god of wisdom, the inventor of writing and protector of astrology; his wife was Tashmit, but she had no independent attributes or worship.

NEBRASKA (44° N., 106° W.), N. central state of U.S.A.; bounded N. by South Dakota, N.W. by Wyoming, S.W. by Colorado, S. by Kansas, E. by Iowa; length, 420 miles; breadth, 210 miles; area of

land surface, 76,808 sq. miles; area of water surface, 712 sq. miles.

Surface is generally undulating, and consists chiefly of extensive plains. Mountains belong to Rocky Mountain system in W., viz. Wild Cat Mountains (with Hogback Mountain, 5082 ft.; Wild Cat Mountain, 5038 ft.); large stretch of sand-hills in N. central region covering *c.* 20,000 sq. miles; extensive prairies in E. and S.; swamps in S.E. Principal rivers are Missouri (on eastern border), Platte, Republican, Niobrara, Snake, White River, Big Blue; numerous salt and freshwater lakes, springs, and a large supply of ground water. Climate is healthy, with dry fine atmosphere; mean annual temperature *c.* 48° F.; average annual rainfall *c.* 23 in., greatest in E. Fauna includes fox, coyote, black bear, mink, raccoon; numerous birds and insects; great variety of butterflies. N. has been visited by several locust plagues. N. has immense tracts of grass, but practically no forests.

N. passed to the U.S.A. as part of Louisiana Purchase (*q.v.*) from French, 1803; explored by several Americans, including Major Stephen Long, 1819; missions established among Indians, 1830 onwards; temporary settlements of Mormons, 1845–57; constituted a territory, 1854; boundaries fixed, 1861, 1863; admitted as a state, 1867. N. took an active part in the Civil War, 1861–65. N. is administered by Governor, Senate (33 members, elected for 2 years), and House of Representatives (100 members); has 2 Senators and 6 Representatives in Congress, and is divided into 92 counties. Principal towns are Omaha, Lincoln (capital), South Omaha. Rom. Catholics predominate; then Methodists, Lutherans, Disciples, Presbyterians, Baptists. Elementary education is compulsory. N. has several univ's, coll's, and other institutions, viz. State Univ. of Nebraska (Lincoln), with medical school at Omaha, Creighton Univ. (Omaha), Cotner Univ. (the Nebraska Christian Univ.), at Bethany, Lincoln; Hastings Coll. (Hastings), Doane Coll. (Crete), York Coll. (York), etc.

Total railway mileage is over 6000 miles. N. is an important agricultural state; chief products are maize, wheat, oats, hay, potatoes, fruit, sugar-beet, live stock, wool; chief industries are slaughtering and meat-packing, flour-milling, brewing, printing and publishing, dairying; limestone and sandstone are quarried. Irrigation is carried on extensively, also tree-planting. N. has many springs, and celebrated saline wells at Lincoln, Beatrice, etc. Pop. (1910) 1,192,214, of whom 7689 are negro.

Morton and others, *History of N.* (3 vols., 1905); Stevens, *Surface Water-Supply of N.* (1909).

NEBRASKA CITY (40° 40′ N., 95° 95′ W.), city, on Missouri, Nebraska, U.S.A.; canneries, flour-mills. Pop. (1910) 5488.

NEBUCHADNEZZAR, see CHRONOLOGY; BABYLONIA.

NEBULA (Lat. *nebula*, a cloud), cloudy objects visible in heavens by telescope; many thousands of most diverse shapes, but at least 120,000 are of spiral nature. Some seem merely clouds of gas, but others more condensed. No doubt n. are clouds of gaseous matter contracting into solid bodies, which eventually form stars and systems of stars.

N. are grouped into classes, *Annular*, or ring-shaped, *Elliptical*, *Irregular*, *Planetary*, and *Spiral*. As no n. has ever given a parallax, their distance must be enormous. True nature was discovered in 1864, when Huggins studied them by spectroscope.

Nebular Hypothesis.—Kant suggested that the solar system had been evolved from a huge nebula, which, in process of gradual cooling, had thrown off rings of matter, and that these in time contracted down, forming the planets, and that some of these rings had in their turn thrown off still smaller rings, which formed their satellites. The theory was also held by Laplace, but recent discoveries and researches suggest that the solar system was formed from a small spiral nebula, itself the result of a collision between two bodies.

NECESSITY, the principle by which the universe, in whole or part, is rendered inevitable.

NECK, the narrow part of the body which unites the head and the trunk. Where a 'neck' is present in invertebrate animals it is altogether indefinite, but in vertebrates it becomes increasingly definite, its character depending chiefly upon the number and shape of the cervical vertebræ, until in all mammals (with four exceptions) a constant number of vertebræ (9) is present. In osteology the neck of a bone is the narrow portion beneath the head.

NECKAR, Rom. NICER (49° 18′ N., 9° 14′ E.), river, Germany, joins Rhine at Mannheim; length, 247 miles.

NECKARGEMÜND (49° 25′ N., 8° 48′ E.), health-resort, on Neckar, Baden, Germany.

NECKER, JACQUES (1732–1804), Fr. statesman; established Paris and London banking firm of Thellusson and N.; director-gen. of finances, 1777; introduced important reforms of details; dismissed, 1781; recalled in desperate condition of exchequer, 1788; advised summoning of estates-gen.; again dismissed by king; Estates insisted on recall; failed to provide funds, and resigned, 1790. Mme N., *née* Curchod (1739–94), had a brilliant *salon*.

NECKLACE, DIAMOND, see ROHAN.

NECROPHORUS, see under POLYMORPHA.

NECROSIS, death of part of the tissues, caused most commonly by a bacterial poison or toxin, in an infective condition; term used especially of bone. See GANGRENE.

NECTARINE, variety of PEACH (*q.v.*).

NECTARINIIDÆ, see SUN-BIRDS.

NECTARY, see under FLOWER, HONEY.

NEEDLES of steel were first made, 1370. By modern method, wire is cut to double length of needle; eyes made in middle; then filed; chief Eng. centre, Redditch. N's have been discovered in prehistoric cave-dwellings and Egyptian tombs, of bone or metal.

NEEDLEWORK, see EMBROIDERY.

NEEMUCH, NIMACH (24° 27′ N., 74° 49′ E.), town, Gwalior, Central India. Pop. 22,000.

NEENAH (44° 10′ N., 88° 30′ W.), city, on Lake Winnebago, Wisconsin, U.S.A.; flour and lumber-mills. Pop. (1910) 5730.

NEER, VAN DER, name of two Dutch painters: (1) AERNOUT (1603–77), contemporary of Hobbema, excelled in landscape painting, but during his lifetime his genius excited no response; (2) EGLON (1643–1703), his son, was an eminent portrait painter.

NEERWINDEN (50° 47′ N., 5° 3′ E.), village, in province of Liège, Belgium, not far from Tirlemont; celebrated for battle in 1693, when French under Luxembourg defeated William III., and for victory of Austrians over French under Dumouriez in 1793.

NEES VON ESENBECK, CHRISTIAN GOTTFRIED (1776–1858), Ger. naturalist; author of many botanical and entomological papers.

NEGAPATAM (10° 46′ N., 79° 53′ E.), seaport, Tanjore, Madras, India; railway workshops; manufactures oil. Pop. 58,000.

NEGAUNEE (46° 30′ N., 87° 38′ W.), city, Michigan, U.S.A.; iron mines. Pop. (1910) 8460.

NEGLIGENCE, see under EMPLOYERS' LIABILITY ACTS.

NEGRI SEMBILAN, see MALAY STATES.

NEGRITOS, see RACES OF MANKIND.

NEGRO, a sub-species of mankind, whose characteristics are chiefly woolly or frizzly hair, dark skin, and dolichocephalic skull; found in largest numbers and truest state in Africa, the home of the negroid type, but now very widely dispersed. The negroes of the Sudan, with their dark brown skin, black, crisp hair, long head, broad, flat nose, and thick lips are generally held to be the best representatives of their kind. The Bantu tribes to the south, the Bushmen and Hottentots and dwarf races are all varieties of negroid types. A similar variety exists in the intellectual progress—the Hausa, a tribe of the central Sudan, being far in advance, in civilisation, of other

Sudanese, Bantu, and dwarf tribes. Generalisations on the mental capacity of the negro have mostly been made on insufficient data, and are therefore of little value.

In 1619 the first cargo of negro slaves was landed in America from West Africa, and the scarcity of labour made this diabolical traffic so profitable that by 1790, when the first census of the United States was taken, the negroes stood in number at 757,208, mainly in Georgia, Mississippi, Alabama, South and North Carolina, Virginia, Louisiana, and Texas. Importation was prohibited in 1808, and slavery abolished, 1863. As a labourer, especially as an agricultural labourer in the Southern States, and as a domestic servant, the negro has proved himself extremely useful to Americans. As a mechanic or a factory employee he has shown less willingness for useful service. Previous to emancipation several of the plantations were really training-grounds in industry and civilisation, while the Civil War afforded valuable discipline to thousands of negroes in the army of the north and on the southern farms where negroes were left in charge.

Negro education in public schools, high schools, and colleges dates from 1870, and is a thing apart in America from the education of the whites. The extension of education and the development of land ownership are regarded as the most favourable of improving the condition of the negro. Several states, notably Mississippi, North and South Carolina, Louisiana, Virginia, and Alabama, have since 1890 excluded the negro from political enfranchisement.

Du Bois, *The Negroes of the Black Belt*; Booker Washington, *Future of the American Negro*; Tillinghast, *The Negro in Africa and America*.

NEHAVEND (30° 40′ N., 48° 20′ E.), town, province of Nehavend, Persia; scene of Persian defeat by Saracens, 641 A.D.

NEHEMIAH (fl. 450 B.C.), Jewish patriot; obtained permission from Artaxerxes to rebuild Jerusalem; put down abuses; see Books of *Ezra* and *Nehemiah* in Bible.

NEILE, RICHARD (1562–1640), dean of Westminster; then bp. of Rochester, Lichfield, Lincoln, Durham, Winchester; abp. of York, 1631.

NEILGHERRIES, see NILGIRIS.

NEILL, JAMES GEORGE SMITH (1810–57), Brit. soldier; crushed rising in Benares at commencement of Ind. Mutiny, 1857; relieved Allahabad; slain at moment of forcing way into Lucknow.

NEISSE (50° 30′ N., 17° 20′ E.), town, on Neisse, Silesia, Prussia; furniture, machinery. Pop. (1910) 25,937.

NEISSE.—(1) LAUSITZER or GÖRLITZER NEISSE (51° 30′ N., 15° E.), river, Silesia and Brandenburg, Prussia; joins the Oder. (2) GLATZER NEISSE (50° 30′ N., 17° E.), river, Silesia, Prussia; joins Oder.

NEITH, NEIT, goddess in Egyptian mythology; equivalent to Minerva.

NEJD (28° N., 45° E.), central province of Arabia, bounded by Nafud Desert, El Hasa, Dahna Desert, Asir, and Hejaz; surface, more elevated than other provinces of Arabia, consists mostly of sandy desert with occasional valleys, ravines, and oases where soil is fertile and cultivated; horses, camels, and sheep reared; chief river basins are Wadi Rumma and Wadi Dawasir; capital, Hail; Wahabi capital, Riad. Wahabis, who were overcome by Mehemet Ali in 1818, still retain considerable power in vicinity of Riad. Pop. *c.* 1,000,000.

NEJEF, MESHED-ALI (32° N., 44° 28′ E.), town, on Lake Nejef, Asiatic Turkey; place of pilgrimage.

NEKTON, the group of animals, such as whales and fishes, which are capable of swimming freely and roaming at will over large tracts of ocean.

NELLORE (14° 26′ N., 80° E.), chief town of Nellore district, Madras, India; on Pennar. Pop. 33,000; (dist.) 1,500,000.

NELSON.—(1) (53° 50′ N., 2° 12′ W.) town, Lancashire, England; cotton-mills. Pop. (1911) 39,485. (2) (41° 17′ S., 173° 19′ E.) seaport, Nelson, New Zealand; bp.'s see. Pop. 10,000. (3) (49° 33′ N., 117° 20′ W.) mining town, Brit. Columbia, on Lake Kootenay. Pop. 6700. (4) (56° 35′ N., 95° W.) river, Canada; outlet of Lake Winnipeg into Hudson Bay.

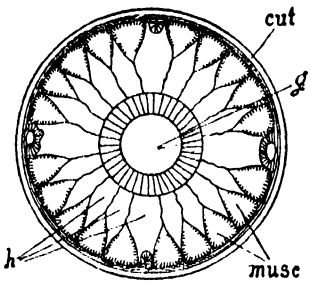
NELSON, HORATIO NELSON, VISCOUNT (1758–1805), Brit. admiral; s. of Rev. Edmund N., rector of Burnham Thorpe, Norfolk; b. Sept. 29; delicate, ailing child of poor physique; entered navy, 1771, under his uncle, Capt. Suckling, on *Raisonable*, and rose speedily by Suckling's influence. Dissatisfied by promotions over his head he uttered bold prophecy that one day he should have a gazette of his own; came to front in wars against French; in *Agamemnon* took part in sieges of *Bastia* and *Calvi*, in Corsica, 1793, losing one eye before Calvi. By disobedience of orders N. won for Sir John Jervis brilliant victory off *Cape St. Vincent* against Spain, 1797; received Order of Bath and annual pension of £1000; lost right arm in hopeless attack on *Teneriffe*; sent to intercept Napoleon's proposed invasion of England, 1798, discovered entire Fr. fleet in ABOUKIR BAY, surrounded and destroyed it in *Battle of the Nile*, Aug. 1; cr. Baron N. of the Nile with £2000 yearly; aided in driving French from Naples, receiving dukedom of Bronte and Neapolitan fief. Denmark was chief sea-power on which Napoleon relied, and in 1801 Britain dealt heavy blow to Napoleonic plans by great victory of *Copenhagen*, by which six Dan. ships were seized, and Baltic reopened to Britain; in this desperate battle Sir Hyde Parker, the admiral, gave signal for retreat, but N. characteristically cried, 'Damn the signal! Keep mine for closer battle flying. That's the way I answer such signals: nail mine to the mast!'

In 1805 he prevented junction of Fr. and Span. fleets in Channel and engaged enemy off *Cape Trafalgar*, Oct. 21, where he gave well-known signal, 'England expects that every man will do his duty.' Though slain in fight, he inspired victory. United fleets of France and Spain (under Villeneuve and two Span. admirals) counted 33 sail of the line, 5 frigates, 2 brigs, and had great superiority in artillery, British only 27 sail of the line, 4 frigates, 1 schooner. N is greatest Brit. naval hero; displayed swiftness, intuition of genius, thorough knowledge of war; simple, quiet character; unfortunate attachment to beautiful Lady Hamilton; blamed for treatment of faithful wife; public career only adversely criticised for intrigues in Naples.

Life, by Southey, Beresford (1898), Laughton (1899), Mahan (1897); White and Muirhouse, *N. and the XX. Cent.* (1905).

NELSONVILLE (39° 30′ N., 82° 15′ W.), city, on Hocking, Ohio, U.S.A.; coal mines. Pop. (1910) 6082.

NELUMBIUM, genus of aquatic Nymphæaceæ, characterised by pinnate leaves and cup-like flowers.



NEMATHELMINTHES, ROUND-WORMS, a phylum of round-bodied, unsegmented worms, most of which are parasitic in other animals. They have a thick external cuticle or skin, and, except perhaps in Acanthocephala, cilia are altogether absent. The group comprises the three classes—Nematodes, Nematomorpha, and Acanthocephala (*qq.v.*).

NEMATODA, Round-Worms, Thread-Worms, Hair-Worms, etc.; the largest and most important class of Nemathelminth or Round-Worms. Many are parasitic, and as such are harmful even to man, but they occur also in the earth and in both fresh and salt water. Nematodes are ivory white or transparent creatures, with a thick protecting cuticle, and groups of longitudinal muscles only, intervals between which are indicated by two 'lateral lines.' There is a well-developed food canal, a mouth and anus, and a peculiar excretory apparatus which opens to the exterior by an anterior pore. The life-history is sometimes a direct development from a free embryo to a free adult, but sometimes the larvæ are free-living and the adults parasitic, or the larvæ are parasitic and the adults free, or, lastly, both stages may be parasitic but in different hosts. Their abundance as parasites may be judged

from the fact that from a single horse many millions have been taken. In man the MAW-WORM (*Ascaris lumbricoides*) and the WHIP-WORM (*Trichocephalus*

A NEMATODE WORM. *o*, position of mouth.

DIAGRAMMATIC CROSS-SECTION OF A NEMATODE WORM. *cut*, cuticle; *g*, gut; *h*, hæmocœle or primary body-cavity; *musc*, muscle cells.

dispar) are common parasites, causing intestinal discomfort; the GUINEA-WORM (*Filaria medinensis*) causes painful abscesses in tropical regions; and *Trichina spiralis*, got from the consumption of an infected pig, gives rise to the occasionally fatal disease, Trichinosis.

NEMATOMORPHA, HAIR-WORMS, long, unsegmented, hair-like worms, which when adult live, with one marine exception, in ponds and ditches. Popularly supposed to originate from immersed horse-hairs, the Hair-Worm really develops after a complex larval existence in the bodies of aquatic insects—example, *Gordius*. They comprise a group of Round-Worms. See NEMATHELMINTHES.

NEMERTINE WORMS, NEMERTEANS, phylum NEMERTINEA or NEMERTEA (Ribbon Worms, Sea Snakes, Bootlace Worms, etc.), round, soft-bodied worms of exceedingly diverse and beautiful colours, which are found most often on the seashore, lurking under stones or in shells near low-tide mark, though some inhabit fresh water (*Tetrastemma*), a few live on land (*Geonemertes*), and one marine genus (*Malacobdella*) lives attached to the bivalve *Cyprina islandica*. The body may be shorter than an inch, or more than 30 yds. long, as in the Common Sea Bootlace or Sea Snake of Brit. coasts (*Lineus marinus*); but a casual estimate is generally deceptive, for Nemertines possess an extraordinary power of contracting and extending their bodies. The majority of Ribbon Worms are brightly coloured, from translucent greys and greens, through all shades of yellows, orange, reds, and browns, to the inky purple of the Common Bootlace.

A NEMERTINE WORM. *pr*, proboscis; *sh*, sheath of proboscis.

The most characteristic features of Nemerteans are the coat of fine vibratile cilia which covers their skin, and which enables them to glide with great ease and rapidity, and the long proboscis, which lies above the food canal and can be shot out with force or retracted with great rapidity. It is probably an organ of sense, but the fact that when ejected its tip is armed with spines and stylets would indicate that it could be utilised also in attack and defence. There are present simple sense-organs, frequently several groups of eyes, a food canal open at both ends, a blood system, sometimes with red-blood corpuscles, and a brain from which run two lateral nerve cords.

Nemertines are carnivorous, feeding ravenously upon animal matter whether living or dead, although polychæte worms and molluscs probably form the staple food supply.

NEMESIS, Gk. goddess, personification of heavenly retribution, akin to the Furies, sometimes confused with other cults; punished those who gained overmuch or who were arrogant.

NEMI, ancient *Nemorensis Lacus* (41° 43′ N., 12° 42′ E.), lake, Italy, occupying extinct crater in Alban Mountains; on shore are remains of ancient Rom. temple to Diana.

NEMOURS (48° 14′ N., 2° 42′ E.), town, Seine-et-Marne, France; sand quarries. Pop. 5200.

NEMOURS, title of famous Fr. family; duchy (cr. 1404) was granted to Jean d'Armagnac, 1452, Gaston de Foix, 1506, house of Savoy, 1528–1659, and then to house of Orleans, in junior branch of which it remains. Among its distinguished members is Marie, Duchesse de N. (1625–1707), whose *Mémoires* were pub. 1709.—LOUIS CHARLES PHILIPPE RAPHAEL, DUC DE N. (1814–96), s. of Louis Philippe; b. Paris; refused crown of Belgium, 1831, of Greece, 1832.

NENAGH (52° 52′ N., 8° 12′ W.), market town, Tipperary, Ireland; remains of ancient castle. Pop. 4700.

NEOCOMIAN, see CRETACEOUS SYSTEM.

NEOLITHIC, see ANCIENT HISTORY.

NEOPHRON, genus of vultures with horizontal nostrils; found in Egypt and India.

NEO-PLATONISM, see PLATO.

NEO-PYTHAGOREANISM, see PYTHAGORAS.

NEORNITHES, see under ORNITHOLOGY.

NEPAL, NEPAUL, NIPAL (28° N., 84′ E.), independent state in N.E. of India; bounded N. by Tibet, W. by Kumaon, S. by United Provinces, Bihar and Orissa, and Bengal, and E. by Sikkim and Bengal; area, *c.* 54,000 sq. miles. Northern portion is lofty and mountainous region, containing part of Himalaya range with some of highest summits in the world; besides Mount Everest (29,000 ft.), Kinchinjunga (*c.* 28,000 ft.), and Dhaulagiri (26,000 ft.), there are many other peaks over 20,000 ft. high. In S. are stretches of fertile and cultivated country, called *Tarai*. State is watered principally by Gogra, Gandak, Sun Kosi, and their tributaries; chief towns, Katmandu (capital), Patan, and Bhatgaon. Owing to differences in altitude there is great variety of flora and fauna; cotton, rice, maize, wheat, barley, oats, pulse, hemp, sugar-cane, tobacco, dyes, drugs, vegetables, fruits, and flowers cultivated; forests produce fine timber. Among wild animals are tiger, leopard, wolf, hyena, rhinoceros, and elephant. N. supplies marble, iron, limestone, zinc, lead, copper, and sulphur; mineral springs numerous; chief occupation is agriculture, many of the inhabitants being engaged in terracing and irrigating land. Manufactures include metallic wares, pottery, paper, and textiles. State is inhabited by several different tribes, most important being warlike Gurkhas, who came originally from Rajputana and took possession of country; war broke out between them and British in 1814, and concluded with Peace of Segowlie in 1815, after which Gurkhas became friendly and allowed Brit. resident to live in capital; later assisted British in Mutiny. Government is in hands of a Prime Minister, who represents the Maharajahdhiraja. Pop. 4,000,000.

Digby, *Nepal and India* (1890).

NEPENTHE, term applied to anything causing oblivion of pain or grief, from an Egyptian drug mentioned in *Odyssey*.

NEPENTHES, genus of climbing plants ('pitcher-plants'), of order *Sarraceniales*, found in the East Indies, the ends of the leaves expanding into pitchers which secrete a digestive fluid.

NEPHELINE, white or yellowish mineral occurring in volcanic rocks; consists of sodium, potassium, and aluminium silicate.

Nephelinites, a group of colourless and transparent rocks containing nepheline; found in Staffordshire, John o' Groat's, Canary Islands, Azores; one of the lavas of Tertiary period.

NEPHELINE-SYENITE, ELÆOLITE-SYENITE, a white or grey holocrystalline rock, rich in alkalis and alumina, and found in volcanic and plutonic rocks in small masses or veins; resembles granite in appearance, and of rare occurrence; numerous varieties.

NEPHROPSIDEA, see LOBSTERS.

NEPI (42° 15′ N., 12° 22′ E.), town, ancient *Nepete*, Rome, Italy. Pop. 3000.

NEPIGON, see NIPIGON.

NEPOMUK, JOHN OF (fl. XIV. cent.), patron saint of Bohemia; tortured and killed in ecclesiastical dispute by Wenceslaus IV., 1393; subject of many legends; canonised, 1729.

NEPOS, CORNELIUS (*c.* 99–24 B.C.), Rom. historiographer; works include *Chronica* (compressed history of world), *De viris illustribus* (lives of famous men); diverting but not altogether reliable.

NEPTUNE, the farthermost known planet of the solar system, its distance from the sun being approximately 2800 million miles or thirty times that of the earth. Owing to its great distance it is invisible in all but the largest telescopes.

The discovery of N. ranks as one of the greatest triumphs of mathematics. J. C. Adams and Le Verrier independently discovered the planet theoretically in 1846 from computations based upon certain observed irregularities in the movements of Uranus, at that time the outermost planet of solar system.

The diameter of N. is about 37,000 miles, and no less than 164 years is required for it to complete one revolution of its huge orbit around the sun. It has at least one satellite.

NEPTUNE, Rom. god; see POSEIDON.

NEPTUNE'S CUP, see under SPONGES.

NÉRAC (44° 9′ N., 0° 21′ E.), town, Lot-et-Garonne, France; the old castle associated with Henry IV. and Marguerite de Valois; beer. Pop. 6600.

NERBUDDA, NARBADA (21° 36′ N., 72° 36′ E.), river, India; flows into Gulf of Cambay; length, 750 miles.

NERCHINSK (52° 5′ N., 117° E.), town, on Nercha, Transbaikalia, E. Siberia; tobacco; trade in furs. Pop. 7500.

NERCHINSKIY-ZAVOD (51° 20′ N., 119° E.), town, Transbaikalia, E. Siberia; silver. Pop. 4000.

NEREÏDS, see NYMPHS.

NERI, FILIPPO DE' (1515–95), Ital. priest; did much by charity to alleviate poverty in Rome; founded the Congregation of the Oratory, which Cardinal Newman introduced into England; canonised, 1622.

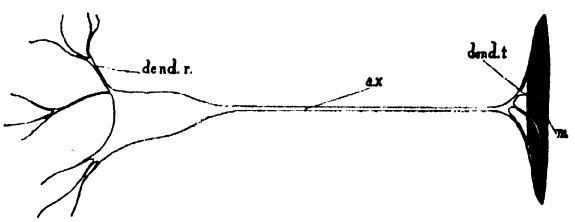
NERITIC, see under PLANKTON.

NERO (37–68), Rom. emperor, 54–68; s. of Gnæus Domitius Ahenobarbus; adopted by Emperor Claudius, 50, his mother, Agrippina, having become empress, 49; m. Octavia, dau. of Claudius, 53; on death of Claudius, 54, poisoned by Agrippina, latter secured throne for Nero. Five years of benevolent rule by Seneca and Burrus ensued; they were opposed by Agrippina, whom Nero, however, imprisoned and caused to be murdered. Nero's mistress, Poppæa Sabina, obtained chief power; secured murder of his wife and her own marriage to him, 62; Burrus and others murdered, 62; revolt of Boadicea in Britain put down, 61, but considered disgrace to Rome; Armenia established independence, 63; great fire, 64, nearly destroyed Rome; said to have been planned by Nero; Rome splendidly rebuilt, but the cost raised revolts; conspiracy, 65, in which prætorians were implicated, led to reign of terror; revolt of Vindex in Gaul and Galba in Spain, 68; Galba declared emperor, and Nero escaped execution by suicide. Last of first imperial line, N. was noted for persecution of Christians; ranks in history as supreme type of vice and frivolity; musician and actor.

Henderson, *Nero* (1904).

NERTHUS, see HERTHA.

NERUDA, MADAME, see HALLÉ, SIR CHARLES.



NERVA, MARCUS COCCEIUS, Rom. emperor, 96–98 A.D.; elected, when over 60 years of age, by Senate on murder of Domitian; exiles recalled, system of informers abolished, and republican machinery employed in governing; *lex agraria* provided lands for poor citizens; measures for supporting poor children in Ital. towns; taxation reduced; won victory against Suebi; became too feeble for rule; adopted Trajan as successor and colleague, 97.

NERVAL, GÉRARD DE, GÉRARD LABRUNIE (1808–55), Fr. author; wrote *Chansons et Ballades populaires du Valois, Émilie, Souvenirs de la Revolution,* translation of Goethe's *Faust, Filles du Feu,* etc.; highly praised by Gautier; unhappy life ended in suicide.

NERVES, see MUSCLE, NERVOUS SYSTEM.

NERVI (44° 22′ N., 9° 4′ E.), town, winter resort, on Gulf of Genoa, Genoa, Italy. Pop. 7500.

NERVOUS SYSTEM includes the *central* n. s., comprising the brain and spinal cord; the *peripheral* n. s., comprising the cranial nerves, the spinal nerves, and the sense organs, eye, ear, organ of smell, organ of taste, touch corpuscles; and the *sympathetic* n. s. Of these the brain, spinal cord, and the various sense organs are treated in separate articles elsewhere. The tissue of the n. s. is composed of nerve cells, nerve fibres, and a connective tissue termed neuroglia. The *nerve cells* vary from practically the smallest to much the largest size of cell in the body, and they have numerous branches. One of these branches, termed the *axon,* or *axis cylinder,* is a nerve fibre, while the others break up into finer branches and come into relation with similar branches of neighbouring nerve cells. The nerve cells are situated mainly in the brain and spinal cord, and their function consists in receiving, sending out, or in taking part in transmitting nervous impulses. The *nerve fibres* are the main processes, or axons, of the nerve cells, only one axon coming from each cell, and they may be either *non-medullated,* i.e. without any covering, or with only a fine membranous sheath, the *neurilemma,* or *medullated,* i.e. enclosed in a sheath of fatty substance termed *myelin,* which is usually covered by the neurilemma. At regular intervals of about $\frac{1}{75}$ of an inch the myelin is interrupted by constrictions, termed the *nodes of Ranvier,* which are characterised by staining deeply with silver nitrate in microscopic preparations. The axon runs without interruption from a nerve cell to a sense organ. The *neuroglia* is of two types, that lining the ventricles of the brain and the central canal of the spinal cord consisting of columnar cells, while elsewhere it is formed of small branching cells, the processes of which, except in the grey matter of the brain, interlace with the processes of the nerve cells.

DIAGRAMMATIC FIGURE OF A NEURON OR NERVE CELL IN CONNECTION WITH A SIMPLE MUSCLE CELL. *ax,* axon; *dend. r,* receptive dendrites; *dend. t,* terminal dendrite; *m,* muscle cells.

The **cranial nerves,** arising directly from the brain, are arranged in twelve pairs. The *first,* or *olfactory,* nerve is the nerve of smell, and is situated on each side, close beneath the frontal lobe of the brain, ending in a bulb, the olfactory bulb from which nerve filaments are given off to the nose. The *second,* or *optic,* nerve is the nerve of sight, and arises on each side of the brain from the optic thalamus and corpora quadrigemina, coming round in front to meet its fellow to the opposite side at the optic chiasma, where half the fibres of each side cross to the other; from here the optic nerve proper passes to the orbit and is distributed to the retina. The *third,* or *oculomotor,* nerve supplies four of the muscles which move the eyeball, the superior, inferior, and internal rectus, and inferior oblique, and also the *levator palpebræ superioris,* which lifts the upper eyelid; it leaves the brain immediately in front of the *pons Varolii.* The *fourth,*

or trochlear, nerve supplies the superior oblique muscle of the eyeball, and winds round the pons Varolii as it leaves the brain.

The *fifth*, or *trigeminal*, nerve leaves the brain by a broad root at the side of the pons Varolii and proceeds forwards to the apex of the petrous portion of the temporal bone, near the centre of the base of the skull, where it expands into a broad ganglion, the *Gasserian ganglion*. From this three divisions of the nerve go forwards, the *ophthalmic*, the *maxillary*, and the *mandibular*, which are sensory nerves, and with the last is associated a motor nerve to the muscles of mastication. The ophthalmic division of the fifth nerve breaks up into the *frontal* nerve, which supplies the upper part of the scalp, the forehead, and the inner part of the eyelids, the *lachrymal* nerve, which supplies the lachrymal gland and the outer part of the eyelids, and the *nasal* nerve, which supplies the nasal cavity and the surface of the nose. The maxillary division of the fifth nerve breaks up into the posterior, middle, and anterior dental branches, to the teeth of the upper jaw, and palpebral, nasal, and labial branches, to the lower eyelid, side of the nose, and upper lip respectively. The mandibular division of the fifth nerve, in addition to the motor branch, breaks up into the lingual nerve, which supplies the anterior part of the tongue, the inferior dental nerve, supplying the teeth of the lower jaw and giving a terminal branch to the surface of the chin, and the auriculo-temporal nerve, going backwards to supply the parotid gland, the skin on the outer side of the ear, and the side of the scalp.

The *sixth*, or *abducent*, nerve supplies the external rectus muscle of the eyeball, and leaves the brain immediately below the pons Varolii. The *seventh*, or *facial*, nerve supplies by its branches all the muscles of the face except the muscles of mastication, and in addition supplies the occipitalis, retrahens aurem, stylo-hyoid, and posterior belly of the digastric; it leaves the brain between the pons Varolii and the cerebellum. The *eighth*, or *auditory*, nerve is in two parts, one of them, the nerve of hearing proper, supplying the cochlea, and the other supplying the semicircular canals, which are concerned in maintaining the equilibrium of the body; it leaves the brain between the pons Varolii and the cerebellum, external to the seventh nerve. The *ninth*, or *glosso-pharyngeal*, nerve is the nerve of taste, supplying the back of the tongue, giving also branches to the tonsil and epiglottis; it leaves the medulla oblongata between the olive and restiform body. The *tenth*, or *vagus*, nerve is partly motor and partly sensory, and gives branches to the pharynx, larynx, œsophagus and stomach, respiratory tract and lungs, while the left vagus is connected with the hepatic nerve plexus, and the right with the cœliac, splenic, and renal plexuses; it leaves the medulla oblongata between the olive and restiform body immediately below the root of the ninth. The *eleventh*, or *spinal accessory*, nerve is composed of one part which leaves the medulla oblongata immediately below the root of the vagus, eventually joining the vagus lower down and supplying the larynx, and another part which arises by several roots from the spinal cord and supplies the sterno-mastoid and trapezius muscles. The *twelfth*, or *hypoglossal*, nerve is the motor nerve which supplies the tongue, giving also branches to the larynx, and the thyro-hyoid and genio-hyoid muscles; it leaves the medulla oblongata between the anterior pyramid and the olive.

The **spinal nerves** arise in pairs, thirty-one in number, from each side of the spinal cord. Each nerve is attached to the spinal cord by two roots, an anterior and a posterior, the former containing motor fibres and the latter sensory fibres, the two roots joining together before leaving the spinal canal. The posterior root has on it, just before it joins the anterior root, an oval swelling or *ganglion*, containing the nerve cells of the sensory nerve fibres. The united nerve leaves the spinal canal through a space between two adjacent vertebræ, and divides into a posterior and an anterior division, each of which contains both sensory and motor fibres. The posterior division divides again into branches supplying the muscles and skin of the back. The anterior division first gives off a branch to, and receives fibres in return from, the sympathetic system, and then proceeds round the trunk, giving off a lateral branch to the muscles and skin of the trunk, and ending in front of the body in a cutaneous branch. The nerves in the dorsal region preserve this simple arrangement, but in the cervical, lumbar, and sacral regions, through the development of the limbs, the symmetry is altered. In these regions the nerves divide and join with one another to form plexuses from which proceed branches for the nervous supply of the limbs; the fourth to the eighth cervical and the first and second thoracic spinal nerves are involved in the brachial plexus, the last thoracic and the first four lumbar spinal nerves in the lumbar plexus, and the fifth lumbar and first four sacral nerves in the sacral plexus.

The **sympathetic system** is composed of a series of ganglia united with one another by nerve cords running on each side of the vertebral column; the ganglia are three in number in the cervical region, and in number corresponding to the vertebræ in the dorsal, lumbar, and sacral regions. From each ganglion a nerve of grey fibres goes to the corresponding cranial or spinal nerve, and from it a branch is received in return. Branches also go from the ganglia to the blood-vessels and to the internal organs, uniting with each other to form intricate plexuses in some of which are found ganglia. The chief of these plexuses are: that situated behind the pharynx; that on the œsophagus; that in the arch of the aorta; that in front of the bifurcation of the aorta; the *solar plexus*, behind the stomach and around the cœliac axis of the aorta, with which are associated the two *semilunar ganglia*; the *hypogastric plexus*, below the bifurcation of the aorta; while plexuses are also formed around the rectum, bladder, prostate, uterus, and vagina. From these different plexuses branches go to the alimentary canal, its glands and blood-vessels, to the generative organs, to the skin, its glands, blood-vessels, and muscles, and to the iris muscle and blood-vessels of the eyeball. The sympathetic fibres which supply the muscular walls of the blood-vessels regulate their contraction and dilatation, and are termed *vaso-motor* fibres; while the movements of the alimentary canal, the secretions of the secretory glands of the body, and the dilatation of the pupil of the eye are all controlled by the sympathetic system.

Pathology.—The path of motor impulses from the brain is in two segments, the upper extending from the cortex of the brain to the anterior horn of grey matter in the spinal cord, while the lower extends from the anterior horn of grey matter to the termination of the motor nerve fibres in the muscles. The symptoms caused by a *lesion* of the motor path depend on whether it is in the upper or lower segment; if it is in the upper there is muscular weakness without muscular wasting, without changes in the electrical reactions, while if it is in the lower there is weakness and wasting and change in the electrical reactions. The path of sensory impulses is in three segments, of which the lowest has its nerve cells in the ganglia of the posterior roots of the spinal nerves, from which one process goes to the muscles and skin, etc., and another to the spinal cord, while the upper two segments serve as links in the chain to the brain. According to the segment of the path affected, the symptoms of a lesion of the sensory path differ, and different kinds of sensation may be deranged separately from one another, such as the sense of touch, pain, heat and cold, muscular sense, the sense of vibration.

When a nerve has been *divided*, the part which is

farther from its nerve cells of origin undergoes degeneration, the myelin sheath and axis cylinder breaking up and disappearing, the neurilemma remaining, its nuclei multiplying. From the central part of the divided nerve the axis cylinder elongates and grows out to the sheath of the farther part, which it penetrates, and grows along inside it to its termination, the myelin sheath then also regenerating.

Inflammation may involve either chiefly the sheath of the nerve, the interstitial tissue, or the nerve fibres themselves. When the interstitial tissue is the subject of inflammation the nerve is swollen, red in colour, and infiltrated with round cells, while the nerve fibres are not affected to any extent. When the nerve fibres are primarily affected the changes resemble those in degeneration after division of a nerve, the myelin and axis cylinders breaking down and disappearing, and the nuclei of the neurilemma multiplying.

The causes of inflammation of the nerves are various, and include over-indulgence in alcohol, cocaine, opium, morphia, tobacco, the poisonous effects of arsenic, carbon monoxide, lead, mercury, toxins in such diseases as beri-beri, diphtheria, influenza, measles. See APHASIA, APOPLEXY, BRAIN, CHOREA, CRETINISM, EPILEPSY, HYSTERIA, INSANITY, LOCOMOTOR ATAXY, NEURALGIA, NEURASTHENIA, SCIATICA, SPINAL CORD, and similar articles.

Lickley, *The Nervous System* (1912); Turner and Grainger Stewart, *Text-Book of Nervous Diseases*.

NESS, LOCH (57° 15′ N., 4° 30′ W.), lake, Inverness, Scotland; length, 22 miles; Oich River joins it to Caledonian Canal on S., the Ness and Canal link it with Moray Firth on N.; celebrated for scenery.

NESSELRODE, KARL ROBERT, COUNT (1780–1862), Russ. diplomatist and statesman; representative of Russia in councils of Allies, 1813–14; helped to draw up Treaties of Paris and to form Holy Alliance; supported war policy against pagan Turkey and revolutionary Hungary, but opposed war with Prussia.

NEST, a structure built by various kinds of animals to protect their eggs or young during immaturity. Amongst birds, with whom nest-building, or *nidification*, is most common, the n. may vary from a simple hollow in sand lined with a few leaves or grasses, and the careless platform of the rook, the beautifully woven grass, lichen, or mossy n's of Thrushes, Finches, Wrens, and the like, the mud n's of Swallows and Oven-Birds, to the elaborate structures of the tropical Weaver- and Tailor-Birds. Claws and beak are used in building, and often salivary juices supply a medium of adhesion. (The *edible bird's nest* of China is made by Swifts with a glutinous salivary fluid which becomes hard.) But, apart from birds, nidification is practised in several other groups: typical nest-builders amongst mammals are Squirrels and Field-Mice; some fishes, such as Sticklebacks, weave masses of seaweed; even the mollusc *Lima* cements shell-fragments and débris; while amongst insects, especially the Hymenopterous Ants, Bees, and Wasps, nest-building of earth, mud, or wood-pulp is common.

NESTOR (classical myth.), s. of Neleus and Chloris; in Homer's epics represents wisdom of old age.

NESTOR (*c.* 1056–*c.* 1114), Russ. monk of Pechersky cloister, Kiev, to whom are attributed earliest Russ. chronicles.

NESTOR, a genus of PARROTS (*q.v.*).
